To the reader,

this volume contains the short papers of the Sinergie-SIMA 2023 Management Conference, hosted by the LUM University and University of Bari at Mercure Villa Romanazzi Carducci (Bari) on June 29th and 30th 2023.

Theory and practice in the field of management have been challenged by the emergence of deep transitions such as those driven by globalization, the rise of social and environmental issues, and the diffusion of digital technologies. Events such as the ensuing geopolitical crises and the pandemic further contribute to spur management scholars to feel the call to produce impactful research with theoretical and managerial implications on the relationship between location and strategy (Bathelt and Li, 2022).

As a consequence, scholars and practitioners have been asked to design new business models and rethink value chains in a twofold direction (Mazutis et al., 2021). First, the relevance of local roots sheds light on the way people create and shape places, as much as places shape people and their organizations, suggesting a need to rethink how all lives ‘take place’ in places, as well as how all business happens in places (Sternad et al., 2017). Second, a need for new interactions emerges, suggesting that businesses are deeply connected to their roots, that are their homes, from which they draw inspiration, identity, and sources of competitive advantage (Soderstrom and Weber, 2020).

Rediscovering local roots and specific assets, as well as developing new ways of interaction among the economic actors and their stakeholders, can help firms to design effective and innovative strategies to create and share values (Mair et al., 2016), with positive economic, social, and environmental impacts (Attig and Brockman, 2017).

Several research questions stimulate an interdisciplinary debate in the field of management. These questions relate to the ability of firms and managers to move, among the others, between global and local relations, near/physical and far/digital interactions, reshoring and offshoring activities, omnichannel competition and retail interactions, market transactions and system operating structures, traditional and innovative approaches, social/local benefits and financial/global performances, business ethics and ethics in business.

In the same way, different theories, methodological approaches, and units of analysis are required to generate scientific research that has an impact not only in terms of theoretical contribution but also on the real business world.

The Sinergie-SIMA 2023 Management Conference was a great occasion to discuss about the research efforts of our research community on thematic tracks related to the Conference theme (the function of territorial or cultural roots and of operational interactions in management) and the SIMA thematic groups (Entrepreneurship, Innovation & technology management, International business, Marketing, Retailing & Service management, Small & family business, Strategic communication, Strategy & Governance, Supply chain management, logistics & operations, Sustainability, and Tourism and culture management).

The Conference call for papers gave the opportunity to submit either short or long papers. Overall, the editorial staff received 215 short papers and 63 long papers.

For the *short and long papers*, the evaluation followed the peer review process, with a double-blind review performed by two referees - university lecturers, expert about the topic - selected among SIMA and the community of Sinergie members.

In detail, the referees applied the following criteria to evaluate the submissions:

- clarity of the research aims,
- accuracy of the methodological approach,
- contribution in terms of originality/innovativeness,

- theoretical and practical contribution,
- clarity of communication,
- significance of the bibliographical basis.

The *peer review* process resulted in full acceptance or rejection of the submissions. In the case of disagreement among reviewers' evaluations, the decision was taken by the Chairs of the SIMA thematic groups or conference track. Each work was then sent back to the Authors together with the referees' reports. The suggestions received by the referees were used by the Authors during the presentation of their research works at the Conference.

The evaluation process ended with the acceptance of 215 short papers and 62 long papers, which were published in two distinct volumes.

All the short papers published in this volume were presented and discussed during the Conference and published online on the web portal of Sinergie-SIMA Management Conference (<https://www.sijmsima.it/>).

While thanking all the Authors, Chairs and participants, we hope that this volume will contribute to advance knowledge about the rediscovering local roots and interactions in management.

The Conference Chairs

Angelantonio Russo, Savino Santovito, Arabella Mocciaro Li Destri and Marta Ugolini

SUMMARY

<i>The impact of corporate governance on corporate social responsibility in family firms: What effects?</i> FRANCESCO GANGI, LUCIA MICHELA DANIELE, NICOLA VARRONE, MARIA COSCIA, EUGENIO D'ANGELO	PAG. 1
<i>Consortia's performance in public procurement contracts: Preliminary evidence from road works</i> ANDREA BAFUNDI, RICCARDO CAMBONI, LUIGI MORETTI, PAOLA VALBONESI	“ 9
<i>The mitigating effect of electronic commerce adoption on the negative relationship between public tendering and export: Evidence from Italian food & beverage SMEs</i> JACOPO BALLERINI, DANIELE GIORDINO	“ 15
<i>Critical thinking in business – Comparative analysis of online job postings in Italy and Poland</i> MALGORZATA SKRZEK-LUBASIŃSKA, RADOSŁAW MALIK, VILMA ÇEKANI	“ 21
<i>Radical innovation project and equity crowdfunding: The role of prior financing and of Teamwork creativity</i> CARLOTTA BOTTARO, RAFFAELE STAGLIANÒ, FABRIZIO CESARONI	“ 27
<i>Human psychology and investment decisions of cryptocurrencies investors</i> NAVEED AND REHAN	“ 33
<i>The effect of dynamic capabilities on AI adoption and management in the Wine Ecosystem</i> ANGELO A. CAMILLO, CECILIA CASALEGNO, GIOVANNA BAGNATO, CHIARA CIVERA	“ 39
<i>Artificial intelligence and digital entrepreneurship: Literature review and further RESEARCH</i> PIERO VALENTINI, MARIACARMELA PASSARELLI, GIUSEPPE BONGIORNO, ALFIO CARIOLA	“ 47
<i>Beyond the virtual realm: An introductory investigation on inward and outward emotional responses to sustainable fashion products in the metaverse</i> IRENE DELLA SALA, MARCO FRANCESCO MAZZÙ, ANGELO BACCELLONI	“ 53
<i>Prototyping new organizational forms to develop and transfer digital innovation: Design and validation</i> VALENTINA FORRER, ALESSANDRO NARDUZZO, MONICA NATHALIE BERTOLINI	“ 61
<i>Living Labs: A systematic literature review</i> KHATEREH GHASEMZADEH, FRANCESCA CAPO, LORENA MARIA D'AGOSTINO, SALVATORE TORRISI	“ 67
<i>Innovation and Peripheries: Cross-disciplinary evidence from a bibliometric review</i> ALBA MARINO, GIOVANNA TERRIZZI, MARIA CRISTINA CINICI, DANIELA BAGLIERI	“ 73
<i>A bibliometric analysis of the effect of emerging technologies on management theories: Current themes and research agenda</i> VALERIO NATALE, NICCOLÒ FIORINI, TOMMASO PUCCI, ELENA CASPRINI, LORENZO ZANNI	“ 85
<i>The impact of technological improvements in the agri-food sector: A literature review from a managerial perspective</i> ALBERTO MASSACCI, MERIAM TRABELSI, ELENA CASPRINI, TOMMASO PUCCI, LORENZO ZANNI	“ 93
<i>Determinants of digital financial behavior</i> SILVIA INTINI, CANDIDA BUSSOLI, LUCREZIA FATTOBENE	“ 99
<i>Evoluzione del modello di business nella filiera agroalimentare: l'impatto degli investimenti tecnologici</i> DILETTA PILOCA, BERNARDINO QUATTROCIOCCHI, SABRINA RESTANTE, FRANCESCO MERCURI	“ 103
<i>International marketing and spirituality: Is there a relationship?</i> RAFFAELE CAMPO, PIERFELICE ROSATO, SAVINO SANTOVITO, SILVIA GRAVILI	“ 109
<i>Investigating the interdependence of innovation and internationalization</i> MARIASOLE BANNÒ, EMILIA FILIPPI, CHIARA LEGGERINI	“ 115

<i>The role of country-of-origin in the relationship between sustainability and consumers' willingness to pay for a brand</i>	PAG. 121
MARIA GABRIELA MONTANARI, MICHELA MATARAZZO, ADAMANTIOS DIAMANTOPOULOS	
<i>Resilience of global value chains: A multiple case study of MNEs in the healthcare industry</i>	“ 127
FEDERICA SACCO, GIOVANNA MAGNANI, PIETRO PREVITALI	
<i>Il ruolo di bridging istituzionale delle imprese multinazionali nella promozione della sostenibilità</i>	“ 137
CRISTINA LEONE, PASQUALE MASSIMO PICONE, ARABELLA MOCCIARO LI DESTRI	
<i>Brand activism: A survey on the level of consumer awareness and involvement</i>	“ 143
FABIO MUSSO, FEDERICA MURMURA, ELISABETTA SAVELLI, LAURA BRAVI	
<i>Generation z's reactions to brand activism: The role of self-identity and familiarity</i>	“ 147
ANTONELLA CAMMAROTA, GENEROSO BRANCA, VITTORIA MARINO, RICCARDO RESCINITI	
<i>Managing consumer-brand relationships on digital live streaming platform: A comparative study</i>	“ 153
FRANCESCO CALZA, GIUSEPPE LA RAGIONE, MICHELE QUINTANO, MARCELLO RISITANO	
<i>Coping strategies and corrective actions to address consumer vulnerability in the digital context: A systematic literature review</i>	“ 159
VERONICA CAPONE, LETIZIA LO PRESTI, GIULIO MAGGIORE	
<i>The benefit factor: Understanding the role of benefits in in-game advertising consumers' response</i>	“ 165
LUCA MATTEO ZAGNI, CRISTIAN RIZZO	
<i>The rise of virtual influencers: Bizarrely realistic or scarily uncanny?</i>	“ 171
RADA GUTULEAC, GABRIELE BAIMA, CRISTIAN RIZZO	
<i>Something red, something blue. A psychomarketing approach to political branding</i>	“ 177
ANDREA BAZZANI, GIOVANNI GASPARINI, UGO FARAGUNA, GIUSEPPE TURCHETTI

The impact of corporate governance on corporate social responsibility in family firms: what effects?

FRANCESCO GANGI* LUCIA MICHELA DANIELE*
NICOLA VARRONE[▲] MARIA COSCIA** EUGENIO D'ANGELO**

Framing of the research. *The last financial crises coupled with the environmental concerns for climate changes, have renewed the academics and practitioners' interest in corporate social responsibility (CSR) (Carroll, 2016; Lins et al., 2017). On this trend, the search for drivers and impacts of socially responsible behaviours remains a long-lasting debated topic that needs to be further investigated (Agudo-Valiente et al., 2017), especially with reference to specific organizational settings as family businesses (Faller and zu Knyphausen-Aufseß, 2018). In this regard, family firms (FFs) are the object of the current study, since they play a prominent role in promoting the growth of the global economy. Deloitte (2022) estimates that FFs encompass the 70-90 % of annual global GDP and represent two thirds of all businesses. On the same line, Chen et al. (2014) argue that FFs are the engine of global economy. Moreover, in response to the COVID-19 pandemic, FFs have demonstrated greater resilience by strengthening their CSR compliance and stakeholder orientation (KPMG, 2021).*

Consistent with previous studies (Patuelli et al., 2022; Van Gils et al., 2014), FFs' propensity to CSR differs from that of non-FFs due to their motivation to pursue non-economic goals, mainly linked to the preservation of socioemotional wealth (SEW), which defines the "family's stock of social, emotional, and affective endowments vested in the firm, such as the opportunity to pass the business on to future family generations, reputational advantages from being associated with the firm, and the preservation of benevolent ties among family members and with other stakeholders" (Gómez-Mejía et al., 2018, p. 1370). In this regard, FFs' management and governance systems are likely to provide the presence of family members that can influence the decision-making process to prioritize SEW goals (Broccardo et al., 2018). This is the case of preserving collective social capital, affective endowments, trust relationships with stakeholders and family reputation. In parallel the potential trade-off between financial and non-financial goals in FFs is a relevant topic (Lam and Lee, 2012; Gomez-Mejia et al., 2018).

Drawing on prior literature (Jain and Jamali, 2016; Naciti, 2019), corporate governance (CG) has been identified as a pillar of CSR engagement (Gangi et al., 2020), even in the context of FFs (Mariani et al., 2021; Campopiano et al., 2019). Specifically, among CG mechanisms, board of directors plays a relevant role in engaging in CSR initiatives (Cuadrado-Ballesteros et al., 2015), as it represents the place where corporate sustainability practices are defined and promoted (Naciti, 2019). From this perspective, at the firm level, board structural characteristics may affect the board's propensity to engage in CSR activities (Jain and Jamali, 2016).

Regarding the FFs, academic research has shown a growing interest in the impact of CSR on firms' performance (Singal, 2014; Tenuta and Cambrea, 2022), with results not always converging. Moreover, consistent with the need of further investigations (Kong et al., 2020), the link between CSR and corporate financial performance (CFP) remains still an open debate in the context of family business. In particular, family businesses are involved in jointly preserving the financial and SEW goals in the long-run (Van Gils et al., 2014; Le Breton-Miller and Miller, 2016). From this perspective, CSR represents a strategic tool that may allow FFs to achieve better CFP, without neglecting socio-emotional goals (Gómez-Mejía et al., 2018; Berrone et al., 2012). This is consistent with the strategic conceptualization of CSR as co-specialized asset that increases the value of other assets, including socioemotional utilities as family legitimacy and the accruing of stakeholder influence capacity (Barnett and Salomon, 2012), which, in turn, may support better CFP (McWilliams and Siegel, 2011; Melo and Garrido-Morgado, 2012)

Consistent with our research framework, we apply the Heckman two-stage model to a worldwide sample of 179 FFs (2002-2020). Therefore, in the first stage, we perform a probit regression to investigate the relationship between effective CG mechanisms and CSR, and, in the second stage, we run an OLS regression to verify if a higher CSR

engagement by FFs can drive better CFP. Accordingly, the current study contributes to complement the debate on the drivers and outcomes of CSR by demonstrating that CSR is a “missing link” between CG and CFP in FFs.

Purpose of the paper. Due to the global urgency to achieve the SDGs by 2030, the focus on firms’ CSR efforts has been reinforced. Indeed, CSR has emerged as strategic vision that needs to be integrated into firms’ business logic to support the sustainable development (Perrini, et al., 2018). In accordance with World Commission on Environment and Development (1987), the CSR concept is consistent with of the goal of sustainable development, as CSR addresses the present needs of social actors, without misleading future generations’ own needs. However, CSR as a strategic asset is not a monolithic concept; rather, it needs to be defined under specific organizational settings (Faller and zu Knyphausen-Aufseß, 2018). Specifically, CSR, its drivers and impacts, may vary according to specific characteristics of certain business, as in the case of FFs (Mariani et al., 2021). In this sense, several research gaps emerge. Indeed, even if there is growing interest in CSR engagement of FFs, the identification of CSR drivers and outcomes remains a topic which needs further investigations (Mariani et al., 2021).

The current study aims to fill the aforementioned gap through an in-depth analysis of two main relationships. First, drawing on SEW construct (Gómez-Mejía et al., 2018) and conflict resolution hypothesis (Jo and Harjoto, 2012), we theoretically refer to the impact of CG mechanisms on the CSR engagement of FFs. Second, based on the stakeholder theory (Freeman, 1984) and RBV (Barney, 1991), we consider the effects of CSR on CFP.

About drivers of CSR, the effective functioning of boards of directors may support the promotion of CSR values that pertains to the CG planning activity. Indeed, in light of the overinvestment hypothesis (Barnea and Rubin, 2010), CSR is conceived as an agency problem (Jensen and Meckling, 1976) since managers may invest in CSR issues for their own interest at detriment of shareholders’ interest. Conversely, following the theoretical foundations of stakeholder theory (Freeman, 1984), the conflict resolution hypothesis (Jo and Harjoto, 2012) assumes that CG, as pillar of CSR (Jain and Jamali, 2016), may be positively related to CSR engagement to the extent that CSR engagement will mitigate conflicts of interest between managers, shareholders and other stakeholders. Thus, this perspective extends the directors’ fiduciary duty to CSR issues (Sandberg, 2013). In this regard, the functioning and the characteristics of board of directors may play a relevant role for CSR compliance by promoting corporate policies aligned with stakeholders’ objectives (Jain and Jamali, 2016). From this perspective, the effectiveness of board characteristics may represent an internal CG driver of compliance with community needs through CSR engagement (Naciti, 2019; Gangi et al., 2020).

Relying on FFs, due to the high relevance of SEW goals, family owners may be inclined to adopt CSR strategies to avoid as the perception of irresponsible citizens for society (Berrone et al., 2012). In this sense, the inclusion of family members within CG bodies (e.g., board of directors) can be useful to prioritise CSR initiatives in support to SEW preservation (López-González et al., 2018), an essence of being a family company (Gómez-Mejía et al., 2018). Furthermore, CSR concept is strictly related to SEW logic due to the common long-term orientation toward non-financial goals (Patuelli et al., 2022). In particular, FFs tend to nurture the set of socioemotional values - i.e. family identity, social ties, affective endowments - through the achievement of long-term and intangible goals. On the same line, CSR investments reward companies in the long-run, while pursuing strategic and intangible benefits such as corporate social legitimacy and the accruing of reliable ties (Gangi et al., 2020). Thus, the grounds of SEW concept provides a useful interpretation for the CSR orientation of board directors into this specific type of firm (Van Gils et al. 2014). Consistent with a humanistic governance paradigm (Turnbull, 2017), CG is a tool for encouraging to increasingly address socially responsible issues (Jain and Jamali, 2016). Hence, effective CG mechanisms may favour the engagement in CSR actions, while fueling the alignment with the SEW construct.

Hence, we posit the following research question:

RQ1: Do effective CG mechanisms predict higher family firms’ CSR engagement?

Passing to the CSR outcomes, based on the stakeholder view, the CSR compliance may present an opportunity for family business to foster socioemotional luggage through the reinforcement of social and trusting bonds with stakeholders (Gomez-Mejia et al., 2018). Moreover, the achievement of stable and durable relationships allows the involvement of stakeholders in CSR practices. This approach leads FFs to gain corporate social legitimacy and the accruing of trust and reliability among stakeholders (e.g., family members, employees, local communities), which, in turn, may help to mitigate the exposure to risk of failure (Gangi et al., 2020), to improve operating performance (Melo and Garrigo-Morgado, 2012) and to increase firm value (Jo and Harjoto, 2012). Hence, the adoption of CSR practices may predict better future CFP and consequent favourable conditions for FFs’ longevity (Gangi et al., 2022).

Drawing on the RBV, CSR can be conceived as a process of accumulating knowledge and experience (Tang et al., 2012), which fuels innovation capacity (Martinez-Conesa et al., 2017) and, consequently, improve FFs’ performance (Gangi et al., 2022). Specifically, from a knowledge management view, the process of “absorptive capacity” (Cohen and Levinthal, 1990) may rely on the internalization of knowledge resources related to CSR activities towards external and internal stakeholders. Thus, the conversion of CSR knowledge into organizational capital supports firms to respond to the requirements of stakeholder groups in the long term (Tang et al., 2012) and fosters innovation capability of firm (Surroca et al., 2010). Following prior studies (Lorenzo et al. 2022), the CSR strategy can overcome the limits to business innovation in FFs, hence CSR engagement can be beneficial in terms of openness to stakeholders’ insights and knowledge, which may have potential benefits to firm competitiveness and financial performance.

Hence, we posit the following research question:

RQ2: Does CSR engagement predict better family firms' CFP?

Methodology. The study relies on data from several sources. Specifically, we refer to Refinitiv for data on FFs' CG characteristics and ESG information, Worldscope database for financial data, World Bank database for GDP per capita data.

Regarding the sample selection procedure, we refer to the FFs included in the World's Top 750 Family Businesses. This list reports the worldwide top FFs ranked by Family Capital, supported by PwC. Similar to Cambrea et al. (2022), which relies on the cut-off of 25% or more of the voting shares to identify family businesses, Family Capital defines "family business" those companies in which the family or group of families held at least the 30% of the voting rights. Thus, to build our sample, we match Family Capital's initial list with Refinitiv and Worldscope databases. Accordingly, we exclude the 521 FFs for which Refinitiv or Worldscope do not disclose any data over the time horizon of the study (2002-2020). This procedure leads to a panel of 179 FFs.

As main variables of the study, we consider a) the board and CEO characteristics as proxy of CG mechanisms; b) the measure of CSR engagement; c) the CFP measurement. First, starting from CG mechanisms, consistent with prior studies (Jamali et al., 2008), we rely on several board and CEO characteristics. First, we refer to the number of board directors (Board size); the female percentage on the board (Board GD); the percentage of independent board directors; a dummy variable equal to 1 if the CEO simultaneously chairs the board, 0 otherwise (CEO separation). Second, as prior studies (Gangi et al., 2022), we measure CSR engagement through the ESG scores provided by Refinitiv. Third, as CFP proxy, we refer to the Z-score (Altman et al., 1995) and ROA to measure the risk of financial distress and profitability, respectively.

To avoid model misspecification, we rely on a set of control variables. Specifically, we adopt the FFs size through the natural logarithm of the total assets (Size); the ratio between total debt and total equity (Leverage); the percentage of total shares in the issue available to ordinary investors (Free float); a dummy variable equals to 1 if the board's members compensation is linked to sustainability objectives, 0 otherwise (Sust. Compensation); and the GDP per capita (GDP per). Regarding the empirical approach, to control for nonrandom sample selection biases, we adopt the two-step Heckman model to answer our RQs. The Heckman procedure includes two steps. With the first step, we estimate the influence of CG mechanisms on CSR engagement (RQ1) through a lagged probit model.

The regression equation is formalized as follows:

$$PR(D_CSR_{i,t-1}) = \phi(\beta_0 + \beta_{i,t-2} X_{i,t-2} + \varepsilon_i) \quad (1)$$

where $D_CSR_{i,t-1}$ is a dummy variable equal to 1 if FFs exhibit a level of CSR (at time $t-1$) above the median of the sample in year $t-1$, 0 otherwise. $\beta_{i,t-2}$ represents the coefficients of the predictors ($X_{i,t-2}$), including the CG mechanisms (i.e. board and CEO characteristics) and control variables lagged by 2 years, and ε_i is the random error term.

In the second stage, we use the second step of the Heckman procedure to estimate the influence of CSR engagement on CFP (RQ2).

The regression equation is formalized as follows:

$$CFP_{i,t} = \alpha + \beta CSR_{i,t-1} + \psi X_{i,t-1} + \varepsilon_i \quad (2)$$

where $CFP_{i,t}$ represents the measures of CFP (Z_score; ROA) of FF i at time t ; CSR is the score of FF i at time $t-1$; X is a vector of control variables; ε is the random error term. As above, all independent and control variables are 1 year lagged to address reverse causality issues.

Results. Table 1 provides the descriptive statistics. The correlation analysis (Table 2) shows that all variables' correlation coefficients are below the conventional level of 0.70 (Ratner, 2009), thus there are not multicollinearity biases. Table 3 (models 1-2) shows the estimates of the first step of Heckman procedure, regarding the impact of CG on CSR, while Table 4 (models 1-4) reports the estimates regards the impact of CSR engagement on CFP. The first step (Table 3) shows that the board characteristics (Board Size; Board GD; CEO separation) have a positive and statistically significant influence on the FFs' CSR engagement, thus we positively answer RQ1. Regarding the second step, Table 4 reports positive and statistically significant coefficients on CSR engagement, confirming that FFs more engaged in CSR tend to be less exposed to the risk of financial distress and to be more profitable in terms of ROA. Hence, we positively answer RQ2.

Regarding control variables, we find that more indebted and larger FFs tend to be more engaged in CSR (Table 3). Moreover, we find that the presence of board members' compensation linked to sustainability objectives also favors a higher engagement of FFs in CSR initiatives (Table 3).

Research limitations. Notwithstanding the valuable insights, the study suffers certain limitations. First, relative to RQ1, we consider only the overall CSR performance of FFs, thus additional studies can disaggregate the CSR performance in its sub-dimensions. Second, to proxy CFP, we look at profitability (ROA) and to financial risks (Z_score). Then, further studies might consider the effect of CSR engagement on FFs market-based measures. Finally, our empirical analysis is based on data retrieved from Refinitiv, which is a widely used source among academics and practitioners (Habermann and Fisher, 2023; Reber et al., 2022). Then, future research could employ additional measures of CSR performance.

Managerial implications. *The present study contributes to the current knowledge relative to the drivers and effects of CSR engagement in FFs. From the perspective of CSR drivers, the investigation reveals that several FFs' board features can enhance CSR engagement. Specifically, the results encourage FFs to adopt larger boards to diversify perspectives and knowledge resources. This is also confirmed in terms of gender balance, as having more females on board can enable FFs to delve more deeply into social and environmental issues, thereby better equipping them to navigate such challenges. Finally, in terms of executive compensations, the study encourages FFs to employ mechanisms that can motivate the board of directors to strategically align the SEW preservation goal with strategic sustainable engagement. Indeed, relative to the effects of corporate sustainability on FFs' financial performance, the current study encourages managers to adopt CSR as a critical tool to balance and relax the attributions between financial and non-financial goals that may characterize the specific organizational settings of FFs. Finally, by implementing socially responsible practices, FFs might simultaneously preserve SEW creation and strengthen CFP, while reducing firm risk.*

Originality of the paper. *The current study is original from different points of view. First, we expand the open debate on the link between CSR and CFP under the specific context of FFs. From this perspective, findings reveal that effective CG mechanisms are useful to support SEW creation through the positive impact on CSR and responsive capability to stakeholder concerns. In particular, the unicity of this study is the exploration of board characteristics that can facilitate the attainment of sustainable development goals through effective CG practices. A relevant topic due to the higher involvement of family members within the governance of family businesses.*

Secondly, given that FFs are the primary drivers of global wealth creation, the study addresses a crucial issue for long-standing firms, in the current turbulent socio-economic environment. In particular, the study presents an original perspective on the impact of CSR on FFs' firm risk, an area that has received relatively little attention in the literature.

Third, the empirical analysis focuses a worldwide sample of FFs, then offering greater generalizability of results, and then, covering limitations of prior studies (Choi et al., 2019; Singal, 2014). Finally, an additional contribution of the study is the dual approach which examine both drivers and effects of CSR in FFs. Our choice strengthens the view of a strong connection between the SEW and CSR, which can help FFs to embrace CSR practices that align stakeholders' expectations while maintaining long-term competitiveness and lower firm risk. The latter is even more relevant in more turbulent scenarios that require higher resilience of businesses.

Consortia's performance in public procurement contracts: Preliminary evidence from road works

ANDREA BAFUNDI* RICCARDO CAMBONI• LUIGI MORETTI▲ PAOLA VALBONESI**

Framing of the research. Governments procure goods, services, and works from private firms for their daily operations. In OECD countries, public procurement accounts for a relevant share of GDP, about 13% on average (OECD, 2021), and it is pivotal in implementing public expenditure in key economic sectors (e.g., infrastructures, health, and education). To balance an efficient and effective use of public resources with transparent and fair procedures, governments have long-established regulations concerning any aspect of the procurement process - from the publication of the call for tender to the bidding stage, the awarding, execution, and delivery phases.

To reduce - or possibly eliminate - adverse selection of private suppliers entering the bidding stage, public procurement procedures usually adopt a qualification stage to attract sound firms and increase the probability of establishing smooth public-private interactions. Only qualified firms can enter tenders in the Italian procurement of public works for roads and constructions. In particular, the public buyer must state in the call for tender all the tasks involved in the project. These tasks are classified according to categories and economic value. One task is indicated as the main category, and all the others, if any, as secondary categories. To enter the tender, a bidder must have the qualification for the main category, while qualifications for secondary tasks can be outsourced to other firms. Acquiring a qualification is costly, and it lasts three to five years and is awarded by private companies that serve as certification offices, called the "Società Organismo di Attestazione" (SOA).

As a result of this system, when suppliers are not qualified, they cannot participate in auctions unless they are organized in partnerships. These partnerships enable firms to pool their expertise and resources for meeting qualification requirements which, in turn, vary depending on contract conditions. We can distinguish between short-term and long-term partnerships. We define short-term partnerships as those interactions between firms that require coordination for a specific activity - i.e., a single public contract - and later dissolve. Long-term partnerships rely on established interactions between firms for different activities arising over time.

The first form of short-term partnership is subcontracting. In fact, without the required qualifications to perform the secondary tasks of the tendered public contract, a firm can participate conditionally on subcontracting these tasks to suitable qualified firms. Moretti and Valbonesi (2015), on a database on procurement for public works in Valle D'Aosta, found that fully qualified firms (which have the option to subcontract or not) offer a lower price than partially qualified firms (which are required to subcontract). This evidence suggests that when firms are forced by the regulation to deal with subcontractors, they face a higher risk of being held up by such partners, and they consider this risk on their bids (see, among others, Lafontaine and Slade 2007 for a discussion of voluntary versus imposed arrangements and firms' boundaries).

Another form of short-term partnership in Italian public procurement is the so-called "Associazione temporanea d'impresa" (ATI). In this case, firms coordinate to participate as joint bidders to a single tendered contract and jointly execute the public contract. On the same dataset investigated by Moretti and Valbonesi (2015), Camboni et al. (2021) found that ATIs are associated with more competitive bidding prices than firms required to outsource the task they are not qualified for. For ATIs, as for subcontracting, the collaboration is dissolved at the end of contract execution.

In this paper, we do not consider these short-term partnerships (i.e., subcontracting and ATIs), but we focus on a long-term partnership a group of companies can take - i.e., the consortium - and other independent firms. Consortia differ from other companies as they are legally established partnerships between two or more firms to participate in common activities - i.e., multiple public procurement contracts - over a period of at least some years. The other companies¹ can instead be classified into two groups, according to their legal and organizational form: limited liabilities and mutual companies, respectively. SRL (Società a responsabilità limitata) and SPA (Società per azioni) are

¹ Note that firms holding all the required qualifications do not need to enter partnerships to bid for public contracts.

part of the first group, and these are characterized by issuing either quotes (SRL) or shares (SPA) and by a generally limited responsibility over companies' liabilities. Also, these legal forms are supposed to generate dividends for their quotes and shareholders. Società cooperative instead belongs to the second group, and they are supposed to provide convenient goods and services for their members.

Purpose of the paper. This paper complements previous literature on how companies' legal forms and partnerships can drive public procurement performance. Specifically, we exploit a sizeable Italian dataset on public procurement of works to study differences in performance between consortia, on the one hand, and other independent companies (i.e., without long-term established partnerships), on the other hand. Our analysis adds to the role of coordination costs that companies might face when participating with and without structured, long-term partnerships in the public procurement process.

Regarding the performance in the execution of public contracts, we consider an *ex-post* measure (i.e., measured at the end of the execution of the contract, as opposed to an *ex-ante* measure at the bidding stage): delivery delays, defined as the difference, in days, between the actual end date of the awarded work and the contractual one. This is a typical measure previously employed in the public procurement literature (see, among others, Lewis and Bajari, 2011; Buccioli et al., 2013; Coviello et al., 2018a; Coviello et al., 2018b; Decarolis and Palumbo, 2015; Coviello and Mariniello, 2014; Decarolis, 2014; D'Alpaos et al., 2013). Excessive delays are even regulated with penalties in the Italian procurement context as these can lead to social and political costs for the public buyers and reflect coordination problems or, in any case, the need for flexibility of private suppliers.

Methodology. We aim to test whether there is an association between different types of companies and the *ex-post* performance of public procurement contracts. We do so by running a series of preliminary regression analyses. The dependent variable is the delay in the execution of public procurement contracts, and the key independent variables are dummy variables representing the legal nature of contract-awarded companies. To this end, we collect information from Italian National Anti-Corruption Authority (ANAC) about public procurement contracts awarded during the period 2012-2021. This data source allows us to have a large set of harmonized information at the contract level (e.g., auction procedures, contract characteristics, public buyer type, winning firms' identities, and the timing of contract execution). We focus on a sample of contracts awarded by one type of public buyers (i.e., the municipal governments) and with a common main task (i.e., road works). These choices are inspired by considerations that emerged from previous literature (see, among others, Coviello et al., 2018a).

The public buyer plays a crucial role in the procurement process as its design, financial and overall managerial capacities can severely affect the efficiency of the overall procurement process (see, among others, Chiappinelli, 2020; Buccioli et al., 2020). Public buyer's (in-)efficiency can directly reflect on our outcome variable (contract's delivery delay). Also, firms observe public buyers' characteristics and (in-)efficiency; accordingly, they can decide whether to participate in the auctions. This poses a potential problem of firms' selection in the analyzed sample. Therefore, we believe that focusing on contracts awarded by a single type of public buyer (municipal governments) can reduce heterogeneity in terms of procurement skills. Parallely, this identification strategy allows us to maintain a large sample size and extended geographical coverage, strengthening our results' potential external validity. However, municipal governments are also heterogeneous among themselves in terms of efficiency. Small municipal governments may not have a level of know-how comparable to larger municipalities or have very different workloads. Moreover, there may be geographical differences in public officials' skills and local politicians' governing capacity. Thus, to further account for the heterogeneity among municipal administrations in any model specification, we control for population size and province-fixed or municipality-fixed effects.

We consider just road works to reduce unobserved heterogeneity in contract characteristics. Indeed, among the many different types of public works, road works are those that somehow have a more standard technology and unit costs (consider, for instance, how buildings can be much more heterogenous than road works; for papers focusing on procured road works, see, among others, Bajari et al., 2014; Lewis and Bajari, 2014; Buccioli et al., 2013; Marion, 2007). To control for the remaining heterogeneity in road works, besides the use of municipality-fixed effects (which can also take into account the accessibility and roughness of the local area), we include the size of the works, proxied by both the value of the contract (reserve price) and the expected duration of the works, as well as dummy variables for the specific sub-sector of the road works (for discussion on the reserve price, see, among others, Decarolis, 2014; Coviello and Mariniello, 2014).

To capture both seasonal effects and time-varying macroeconomic changes, which can affect both the private construction industry (where some of the winning firms in our sample can also operate) and the budget constraints of municipal governments, we include quarter-year-fixed effects. This set of fixed effects allows us to focus on the within-quarter-year variability and limit the role of common, time-varying confounding factors.²

Lastly, as a robustness check, we also re-estimate all our model specifications using a sample restricted to municipalities in which a public contract was awarded to at least a consortium for road works during our period of analysis. Using this subsample allows us to further control for omitted variables and potential selection problems affecting consortia and other firms in the sample in a heterogeneous way.

² For what concerns inference, we consider possible heteroskedasticity by estimating robust standard errors, also clustered at the municipality level in some specifications as to account for error correlations within groups.

Tab. 1: Descriptive statistics

	Full sample	Sample restricted to municipal governments that awarded at least one contract to a consortium

Sample means and, between brackets, standard deviations.

Results. It is worth first describing the characteristics of the sample of contracts we analyze (see also Table 1). The estimated sample has 13,885 contracts for road works awarded by 3,392 Italian municipal governments (located in 107 different provinces) between 2012 and 2021. In this sample, about 59% of the works are delivered with some delay concerning the contractual deadline (median non-negative delays are 23 days). About 1% of the contracts were awarded to consortia, 2.5% to mutual companies, about 13% to general partnerships, and the remaining 84% to limited liability companies. About 15% of these contracts were awarded with open procedures, while the rest were negotiations (in the former, all firms can participate in the tender while, in the latter, the public buyer can set limitations on firms' entry). The road works in our sample have a median value (before auction rebates) of about 132,000 euros and a median expected duration of 213 days. Nevertheless, these statistics do not dramatically differ once we restrict the sample to contracts awarded by municipal governments which have interacted at least once with consortia to realize road works (tough, as expected, in this subsample, the share of contracts awarded to consortia increase to 5%).

The preliminary estimation results are reported in Table 2. In Columns 1 to 4, the dependent variable is a dummy equal to 1 if road works were executed with a delay with respect to the expected deadline. An OLS estimation of a regression model with a dummy as a dependent variable implies the reliance on a linear probability model. In Column 1, we control for province-fixed effects. The estimated coefficients associated with the dummy variables representing the different legal forms of the contract-winning companies are not statically significant but for the consortia. Therefore, general partnerships and mutual companies do not have a significant different probability of incurring execution delays with respect to the excluded category of firms (i.e., limited liability firms). Instead, consortia have a positive and statistically significant coefficient of about 0.09. This implies that a consortium has an estimated probability of 9 percentage points higher than limited liability companies executing road works with some delays. The value is economically meaningful, representing 15 percent of the average probability of delays observed in the sample. The signs, statistical significance, and magnitude of these coefficients are very stable when we restrict the sample to those municipalities which have awarded a consortium at least once (column 2) and when we replace province-fixed effects with municipality-fixed effects (Columns 3 and 4).

In Columns 5 to 8, we present the intensive margins and use as a dependent variable the size of the delays in works execution. This variable is equal to 0 if works were executed on time, and a positive value corresponds to the difference, in days, between the actual delivery and the contractual deadline date. We rely on the log transformation of (1+ days of delay), so to interpret the estimated effects as semi-elasticities. Similar to the previous results, estimated coefficients for general partnerships and mutual companies are not statistically significant, but the coefficient for consortia is positive and statistically significant. This result suggests how consortia executed works with more days of delay than limited liability companies. Specifically, on average, consortia make about 50% days of delays more than limited liability companies. Also, estimates for these intensive margins are robust to the restriction of the sample to municipalities with some experience working with consortia (Column 6), and to the inclusion of the larger set of municipality-fixed effects (Columns 7 and 8).

In general, these results suggest that, in the execution of road works, consortia have significantly higher probability of incurring delays and display even longer delays than other forms of companies. A possible interpretation of these results has to do with the fact that consortia, by their nature, deal with long-term established partners (i.e., other firms which are members of the consortium), while the other considered companies as well as our baseline companies (limited liability firms) operate individually. This difference in the organizational structure could potentially produce two opposing effects. On the one hand, consortia might have some advantages as firms in this partnership have experienced previous interactions and are linked to future common interests (which can improve cooperative attitudes). On the other hand, the long-term and somehow fixed nature of the partnerships within a consortium might not be flexible enough as opposed to the operational organization of other firm's types that do not operate in partnerships. This latter mechanism seems to prevail in our data, as consortia need more time in works executions.

Among the other control variables, the estimated coefficients of the reserve price and the dummy variable for open procedures are statistically significant and stable across specifications and outcome variables. It is somehow reassuring that both of them show the expected positive signs: larger auction reserve prices are associated with larger projects, which can indeed be characterized by more unexpected events and display larger delivery delays; open procedures have a higher degree of competition among bidders, and winning firms might then recover some of the benefits through additional time in the execution of the works.

Standard errors (clustered at the municipal level in columns 1,2,5,6 and robust in columns 3,4,7,8) are in parentheses. *** p<0.01, ** p<0.05, * p<0.1. The dependent variable in columns 1 to 4, "Delay D", is a dummy variable equal to 1 in case, for each contract, the actual end date exceeds the contractual end date. The dependent variable in columns 5 to 8, "Ln Delay" is log (1 + "days of delay"), where "days of delay" is the difference, in days, between the actual and the contractual end date, in case this difference is positive, and zero otherwise. The sample in columns 2, 4, 6, and 8 is restricted to those contracts managed by municipal governments that have awarded at least one contract (in our dataset) to a consortium.

Research limitations. *We believe this preliminary and "work in progress" research has at least two main limitations. First, although we condition the relationship between firms' legal forms and delays to a series of control variables and fixed effects, the estimates cannot be interpreted as a causal effect of consortia on delays. Omitted variables and selection mechanisms may still be at work and bias the estimated coefficients. Second, we interpret the larger delays displayed by consortia as arising from the coordination costs of the firms operating within them. However, we do not have micro-level data to directly test whether the channel linking consortia to delays is based on coordination costs. These limitations, together with other refinements concerning the execution of the empirical analyses as well as the framing and interpretation of the results, are expected to be addressed in future and revised versions of this study.*

Managerial implications. *From a managerial perspective, there are implications for different issues. First, it would be important to understand whether the probability of incurring delays depends either on the quality of the corporate governance of consortia or on the types of procurements works. Second, the delays seem to be associated with the types of organizational structure between consortia and other legal forms. Here the crucial question is*

understanding how the coordination mechanisms within consortia can operate differently compared with other legal forms. Lastly, assessing whether delays in the procurement of works depending on the remuneration systems among the different levels in consortia remains an open question.

Originality of the paper. *The paper presents a preliminary empirical test to understand whether a conditional correlation occurs between winning firms organized in the form of long-term, established partnerships among firms (i.e., the consortia) and delays in the execution of public works. This test contributes to the discussion about the effects of firms' interactions in the public procurement market by looking at long-term partnerships (as opposed to temporary partnerships based on a single contract) as well as by looking at ex-post performance in the form of time delays in the delivery of the works (as opposed to bidding prices).*

The mitigating effect of electronic commerce adoption on the negative relationship between public tendering and export: evidence from Italian food & beverage SMEs

JACOPO BALLERINI* DANIELE GIORDINO*

Framing of the research. *The European economic growth and development depend on small and medium-sized enterprises (SMEs). SMEs make up 99% of European (EU) firms (European Commission, 2020). The EU's largest manufacturing sector by value and employment is the food and beverage (F&B) industry (European Commission, 2022), making it crucial to the region's development. Due to market instability and heightened hazards, recent times have been challenging to all organisations (Hadjielias et al., 2022; Hamid et al., 2022). Thus, F&B SMEs must diversify their portfolio and seek dependable revenue streams to survive. Internationalization and stable funding sources from public procurement and grants are needed to strengthen their survivability (Bertello et al., 2021; Loader and Norton, 2015). However, small businesses struggle to engage in public procurement due to their size and resources constraints (Loader, 2011).*

According to the literature, enterprises often lack the necessary knowledge and resources to explore and understand public procurement regulations and contract requirements (Karjalainen and Kemppainen, 2008; Saastamoinen et al., 2017). Furthermore, smaller SMEs may also struggle to enter new markets due to their resource constraints (Dethine et al., 2020; Paul et al., 2017). Therefore, the previously published empirical data raise the issue of whether enterprises constrained by their size and capabilities may pursue both pathways when they typically fail to pursue and attain one of the foregoing revenue streams. Capabilities and performance have been studied in most export performance research (Falahat et al., 2020). Despite their importance, electronic commerce, public procurement, and exports in F&B Businesses are seldom studied. Hence, further empirical studies are needed to better comprehend their kinship. Due to F&B SMEs' crucial role in the EU economy, this kind of investigation is of great theoretical and managerial relevance. (European Commission, 2022). SMEs' health and growth are crucial to national progress (Ensari and Karabay, 2014; Etuk et al., 2014). Consequently, it is vital to reveal how such governmental tenders might affect businesses' capacity to develop beyond their domestic market, which is crucial to their competitive advantage (Kalinic and Brouthers, 2022). In addition, the literature suggests that more research is needed to understand how electronic commerce affects exports (Ballerini et al., 2021; Dethine et al., 2020; Jia et al., 2022), how public procurement affects exports (Flynn and Davis, 2015; Loader, 2015; Loader and Norton, 2015; McKeivitt and Davis, 2015; Saastamoinen et al., 2017), and whether companies' resilience matters in the investigated sector (Hadjielias et al., 2022; Iborra et al., 2020; Khurana et al., 2022).

Purpose of the paper. *In light of the aforementioned literature and the underlined research gap, the current study aims to provide empirical evidence to answer the following questions: Does participation in public procurement have a detrimental impact on a company's attempts to export? Are F&B SMEs that support public procurement able to reduce the possible detrimental impacts of this on exports by utilizing electronic commerce platforms? Thereafter, the authors formulate the following hypotheses to be empirically tested:*

(H1) In the context of SMEs working in the F&B sector, the electronic commerce adoption contributes favourably to internationalisation.

(H2) There is a negative influence on the internationalisation of F&B SMEs engendered by governmental tenders' application.

(H3) In the context of SMEs working in the F&B sector, the electronic commerce adoption favourably adjusts the negative relationship between governmental tenders' application and internationalization performances.

Methodology. *The generated hypothesis will be put to the test in this research by means of an empirical inquiry that will be accomplished via the development of a structured equation model. The following criteria were used to sample firms. First, the companies should have their location in Italy. Second, only enterprises in the European Community statistical categorization of economic activities (NACE) C.10 group - "manufacturing of food products" - were included. Finally, the research comprises only enterprises who reveal their latest turnover, with a limit of 50 million*

Euros and a range of workers between 1 and 250, following the 2020 European Commission definition of SMEs. On 30 September 2022, 2186 firms met the requirements.

Prior research has shown that the solution is workable despite data observations being secondary (Caputo et al., 2022). Electronic commerce platforms, governmental procurement, and export performance are the factors. Digital selling platform deployment covers not only electronic commerce websites but also social media sites that allow social commerce (Cassetta et al., 2020). A web scraping algorithm in Margò database can detect whether a company has an official social media presence on Facebook, LinkedIn, Instagram, Vimeo, Pinterest, Youtube, Twitter, and e-commerce solutions. Government procurement dependence is measured by corporations' 2020-2022 open tender wins (pandemic and post-pandemic period). Third, internationalization performance involves determining whether SMEs can sell overseas (Kapri, 2019) and what proportion of revenue exports comprise (Eramudugoda and Ramos, 2022). Company owners disclose exports and intensity in Margò database. An exploratory factor analysis is needed initially since there are no measuring scales for these constructs based on these items (EFA).

To prevent heterogeneity, the research will add manifest control factors to the model along with the three factors to verify. First, intellectual resource is thought to affect enterprises' export performance (Azar and Ciabuschi, 2017), hence the analysis includes the number of workers and their hiring pattern from the previous year as control variables. Given that company size affects export success (Faria et al., 2020), the research incorporates the number of controlled branch locations and income assessed using its natural logarithmic format to reduce confidence interval (Nirino et al., 2020). Scholars also believe innovation level might impact foreign trade (Azar and Ciabuschi, 2017). Thus, this analysis relies on Crif's 1-5 innovation score for organisations in the dataset, evaluating multiple indicators. Lastly, recognising that authorized standards of quality licenses are further determinants boosting businesses' exportation (Moya et al., 2019), the analysis controlled for firms' Accredia licences using a 1-0 dummy variable.

EFA verifies the framework's latent constructs. Sample size and item correlation are the first steps in assessing data for EFA. KMO yielded $> 0,6$ and Bartlett's test yielded $p < 0,05$, making both tests positive. After 13 to 8 item exclusions, the authors found a solid factors loading setup. Only Facebook and Instagram have enough PCA extraction commonality. All retained commonalities exceed 0.55, indicating excellent correlation. Promax rotation shows all components loading their factor with a coefficient above 0.600 and Std. Cronbach Alfa coefficients exceed 0,700. Three components with eigenvalues > 1 explain 70,25% of the cumulative variance. Given that the panel dataset was partially based on survey information, the authors use Harman's single factor test with a robust result of or squared variance of 30,35%, much below the 50% threshold, to discover common method variance and probable biases.

The study used Confirmatory Factor Analysis to verify the constructions' suitability for CB-SEM models (CFA). The CFA methodology initially checks the goodness of fit indices of the three correlated latent components. Table III shows that all absolute and incremental fit indices exceed the thresholds: GFI $> 0,95$, AGFI $> 0,90$, $X^2/df < 5$, RMSEA $< 0,07$, PCLOSE $> 0,05$, NFI and CFI $> 0,95$, PNFI and PCFI $> 0,5$

Second, the EFA-retained items' factor loadings are examined. As these latent construct components are new, the result is sufficient. Every item loads the latent variables at least the minimal 0,50 level necessary in this sort of research, although the construct reliability (CR) of each component still showed solid overall loadings over the 0,7 barrier. The study then calculates the AVE value for each concept, which was above the 0.5 criterion for convergent validity. The study conducted the discriminant validity test by comparing the AVE square root of each component to their correlation coefficient. All were higher than the correlation coefficient, proving the components' discriminant validity.

Results. The Structural Equation Model was used to evaluate hypotheses after EFA and CFA processes. Tests support all hypotheses. Electronic selling platforms increase business exports, assisting hypothesis one ($\beta = 0,230$; p -value $< 0,01$). Nevertheless, earning public tenders, hurts company international competitiveness assisting hypothesis two ($\beta = -0,061$; p -value $< 0,01$). Notwithstanding, the interplay involving relying on public procurement and adopting electronic commerce tools has a significantly favourable effect on the internationalization success of the enterprises corroborating hypothesis three ($\beta = 0.034$; p -value < 0.05). Earnings, staff hiring trend, and Accredia certification had a statistically meaningful beneficial influence on internationalization. Yet, the amount of regional branches, workers, and innovation score significantly hurt internationalization success. The model has a strong R-square of 0.624, much over the minimal value of 0.250 used in business and marketing research (Sarstedt and Mooi, 2014). The model predicts to capture 62,4% of the export performance variation across Italian F&B Firms.

Research limitations. There are various limitations connected to our research that might be overcome by further investigation into strategic flexibility, procurement practices, and company websites. First, the most significant constraint is the sample that was used, which was made up of Italian SMEs who operate within the F&B production business. More empirical data on the issue under investigation may be gleaned through research conducted with a more representative sample size. Second, our investigation highlights some of the drawbacks of using a structural equation model. Despite the fact that SEM has been used well in a number of different studies in the past, it does have a number of inherent flaws, particularly when it comes to the assessment and depiction of the salient components that have been found. In addition, the employment of different qualitative research methods may prove to be beneficial in the process of offering a more in-depth analysis of the findings that were obtained via quantitative research in this study.

In conclusion, further investigation might test our theory in a variety of settings and investigate the possibility of differences being seen across nations and industries. In addition, further research might include a variety of factors to evaluate the dexterity of businesses and validate our empirical results in connection with hypothesis number three (Andrade et al., 2022).

Managerial implications. *Our research has numerous important pragmatic ramifications for business leaders in the F&B sector. Before anything else, our research bolsters the fact that digital online channels are helpful to manufacturers internationalisation (Dethine et al., 2020; Jia et al., 2022). Second, despite previous literature supporting the hypothesis that awarded grants increases companies' research and development and ESG scores (Forliano et al., 2022), this study's findings support that F&B SMEs with a strong focus on public procurement tend to have worse export success. SMEs' management must carefully weigh the strategic goals of their organisations before committing to the lengthy process of submitting bids for public procurement contracts. Also, businesses who seek to engage in public procurement as one of their core business focus are urged to consider the implementation of one or more electronic commerce. By adopting them, SMEs may increase their bidirectional flexibility and attain international results which are on a par with those of enterprises that do not pursue procurement contracts (Saastamoinen et al., 2018).*

In conclusion, this research proves particularly useful to legislators. It is because of SMEs with scarce funds that apply for tendering process to obtain procurement partnering with government entities suffer a drop in internationalisation success, lawmakers must consider methods to make it easier and abbreviate the time span for these competitive tendering (Flynn, 2018; Reis and Cabral, 2015), such as increasing adaptability and speed, reducing the over procedural prerequisites, shortening agreements, and consolidating web page availability into one central location (Loader, 2015). Government agencies might also do their part to make things easier for vendors and grantees by streamlining their ordering procedures and billing bureaucracies, which would help speed up both choosing and collaboration phases of any agreements (Flynn, 2018; Loader, 2015). Yet, laws that encourage the use of electronic commerce platforms by SMEs, particularly those operating in the F&B beverage sector, would surely improve the international prospects of these businesses.

Originality of the paper. *By investigating the connections among internet and electronic commerce, procurement practices, and exporting, this investigation adds to the existing body of research on SMEs working within F&B industry. The overarching implication of this study is to emphasise evidence based proof indicating that public procurement management and reliance has a detrimental impact on companies' internationalisation. Additionally, the study provided empirical data suggesting that electronic commerce platforms adoption have a beneficial influence on firms' internationalisation. As a result, we are responding to the need for investigation about such issues (Dethine et al., 2020; Jia et al., 2022; Loader and Norton, 2015; Loader, 2015; Flynn and Davis, 2015; McKeivitt and Davis, 2015; Saastamoinen et al., 2017).*

A second innovative and original input to the theorists is to offer evidence based proof that suggests that the mixture of dependence on procurement contracts and embracing electronic commerce significantly mitigates the adverse impacts that public procurement has on the internationalization of F&B SMEs. According to current research, firms can enhance their agility with a correct adoption of digital technologies (Ciampi et al., 2022) and may overcome constraints to win public tenders without affecting their international success. These publications also emphasise how these businesses can pursue various business goals at the same time (Hadjielias et al., 2022; Iborra et al., 2020; Khurana et al., 2022). In addition, the advent of electronic commerce helps increase the strategic flexibility of SMEs since it requires less assets from enterprises in order to internationalise; as a result, these companies are better able to devote their efforts upwards to the quest for government tenders (Iborra et al., 2020). In addition to this, public procurement may be seen as a reliable source of income and service for businesses to depend on. As a result, it makes it possible for them to explore other kinds of ventures that have fairly predictable customers' behaviours (Saastamoinen et al., 2018). Accordingly, the study results shed light on the significance of utilising online technologies within F&B SMEs in order to expand in foreign markets and enhance the firm's strategic flexibility, thereby mitigating the adverse effects that public procurement contracts have on internationalisation.

Critical thinking in business - comparative analysis of online job postings in Italy and Poland

MAŁGORZATA SKRZEK-LUBASIŃSKA* RADOSŁAW MALIK• VILMA ÇEKANI♦

Abstract

This research provides new insight into the companies' approach to the critical thinking skill as a required competence in online recruitments in Poland and Italy. The study provides four-folded contribution based on the empirical analysis of job postings at the two leading recruitment portals in Italy and Poland. First, the study shows that critical thinking skill is seldom considered as prerequisite for the job applications in business. Second, the study provides initial indication that the frequency of critical thinking skill occurrences included in the job postings may increase with the seniority and complexity of job openings. Third, critical thinking skill is often considered by business as a part of complex competence bundle which tend to include also: analytical skills, problem solving skills, decision making skills, creativity, attention to details. Fourth, the study demonstrates that the business approach to the critical thinking skill as a recruitment requirements is largely consistent in Italian and Polish contexts.

Keywords: *critical thinking, labour market, recruitment, job posting, Poland, Italy*

Introduction. *The last decade is characterized by an increased uncertainty and permanent volatility on labour markets. Under such conditions, an education that prepares a person for a single life-long profession no longer has been considered an realistic option. Therefore, an increasingly crucial factor influencing employability is a set of adaptable skills that supports individuals in pursuing jobs in an environment of rapidly changing requirements and ultimately could even be used to perform future jobs that currently do not exist (Rios et al. 2020). Thus, there is a large body of research developed with the aim to investigate and operationalize the competences that could prove useful in continuously uncertain labour market in the future (Di Gregorio et al., 2019).*

Moreover, in the last five years, the issue of future skills has been addressed in a number of research publications by the most prominent international institutions and their affiliates monitoring the labour market, such as : OECD, the EU, ILO, WEF. Furthermore, a substantial number of analyses of this issue have been recently undertaken by large consulting companies (e.g. KPMG, EY, Deloitte) as well as hundreds of researchers and academics (e.g. Fajaryati, Akhyar 2020, Curtin 2004, Bakhshi et al. 2017, Brewer, Comyn 2015, Gunawardena, Wilson 2021, UKCES 2014)

The research results in the domain of future skills indicate that critical thinking appears to be prominent example of a skill that could considerable increase employability on the future markets. For example, the OECD recommendations for Poland (OECD 2019b) that "Digital skills and other types of skills - including critical thinking, communication skills, adaptability and accountability - will become essential for adults to succeed in both work and life". Furthermore, critical thinking as a core future skill was highlighted by a number of international organizations (OECD 2018, Schleicher 2018, OECD 2019 WEF 2016, Aring - ILO 2015).

The critical thinking skill is consistently viewed as essential in a business practice and evidence has been identified that critical thinking is considered in hiring process. For instance, Deloitte, a consultancy, has developed the Deloitte Critical Thinking Test, known also as the Watson Glaser Thinking Test. According to the authors, the test can prove the candidate's abilities in judgment, analysis, and decision-making and its structure consists of five key components: (1) Inference assessment (2) Recognising assumptions (3) Deduction (4) Interpretation (5) Evaluation of arguments.

However, the extent, to which the examples of critical thinking skill applications in recruitment process constitute a common business practice, is yet to be investigated. Moreover, the implementation of the critical thinking skills in business requires further scientific scrutiny to explore, inter alia, how valuable this skill is for entrepreneurs and in which business areas its implementation could be particularly beneficial (Skrzek-Lubasińska, Malik 2023). This research addresses these research gaps by providing new insight on how critical thinking skill is used as a requirement in the hiring process. In particular, our study addresses the following research questions:

1. How frequently is critical thinking skill used as a requirement in hiring process?

* Assistant Professor - Warsaw School of Economics, Poland

• Warsaw School of Economics, Polan
e-mail: rmalik@sgh.waw.pl

♦ Ph.D. Big Data Management - University of Salerno
e-mail: vcekani@unisa.it

2. *What are other skills that critical thinking frequently co-occur in job postings?*
3. *What are the differences in the use of critical thinking skill as recruitment requirement between Polish and Italian companies?*

The rest of the text is structured as followed. The Method applied in the research is discussed in the section 2. The results of the job advertisements analysis in Poland and Italy are presented in the section 3. Results. In the discussion the results of comparative analysis of both markets are elaborated on. The conclusions follow.

Method. A content analysis of job advertisements has been selected as an adequate research method for the purpose of this study. In order to enhance the quality of the research results and advance its business applicability the research performs a comparative analysis of two labour markets, Polish and Italian. By empirically analysing requirements in job postings on both markets we were able to examine the research questions with a greater perspective and with more research acumen. The similar research approach for qualitative analysis of requirements in job advertisements has been used previously to examine among others: marketing skills in intentional context (Di Gregorio et al., 2019), competences in artificial intelligence and machine learning in the USA labour market (Verma et al., 2021) and leadership competences for digital transformation projects (Gilli et al., 2022).

The analysis performed in this study is divided into three steps: (i) selection of adequate recruitment portals, (ii) data scope and query design, (iii) data collection and content analysis. In the first step, a selection of recruitment portals has been carried out in Italy and Poland in line with the following criteria:

- *Popularity, to select one of the leading recruitments portals on each market*
- *Specialization, to ensure adequate quality of data for the purpose of this research, only general recruitments portals have been considered, thus portals specializing in one type of work (e.g. only white-collar jobs or only blue-collar jobs) were excluded.*

Based on the above criteria <https://www.pracuj.pl/> recruitment portal was selected as an adequate for analysis carried out for the Polish labour market and <https://it.indeed.com/> was chosen for the Italian market.

In the second step of the analysis, data scope and query design, the phrase “critical thinking” in national language (Polish and Italian respectively) and in English was considered as adequate for data search. To provide suitable range of data analysis the searched phrase (critical thinking) was used in all the fields of job postings. To sufficiently address the research questions the collected data included: number of job postings with the critical thinking phrase; percentage of job posting with critical thinking phrase to all advertisements available on the day of the search; position level (junior, specialist, management position); the competence-bundles to which the competence “critical thinking” is related.

The third step of the analysis, data collection and content analysis, was performed in January 2023. First, from the recruitment portals the data was extracted, which included: number of positions available, frequency of critical thinking related postings and data about job type and seniority. Second, all job postings meeting the criteria were downloaded with the set of data covering: position name and competence bundle where critical thinking was posted. The information from the searched ads was entered into spreadsheet and coded (Harper 2012) and the coding included co-occurring competence bundles.

The research method applied in this study is recognized as adequate in the qualitative studies regarding required competences on the labour market. However, the method is not deprived of some limitations. The limitation of the method applied in the study is that job postings do not always fully reflect the actual demand of companies for the specific competences described in the advertisements. Job posting can serve a variety of purposes, not just strictly recruitment purposes (Rafaeli, Oliver, 1998). Advertisements usually present the competences that are most important from the point of view of recruitment and may not fully represent actual competence needs of the company. Thus, this may lead to the outcome that only narrow, job-specific, specialized competences are presented in the job posting. On the other hand, broad competences such as critical thinking are omitted there, even though they may be considered just as important as specialized competences.

Findings. This section presents the results of the research that was carried out in January 2023 in line with the method discussed above for two recruitment portals in Poland and Italy with the aim to assess the importance of critical thinking skill as a recruitment requirement. The findings provide insight into perception of critical thinking by employers on labour markets in both countries. In particular, the findings provide observations related to three dimensions: the frequency occurrence of critical thinking in job postings, seniority and type of jobs that required critical thinking skill and other competences perceived as directly related to critical thinking skill.

The results show that the phrase “critical thinking” appears only occasionally in the pool of job postings as demonstrated in Table 1 which summarises the occurrence of the phrase “critical thinking” in job postings in the leading recruitment portals in Poland and Italy.

Tab. 1: The number of job postings with “critical thinking” reference, two leading recruitment portals in Poland and Italy

	Poland	Italy
Total number of job postings	95231	215297
Number of job postings with a reference to critical thinking	275	239
% of job posting relating to critical thinking	0,29%	0,11%

Source: own research

The results of the search provided 275 job postings with reference to critical thinking in Poland and 239 job offers in Italy. However, the pool of available jobs were significantly greater at the Italian portal than at the Polish one, over 210k and over 95k respectively. Thus, a percentage of job postings with a reference to critical thinking was 0,29% for Polish recruitment webpage and 0,11% for the Italian one. Although, there are some differences between the frequency of the occurrence for both markets, the results overall tend to indicate that the critical thinking skill was a competence very seldom sought by the companies in their recruitment undertakings in both market.

The results of the research provide insight into the seniority and type of jobs in which the critical thinking skill was deemed sufficiently important to be single out in the job advertisement, as shown in the Table 2, below.

Tab. 2: Number of job postings requiring critical thinking skills by the seniority of position recruited

	Poland		Italy	
	No. of postings	in %	No. of postings	in %
Total	275	100%	239	100%
Junior positions	25	9%	67	28%
Specialist positions	209	76%	126	53%
Management positions	41	15%	46	19%

Source: own research

At the Polish recruitment portal subjected to the research, out of 275 positions, 25 could be considered junior level, 209 applied to specialist positions and 41 to management posts. This represents 9%, 76% and 15% of respective position type out of all job postings with reference to critical thinking in the analysed dataset. At the Italian recruitment portal, 67 position could be attributed to the junior level, 126 referred to specialists and 46 to management positions, that translates to 28%, 53% and 19% job types respectively out of all positions that required critical thinking skills. Thus, the results show that for both markets majority of posts that required critical thinking skill belong to specialist positions. The key difference between markets in this respect is relatively high number of junior level positions that specify the critical thinking skill among required skill in Italy compared to Poland. However, the results do not provide the total number of job postings per position type. Therefore, the results do not permit a cross-country comparison between the percentage of positions with critical thinking skill requirement per job type. Such results could provide further valuable insight into the relative importance of critical thinking skill in business recruitment requirements.

The research results provide new information about the bundles of competences which were linked to the critical thinking in the job postings. This part of the study was strictly qualitative. From the job postings, one bullet was extracted from the 'Our requirements' section, in which the search phrase occurred. All other competences that co-occurred with critical thinking skill in that string of competences were identified. Competences that co-occurred more than once with critical thinking skills were captured and clustered in line with their primary scope. Moreover, in order to provide more coherent overview of the key skills that create a common bundle with the critical thinking skill, the various job postings from one employer such as duplications of geographical areas were treated as one item. The list of competences that co-occurred in bundles with critical thinking skills for both recruitment portals have been combined and are presented below.

The results from the leading recruitment portal in Poland indicate that employs searched for critical thinking skills in connection with the following other competences:

1. Analytical skills
2. Problem-solving, solution-oriented approach
3. Independence, independent thinking
4. Creativity, creative thinking
5. Decision-making (appropriate, accurate, quick, under time pressure)
6. Drawing appropriate conclusions (autonomy in conclusions)
7. Planning and management of priorities, ability to prioritise tasks
8. Anticipation of consequences of actions
9. Goal orientation
10. Attention to detail
11. Lifelong learning, work-base learning

The results from the recruitment portal on Italian market showed that companies tend to search for the following competences in direct relation to critical thinking skill:

1. Problem solving skills
2. Analytical skills
3. Result-oriented thinking
4. Decision making skills
5. Creativity and curiosity
6. Adaptability
7. Lateral thinking
8. Teamwork

9. Attention to details

While results provided for both market differ slightly in the set of competences which occurred bundled with critical thinking skills by the posting companies, it can be observed that five competences appeared to be shared for both markets, and these are: problem solving skills, analytical skills, decision making skills, creativity, attention to details.

In the job postings, both Polish and Italian, there were various phrases used indicating that employers understand the term “critical thinking” very broadly. There were terms for skills that were only loosely related to critical thinking, such as pro-activity, the “can do” approach, entrepreneurship, self-organisation, managerial competence, simplification, punctuality, communication skills. Thus, it seems that some employers treat critical thinking not only as a cognitive skill, but also as an individual character trait (pro-activity, punctuality), and as other soft skills (communication, work-based learning), and as technical skills (analytical skills). Therefore, it can be speculated that for employers, critical thinking has become a key word defining the ability to cope with any situation, including changing one’s own way of thinking and behaviour - so that it becomes consistent with the employer’s requirements.

Discussion. In this section the results of the research are elaborated on to provide answers to the three research questions developed in the Introduction with the aim to explore new insight into the application of critical thinking skill in job requirements in Poland and Italy.

Our study of job postings has shown that critical thinking is valued by employers much less than experts predicted (Schleicher 2018, OECD 2019 WEF 2016, Aring - ILO 2015). The review of the job postings at the leading recruitment portals in Italy and Poland provided strong evidence that the critical thinking skill is seldom considered a popular competence expected by the companies seeking new hires. The critical thinking skill was specified in only 0,29% job postings in Polish recruitment portal and in 0,11% job offers posted at the researched Italian recruitment portal which provides scant support for the importance of this skill for employers.

Among the job postings which required a critical thinking skill majority could be attributed to the specialist type of jobs and far lower number for junior positions which indicates that the demand for critical thinking skills could increase with the scope of responsibilities, level of technical competences and experience. In terms of the number of managerial job postings with the reference to critical thinking skill the number is smaller than for specialist job offers. It is, however, reasonable to expect that the number of job postings decreases with the level of seniority and the overall structure of recruitment offers is pyramid-shaped, with limited number of posts for managers, moderate for specialists and by far greater for junior positions. Thus, under such assumption, the results could provide indication, alas weak one, for the growing demand for critical thinking skills that increases with the level of seniority of searched job candidates which could be shown by probably higher relative frequency of critical thinking skills referencing in specialist and managerial job openings.

The second research question in the chapter called for the analysis of competence bundles in which the critical thinking skill usually occur. The results showed that there are several skills that tend to be directly linked to critical thinking in the job postings with the notable examples of: problem solving skills, analytical skills, decision making skills, creativity, attention to details. The analysis of the typical critical thinking skill related competence bundles indicate that the critical thinking is primarily viewed as leverage of adequate way of addressing business related issues with the sequence of: analysing, reasoning and decision making. Moreover, it has been indicated by the results that in order for this process to be performed in an appropriate way, elements of creativity and fine-grained scrutiny are viewed as relevant and are entangled with critical thinking skills. By indicating skills related to critical thinking, the results of this research may contribute to better understanding of companies’ competence requirement.

Our research confirmed the findings of other researchers (Penkauskienė et. al. 2019) that for employers the concept of “critical thinking” is very broad. It is not only a cognitive skill (acquisition, verification and analysis of information, the ability to draw conclusions), but also a skill important in almost every aspect of professional life. Critical thinking also applies to the ability to implement conclusions, communicate the results and successfully manage business.

For some employers critical thinking skill seems to be an universal skill that will improve the effectiveness of professional activities, but also contribute to self-development and improvement of personal character traits. The results of our research are consistent with the results of Indrašienė et al. 2021, where the employers’ conception of CT has been revealed as an abilities and a person’s qualities grouped in 5 categories: analysis; evaluation; argumentation; independence and self-confidence.

With the reference to the third research question, about the differences between approaches to critical thinking skill in Polish and Italian recruitment environment, it could be stated that the results provide moderately coherent picture of business attitude to this skill. Although, there have been some limited differences in critical thinking skill occurrence frequency and number of job types where critical thinking skill was regarded as expected by employers, the scale of the diversions confirm the relatively consistence approach to critical thinking skill in the recruitment processes in Italy and Poland. The consistency of the results has been strengthened further by the similarities in the composition of competence bundles related to critical thinking skill.

Conclusions. This research provides contribution to the understanding of the use of critical thinking skill in labour markets by producing new insight into the companies approach to the critical thinking skill as a required competence in recruitments in Poland and Italy. The study analyses job postings at the two leading recruitment portals in Poland and Italy to provide answers to three research questions. In particular, the contribution of this research is four-fold. First, we have shown that the critical thinking skill is seldom considered as prerequisite for the job applications regardless of analysed market. This result sheds new light on the importance of critical thinking skill and is in contrast to some previous research which tend to indicate that critical thinking is highly valued by employers. Second, our study

provides initial indication that the frequency of critical thinking skill job posting occurrence may increase with the seniority and complexity of job openings. Third, the study highlights that critical thinking skill is often considered by employers as a part of complex competence bundle which tend to include also: analytical skills, problem solving skills, decision making skills, creativity, attention to details. Thus, the indicated competence bundle enables to facilitate the integrated approach to addressing business issues and it covers: analysing, reasoning and decision making. Fourth, our study demonstrates that the companies approach to the critical thinking skill as a recruitment requirements is largely consistent in Italian and Polish contexts.

The study is not deprived of some limitations which include among others the fact that the research methodology (job ads research) does not fully show cause and effect relationships. The fact that employers do not mention certain skills in the advertisement does not necessarily mean that they are not important and considered on the course of recruitment process. Moreover, such skills may not be specific to the job or may be taken for granted. Therefore, it would not be justified to draw too far reaching conclusions, especially since the scope of the study was limited to two recruitment portals in just two markets.

Several new research directions could be indicated as the outcome of our analysis. It seems that studies based on job posting analysis in the context of the importance of critical thinking skill in the labour market should be treated as pilot studies. As critical thinking research is proliferated in research field of education, more advanced research (both quantitative and qualitative) for the labour market should be developed. This area in our opinion represents a considerable research gap that should be addressed in the future studies. The analysis of the previous research and our results show that more research is also advisable that will contribute to the conceptualization and operationalization of critical thinking levels applied to the labour market, so that employers and employees are equipped with appropriate tools to evaluate individual development in critical thinking skill. We also hypothesize (to be tested in future research) that there is a positive correlation between the company's effectiveness and the level of critical thinking skills of its employees and top management in particular.

Radical innovation project and equity crowdfunding: the role of prior financing and of Teamwork creativity

CARLOTTA BOTTARO* FABRIZIO CESARONI* RAFFAELE STAGLIANO[▲]

Abstract

The equity crowdfunding phenomenon has become increasingly important in the last decade in the innovative project financing landscape. The aim of the study article is to analyze in depth the success of radical project financing and the related variables that influence it. The research paradigm included external funding obtained prior to the launch of the equity crowdfunding campaign and the degree of creativity of the team that developed the project. The results show a relationship between radicality and campaign success, allowing us to show that a high degree of radicality of the project positively influences the probability of campaign success. A high degree of creativity on the part of the team also influences the likelihood of campaign success, and the presence of previous funding has a significant influence by acting as a solid and credible quality signal.

Framing of the research. *Equity crowdfunding (ECF) has grown rapidly since it was first regulated in 2012 in the USA by the Jobs Act. Equity crowdfunding has become an increasingly popular way for startups, SMEs, and innovative projects to raise capital, and online equity crowdfunding platforms play a crucial role in facilitating these transactions (Vulkan et al., 2016), although some national regulations have imposed a limit on who can participate in equity crowdfunding and how much can be invested (Cumming and Johan, 2013; Hornuf and Schwienbacher, 2017). This alternative financing system has been studied for its role in closing the financing gap for small firms, especially those with a high growth potential (Valenza et al., 2021; Elridge et al., 2021).*

Schwienbacher (2019) defines equity crowdfunding platforms as “two-sided markets” as one of the primary roles is to provide a marketplace for businesses and investors to connect, a sort of point of convergence between entrepreneurs seeking capital for their projects and online investors.

In consideration of this, it is possible to state that ECF platforms play a central role in the entrepreneurial financing landscape. Among the different operational aspects that characterized ECF platforms, the total capital raised and the number of investors are visible to all users and may represent a strong signal for future investors (Vismara and Rossi, 2018), meaning that others have already looked at the project, like it, and have confidence in the promoters' ability to complete it (Colombo et al., 2015).

Crowd investors can purchase shares directly from a start-up or indirectly by investing in a financial vehicle that collects all their contributions. The latter is often called pooled investment, and the trustee manages the collected money on their behalf. Any dividends paid to the crowd shareholders are distributed net of management fees (Hornuf and Schwienbacher, 2016).

Investor behavior is strongly influenced by updates and comments posted about the project, especially when previous supporters show confidence in the specific product or investment area (Hornuf and Schwienbacher, 2018). Vismara (2018) pointed out the importance of initial investors in equity crowdfunding campaigns by providing information about their commitment to a project and their ability to contribute funds. In addition, investors with a public profile increase the attractiveness of a project and influence future crowd investors who may also participate in the project.

Existing literature on equity crowdfunding has examined several topics, including how platforms work (Hornuf and Schwienbacher 2018; Vismara and Rossi, 2018; Lukkarinen et al. 2016; Vanacker et al. 2019), success factors of equity crowdfunding campaigns (Vismara 2016; Lukkarinen et al. 2016), and outcomes following equity crowdfunding campaigns (Signori and Vismara, 2018; Vanacker et al. 2019).

Several authors have focused their studies on ECF-related signaling theory and identified factors that influence project funding and success. Ahlers et al. (2015) found that accurate information about both the risk of the project and the involvement of the founding team members increased the chances of success of an ECF campaign. Li et al. (2016),

taking a sample of 49 projects published on the Chinese platform Dajiatou, examined the role of information disclosure, such as team size and experience, ongoing updates on the project, etc., and primary investors as quality signals for funding success. Kleinert et al. (2020), through their analysis based on the screening of 221 business plans and project descriptions on Crowdcube, showed that the presence of external funding prior to the launch of the equity crowdfunding campaign is a sign of quality and is more relevant for start-ups.

Barbi and Mattioli (2019) focused on the role of human capital as a quality signal, which is mainly determined by 'education, prior business/financial/economic work experience, and the gender of the team. Their study shows that human capital proves to be a reliable quality signal for the firm when it comes to increasing the capital collected during the ECF campaign.

Other studies have examined the role of innovation as a quality signal in raising capital through equity crowdfunding platforms. Pendeven and Schwienbacher (2021) used a sample of 179 campaigns from different platforms operating in France. Taking the investors' point of view into account, the results show that highly innovative projects attract more attention and thus raise more capital than less innovative projects.

More interestingly, further studies have examined in depth the role of radical or incremental innovation in equity crowdfunding financing. Radical innovations represent something new that did not previously exist in the marketplace, and their introduction can represent a break with the past by overturning industry conventions and changing customer expectations (O'Connor, 1998), and creating demand for products or services that were not previously known in the marketplace, thereby creating new markets and industries (Garcia and Calantone, 2002). Given their many characteristics and drawbacks, radical innovations are also defined as particularly uncertain and risky in terms of their outcome and return on investment (Keizer and Halman, 2007).

According to Gatignon and Xuereb (1997), there is a positive relationship between innovation success and radical innovation. The more different an organization's innovations are from existing products and services, the greater the advantage they will have. Therefore, the greater radicalness of innovation is, the better its results will be.

Hervé and Schwienbacher (2018) argue that equity crowdfunding is an effective way to raise funds for radical innovation because it provides a way to invest in a long-term project with an expected return in the future. Le Pendeven (2016) studied the relationship between the degree of innovation and overall funding success in three dimensions (market, technology, and business model) for 39 French firms founded on the Anaxogo platform. The results suggest that more innovative firms (technology and firms with patents) raise higher amounts of capital and have a higher number of investors than less innovative firms. In addition, Stanko and Henard (2017) found that in equity crowdfunding campaigns, the degree of innovation developed correlates positively with the degree of investor participation in the process. This indicates that investors in the early stages of innovation development prefer to support firms that have already demonstrated a certain level of success, focus on radical innovation, and exploit the full potential of their firm (Stanko et al., 2016). In contrast, Liu and Su's (2018) study found that radical innovation projects do not achieve the same results through equity crowdfunding campaigns as incremental innovation projects.

There is a broad consensus in the literature on the financing of radical innovations regarding their lack of funding (Keupp and Gassmann, 2013; Woschke et al., 2017). Caggese (2019) explains that a lack of funding for radical innovations can act as a barrier to entry and severely limit competition in the market. This reduces radical innovation because firms cannot afford to adopt it, which affects productivity growth at the firm level.

The existence of a funding gap for radical innovation is prompting researchers to explore alternative forms of investment opportunities. Although the literature on equity crowdfunding is extensive there has not been enough investigation regarding the funding of radical projects and, more specifically, what factors may influence the funding and success of these projects.

Purpose of the paper. The purpose of this study is to investigate the success of funding radical innovation through equity crowdfunding. Since radical innovation projects are high-risk investments, they may not meet the expectations of traditional investors, leading entrepreneurs to consider alternative forms of investment.

We hypothesize that the sources of prior financing and teamwork creativity can influence the relationship between radicality, and campaign success. Previous studies have already analyzed the role of prior financing in influencing the success of an equity crowdfunding campaign (e.g., Kleinert et al., 2020) and there is a broad consensus that they represent a credible quality signal for online investors on ECF platforms. Starting from this, it's necessary further investigate if prior financing still represents a credible quality signal for a radical innovation project, commonly more difficult to fund. The goal is to consider external funding received by the firm before the launch of the equity crowdfunding campaign. The main external funding sources considered for this analysis are business angels, venture capitalists, grants, and other forms of crowdfunding such as reward-based and lending-based.

Previous research has extensively analyzed the role of teamwork creativity for organizations. Amabile (1988) defined creativity as the generation or production of ideas, and it is usually considered the first stage of the innovation process. Next, innovation is considered as the implementation of the idea, attributed to a team or a person who developed it from its initial state (Amabile et al., 1996). Some authors such as Rego et al. (2007) argue that creative teams in organizations are valued for their ability to come up with new ideas and solutions that help the firm stay ahead of its competitors. However, the fact that a team's idea is new or innovative does not mean that it is automatically considered creative; to be considered valid, the idea must have potential use for the firm. Applying the team creativity conceptualization discussion to the equity crowdfunding context, it can be hypothesized that a high level of team creativity positively influences project quality. Indeed, presumably, more creative teams will be able to conceive and develop more creative projects, which will capture the attention of investors more at the time of the campaign launch.

Methodology. The methodology chosen for this study uses primary data and involves the administration of an email questionnaire to firms that have launched an equity crowdfunding campaign on a well-known Italian platform. The initial target population consists of a sample of initiated campaigns. As described by Vismara and Rossi (2018), Italy was the first nation in Europe to introduce specific regulations for equity crowdfunding in December 2012, namely Decreto Legge n. 179/2012 or Decreto Crescita Bis. Online platforms wishing to operate in the crowdfunding equity market must be authorized by the authority responsible for regulating financial markets in Italy (CONSOB). Since 2012, more than 1100 campaigns have been published on the Italian ECF platforms, raising capital of more than 500 million euros. Of the published campaigns, more than 800 have been successfully completed. Considering this, the success rate of ECF campaigns has also progressively increased, from 50% in 2017 (Politecnico di Milano, 2017) to around 90% in 2022 (Politecnico di Milano, 2022).

The questionnaire is divided into different sections that can be used to measure each variable. Each of the scales used in the questionnaire has been previously validated in other studies. The degree of the project's radicalness in launching an equity crowdfunding campaign is measured by the scale used by Dominguez-Escrign et al. (2019); Cronbach's α for this construct is 0.93. Team creativity is measured using the scale previously validated by Rego et al. (2007), which has also been used by later studies such as Barczak et al. (2010); Cronbach's α for this construct is 0.85.

In addition, concerning previous external financing, respondents are asked to indicate which of the explicit financing they have received or whether they have received any at all. The campaign success is measured by the secondary data available on the platform if at least the campaign goal is met, if not exceeded. Finally, several common control variables in equity crowdfunding studies were identified and used (Kleinert, 2020; Barbi and Mattioli, 2019; Vismara 2018).

Results. The results show a relationship between radicalness and campaign success, making it possible to highlight that a high degree of radicalness in the project positively influences the likelihood of campaign success. This result is in line with previous results obtained by several authors (Le Pendeven, 2016; Le Pendeven and Schwienbacher, 2021). Moreover, the presence of prior financing also significantly influences acting as a solid and credible quality signal. The presence of prior financing act as an accelerator for the success of the equity crowdfunding campaign, meaning that previous investors have already believed in the project's potential, and previous funding of the project is a sign of credibility (Kleinert et al., 2020). Finally, a high degree of creativity on the part of the team also influences the likelihood of a successful campaign. This is because the team's creativity enables the development of highly innovative ideas, which, transformed into projects for the launch of the equity crowdfunding campaign, are particularly attractive to online investors.

Research limitations. The study's two major limitations are that it focuses exclusively on equity crowdfunding platforms for financing radical innovation, excluding other forms of crowdfunding such as loan-based and reward-based. A more in-depth study including these additional forms of crowdfunding could lead to different results. Next, the second limitation is the focus on a single ECF platform operating only in Italy, thus excluding additional possible platforms operating in Europe or outside Europe. Broadening the study to platforms operating in different states could lead to further results considering two main aspects: (1) the specific operation of each platform (which is subject to national legislation); and (2) macroeconomic conditions like investment opportunities.

Managerial implications. This study offers numerous implications for entrepreneurs. First, it contributes to the literature on crowdfunding and innovation by providing new insights and findings. The study focuses on successful campaigns launched in the Italian context, the first nation in Europe to introduce and legislate a framework for equity crowdfunding. Italian equity crowdfunding context is becoming more and more interesting, with an ECF success rate that is settling around 80% (Politecnico di Milano, 2022). For entrepreneurs seeking to fund radical projects, equity crowdfunding emerges as an alternative form of external financing to traditional forms of financing and may be valuable for radical innovation (Hervé and Schwienbacher, 2018), although further investigation is needed. Understanding how equity crowdfunding platforms work, the dynamics of project funding, and the specific factors that influence the allocation of external capital by retail and professional investors is critical for entrepreneurs and firms. One of the key factors that help in determining project success is the creativity of the team behind it, and this can be seen as a quality signal to investors. Previous funding can also help get projects up and running quickly and without getting bogged down. The analysis conducted on the creativity of the teamwork and the role played by previous external funding are elements that enable the entrepreneur or firm to understand how to pitch the project on the platform and which elements are most relevant to investors.

Originality of the paper. The originality of the paper lies in the analysis addressed and the data used. First, despite the presence of previous studies that have extensively considered the role of innovation in equity crowdfunding campaigns, few studies have specifically analyzed the funding of radical projects, focusing more on innovativeness as a perceived success factor from an investor perspective. Second, this study represents one of the few studies that brings together numerous elements from different works of literature, such as the creativity of the team and previous funding, into the perspective of equity crowdfunding.

Third, this represents one of the few studies conducted on ECF campaigns financed through an Italian platform. Previously, only a limited number of studies have focused the analysis on purely Italian data (Troise et al., 2020; Battaglia et al., 2022; Valenza et al., 2021).

Keywords: equity crowdfunding; radical innovation; team creativity; prior financing; crowdfunding; innovation

Human Psychology and Investment Decisions of Cryptocurrencies Investors

MUHAMMAD NAVEED* REHAN AFTAB*

Framing of the research. *The changing financial landscape has digitalized the financial world with innovations. In the ongoing century with the new generation and its requirements, financial innovations have revolutionized financial products and their knowledge (Petry, 2021). Investment choices with financial technologies like blockchain and innovation have taken the form of cryptocurrencies. People who were investing in bonds and stocks are not the only investors in cryptocurrencies but also many other people who were not investors conventionally have opted for this investment choice (Ahmed et al., 2021). Likewise, the impact of behavioral anomalies in traditional markets, there seems an expected impact of behavioral factors on investment decisions in cryptocurrencies markets as well (Nofsinger, Patterson, and Shank, 2018). Despite, the developments in generations and increasing financial innovations, human psychology seems to influence the financial decisions of investors in cryptocurrencies markets (Fonseca, Pacheco and Lobão, 2019).*

The stock market investors decisions are biased to a certain extent as evident from the established literature. Behavioral biases seem to have an influential role in investment decision-making. Strömbäck et al. (2017) estimated the impact of self-control, optimism, and deliberative thinking on investment decisions. They found a significant impact of these human biases on investment decisions. This study used three biases a human can have at the time of investment decision-making with the controlled impact of financial literacy. The study of Kubilay and Bayrakdaroglu (2016) establishes that there is a significant association between the personality traits of investors and financial risk tolerance. Additionally, the study also concluded a significant relationship between the personality traits of investors and psychological biases. Another study focused on the impact of loss aversion on the risk-taking behavior of investors. The study concluded that investors with a loss-aversion approach have a low inclination towards risk-taking. It establishes a significant relationship between the variables of interest (Yuniningsih, Widodo, and Wajdi, 2017). Along with these biases, the literature shows a moderating impact of financial literacy, and investors decisions are affected in the presence of financial literacy as moderator (Ahmad et al., 2019).

The evidence from the background on the research states that cryptocurrencies are the newest and growing form of investment and the application of behavioral finance to the context of cryptocurrencies is the missing link in the literature. The empirical analysis of studies carried out in developed, developing and emerging economies reveal developing countries must initiate studies to establish the literature of behavior finance and cryptocurrencies. Also, the financial literacy role in stabilizing investment choices must be tested.

The empirical analysis of the literature suggests that human psychology leads to irrationality in the market. The market decisions of investors despite the availability of information and technical support are biased to a certain extent (Grežo, 2020). This behavior of the investors leads to anomalies in the market and unpredictable behavior. Therefore, the irrationality of investors in the form of behavioral biases has strong implications for investment decision-making. The same impact of human psychology is pertinent to developing countries like Pakistan (Asad, Khan, and Faiz 2018), therefore this study examines the problem that human psychology has its impact on the investment decision making in the cryptocurrencies market. As human biases have a considerable link with investment decision making thus leading to irrationality, therefore, this study focuses on a few of the human psychological aspects causing irrationality while making investment decisions. The impact of three biases is considered as research questions because anchoring, optimism and overconfidence biases have been found influencing and very much related to financial markets in developing countries as compared to other psychological biases (Asad, Khan and Faiz 2018). So, the same factors of behavior finance may be linked to the cryptocurrencies market as well.

In line with seminal objectives this study examines the impact of human psychological factors on cryptocurrencies investment decisions through the underlying moderating role of financial literacy. The methodical aspect is based on primary data using questionnaires to retrieve information from investors actively participating in cryptocurrency's investment.

Purpose of the paper. The core purpose of this paper is bridging between the aspects of behavioral finance and cryptocurrencies investments. The psychological biases impact on investors decisions dealing in cryptocurrencies is empirically analyzed in this paper. Additionally, the role of financial literacy in moderating investment choices is also analyzed. The existing literature in developing countries is insufficient to claim the true nature of the relationship between human psychology and cryptocurrencies investment decisions. This study enhances the understanding of the investor's psychological behavior. The impact of optimism, anchoring, and overconfidence becomes apparent and the level to which these three biases assume the impact is also identified. The researchers can use the results of this study in future studies for more reliable testing of the hypothesis. Researchers can incorporate some other variables to examine the impact of psychological biases on investment decisions. A biased investor can wrongly take a short or long position in the market and can influence the price without knowing the actual market position. So, behavioral biases lead to unrealistic market positions of the firm as well. This study is helpful for firms to spread awareness regarding the possible role of studied biases at the time of investment decision making.

Therefore, the key purpose of this study is the analysis of the impact that human psychological factors like anchoring, overconfidence and optimism have on cryptocurrencies investment decisions made by investors in Pakistan. Also, the moderating role of financial literacy in between human psychology and investment decisions is examined in this study.

Theoretical perspective; In contradiction to the stance of behavioral finance in terms of human psychology, the domain of standard finance establishes itself on the rationality of the investors in the financial markets including cryptocurrencies segment, it means that investors will consider the theories and models of standard finance at the time of decision making for investment (Mittal, 2019). The basic assumption of standard finance pleads that investors will make rational decisions thus leading to equilibrium in the market. The market equilibrium then states that the financial instruments in the market are priced based on standard finance assumptions, primarily recognized as an efficient market hypothesis (Rossi and Gunardi, 2018).

The theories of standard finance especially the efficient market hypothesis are challenged by the unpredictable behavior of the participants. In contradiction to the standard perspective, behavior finance emerged as a replacement for traditional finance. The start of behavior finance finds its roots in the work of Kahnemann and Tversky during the 1970s. These two psychologists suggested the prospect theory for the explanation of participant behavior in the decision-making process.

According to Kahnemann and Tversky (1974), the prospect theory describes an investor's choices based on certain losses and gains rather than putting reliance on outcomes. This area of study developed over the period with the identification of several biases, problems of self-control and cognitive errors in the decision-making process. The standard finance is replaced with behavior finance in recent literature (Brüggen et al., 2017). The role of behavioral finance in the decision-making process of investors is studied frequently in research studies. The studies about varying dimensions of behavior finance are rooted across different economies of the world.

Anchoring and Investment Decisions; The empirical evidence is gathered for behavior biases to examine their relationship with investment decision making. Specifically, anchoring, overconfidence, and optimism are empirically evaluated for the purpose of the current study. The study related to behavior biases undertaken in Malaysia investigated the impact of behavioral biases like overconfidence, herding behavior, conservatism, and availability on the decision making of the investors (Bakar and Yi, 2016). In this study, the behavioral biases are taken as independent variables whereas investment decision making is adopted as a dependent variable in this study. Bakar and Yi (2016) also included a different sample from various geographical regions for the determination of a possible relationship between the behavioral biases and financial decisions of investors.

In the same manner, another study by Pochea, Filip and Pece (2017) included different market conditions to investigate the impact of behavioral biases at the time of decision-making decision making. This study found that behavioral biases and market conditions are significantly related to each other. This study used secondary data from the markets for analysis of the relationship between the variables of interest. Furthermore, regression analysis for gathered secondary data from the stock exchanges related to market condition and herding behavior was performed in the study of Pochea, Filip & Pece (2017) for the examination of a possible relationship. The researchers came with the results that there is a complete presence of herding behavior under different market conditions.

Anchoring being one of the investor biases represents the strong influence of one value on the investment decision of an investor (Blumenthal-Barby, 2016). It means that an investor will make a decision that is dependent on single or standalone value. This value anchors the decision of an investor around the same value. Investor final decision will surround the initial value that he has in his mind. This gives rise to anchoring bias at the time of investment decision making.

According to the study of Jetter and Walker (2017), anchoring has a significant impact on financial decisions. This study examined the financial decision of 6,060 contestants in the United States for wagering decision. The financial decision of individuals was close to the initial value of the dollar provided to them as a clue. The anchoring phenomenon in this study was consistent among the participants and it stood statistically significant. This study also presented the fact that the contestant to make financial decisions from various demographics is all suspects of anchoring bias. It means that the selected sample in the study of Jetter and Walker (2017) belong to different age groups and the results demonstrate that anchoring bias persists at the time of decision making for all participants.

Overconfidence and Investment Decisions; The other bias related to this research work is overconfidence, overconfidence bias is the reliance of investors on their abilities and intuitions for decision making (Baker, Filbeck, and

Ricciardi, 2017). It means that an investor is placing more reliance on its internal strengths at the time of investment decision making. If an investor has a strong record of investment decisions, it is more likely that he will get an impact of overconfidence at the time of investment decision making. Investors with overconfidence try to make decisions on basis of their intuitions. An overconfident investor is dependent on its abilities to make decisions, such investors place little value on information for decision making.

In another study by Zain ul Abdin et al. (2017), the anchoring and overconfidence biases have a positive and significant impact on anomalies in the stock market as a result of investment decisions. These two biases have a positive impact on the trading volume in terms of fundamental anomalies that is variation in trading volume from the normal. A sample of around 324 investors was used in the stated study. The questionnaire was adapted for data collection through surveys. This study was aimed to examine the fundamental and technical stock market anomalies. It is observed in this study that the behavioral biases like availability, anchoring, and overconfidence have a strong link with the investment performance with the presence of fundamental anomalies.

The study of Alquraan, Alqisie, and Shorafa (2016) also come up with a significant relationship between investor decision-making and behavior biases. This study analyzed the role of behavioral biases in the Saudi Stock Market. The Saudi market is an emerging market in the Middle East. The investment decisions of investors in the Saudi stock market are influenced by psychological factors like overconfidence. On the other hand, herding behavior has an insignificant relationship with investment decision-making in the Saudi stock market (Alquraan, Alqisie, and Shorafa, 2016). Similarly, another study by Tauni et al. (2018) studied the impact of financial advice on investment decision-making. The moderating role of personality traits is also examined in this study. The study revealed that financial advice has a significant relationship with the personality traits of investors. According to the study of Alquraan, Alqisie and Shorafa (2016) overconfidence, conservatism, and availability bias have a significant impact on investment decision making.

Optimism and Investment Decisions; Optimism relates to the investor's positive attitude towards the situation of certainty and uncertainty regardless of changing situations (Baker, Filbeck and Ricciardi, 2017). This bias prevents investors from making wise decisions in the varying situations in the investment markets. The optimism of investors makes them ignore the negative sides of the situation. An optimistic investor is always expecting favorable and attractive outcomes from the possible investment. This bias hinders the process of rational decision making which includes the analysis of all possible scenarios resulting from the investment decision (Baker, Filbeck and Ricciardi, 2017). Therefore, optimism is also prevalent at the time of decision making as part of investor's cognitive decision making.

A study related to investors in Pakistan and Malaysia establishes significant relationship between behavior biases and investment decision making. This study examined the impact of anchoring, optimism, overconfidence, representativeness, herding and mental accounting bias on the investment decision making and found significant relationship between the variables of interest (Khan et al., 2017). The study used primary data collection methodology for quantitative data analysis. A structured questionnaire was used to gather data from different respondents of two different countries. The study of Khan et al. (2017) revealed that the selected heuristics have significant relationship with stock buying decisions. The same results were obtained for samples from both countries. This study also inferred that the demographic factors have an influence over the relationship between heuristics and investment decisions. Education and experience of investors can enable them to make informed decisions. These demographic variables can resist the impact heuristics on decision making.

There is another study pertaining to examination of impact behavior biases have on investment decision making. Strömbäck et al. (2017) in their study developed an understanding of rational behind the investment decisions of investors. The researchers in this study examined the impact of psychological characteristics on the financial wellbeing and financial decision making of investors. The study included self-control, deliberative thinking and optimism as independent variables. Whereas the financial behavior was selected as dependent variable for analysis. The research approach of this study was based on quantitative data technique as the study used structured questionnaire for data collection through primary approach. The OLS regression was then used to analyze the gathered data for potential relationship between the investor's characteristics and financial decisions. From the analysis, it was revealed that the behavior biases have positive and significant impact on investment choices of investors in the stock market.

Hypotheses development from empirical review

Anchoring, overconfidence and optimism are considered for possible relationship with investment decisions in this study. The specific literature pertaining to these behavioral biases comes from the studies of (Blumenthal-Barby, 2016; Baker, Filbeck and Ricciardi 2017; Jetter and Walker 2017; Zain ul Abdin et al., (2017); Khan et al., 2017; Strömbäck et al., 2017). Financial literacy also seems to have a moderating role in investment decisions. The reviewed literature from the mentioned studies reveals that anchoring, overconfidence and optimism and other emotional and cognitive biases have significant impact on the investment decision making. Therefore, the following testable statements are proposed from the literature review. There seems no attempt in recent literature to analyze the investment decisions of cryptocurrencies investors in response to human psychology. So, the hypotheses for this research work are:

H₁: There is a significant impact of anchoring, overconfidence and optimism biases on cryptocurrencies investors investment decisions.

H₂: Financial literacy significantly moderates the impact of anchoring, overconfidence and optimism biases on cryptocurrencies investors investment decisions.

Methodology. The underlying research study collects quantitative data for further statistical analysis to meet the set purpose. Primary data collected through questionnaires is statistically analyzed for determination of impact that

behavioral biases have on investment decisions. The research approach identified and selected in this study is consistent with the studies of other authors in the recent past who have examined the same nature of models with statistical analysis. Kubilay and Bayraktaroglu (2016) in their study related to behavior biases and investment decision making adapted questionnaire for data collection under quantitative approach. They used primary research for data collection and further analysis.

The research area relates to the examination of investors who are actively participating in the cryptocurrency's investment. The research scope delimits the sample selection to the population of cryptocurrencies investors in Pakistan. Convenience sampling is opted to select final sample for the study. Convenience sampling aims to select accessible subjects from the identified population as sample of interest to the study (Fowler, 2013). The questionnaire is sent to almost 1,000 investors electronically. Out of these final response to 803 investors is analyzed in the progression of this study. The questionnaire related to behavior biases and investment decision making is based on five-point Likert scale. The questionnaire related to Behavior Biases is adopted from multiple sources. The questionnaire for anchoring bias is taken from scholarly work of Kapteyn, Smith, Van Soest and Vonkova (2011). Similarly, the questionnaire for optimism bias is taken from Harris, Griffin and Murray (2008). Additionally, the questionnaire for overconfidence bias is taken from Seppälä (2009). The questionnaire for investment decision making is taken from Hira and Loibl (2005). Lastly, the scale of financial literacy is obtained from Lusardi & Mitchell (2014) with seven items in the construct of financial literacy.

Consistent with structure of data, OLS regression model is being performed supported with empirical evidence for this study (Khan et al., 2017; Kubilay and Bayraktaroglu 2016; Strömbäck et al. 2017; Oprean 2014)

$$ID = \alpha + \beta(Anch) + \beta(OC) + \beta(OP) + \epsilon$$

Where:

ID = Investment Decision Making

Anch = Anchoring

OC = Overconfidence

OP = Optimism

Results. Consistent with Table 1, factor analysis performed for validation process which has shown the factor loadings for all items in the constructs are greater than the acceptable range (Yurdugül ,2008). Subsequently, the reliability measure is performed for analysis of entire construct including all items cleared from Principal Component Analysis such that having factor loading of greater than four (> 0.4). According to Kline (2013), the acceptable range for reliability of constructs is set at 0.7. Table 2 demonstrates the value of Cronbach's alpha for each construct in the model along with the number of items included for reliability analysis after principal component analysis. The above stated values for Cronbach's alpha for each construct included in the model are greater than the acceptable range of 0.7 as indicated by the researcher Kline (2013). It is inferred that the research instrument leads to reliable responses for measurement of statistical model developed to address research problem. After reliability analysis the descriptive analysis is performed, and data is statistically analyzed. Table 3 shows descriptive analysis. The impact of independent variables (anchoring, optimism and overconfidence) on dependent variable (investment decision making) is analyzed through regression analysis.

Table 4 shows the outcomes of the regression analysis for all variables under consideration of this study. R square represents 68% variation in dependent variable is explained by independent variables in the developed model. The f-statistics for this study is 116.47, which is greater than acceptable value, it means the model to fit to explain the association between variables in the study. Firstly, the coefficient for anchoring bias obtained from regression analysis is 0.114. It means that there is positive impact of anchoring bias on the investment decisions of investors in the cryptocurrencies market. The p value is 0.012, it is significant because it is less than maximum acceptable percentage of 5 % confidence interval. The study of Kansal and Sing (2015) also has consistent results as obtained in the regression analysis of current study, it shows that anchoring bias has positive and significant impact on the investment decision making.

Secondly, the coefficient of overconfidence bias is positive and is equivalent to 0.207, it resembles positive impact of overconfidence bias on the investment decisions of investors in the cryptocurrencies market. The overconfidence of investor that they can make good decisions and get favorable outcomes in all situation lead to intense investment decision making. The impact is significant at 1 % confidence interval as the p value is .000 for overconfidence bias. The results of the study in relation to the impact of overconfidence bias on the investment decision making are consistent with the studies of (Blumenthal-Barby, 2016; Baker, Filbeck and Ricciardi 2017; Jetter and Walker 2017; Zain ul Abdin et al., (2017); Khan et al., 2017; Strömbäck et al., 2017). Lastly, the coefficient of optimism bias is positive and is equivalent to 0.307, it resembles positive impact of optimism bias on the investment decisions of investors in the cryptocurrencies market. The optimistic investors tend to invest more due to their favorable expectations from the investment choice. The positive impact of optimism bias on investment decision making of investor's is significant as well. It is significant relationship because the p value is .000 and it is significant at 1 % confidence interval. The positive and significant impact of optimism bias on investment decision making is consistent with the empirical studies of (Blumenthal-Barby, 2016; Zain ul Abdin et al., 2017; Khan et al., 2017; Strömbäck et al., 2017).

The financial literacy moderation in the model is examined using the Process Hayes technique, the outcomes of the analysis show a significant moderating impact of financial literacy. The significance of moderation is at different level of strength, the different levels of moderation are explained by Table -5.

It shows that the moderation of financial literacy is significant while analyzing the impact of anchoring bias, overconfidence bias and optimism bias on investment decisions at different levels. The moderation of financial literacy is significant ($p < 0.05$) at a higher level in case of analysis of the impact that overconfidence bias has on investment decisions. Similarly, the moderation of financial literacy is significant ($p < 0.05$) at a lower level in the case of analysis of the impact that optimism bias has on investment decisions. Additionally, the moderation of financial literacy is significant ($p < 0.05$) at a lower level in case of analysis of the impact that anchoring has on investment decisions. The same sort of explanation in terms of financial literacy moderating role in the effect between psychological biases and investment decisions is endorsed by Ahmad et al. (2019).

Research limitations. Scope of study is just limited to developing country (Pakistan) which could be enhanced through future research by focusing on comparative analysis of developed, emerging, developing and frontier economies based on customized analysis of sector specific investments.

Managerial implications. Study provides important insights to financial users and policymakers to closely observe the consequences of behavioral biases on cryptocurrencies investors investment decisions. Financial literacy can help in overcoming the negatives of psychological factors so investors can gain financial knowledge.

Originality of the paper. The application of behavioral biases in the context of the cryptocurrencies market by choosing a well-defined sample of cryptocurrencies investors adds value to the work. Traditionally, the stock market investors were the focus of researchers. Moreover, the role of financial literacy in shaping cryptocurrencies investors behavior is another valuable addition.

The effect of dynamic capabilities on A.I. adoption and management in the Wine Ecosystem[♦]

ANGELO A. CAMILLO^{*} CECILIA CASALEGNO[♦] GIOVANNA BAGNATO[▲] CHIARA CIVERA^{**}

Abstract

Over the last decades, grape farming and wine production have been influenced by technological advances, especially in A.I. (Artificial Intelligence), IoT (Internet of Things), M2M (Machine to Machine) infrastructures, Robotics, and Cobotics (collaborative robots.) For wine business companies, gaining and sustaining a competitive advantage through those technologies is becoming crucial for creating vast opportunities for stakeholders in the wine ecosystem. What drives managers' willingness to adopt those technological infrastructures in the wine industry is an underexplored territory, which we aim to investigate. This research aims to explore the role of dynamic capabilities on companies' intention to adopt AI-based technologies in the wine sector. To do that, we plan on conducting field observations, focus groups and interviews among US-based wine companies, which succeeded so far in implementing A.I. technologies and can function as best practices for Europe-based producers. The preliminary results of non-intrusive observations of U.S. wine companies that have adopted new technologies indicate that staying competitive is no longer a matter of whether to adopt new technologies but rather the level of technological adaptation intensity. That is why our study intends to determine the moderating or mediating role of the influential factors in the decision-making process on adopting A.I.

Framing of the research. In the era of the Fourth Industrial Revolution (4IR), advances in artificial intelligence (A.I.), including the Internet of Things (IoT), sensor and robotic technology, remote-sensing, Machine to Machine Communication (M2M), machine learning, smart algorithms that learn from patterns such as keyboard strokes, in complex data or big data - are rapidly transforming the world of viticulture and its management within the global wine ecosystem (Winkler et al., 2017).

These developments and the adoption of technological infrastructures present vast opportunities and challenges for stakeholders in the global wine ecosystem. Specifically, an A.I. structure is an intelligent machine-based system capable of influencing the ecosystem by collection, analysis, and synthesis of data to generate useful recommendations and make predictions or provide other results for a determined set of purposes. It uses data collected by intelligent machines or human-based inputs/data to make assumptions and generate simulation models to formulate various options with perceived outcomes (Portinale et al., 2017).

Future business existence and longevity will depend on the adoption intensity of new technologies; thus, A.I. can be adopted at any stage of the supply chain and value chain. In the U.S., wine is produced or imported and then distributed through the "Three Tier Distribution System". Consequently, A.I. systems can be designed and applied to operate autonomously or be fully integrated, from sourcing grapes for wine production or importing the finished product to distribution to retailers and consumers. However, based on the country's laws, A.I. can improve the competitive position of an enterprise through cost minimization and pricing optimization, therefore making wine more competitive to benefit the consumer as in the case of the U.S. Three Tier Distribution System (Wine Folley, 2023)

According to Tardaguila, et al. (2021), A.I. applications in grape farming use various technologies and tools, including remote and proximal sensing technologies, Global Positioning System (GPS), Geographic Information System (GIS) to collect Geo-Spatial Data (GSD), and Decision Support Systems (DSS). According to the National Institute of Food Agriculture (NIFA), "Collecting data from one sensor, or many sensors, is only the first step in the overall decision-making process, which might be inspection, monitoring, tracking, etc.;" (NIFA, 2023).

[♦] This extended abstract is a work in progress. The study will continue with the following post-conference activities: focus group interview and data collection; questionnaire development and survey; data collection from self – administered online questionnaire.

An example of a successful A.I. adoption and integration coined as “Intuitive Farming” is that of Las Palmaz Winery Management in Napa, California, which uses advanced Geographic Informational Systems (GIS) to provide the winemaking team with information about vines’ nutritional requirements based on the conditions above- and below the ground. Using a GIS-generated digital map of vineyards and blocks Las Palmaz Vineyards Management can assess and provide multiple data of the grapes grown at differing microclimates, geographically located between 300 feet and 1,400 feet elevation, about ± 91 . m. and 426. m. above sea level. Hence, remote sensing using A.I. applications provides grape producers with essential data to monitor grape nutrition and growth and to provide derived predictive data to viticulturists regarding the vineyard’s health, water level and usage, and potential production yield, and act upon anything requiring attention to mitigate the effect of quality and quantity of the end product (Romero et al. 2018).

As new A.I. technologies evolve, so do the applications that winery management can adopt. An example of advanced A.I. applications is premium grape sorting before being processed into must at a modern winery fully integrated with A.I., from grape production to packaging and distribution (Palmaz Vineyard, 2022). It uses an optical berries’ sorting table using color density recognition with M2M technologies. For the process, grapes arrive at the winery from the vineyard; grape clusters are placed in a destemming machine. Grape berries are separated and sorted out through an optical lens screening and sorting process that separates ripe berries from others, according to the color density programmed into the A.I. procedure, based on a pre-established outcome to create an end product that the consumer demands (Palmaz Vineyard, 2022).

Additional A.I. applications exist across the wine production and distribution systems. For example, using a drone, the viticulturist can treat a single vine affected by diseases from the office without spraying the entire vineyard with a crop duster. Fast forwarding, the end consumer uses smartphone apps to shop for wine and place an order. Consequently, the global wine ecosystem players might be compelled to deal with the constant evolutionary technological changes in the wine business. Looking ahead, it is inevitable that the ecosystem has reached the point of no return and is moving forward to challenge each player with the following considerations: “it is not a matter anymore whether to adopt evolving technologies; it is more a question of the intensity of technology adoption by the stakeholders striving to produce the most competitive product”. Evidence is shown in the legislation changes in many wine-producing countries in the free market economy. Across the global wine markets, there is a thrust to implement a system of wine traceability using A.I. applications (Agnusdei et al., 2022; Beck, 2022; GSI, 2023). In the U.S., for example, alcoholic products are strictly regulated, and labeling is the first approval that must be obtained from the Alcohol and Tobacco Tax and Trade Bureau (TTB) before producing commercial wines. Among several other agencies like the United States Department of Agriculture (USDA, 2023) and the Food and Drug Administration (FDA, 2023), the TTB is a Federal Government Agency that regulates the alcohol industry (TTB, 2023). As new developments are introduced and adopted, so does the alcohol law. The global industry competes mainly on the following wine products: Organic, Biodynamic, Natural, Sustainable, Vegan, Fairtrade, and No Sulfites Added.

A.I. applications in the wine supply and value chains are here to stay and are evolving like every other technological advance across industries. The Government’s regulatory agencies are concerned about truth in advertising through product labeling; therefore, producers must be regulated. Hence, the label is the first step in obtaining the approval to produce and sell wine with a specific designation. Nevertheless, despite being one of the most overly regulated industries, counterfeiting remains a problem for high-profile wineries. In 2018, the U.K. lost £218 million in economic activities from counterfeit wine and spirits. In the U.S., in response to counterfeit import activities, Avery Dennison And Everledger launched the Authenticated Provenance Tracking System using Blockchain technology (Avery Dennison, 2019).

The applications and implications of A.I adoption in the wine industry are multiple. Practitioners and researchers concur that A.I. within the wine business ecosystem will determine how the wine companies will operate and how the application and adoption of artificial intelligence will influence consumer shopping behavior. Through adopting A.I., wine producers competing in the global hypercompetitive market are exploring alternative strategies to predict what consumers will demand to create better products and increase profits (OPENGOV, 2021). The International Organization of Vine and Wine (OIV) has introduced a new center to monitor and identify main developments in digitalization and technologies and the adoption in the viticulture and enology sectors (OIV, 2021). According to The Indian Express (2017), “over the next few decades, the wine ecosystem would undergo a sea change, from how consumers buy wine to the involvement of machines in the production”. Literature shows that A.I. adoption is happening across the wine supply chain and value chain, particularly in viticulture.

However, no comprehensive research has been undertaken to study the dynamic capabilities across the wine supply chain - within the wine business ecosystem, as a fertile ground to explore companies’ willingness to adopt A.I technologies. Over the past decade, A.I. accessibility and adoption have advanced the scientific understanding of viticultural and winemaking processes. The unpredictable climatic variability in most wine regions globally is a critical issue that led some grape scientists to study and adopt A.I. in viticulture. They determined that due to these uncertain events’ complications and the effects on grape growing and winemaking, a wiser methodology is necessary to gather related information and analysis to improve efficiency in the decision-making process (Prabha, 2021; Fluentes et al. 2021).

This research is based on the theory of dynamic capabilities to create a competitive advantage in a complex ecosystem. According to Teece et al. (1997), a dynamic capability is “the firm’s ability to integrate, build, and reconfigure internal and external competencies to address rapidly changing environments” (Teece et al., 1997; Teece,

2014.) For this study, we adopt Teece's (2007) model, which distinguishes three macro-categories of dynamic capabilities within an ecosystem.

Since the early development stage of this conceptual work, various authors have engaged in further developments and possible application of the framework (Teece et al., 1997; Helfat et al., 2007; Teece, 2007; Teece, 2010; Teece, 2014; Kevill et al., 2017; Teece, 2018). Di Stefano et al. (2010) deconstructed the conceptual framework literature by examining the research domain's origins, development, and future directions. The deconstruction showed that the conceptual framework, first published within the management domain, had sparked the interest of other scholars. Subsequent research was conducted in various disciplines, such as information systems, marketing, and operations. However, most publications remained in management journals: *Strategic Management Journal*, *Journal of Management Studies*, *Academy of Management Review*, *Industrial and Corporate Change*, and *Organization Science* (Di Stefano et al. 2010).

Dynamic capabilities are not internal and external operation capabilities; they are operations that deal with the firm's current "going concern". In comparison, dynamic capabilities are about the capacity to create, extend, or modify how best to exploit the firm's resources and capabilities, hence its core competencies, in a decisive and well-planned manner.

Within this conceptual framework, a firm uses a well-planned strategy to make tactical changes to its competitive status quo and uses those changes as the basis to gain and sustain long-term competitive advantage (Barreto, 2010; Di Stefano et al., 2010). These capabilities have been widely investigated and applied in many research studies to determine their effect on global performance (Jantunen et al., 2005; Evers, 2011; Prange & Verdier, 2011). Based on the literature, this research examines the presence and the use of dynamic capabilities to foster the adoption and application of Artificial Intelligence technologies in a "volatile, uncertain, complex, and ambiguous (VUCA)" environment of the global wine ecosystem (Schoemaker et al., 2018; Hercheui & Ranjith 2020), to assess the current performance and the potential future creation of competitive advantage of wine businesses. Within the context of striving to achieve a competitive advantage by adopting evolving technologies within the domain of Artificial intelligence, the dynamic capabilities framework consists of the following three pillars: sensing, seizing and transforming (Schoemaker et al., 2018), which are explained below.

A. Sensing

The capability to assess the changes in the local and global wine business landscape by analyzing the opportunities and threats that may present themselves then and possibly in the near future. This first pillar is supported by exploring what advantages A.I. technologies might offer to managers.

B. Seizing

The analysis of the external environment is crucial but not sufficient for the management to seize the opportunities by adopting adequate technologies within the framework of Artificial Intelligence. The management must also seize the opportunity promptly and attempt to determine the unexpected changes needed to innovate and implement new systems. Consequently, this represents the second pillar when current business models are improved or new ones are developed and implemented.

C. Transforming

According to the dynamic capabilities framework, exploiting the capabilities in an uncertain environment is often insufficient for the management to adapt to changes gradually. Management may need to stay vigilant and wait for the changes to reshape themselves and possibly their ecosystems to gain full advantage of new business models. Continuous structural renewal represents the third pillar of dynamic capabilities. However, management must be conscious that a major investment has been made, and if the transformation in this third pillar is not successful, the status quo is at the point of no return, and the strategy will have failed. Thus, investing in an A.I. infrastructure is expensive, and if achieving a competitive advantage is not feasible, the return on investment cannot be exploited.

Application of dynamic capabilities

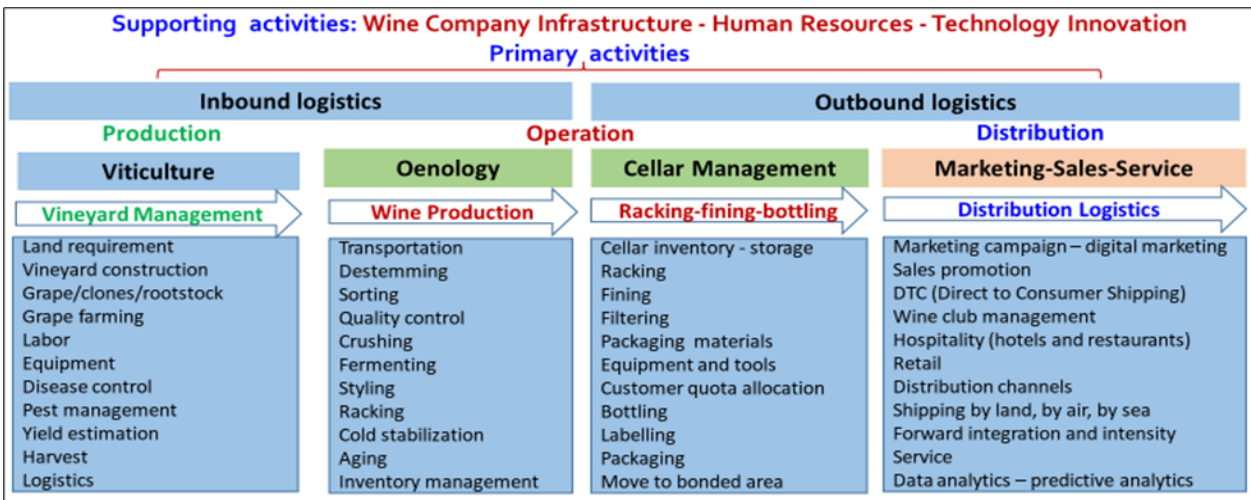

Artificial Intelligence (A.I.) is known to influence any ecosystem globally. A.I. plays an essential role in the wine business, from planting a vineyard to how wine is made and aged to how consumers select and buy wine, whether for personal consumption or investment. In the wine industry, A.I. applications are used along the supply chain, from resource acquisition to production, operation, packaging, marketing, distribution, and post-sales activities with the end consumer. Figures 1. and 2. Depict the U.S. wine supply and value chains based on the three-tier distribution system. The activities described in the three pillars of the dynamic capability framework, through the application of A.I. technologies, will moderate and/ or mediate the activities within the ecosystem, as described in Figure 3.

Purpose of the paper. *This study investigates the role of dynamic capabilities on companies' intention to adopt AI-based technologies in the wine sector, with the aim of determining A.I. adoption intensity and management in the global wine ecosystem and the creation of competitive advantage. Specifically, we intend to determine the moderating or mediating role of the influential factors in the decision-making process on adopting A.I. technologies to gain and sustain competitive advantage. To the best of our knowledge, no previous study has addressed the effect of dynamic capabilities on A.I. adoption, particularly in the wine sector, and the effect of hindering factors such as financial investment and organizational and operational capability, and capacity constraints. Accordingly, we propose the following research model to be tested.*

Fig. 4: shows a graphical representation of the theoretical model to be tested

Methodology. *This research adopts an exploratory approach, given the lack of literature on artificial intelligence and the role of dynamic capabilities applied to the wine business ecosystem. We plan on applying qualitative and quantitative methodologies based on dynamic capabilities theory through adopting and managing artificial intelligence technologies to investigate how wine business managers create a sustainable competitive advantage for the ecosystem. This study will use focus groups and face-to-face interviews with wine industry players to collect data to develop a questionnaire to survey a purposive sample of participants. The questionnaire will be self-administered online. Depending on the variables' development from data collected through the focus group and structured interviews with industry experts, the final instrument may contain multidimensional variables which will allow measuring the effect and the probability of adopting A.I. technologies through possible regression analysis and partial least square and structural equation modeling.*

Results. *The preliminary results of non-intrusive observations of wine companies that have adopted new technologies indicate that staying competitive is no longer a matter of whether to adopt new technologies, but rather the level of technological adaptation intensity. This is a work in progress and the final results will be available following the focus group interviews, face-to-face interviews with industry leaders, and an online survey with a purposive sample of participants who operate a wine business in the United States, which functions as a benchmark player for the purpose of this study.*

Research limitations. *Despite this study being a work in progress and, therefore, not having produced any results thus far, we can certainly detect a first limitation of the research due to the fact that the focus groups and face-to-face interviews will be primarily directed only to successful cases of A.I technology adoption. Future avenues of research can, therefore, focus on investigating the limitations of A.I technologies adoption under the lens of poor dynamic capabilities presence.*

Managerial implications. *This research can produce effective replicable results for Europe-based wine producers, by suggesting to managers in the wine industry a dynamic capability framework that can boost their ability to adopt A.I technology and manage it for the benefit of the entire wine ecosystem.*

Originality of the paper. *To the best of our knowledge, no previous study has addressed the effect of dynamic capabilities on A.I. adoption, particularly in the wine sector. To investigate the phenomenon, we propose a model that represents the wine business ecosystem and a research model to test the effect of A.I. on current wine business operations or make predictions for future investments. The ultimate goal of the study is to measure and determine the effect of the "hindering" or moderating - mediating factors within the A.I. - dynamic capabilities frameworks, such as financial investment, organizational and operational capability, and capacity constraints, among other factors unknown at this point. Accordingly, we wish to present this developmental paper to seek feedback from peers to help us strengthen our research.*

Artificial intelligence and digital entrepreneurship: literature review and further research

PIERO VALENTINI* MARIACARMELA PASSARELLI* GIUSEPPE BONGIORNO[▲] ALFIO CARIOLA**

Framing of the research. *In recent years the word “Artificial Intelligence (AI)” is increasingly common and used in different contexts because it could be referred to different types of applications.*

Several studies have focused on the theme of artificial intelligence; however, it is still difficult to give a comprehensive definition (Long and Magerko, 2020). Some authors say that AI is a process able to mimic human behaviour and decision-making abilities, so it is a manner to train software and devices to accomplish reasoned tasks (Legg and Hutter, 2007; Vaishya et al.; 2020). AI was also defined as “intelligence demonstrated by machines – or, in terms of an academic field, the examination of how digital computers and algorithms perform tasks and solve complex problems that would normally require or exceed the human intelligence, reasoning, and prediction power needed to adapt to changing circumstances” (Giuggioli and Pellegrini, 2022). Artificial intelligence (AI) provides start-ups chances to compete with industry giants in cross-border; in addition, AI not only creates several digital start-ups, but also changes the way in which entrepreneurial research and practice interact (Li et al., 2022). There are many articles that show how AI is used in different contexts and many organizational areas, with different application (Panch et al., 2019 ; Cox, 2021), promising potential challenges and opportunities, among these, artificial intelligence is considered a central theme in the field of Industry 4.0 (Lasi et al., 2014; Arrieta et al., 2020) and is also integral for Internet of things (IoT) (Ahmad et al., 2021) and for blockchain (Treiblmaier, 2018). AI also functions as an enabling factor and as government, society and global peace transformer, as a matter-of-fact bibliometric analysis can be used as a key mean to the achievement and the maintenance of a digital transformation and evolution, that respect people and nature (Carayannis and Draper 2022). Regarding the relation between AI and entrepreneurship, it seems that artificial intelligence plays a crucial role regarding how entrepreneurs decide to organize, develop, and design their firms (Chalmers et al., 2021). As stated above, the digital technologies represented by AI technologies have contributed to the growth of the national economy through big data, the Internet of Things (IoT), edge computing accelerating, also due to the Internet rise, the process of industry 4.0, which brought fresh blood to entrepreneurship (Javaid et al., 2021; Khan and Javaid, 2021; Viriyasitavat et al., 2019). Nonetheless, more attention is needed in entrepreneurship research (Zhang and Van Burg, 2020). Even though some large incumbents may find difficult the full embracing of these new technologies that emerge (Obschonka and Audretsch, 2020), here, technological change acts as an external enabler of entrepreneurial activity, introducing new economic activities to present new products or services through entrepreneurship, for instance AI Brain, Banjo and DeepMind. AI can improve entrepreneurs in their decision-making strategies, in terms of efficiency and effectiveness (Kraus et al., 2020). In the recent years there was wider and deeper application of AI in different types of industries such as shopping platforms (e.g. Amazon), social network (e.g. Tiktok) and also personal assistant (e.g. SIRI) (Xiong et al., 2020). Many scholars consider different types of AI as something that can modify the markets, companies, and entrepreneurial activities (von Briel et al., 2018). Some articles have also demonstrated positive effects of AI on sustainable entrepreneurship thanks to its ability to influence, among others, the global productivity (Gupta et al., 2023). Finally, authors highlight how AI could improve knowledge, human learning using some technologies as: perception, practise, imitation etc. (Yang et al., 2021). In this wider research context, we also tried to pay particular attention to the major areas of application of AI in specific types of companies; more specifically we want to understand the differences between companies belonging different sectors of the economic system. In particular, we chose the agricultural firms for the primary sector, fashion industry for the secondary sector and financial firms (intended as service society) as tertiary sectors; in this way we could understand the effect that AI could have on companies very different from each other.

Purpose of the paper. *This paper aims to understand the relationship between artificial intelligence and entrepreneurship. In particular, we want to answer two research questions: Which is the state of the art in the field of*

artificial intelligence and entrepreneurship? Which are the different kinds of applications of AI between companies belonging to the primary, secondary and tertiary sectors? Which directions should researchers pursue to advance AI research? Our purpose is twofold: give a theoretical background on the literature related to the connection between AI and Entrepreneurship, analysing, among others, countries, authors, documents and keywords; subsequently we offer a comprehensive description of the various application of AI in the aforementioned types of companies and, eventually the positive impacts on them.

Methodology. To answer all research questions, we conducted a systematic literature review (SLR) (Kraus et al., 2020). According to Kraus et al., (2022), a SLR is a rigorous and relevant approach that produces knowledge, helps identify trends and research pathways, and potential future research. These reviews follow a systematic manner using an adopted protocol to guide data analysis, thus enabling transparent and replicable dissemination (Lim et al., 2022a; Kraus et al. 2020). Going in depth, according to Tranfield et al. (2003), this structured method relies on filtering such that the process is replicable allowing bias in the results to be minimized. In this paragraph, we analyse the main steps involved in methodology with the aim of developing a systematic, transparent, and replicable 3D literature review methodology. Specifically, the first D requires the definition of the research questions, which Massaro et al. (2016) defined as the preliminary step to conduct a SLR. For the purpose of this study, some research questions were identified: what is the state of the art in the field of Artificial intelligence and entrepreneurship? Which are the main trends in literature? Which are the main themes on which to focus future research? To answer these questions, we move on to the second D, that is Design, a review protocol that helps us to determine the articles to be included and perform a comprehensive search of the material. In this phase, the guidelines followed were the ones related to Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) (Moher et al., 2009), in order to minimize errors in interpreting the results of the collected studies. Finally, going through the last D, a coding framework was developed. This approach was chosen to improve the value of the literature review results and minimize errors in interpretation (Fahimnia et al., 2015). The methodology chosen for the analysis is the bibliometric methodology (Kraus et al., 2022; Cobo et al., 2011). In particular, we used the tool called “Biblioshiny”, included in the Bibliometrix package of R-studio, that we used for our bibliometrics analysis “a quantitative approach for analyzing academic literature using bibliographies to provide the description, evaluation and monitoring of published research” (Garfield et al., 1964; White and McCain, 1989; Aria and Cuccurullo, 2017). To do that, we did our research on the Web of Science platform “a database of bibliographic citations of multidisciplinary areas, relating to journals of medical, scientific and social sciences, as well as humanities (Translational Bioinformatics in Healthcare and Medicine, 2021). Previously, we searched articles using just the word “Artificial intelligence” AND “Entrepr*” and this gave us 1918 documents; after that, in order to narrow our search, we used some filters that allowed us to select just English documents restricted in the fields of management and business and economics, in the period between 2015 and 2023. We choose this period because, according to De la Vega Hernández et al., 2023 “AI space is dynamically and disruptively evolving from both a technological and social point of view and, according to a business perspective, analyses and meta-analyses (including bibliometric methodologies) need to be periodically repeated, including means such as bibliometrics, surveys, semi-structural interviews etc.” The material search phase was conducted in February 2023. Despite these filters (of the total of 322 documents), we obtained 150 works related to themes such as medicine, psychology, history and environment. Different information coming from these articles have been analysed, in particular we focused on: sources, authors, documents, themes and countries in order to obtain a clear overview of this topic (Kraus et al., 2022).

Subsequently, we pay our attention in the research, again on the platform Web of Science, of articles related to the use of AI in the selected types of companies (agricultural firms, fashion companies and financial companies), doing three different research, one for each type of company. Many articles were not considered because they were too general and they were published many years ago, when artificial intelligence was considered something new. On the contrary our research aims to be current and specific; this approach gave us the possibility to obtain information about how this firm works today, to understand how they have implemented AI in their activities and if this introduction has brought some improvements.

Results. Firstly, we pay our attention to preliminary information, such as: documents, keywords, authors etc. These main findings show the number of authors, which in the specific case are 515, and the type of documents examined, where the articles predominate. In addition, it is possible to have an idea of the evolution of scientific production, in terms of the number of articles published over the years. It can be seen that the growth in the number of publications begins around 2015, reaching a peak in 2022, the year in which 49 articles were published, with an average annual growth rate of about 19%. We also understood which are the countries with a high productivity rate; among these we found China, USA, India, United Kingdom, France, Germany and Italy. In the results related to the analysis of documents, we tried to understand which are the most frequent words used by the authors.

In order to avoid expected results, we created two TXT files (to be used as a filter), containing keywords as “artificial intelligence, digital entrepreneurship and innovation; results show that the most used words are, among others, technologies, impact and model and it seems that authors are interested in understanding how technologies could impact the firms. Results related to conceptual structure, in particular to the thematic maps, are useful to understand how the research themes have evolved over the years, analysing their position within the Thematic Map.

Consequently, the thematic table was generated, consisting of 4 different quadrants, where each of these refers to a particular theme that needs to be defined. In constructing the table, two parameters were considered: Centrality (X-axis) and Density (Y-axis) (Callon et al., 1991). Main two characteristics of Motor Themes are high centrality and high

density; indeed, these are identified as the themes that have gradually become more prominent and are the "leading" research themes. Basic Themes are characterized by high centrality and low density. Also, due to the underdeveloped and marginal topics they deal with, Emerging Themes have low density and low centrality. Finally, Niche Themes have high density (highly developed) and low centrality, due to the fact that they are very isolated themes. In order to give a better explanation, we must say that the entire time frame of analysis was divided into two, using 2020 as the "cutting year," thus obtaining two different Thematic Maps. These outputs given, we can notice how in the first period, until 2020, the "Motor" themes mainly concern the sphere of applications and technologies based on AI (machine learning, international business and management, international entrepreneurship, blockchain and digitalization). Whilst future use is niche (robots, IoT and big data), the theme that refers to artificial neural networks and digital economy is counted among the emerging themes. From 2020 onward, the motor themes tend to focus more on various factors concerning digitalization, such as digital entrepreneurship, servitization and transformation with their effects on value creation. It will be interesting to observe how during this period applications and technologies based on AI (machine learning, IoT and innovation management) become a basic theme, as in the post covid period issues related to applications and technologies based on AI become established.

In order to create different clusters, a Co-citation network (Small, 1973) where developed. The analysis returned three clusters, referring to different research topics:

- the first includes all contributions in the literature that analyse the impact of AI on firm's activities (Reier et al., 2021; Mikalef and Gupta, 2021);
- the second cluster includes works that address issues related to the sphere of innovation and management (Liu et al., 2020; Wang et al., 2022);
- the third cluster includes the relation between AI and "business performance" (Wamba et al., 2020; Lee, 2020).

Finally, we analysed collaborations between and among countries, using 50 nodes and a minimum of two edges, we found three different clusters: the biggest one is composed by 16 countries, among them, the greater contribution to the analyses was given by UK, USA, India and China; the second cluster is represented by 4 countries, where two are European (France and Spain) and the last one is composed by 5 countries (Sweden, Finland, Norway, Switzerland and Colombia). Nevertheless, there are also collaborations between countries belonging to different clusters. Results coming from the analysis carried out to answer the second research question demonstrate, as we expected, that there are many differences in the use of the AI and in the problems that this technology aims to solve. Articles related to the use of AI in the agricultural sector show how different types of AI methodologies such as: machine learning, smart sensors, computer visions etc. are used to solve many problems in agriculture as, for examples, crop diseases, pesticide control, lack of irrigation and water management (Elbasi et al., 2022; Choudhury et al., 2022). It seems that the use of AI in the agricultural sector could produce benefits for farmers and companies. The use of different technologies could improve the control of farms and help farmers in the resolution of possible contingencies; industries can take advantage in terms of data collections and process automation that will also reduce waste and maximize efficiency (Elbasi et al., 2022) and this is also positive in terms of increase in production to meet the growing demands for global food (Hunter et al., 2017). Fashion companies, but in general companies belonging to the secondary sector, try to keep up with times, adapting their strategies to customers' requests and technological innovations. Artificial intelligence has been used a lot in the fashion companies but the most important applications regard the trends forecasting and decision making in supply chain management (Boos, 2021); social media, influencer marketing and user-generated content have become fundamental in this reality of consumption and it's undeniable that these have an impact on driving trends and push consumers to see and buy more (Vitorino et al., 2022). Another important application of AI in this type of companies regards chatbots, able to guide the consumers through the online shopping experience, helping him suggesting items that he might like; this is possible thanks to data obtained during the period of time that the customer spent on the website and his past shopping experiences (Saponaro et al., 2018). Finally, we analysed articles related to the use of AI in the tertiary sector, with particular attention to the companies that offer financial services. "The finance sector is arguably the most benefited industry segment among the different applications areas of AI. The financial sector extensively uses AI in machine learning, chatbots, digital personal assistants and cognitive computing" (Prمود and Raman; 2022). This sector has shown great development opportunities thanks to the rise in the number of firms like Microsoft, IBM Watson etc (Sharbek, 2022). This type of companies is able to analyse financial big data and lead firms to take the best decision, for example in terms of investments (Wang et al., 2020); moreover, is possible to use AI for fraud prevention (Mahalakshmi et al., 2021).

Research limitations. As the theme of AI is constantly evolving, there will be further contributions in the future; for this reason, it will be necessary to repeat this type of bibliometric analysis in a few years to observe the evolution of the theme. In addition, we investigated just three types of companies and it's reasonable to expect that considering other types of firms (belonging to the same sectors), the AI application and the relative benefits will change.

Managerial implications. From the bibliometric analyses we can note how the artificial intelligence theme is constantly evolving, authors productivity has grown in recent years, reaching a peak in 2022, and how this theme is discussed worldwide. Moreover, observing the thematic maps, we can note that clusters related to innovation and digitalization are growing including more thematic areas; themes like big data and internet of things, that previously were minor, became basic and finally, digital entrepreneurship that we can assume it could be the central theme of future researches. Thanks to a deeply analysis of documents, we can now say that the effect of AI changes according to the type of company. Benefits of AI on the agricultural sector are closely related to solving farmers' contingencies and to helping firms to maximize production and minimize waste. In the case of fashion companies, benefits are mainly

referred to the effects on consumer behaviour; it seems that the use of AI could help firms to understand what consumers are looking for and what he may desire in the future. Finally, many financial companies have already adopted different AI technologies; however, their principal use is related to fraud prevention and decision making.

Originality of the paper. This research offers a description of the state of art on the “AI and entrepreneurship” theme analysing how this relation has evolved during the years. More specifically, we proposed a systematic literature review concerning the use of AI in companies belonging to different sectors to understand if the effects on the firm’s performance is related to the type of company.

Keywords: artificial intelligence; entrepreneurship; bibliometric, emergent themes, applications

Beyond the Virtual Realm: an introductory investigation on Inward and Outward Emotional Responses to Sustainable Fashion Products in the Metaverse

MARCO FRANCESCO MAZZÙ* IRENE DELLA SALA* ANGELO BACCELLONI[♠]

Abstract

Relevant trends, affecting the development of the Metaverse together with other technological innovations, are currently shaping the way through which individuals' emotions are elicited, when exposed, in a context of para-social interaction, to brands and products. In this context, limited attention has been devoted to exploring the effects of this new touchpoint on consumers' specific inward and outward emotions. Therefore, the aim of the present work is to analyse the differential effect on forming individual emotions in the Metaverse - a 3D virtual reality - comparing the outcomes with the conventional 2D environment (Webex platform) in the context of sustainable high-end fashion products. Findings suggest the presence of significant relationships between the environment in which the discussion is conducted, and the way through which some specific emotions are evoked during individuals' exposition to sustainability's stimuli, in turn affecting the perceived financial value of the goods.

Introduction

Over the recent years, businesses have focused their efforts on being part of the Metaverse, a fast-evolving 3D virtual environment (Dincelli et al., 2022; Joy et al., 2022). The Metaverse is defined as a fully developed digital world existing in parallel to the one in which we live (Kim, J., 2021), with the potential to shape the way through which people work (Pantano and Viassone, 2015), do business (Papagiannidis et al., 2017), socialize (Laukkanen et al., 2022) and entertain (Dwivedi et al., 2022). Indeed, the use of the 3D technology allows people to visually simulate complex physical environments and communicate using avatars - digital versions of themselves (Bainbridge, 2007; Jin et al., 2009). Both professionals (such as IBM) and academics have acknowledged the ability of such a rich medium also for virtual collaboration (Wilson, 2009; Van der Land et al., 2011). In this perspective, para-social interactions can take place between users and digital characters or avatars in virtual environments (Chung et al., 2007), thus letting customers experiencing a feeling of intimacy with a media personality or avatar, without any actual reciprocal communication or personal contact (Zhang et al., 2022). Para-social interaction within the 3D virtual world offers a higher level of interactivity thus enabling an increasing engagement and enjoyment of individuals (Niedenthal et al., 2005). As a result, these technologies can be applied by companies to engage groups of consumers during all stages of the customer journey (Flavián et al., 2019a) and thus offering a valuable and holistic experience (Petit et al., 2019).

While the Metaverse marketing literature is in its infancy, it is growing rapidly in several domains, including high-end goods (Joy et al., 2022). Such industries are embracing disruptive technologies (Xue et al., 2020) and new channels of communication (Arribas et al., 2022; Blázquez et al., 2014) to better understand emerging needs (Trabelsi-Zoghalmi and Touzani, 2019) and meet consumers' growing demands for more immersive experiences (Buhalis et al., 2022). While implementing these strategies - and given the relevance of the Metaverse in today's technological environment (Martínez-Navarro et al., 2019) -, it is imperative for these companies to design integrated online platforms (Blázquez et al., 2014) in order to elicit a emotional responses (Hartmann et al., 2006), Dwivedi et al., 2022; Martínez-Navarro et al., 2019) that could lead to purchase (Fuxman et al., 2022). Compared to two-dimensional (2D) online platforms, in fact, the 3D virtual space provides a more immersive and interactive experience that enhances customers' emotions, attitudes, and behaviors toward the products (Wu et al., 2021). Moreover, through a high level of media richness and visual vividness, the 3D virtual space promotes engagement and enjoyment (Wu et al. 2021).

As limited attention has been dedicated to the impact of the Metaverse in eliciting consumers' emotions, this introductory research investigates the differential impact on forming individual emotions in the 3D dimension (Horizon Workrooms app with access to Metaverse) vs. the 2D dimension (Webex platform), during para-social interaction, applying it to group of individuals when exposed to products and brands. For this investigation, we then selected the

case of the high-end fashion industry, where consumers form their emotions also in expecting well-known brands to play, through their products, an increasing role towards sustainability (Kim and Hall, 2015; Gimenez et al., 2012; Akrouf and Guercini, 2022).

The remainder of the paper is organized as follows. After an overview of the extant literature, we present our methodological approach, results, and main findings. We close the work highlighting the theoretical and managerial implications, the limitations of the study and further research trajectories.

Theoretical Background and Research Hypothesis

Emotions have been defined as “states of feelings that arise as reactions to experiences” (Mehrabian and Russell, 1974). As the technology evolves, the arrival of new devices (Tussyadiah et al., 2018) has altered the way through which individuals perceive (Flavián et al., 2019), interpret (Laukkanen et al., 2022), and interact with their immediate environment (Tussyadiah et al., 2018), and between each other (Fox et al., 2009). As the virtual experience has both cognitive and emotional aspects (Lin et al., 2012; Trabelsi-Zoghalmi et al., 2019), it has been postulated that the multi-sensory stimuli provided by the Metaverse hold special potential by improving immersiveness and promoting not just the transfer of information (Lee et al., 2021), but also feelings and emotional reactions (Kim et al., 2020; Laukkanen et al., 2022). Furthermore, in comparison to the traditional 2D environment, 3D virtual reality can influence customers' perception by offering them a more accurate representation of products and services, enabling customers to experience them in a more meaningful way, and thereby enhancing the emotional aspects of customers' perception (van Herpen et al., 2016). As stated by Yim et al., (2017), “interactive technologies that present more vivid product visualizations are linked to a more positive affective emotional experience”, enabling customers to enjoy the thrill of discovering realistic products. This, in turn, produces varying degrees of positive emotional evaluations (i.e. enjoyment) that are felt as happiness, contentment and joy (Yim et al., 2017; Jin et al., 2009).

As far as the high-end sustainable fashion industry is concerned, companies have the opportunity to exploit the capabilities of this new and richer communication medium, which can arouse positive emotions towards the products (Flavián et al., 2019). Experiencing positive emotions is then of paramount importance for generating satisfactory experiences and attitudes towards brands (Khan et al., 2017). Specifically, through the use of the Metaverse, users can experience a sense of psychological involvement (Mollen and Wilson, 2010), and thus feeling intense emotions (Mayer et al., 2020) that lead to a high degree of engagement (Bilro et al. 2019).

We then hypothesize that using the Metaverse will produce more positive emotions compared to the conventional 2D environment.

Moreover, emotions can be classified into two main categories (Laros and Steenkamp, 2005), where inward emotions are complemented by outward emotions to form individuals' emotional reactions towards specific situations or products (Algoe & Haidt, 2009). On the one side, inward emotions refer to feelings that individuals perceived when exposed to situation, such as the display of a sustainable high-end fashion item, and can be outlined in: a) Pride b) Contentment c) Happiness d) Admiration e) Love (Table 1).

Tab. 1: Inward emotions related to sustainability's stimuli - Tested scales.

Construct	Description	Reference
Pride	Feeling that occurs when a consumer feels superior compared to another person because of the product	Laros, F. J., & Steenkamp, J. B. E. (2005)
Contentment	It is a feeling of quiet satisfaction generated by the product	Laros, F. J., & Steenkamp, J. B. E. (2005)
Happiness	It is an emotional state characterized by feelings of joy and fulfillment generated by the product	Laros, F. J., & Steenkamp, J. B. E. (2005)
Admiration	Feeling of surprise associated with some pleasure and a sense of approval towards the product	Algoe, S. B., & Haidt, J. (2009)
Love	Feeling of passion and love generated by the product	Algoe, S. B., & Haidt, J. (2009)

On the other side, outward emotions relate to the emotional connection with particular products or with the relative company. As stated by Algoe & Haidt (2009), the elicited outward emotions associated to the exposure of a sustainable high-end fashion product/service are: a) Gratitude b) Inspiration c) Elevation d) Awe (Table 2).

Tab. 2: Outward emotions related to sustainability's stimuli - Tested scales.

Construct	Description	Reference
Gratitude	It involves being thankful and appreciative towards the company behind the product	Algoe, S. B., & Haidt, J. (2009)
Inspiration	Being mentally stimulated by the company behind the product to do or feel something	Algoe, S. B., & Haidt, J. (2009)
Elevation	It is a response to acts of moral beauty of the company behind the product in which individuals feel as though they have become less selfish, and they want to act accordingly	Algoe, S. B., & Haidt, J. (2009)
Awe	Feeling of appreciation, respect and esteem generated by the product	Algoe, S. B., & Haidt, J. (2009)

Therefore, we expect that:

H1: *Inward emotions are enhanced during exposure in the Metaverse (vs. 2D platforms) to sustainable high-end fashion products*

H2: *Outward emotions are enhanced during exposure in the Metaverse (vs. 2D platforms) to sustainable high-end fashion products*

Moreover, financial value plays a key role in high-end fashion (Henninger et al., 2016), and it is considered one of the main drivers of consumption choice when compared to the other values (Sheth et al., 1991); a study carried out by Khan et al., (2017) demonstrated that personal emotions have a great impact on financial value, when exposed to a sustainable products/services. This research attempts then to highlight how, in the high-end fashion, the use of different media impacts customers' emotions (Chae and Ko, 2016; Wu et al., 2021; Pezzuti et al., 2021), when dealing with sustainability's stimuli (DiRusso and Myrick, 2021), that in turn affect perceived financial value (Khan et al., 2017).

Therefore, as the use of 3D virtual reality platforms is supposed to stimulate consumers' emotions (Yim et al., 2017; Jin et al., 2009), we expect specific inward and outward emotions to mediate the impact of 3D technologies (vs. 2D platforms) on the financial value of sustainable items, and specifically:

H3: *Emotions mediate the interaction effect of the type of media (2D vs. 3D platforms) on the financial value of sustainable high-end fashion products*

Methods

Data collection and Sample

Data was collected at the end of each experiment from 133 Master students ($M_{age} = 23$, $SD_{age} = 1.8$) at Luiss University in Rome, rewarded for participating in the project with extra points in their final course grade. The sample was divided into 2 main groups (Group A and B), and students were randomly assigned to teams with a size range of four to six individuals. A total of 15 teams for Group A and 16 teams for Group B resulted from such aggregation process.

Procedure

All participants were exposed in advance to a training stage necessary to become familiar with the use of Metaverse platforms and the Oculus, the VR headset tool provided by Meta to handle the Metaverse world. Individuals were already familiar with the use of Webex platform, as part of other online learning activities. Pre-tests were run to evaluate participants' attitude and usage motivation for technology.

The experiment was conducted in two different rounds, following the wait-list control group model (Elliot, 2002), where participants used sequentially the two different technologies (3D Metaverse and 2D Webex App. Specifically, part of the team of Group A performed a prioritization task to reach group-consensus on the ranking of specific factors ("experimental group") of a sustainable high-end fashion item, while part of the team Group B was exposed to the same task on the Webex platform ("control group"). The opposite for another subset of each group. As a result, each group meeting ended when the group's leader exposed the answers agreed upon during the 30-minute meeting. Respondents knew that every groupwork has been evaluated by the teaching team. The structure of the experiment had the aim to avoid bias in the students' responses, given the novelty of the Metaverse platform, and to allow participants to work with the same technologies.

In each round, drawing on Elliott et al. (2002), the first intervention group was exhibited to the stimulus prior to the second one functioning as a control group. This method allows us to include students from both Groups in the project while keeping technological constraints in mind. To ensure that the variance of the process was minimized and to guarantee equality of information between the students, a structured protocol for both the training and intervention phases was prepared.

Stimuli and measurement scales

To establish the adherence to a real managerial situation, the business case and the associated stimuli were developed with the support of the management of a leading, well-known international high-end fashion company.

Stimuli were visual display of the product, related details and sustainable initiatives of the company. Inward and outward emotions were based on Laros and Steenkamp (2005) and Algoe and Haidt (2009) work on consumers behaviors and emotional responses, and the consumption driver (i.e. financial value) on Hennigs et al., (2012) study on consumption values in luxury.

Statistical Analysis

We performed a quantitative data analysis, through which a t-test was carried out using IBM SPSS Statistics 28 by retrieving data from the Qualtrics questionnaires. In particular, in Study 1, we aim at observing (**H1** and **H2**) which of the investigated emotion is affected by the use of 2D vs. 3D media, evaluating the main direct effect between the use of 2D/3D technology and each inward and outward emotions. Taking into account the results of Study 1, in Study 2 we analyze the mediating effects of emotions retained from the previous hypotheses, in the relationship between technological platform's type (2D/3D) and the financial value of the sustainable product (**H3**). To this end, we utilized the PROCESS macro for SPSS (Model 4).

Results

Study 1

All tested constructs were reliable (Table 3), as the Cronbach’s alpha of each variable was higher than the cutoff value of 0.7 proposed by Kaynak (2003). Moreover, results from the t-test underline few significant relationships between medium and emotions. As regard to Inward emotions, the 2D platform received higher scores than the 3D environment both for happiness ($M_{2D}=5.36$; $M_{3D}= 4.7$; $t(135)= 2.96$, $p<.01$), and contentment, which measures the feeling of a quite satisfaction generated by the product ($M_{2D}=5.19$ vs. $M_{3D}=4.78$, $t(135)=1.96$, $p<.05$). With regards to outward emotions, significant difference is exhibited for the variable inspiration ($M_{2D}=5.41$ vs. $M_{3D}= 4.90$, $t(135)=2.00$, $p<.05$) and elevation ($M_{2D}=4.63$ vs. $M_{3D}= 4.18$, $t(135)=1.90$, $p=.05$).

Tab. 3: Inward and Outward emotions elicited by 2D/3D environment: means and standard deviations.

	2D condition (n= 64)	3D condition (n=73)	t-Test statistics	p value	α
Inward Emotions					
Pride	4.76 (1.3)	4.63 (1.5)	$t(135)=.52$	$p=.60$.916
Contentment ⁽¹⁾	5.19 (1.1)	4.78 (1.3)	$t(135)=1.96$	$p=.04$	
Happiness	5.36 (1.1)	4.7 (1.4)	$t(135)=2.96$	$p<.01$.916
Admiration	5.01 (1.2)	4.8 (1.4)	$t(135)=1.33$	$p=.19$.940
Love	4.68 (1.3)	4.33 (1.4)	$t(135)=1.50$	$p=.14$.928
Outward Emotions					
Gratitude	5.02 (1.3)	4.60 (1.5)	$t(135)=1.64$	$p=.10$.945
Inspiration ⁽²⁾	5.41 (1.3)	4.90 (1.6)	$t(135)=2.00$	$p=.04$	
Elevation	4.63 (1.4)	4.18 (1.4)	$t(135)=1.90$	$p=.05$.982
Awe	4.82 (1.5)	4.48 (1.5)	$t(135)=1.33$	$p=.18$.953

- (1) Measured as a single-item scale: “I feel contented”
- (2) Scale composed of a single item: “I feel inspired”

Study 2a

For Study 2, we took into consideration only the variables which displayed a significant difference in Study 1. To test the hypothesized model (H3), we first assessed the conditions of mediation of the variable happiness (Figure 1). We coded the 2D as 0, and the 3D as 1. The results of the regression analyses showed that the type of media (X) significantly predicted happiness (M) ($\beta = -.61$, $SE = 0.23$, $p < 0.01$), and M significantly predicted financial value (Y) ($\beta = 0.18$, $SE = 0.06$, $p < 0.01$). The total effect of X on Y was not significant ($\beta = -.27$, $SE = 0.18$, $p = .13$), indicating that type of media has not a direct effect on happiness. On the other hand, the indirect effect through the emotion was significant ($\beta = -.11$, $SE = 0.06$, $LLCI=-.23$, $ULCI=-.01$), indicating that happiness mediates the relationship between the media and the financial value. These results suggest that the type of media has an indirect effect on product’s financial value through the feeling of happiness, however in the opposite direction vs. what expected. Specifically, our results showed a full mediation.

Figure 1. Estimated path coefficients of the hypothesized model - 2D/3D, Happiness, Financial Value

* $p<.05$; ** $p<.01$; *** $p<.001$

Study 2b

To test the hypothesized model (H3), we first assessed the conditions of mediation of the variable contentment (Figure 2). We coded the 2D as 0, and the 3D as 1. The results of the regression analyses showed that the type of media (X) significantly predicted contentment (M) ($\beta = -.42$, $SE = 0.22$, $p = 0.05$), and contentment significantly predicted financial value (Y) ($\beta = 0.19$, $SE = 0.07$, $p < 0.01$). The total effect of media on financial value was quasi-significant ($\beta = -.31$, $SE = 0.18$, $p = .08$), indicating that X has a direct effect on Y. The indirect effect of media on financial value through contentment was significant ($\beta = -.08$, $SE = 0.05$, $LLCI = -.21$, $ULCI = -.000$), indicating that this variable mediates the relationship between media and financial value. These results suggest that the type of media has an indirect effect on product's financial value through the feeling of contentment, again in the opposite direction vs. what expected. More in detail, our results demonstrated the mediated role of contentment between our independent and dependent variables.

Fig. 2: Estimated path coefficients of the hypothesized model - 2D/3D, Contentment, Financial Value

* $p < .05$; ** $p < .01$; *** $p < .001$

Study 2c

To test the hypothesized model (H3), we first assessed the conditions of mediation of the variable inspiration (See Figure 3). We coded the 2D as 0, and the 3D as 1. The results of the regression analyses showed that the type of media (X) doesn't significantly predict inspiration (M) ($\beta = -.31$, $SE = 0.27$, $p = 0.25$), and M doesn't significantly predict financial value (Y) ($\beta = 0.08$, $SE = 0.06$, $p = 0.14$). The total effect of X on Y was significant ($\beta = -.36$, $SE = 0.18$, $p < .05$), indicating that X has a direct effect on Y. On the other hand, the indirect effect of X on Y through M was non-significant ($\beta = -.02$, $SE = 0.04$, $LLCI = -.13$, $ULCI = .03$), indicating that M does not mediate the relationship between X and Y. These results suggest that the type of media has only a direct effect on product's financial value, excluding the interaction with inspiration. More in detail, our results didn't demonstrate the mediated role of inspiration between our independent and dependent variables.

Fig. 3: Estimated path coefficients of the hypothesized model - 2D/3D, Inspiration, Financial Value

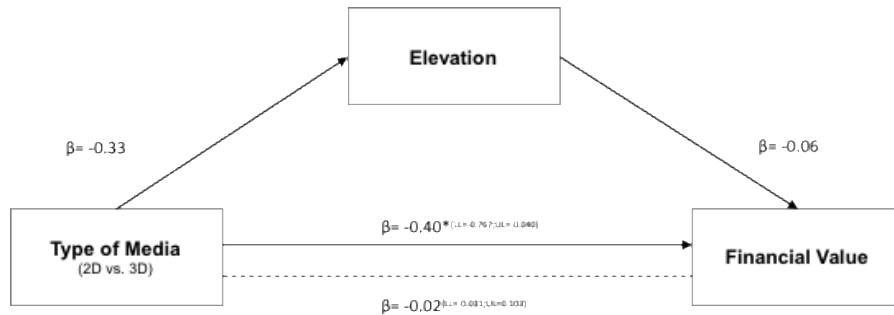

* $p < .05$; ** $p < .01$; *** $p < .001$

Study 2d

To test the hypothesized model (H3), we first assessed the conditions of mediation of the variable elevation (Figure 4). We coded the 2D as 0, and the 3D as 1. The results of the regression analyses showed that the type of media (X) doesn't significantly predict elevation (M) ($\beta = -.33$, $SE = 0.25$, $p = 0.18$), and M doesn't significantly predict financial value (Y) ($\beta = -0.06$, $SE = 0.06$, $p = 0.30$). The total effect of X on Y was significant ($\beta = -.40$, $SE = 0.18$, $p < .05$), indicating that X has a direct effect on Y. On the other hand, the indirect effect of X on Y through M was non-significant ($\beta = 0.02$, $SE = 0.03$, $LLCI = -.03$, $ULCI = .10$), indicating that M does not mediate the relationship between X and Y. These results suggest that the type of media has only a direct effect on product's financial value, excluding the interaction with elevation. More in detail, our results didn't demonstrate the mediated role of elevation between our independent and dependent variables.

Fig. 4: Estimated path coefficients of the hypothesized model - 2D/3D, Elevation, Financial Value

* $p < .05$; ** $p < .01$; *** $p < .001$

Conclusions

General Discussion and Managerial Implications

In the current context of fast evolving emerging technological, multiple devices are enabling VR experiences, through which consumers communicate and interact. Accordingly, the use of this new interactive setting might impact customers' emotions, attitudes and behaviors towards the product (Wu and Whang et al., 2021; Fisher et al., 2008). With regards to the adoption of true sustainability practices, affecting individual feelings and emotions (Kyu Kim et al., 2021; Fuxman et al., 2022), the paper highlights the presence of a differential effect when customers, engaged in group discussion, interact in a Metaverse/ 3D virtual reality environment vs. when they do the same in a 2D environments.

In this scenario, our findings reveal that only a limited set of inward (Laros and Steenkamp, 2005) and outward emotions (Algoe et al., 2009) are affected by the type of media setting in which the discussion takes place. More specifically, this introductory research showed a direct effect between the use of different media and specific inward emotions such as Happiness, Contentment, Inspiration and Elevation. Differently from what expected, 2D settings still have a better influence on such emotions when dealing with sustainable high-end fashion products.

The above suggests that those emotions need to be carefully stimulated, as they might be a central element in a potential engagement plan in 3D media setting. Thus, future effective marketing strategies in the Metaverse should focus on improving Happiness - as the "emotional state characterized by feelings of joy and fulfillment generated by the product" - and Contentment - as the "feeling of quiet satisfaction generated by the product". The impact of these emotions would then be translated in a differential perceived financial value of the sustainable products: results from our path analysis indicated, indeed, that the emotional reaction (i.e. happiness and contentment), obtained from the display of the sustainable high-end Fashion items, mediates the effect of the type of media (2D vs. 3D platforms) on the product's financial value.

In order to boost users' feelings and behavioral intentions towards high-end sustainable fashion products, especially with embodied technologies, Choi et al. (2018) suggest that users may need to be enjoyed and engaged in the virtual experience, and thus managers should carefully reflect on how to develop appropriate communication plans in a multi touch-point environment.

As a result, experiences with highly embodied and virtual devices (i.e. Oculus) can generate a higher level of emotional display which, in turn, might influence the individual perception of the product's sustainable qualities and the reasons for its associated value. In their quest to discover fresh emotional approaches for promoting products, marketers ought to consider the influence of the Metaverse and how to set-up proper immersive experiences. In order to be effective in the market, accordingly, a profound and careful investigation should be run to understand the impact of the setting of the Metaverse; managers might then explore how to enrich their VR tools, its sensory inputs and interactivity (i.e. working on Avatars) to enhance positive emotional reactions (i.e. enjoyment and engagement) and attitudes towards sustainable products.

Limitations and Future Research

This study has several limitations that could generate future research avenues. First, the sample size of our research is relatively small with limitations on a specific age group, already more prone to the use of innovative technologies; thus the validity of the outcomes might be increased by enlarging the sample and the expanding to other socio-demo groups. Second, the stimulus analyzed was the display of one sustainable high-end Fashion product of an international well-known Fashion company. It would be interesting to use different stimuli (i.e. different types of products) and different Fashion brands to compare the effectiveness of the different media (i.e. 2D vs. 3D platforms). Third, all variables, including inward and outward emotions and financial value, were measured self-reportedly (i.e., Likert scales), and there was a limited exploration of more behavioral variables. Future research can go beyond these limitations and extend our findings by conducting qualitative data analysis based on coding semi-structured interviews on respondents' emotional states and attitudes. Finally, the validity of the results might be explored also in other

industries to understand whether a common differential pattern exists on emotional responses and on other consumption drivers in different contexts, when customers interact to form their opinion in the Metaverse vs. other touchpoints.

Prototyping new organizational forms to develop and transfer digital innovation: design and validation

VALENTINA FORRER* ALESSANDRO NARDUZZO* MONICA NATHALIE BERTOLINI[♦]

Framing of the research. Knowledge is considered a source of competitive advantage, which is why the discussion concerning knowledge and the transfer of knowledge, as well as technology, have gained increasing importance for the competitiveness of enterprises (Spender and Grant, 1996; Argote and Ingram, 2000). Knowledge transfer is relevant, especially in the ongoing digital transformation, which has been generating profound transformations of organizations, industries, labor market, and society (Schwab, 2017), due to the introduction of new technologies that have opened new opportunities for knowledge creation and innovation (Dougherty & Dunne, 2012). Digital innovation regards both the adoption of digital technology for innovation processes and the digital outcome of innovation (Nambisan et al. 2017). In addition, digital innovation is reshaping consolidated configurations of value creation and appropriation, also with the involvement of new and heterogeneous actors characterized by different goals and capabilities (Iansiti and Lakhani, 2014; Porter and Heppelmann, 2014). In particular, the science-industry relations and related knowledge transfer have been affected by significant changes in recent times (Arora et al., 2018; Zahra et al. 2018), emphasized by these context transformations. Knowledge transfer issues are not limited to the dyadic relation “science-industry” but encompass the different knowledge bases that characterized the so-called “innovation ecosystems” (Granstrand and Holgersson, 2020), which cross several industries due to the increasing blurring of sectorial borders. The interdependencies of the actors in this context of digital transformation are posing relevant issues regarding new organizational forms for the development and transfer of digital innovation (Albats et al., 2020). Despite the effectiveness of some exemplary experiences of knowledge transfer across organizations, replications of templates proved to be to large extent unsatisfactory. The growing and ubiquitous presence of digital innovation that is progressively spreading pervasively calls into question the effectiveness of technology transfer models that have already shown their limitations.

Purpose of the paper. Over the last decades, various organizational forms have been proposed as solutions for fostering science-industry knowledge transfer, such as establishing science and technology parks (Phillimore, 1999; Hobbs et al. 2017), the creation of fab labs for firms and scholars interactions (Maravilhas and Martins, 2019), science-based open-labs (Fritzsche, 2020; Paskaleva and Cooper, 2021), digital platforms (Dahlander et al., 2021), big science center (e.g., ITER, Dahlander et al., 2021), and corporate science labs (Arora et al., 2021). However, how new organizational forms for digital innovation are designed and validated is overlooked. Therefore, this paper aims at exploring how new organizational forms better foster knowledge creation and knowledge transfer in a digital context.

Specifically, this paper outlines what options and patterns are most effective for knowledge transfer between heterogeneous actors, as well as the role of open innovation intermediaries (Agogu e et al., 2013) for value creation processes in knowledge creation and transfer processes of both the intermediaries and the other involved actors (such as university, research institutes, large companies, and SMEs).

Methodology. In order to answer the exploratory research question, this study relies on an inductive qualitative research method. In particular, the author samples the case study of some open innovation intermediaries that are part of a Competence Center (we will call it “I4.0 Competence center” for guaranteeing anonymity). In general, Competence centers are public-private partnerships whose task is to carry out guidance and training activities for companies involved in digital transformation, as well as support the implementation of innovation, industrial research and experimental development projects (<https://www.mise.gov.it/>). The Competence centers are a consequence of a policy measure introduced in Italy in 2018, which lists several ways of conducting business training, but for the purposes of this study, the following is the relevant one: implementation of one or more demonstration production lines within the competence center with the aim of presenting, in a real environment, the application of technologies in the context of Industry 4.0. Hence, the aim of the Competence Center is the realization, by the user companies, in particular small and medium enterprises (SMEs), of new products, processes or services through advanced digital technologies. These open innovation intermediaries, which we will refer to as Live Showcases (LSs) in order to guarantee anonymity, are spaces, such as laboratories, that enable the innovative technology transfer specifically related to Industry 4.0 (i.e.,

the application of digital technologies in the manufacturing industry). This case is particularly relevant with respect to our research question because LSs have been intendedly designed and implemented to foster digital technology awareness, adoption, and innovation in the Italian Northeast area, which is characterized by the strong presence of traditional manufacturing industry, enabling knowledge transfer and collaborations. In order to analyze the knowledge transfer within a complex organization such as the I4.0 Competence Center, which contains different LSs, the authors decided to investigate in depth two LSs. The LSs are thematic facilities based on an industry or a technology: digital twin, agrifood, wine industry, machine-to-machine technologies, and human-to-machine technologies. The LSs that we selected for our paper are the ones involved in human-to-machine technologies (LS1) and in digital twin technology (LS2), respectively. In particular, LS1 was selected because it is the LS that has been the last inaugurated. Conversely, LS2 was the first LS inaugurated and it has the peculiar aspect to be a “non-physical” LS since it does not have a physical laboratory but it is only digital (we will deepen this aspect afterward).

This paper uses case study analysis as a basis for understanding due to “its revelatory potential and richness of data” (Langley and Abdallah, 2011, p. 109). The data are then analyzed through the Gioia method (Gioia et al., 2013). The study aims to understand any similarities or differences between the two LSs, which are both parts of the context of the I4.0 Competence center and are therefore conceived by the same organization but deal with different topics in different territorial contexts. The data collection consists of 6 semi-structured interviews with the various actors involved in the observed LSs. The interviews were carried out online through the Teams platform between January and February 2023. In order to bring back the intrinsic complexity of these LS structures, it was decided to interview actors with different roles and contexts: researchers and scientific representatives, end users, and technology providers, as well as LSs project managers. The interviews were recorded and transcribed by the authors. Moreover, the authors had access to the documentation provided by the I4.0 Competence center in order to triangulate the data collected through interviews.

The topics explored in the interviews included the interviewees’ perception of what a LS should be, the objectives and expectations that led them to enter this collaboration, potential similar projects that they experienced during their professional life, as well as an assessment of how the LS objectives have been reached thus far. Besides general questions, customized questions were asked based on the type of interviewed subject (i.e., researcher, end-user and technology provider, and project manager). The questionnaire was initially validated by a manager of the Competence center in order to provide robustness to the questions. The following macro-themes have been identified: LS nature and purpose, actors’ motivations and expectations, actors’ experience with similar projects, inter-organizational learning generated by conceiving and developing the LSs, observed knowledge transfer effect, emerging interaction structures, critical issues emerged in the design and the implementation of LS, and expectations fulfillment.

Details about the interviews, as well as the list of actors who participated are displayed in Table 1.

Tab. 1: Interviews’ information (source: authors’ elaboration)

Interviewee name	Name LS	Role of the actor interviewed	Date	Length of Interview
R1	LS1	Scientific referent	02.02.2023	25 min
TP1	LS1	technology provider	08.02.2023	28 min
PM1	LS1	LS Project Manager	03.02.2023	49 min
R2	LS2	Scientific partner	26.01.2023	51 min
EU1	LS2	End user/technology provider	20.01.2023	54 min
EU2	LS2	End user/ technology provider	01.02.2023	40 min

Results. Through the application of the Gioia method, the aggregate dimensions that we identify are the following.

LSs as a showcase for SMEs: From the interviews, we can infer that the concept of what a LS is more or less the same for both LSs, and heterogeneous actors involved in both LSs also agree. The LS is generally seen as a space for showcasing the usability of specific technologies so that SMEs can observe concrete applications of digital technologies developed by large companies and then integrate them as solutions that can be adapted to their own business context, as well as actively helping SMEs to identify digital solutions serving their current problems. LSs support knowledge transfer as they expose potential adopters to concrete applications that may be adapted into solutions that serve their needs.

Heterogenous motivations of open innovation intermediaries: In this case, we can notice a difference between LS1 and LS2. All the actors belonging to LS2 reported as a relevant motivation the unnecessary duplication of R&D investments that can be avoided if academia and innovative firms work together on applied projects. These informants are persuaded that cooperation between academia (scientists) and business saves effort, resources, and time. EU2 in fact mentioned “cooperation which does not kill competition”, in particular with respect to the optimization of the manufacturing process, which is a major need all big companies face, and could more efficiently be solved within a networked context, by dividing the investments and sharing the results. When it came to LS1, the motivation to be part of a network emerged as well. In this case, actors acknowledge the value of having access to multiple collaboration projects, as well as of finding more applications for existing technologies to show to their customers. In comparative terms, a difference between the two LSs emerges also in terms of network size and development. In the case of LS2, the regional environment is characterized by the presence of many potential players that aim at being connected. Conversely, at this stage, LS1 is primarily focused on the identification and selection of projects to demonstrate useful applications of digital solutions to existing customers.

New organizational forms as a combination of existing forms: The similarities and differences of LSs from other projects are surely more complex to identify, as they largely depend on the heterogeneous professional experience of the informants of this study. In general, we can say that every actor belonging to a company mentioned other projects that their firm carried out in the past or is still carrying out as similar to LSs. More specifically, a common structure has emerged: similarly to LSs, a larger company provides spaces and machinery for SMEs to test and experiment with their technologies. In this regard, LSs have been compared also to accelerators and research institutes concepts. Indeed, an interviewee stated:

“BMW acceleration hubs and Fraunhofer Institut’s investments consist of labs which can be experienced and used by smaller companies. This can be both compared to a LS activity and act as an inspiration for future activity” (EU2, LS2).

From the researcher’s point of view, the LS project has been compared to some university projects abroad. For instance, the German “Lernfabrik” has been mentioned as an experience similar to LSs, since the university provides SMEs with some spaces and technologies so that they can experience and test innovations developed by research. Therefore, this example resembles the template described by companies.

“Conventional” science-industry projects usually entail a contract between firms and research institutions to precisely set the deliverables. Nevertheless, in LSs’ case, a contract is put in place but without clear deliverables and deadlines. Therefore, the partnership between LSs, technology providers and universities is based mainly on mutual trust and commitment. Here is what was stated by an end user:

“When talking about university-company interaction [...], when we establish a contract with a supplier it is defined both in terms of time, duration and the actual cost. If something exceeds, the relationship stops. The point with the LS is that obviously the parties have to enter this partnership in good faith.” (EU2, LS2).

Critical issues of the early-stage organizational forms establishment: A critical aspect that emerged from actors of LS2 is the excessive complexity of the displayed usecase. A complexity that may exceed the needs and experience of most SMEs who come to visit the LS. In addition, the non-physical nature of the adopted digital technology (LS2 is specialized in digital twins) increases the perceived distance between the proposed solutions and the current needs. On the other hand, the opposite situation, meaning the display of too simplistic and trivial applications of digital technologies that may not attract the attention of SMEs has been raised as a serious concern. Moreover, LS1 experienced significant difficulties in finding partners to populate the LS, and later motivating them to collaborate on projects within the Competence center network. Thus far, word-of-mouth has been identified as the main driver of visitors to the LS. However, the evangelist role of actors already involved in LSs proved to be decisive in bringing new people to visit and engage with the LS.

Recruitment of skilled HRs to support the implementation of LSs activities is also a critical issue. LS2 explicitly mentioned the difficulty in recruiting skillful individuals, as well as providing them with the right documentation when needed.

Finally, selecting the right technologies to be showcased in the future has emerged as a significant concern, since selected technologies need to be of great interest to I4.0 Competence center, universities, and SMEs. However, this issue is more closely related to the ideation phase of the LS, rather than the operations phase.

The bridging role of the open innovation intermediaries: Inter-organizational collaboration has been fostered in different ways for the two LSs. Relationships in the context of LS1 are mostly still in an early stage, whereas LS2 entails more established relationships. After interviewing actors belonging to LS1, we can conclude that in this case, technology providers and research institutions have the strongest collaboration. Around 50 end users have come to visit the LS1 thus far, highlighting the importance of the tangible nature of the displayed usecases. physical facility to engage end users, especially SMEs. When it comes to LS2, the technology is intangible (i.e., digital twin) and thus more difficult to perceive and acknowledge the concrete value of what is displayed. For this reason, the main interactions merely involve technology providers and research institutions: and the technology provider (that in this case is a large firm) mentioned other large firms, as well as researchers as their privileged partners and vice-versa.

However, when asked about the relationship with SMEs, i.e. who the authors identified as the main end-users of the LSs, neither the research institution nor the technology providers reported having contact with them.

In comparative terms, LS1 and LS2 developed two distinct templates of interaction among the involved actors.: While in LS1 researchers are always present in the demonstrations and technology providers actively try to bring their customers into the LS, LS2 fostered rather few interactions between researchers, technology providers and SMEs, thus far. Furthermore, the project manager of LS1 was asked to make an assessment of how he evaluates interactions within the LS from his point of view. From the interviews, it emerges that during the planning phase, the relationship between technology providers and end users was nonexistent, as was the relationship between researchers and end users, precisely because the end users were not involved before the inauguration. After the inauguration, these dynamics have changed slightly. PM1 reported that:

“During the inauguration, the technology providers were present and had their own workstation to communicate with the end users too, whereas during the demonstrations it is low, we hand out flyers but there is no direct contact, perhaps LS1 does not need this kind of interaction.” (PM1, LS1).

Finally, PM1 reported a very low interaction between multiple technology providers in LS1:

“We tend to have TPs that are not too repetitive, so there may be some interest in exchanging applications and integrations but they are not simple.TP interactions may occur, but outside the LS; in the future, it could actually be a way of involving the TP.” (PM1, LS1).

This observation points to another element that emerges as a difference between LS1 and LS2: the motivation to be in. As mentioned above, large companies entered LS2 also to minimize R&D investments and reduce research duplications. As it became more apparent, LS1 does not share a similar concern, because even technology providers are often very heterogeneous, so the risk of conducting the same resource twice is considerably lower, which is why technology providers do not interact as much with each other.

When it comes to the knowledge transfer structures, actors of LS1 perceive the I4.0 Competence center as a facilitator and container for knowledge transfer, but not necessarily as an active player. This changes when we observe the assessments made by actors belonging to LS2. The actors involved expressed the need to place the project manager of the I4.0 Competence center at the center of the collaboration, as a bridge between the university and industry. A further noteworthy aspect is that in the case of LS2, often technology providers and end users overlap due to the intangible nature of the digital twin technology - technology providers develop the technology with and thanks to the university and are also the end users of the developed technology. In this case, the I4.0 Competence center should act as a bridge to attract other end users (different from technology providers) in order to grasp the full potential of the LSs.

Expectations matching of heterogeneous actors: The last aggregate dimension included is expectations matching. More specifically, this analysis will explore two subtopics. Firstly, we will briefly talk about the satisfaction level per se, for sake of completeness and because satisfaction level affects trust and other parameters that are the object of further analysis. Secondly, we will elaborate on the learning experience and the amount of learning, especially inter-organizational, that was fostered by the collaborations enabled by an open innovation intermediary.

Members of LS2 are generally satisfied with the collaboration, R2 mentioned that one of the technology providers created a new collaboration with a research institution to fund an industrial doctorate after collaborating with the I4.0 competence center, therefore this partnership already laid the grounds for further future inter-organizational collaboration and knowledge transfer. Both EU1 and EU2 mentioned not having a tangible service yet but stated being satisfied with the partnership anyways because, during this project, they had the opportunity of conducting innovative analysis and understood the potential of some technologies (EU1), and gained new knowledge in Machine Learning and Artificial Intelligence more in general (EU2). The opinions were not so unilateral in the case of LS1. While TP1 appeared rather enthusiastic about the cooperation both with the I4.0 Competence center and the research institution, mentioning that her company started to address a market need after the cooperation with the I4.0 Competence center:

“We are developing a digital factory, which was really born out of a market need that we were aware of but didn't address yet, so we are trying to acquire as much knowledge through this cooperation as possible. We can state that our employees are enriching their knowledge base as well.” (TP1, LS1).

However, the research institution claimed to be expecting more and bigger projects coming from the Competence center's side. In turn, PM1 assessed the activity of the LS positively, as he noticed that end users and researchers got together during the demonstrations, which managed to successfully show the end users that a concrete application of the technologies is possible and necessary. The generally higher satisfaction level in LS2 can be explained because, as stated above and also mentioned by R1, LS1 has been launched very recently so it has not reached its full potential yet.

Discussion. The results outline the design and validation phases of a new organizational form which is shaped as an open innovation intermediary between heterogeneous actors.

We observe that knowledge transfer occurs, not without problems, between academia and industry, thanks to the bridging role of the LSs. The LSs enable knowledge creation and transfer processes that are not limited to the “traditional” paradigm wherein the university produces basic research and the industry carries out the applied research phase. Indeed, what emerges from the study is that there is a mutual and reinforcing cycle of knowledge between science and industry, which is triggered by the opportunities enabled by LSs. Moreover, the R&D process does not entail only “vertical” relations within the same sector but the open innovation intermediaries allow cross-sectorial collaboration, enabling cross-fertilization between different fields.

Another aspect that appears from the results is the parallelization of the “innovation-development process” (Rogers, 2010). Indeed, usually, the innovation process disentangles into the following phases: identification of a need or problems, research (basic and applied), development, commercialization, diffusion and adoption, and assessment of the consequences (Rogers, 2010). The analyzed organizational form breaks the pattern that the development precedes the diffusion. In this case, LSs enable to develop a technology while, at the same time, finding a diffusion path. Digital technologies have the power to ease the unfolding of these two steps simultaneously. Indeed, while LS users look for new spaces of application, they start the innovation process.

Regarding the LSs that we examined, they are embedded in a technology park, which serves as a sort of “incubator” for the LSs. Therefore, the LS can be seen as a prototype of a technology park. If LS will be validated further (through other case studies and longitudinal analysis), it may work autonomously (without the park “support”) acting as a “lean technology park”, wherein actors can gather and collaborate in a space of knowledge creation and transfer.

Originally, LSs was born mainly as a training center. However, the customer of the LS (usually a SME) can be seen as not only the end user of the technology but the pioneer of end users. Therefore, the presence of these pioneer end users can “train” a number of other SMEs, shortening the penetration line which is needed for the diffusion of the digital transformation in the ecosystem.

Research limitations. Regarding the limitations, the empirical analysis includes two of five LSs. The involvement of all the LSs would provide completeness and robustness to the results, as well as longitudinal analysis (e.g., updating the

results presented in this paper once LSI will be up and running). These limitations may be the subject of a future research agenda. Finally, the I4.0 Competence center conceptualizes the North-East of Italy as a big innovation ecosystem, however, in the interviews, it appears that this multiregional ecosystem is in turn composed of smaller regional or even provincial ecosystems, and in-depth analysis could be conducted to investigate characteristics and dynamics of this configuration.

Managerial implications. This paper lies the foundation for understanding how value is created, delivered and captured through LSs, both for Competence centers and the involved actors. For this reason, this investigation is a valuable starting point that may be useful for Competence centers' business model development and for future related in-depth analysis.

Originality of the paper. This paper explores how new organizational forms foster knowledge creation and knowledge transfer in a digital transformation context. Specifically, this paper sheds light on particular new organizational forms that were born for supporting and spreading digital innovation, especially to SMEs. In particular, the paper explores the design and validation of the prototype of this new organizational form labeled as open innovation intermediary, investigating what patterns are most effective for knowledge transfer between this new subject and involved heterogeneous actors (such as university, research institutes, large companies, and SMEs).

Keywords: digital transformation; digital innovation; knowledge transfer; prototyping; new organizational forms.

Living Labs: A systematic literature review

KHATEREH GHASEMZADEH* FRANCESCA CAPO[•]
LORENA MARIA D'AGOSTINO[▲] SALVATORE TORRISI^{**}

Abstract

Living labs (LLs) have gained popularity as an innovation practice and have gained the attention of the debate on multi-stakeholder and collaborative innovation rooted in Open Innovation (OI) and User Innovation (UI) conceptual frameworks. Despite the fast expansion of the LLs field and the breadth of topics related to LLs, only a handful of systematic reviews have been carried out so far. The paper aims to conduct a systematic, up-to-date literature review in the domain of Living Labs (LLs). In our study, we categorized the scientific articles into six different streams. The results of this study offer innovation management scholars an organized framework of internal and external characteristics and practices of LLs. Our study can also help business practitioners set up and manage LLs for innovative targets and different contexts, and profit from them.

Framing of the research. *This research put into perspective the LL method so that it contributes to the two overarching UI and OI paradigms. Eric von Hippel introduced the UI paradigm in the 70s, in which users are the leading innovators, and the OI was put forward by Henry Chesbrough later in the early 2000s, who proposed to enlarge the innovation resources to the outside borders of firms that embrace multi-stakeholder perspective.*

Purpose of the paper. *LLs are deemed as virtual or physical sites where stakeholders ranging from firms, public agencies, universities, institutes, and users meet to find a solution for an unsolved challenge (Westerlund et al., 2018). LL discussion draws on various streams of the innovation literature, primarily “Open Innovation”, “User Innovation”, and “co-creation” studies which have contributed to understanding lead users’ needs and participation in co-creating value and innovation (Chesbrough 2003; Schuurman et al., 2016; von Hippel 1976). The sticky nature of users’ ideas makes it hard for firms to understand their real needs and perceptions while the specificity of needs reduces a firm’s incentive to develop users’ innovations (von Hippel 1994). Hence within LLs, firms could collaborate with participants using various tools and techniques depending on the project’s goal to tap into their actual needs. The research on LLs has been increasing in scope ranging from the characteristics and motivations of participants, the methods and tools applied, and the structure and governance of the LLs (Leminen et al. 2016; Leminen and Westerlund 2019). In recent years, the research on LLs has moved away from the conceptual framework of what LLs are, how they are perceived, and who takes part in the practical applications toward how to design and manage LLs, their processes, and participants, especially users, as key stakeholders (Westerlund et al., 2018).*

Despite the fast expansion of the LL field and the breadth of topics related to LL, only a handful of systematic reviews (bibliometric and thematic analyses included) have been carried out so far. A subset of existing reviews are mostly conceptual-oriented and revolve around: i) exploring the emergence and evolution of LLs over time (Leminen and Westerlund 2019; Westerlund et al., 2018); ii) identifying key research streams in terms of how LLs are perceived and applied (Leminen and Westerlund 2016); iii) pinpointing the main perspectives on LLs and understand how they have been incorporated within the more established innovation theories (Schuurman et al., 2015); iv) realize how LLs as a concept and research approach has expanded, proliferated and prompted scholarly research (McLoughlin et al. 2018).

Over time and with the expansion of LL utilization in different settings and industries, studies, specifically the empirical ones, have focused on more niche topics. Hence, another subset of conducted reviews are narrower in topic i) exploring different research streams concerning the role of specific groups of stakeholders (e.g., users) (Huang and Thomas 2021), ii) how LLs are utilized as processes and methods to organize innovation in particular sectors, and contexts, e.g., higher education, energy, public administration, Information and Communication Technologies (ICT),

* Postdoctoral Researcher of *Innovation Management* - University of Milano-Bicocca

** Full Professor of *Management* - University of University of Milano- Bicocca
e-mail: salvatore.torrise@unimib.it

etc. (Dekker et al., 2020; Følstad 2008; van den Heuvel et al. 2021), and iii) what is the impact and effectiveness of LLs (Bronson et al., 2021; Paskaleva and Cooper, 2021). Hossain, Leminen and Westerlund (2019) carried out the most comprehensive review in the field so far in which LLs have been investigated from different angles, including the origin of the LL concept, their fundamental characteristics, as well as stakeholder roles, contexts, challenges, primary outcomes, and sustainability.

Given that LLs literature is growing in scope and quantity (150 publications only in 2022), we aim to carry out a comprehensive review of studies to discover the lacunae in current studies and to map the evolution of LLs, the internal and external-related characteristics, and potential key performance indicator (KPIs). Accordingly, we tried to identify consolidated research themes, emerging trends, and literature gaps. Unlike previous reviews, our study proposes a framework on different angles of the LL phenomenon by taking a holistic approach to the topic. The current review will provide a consolidated and comprehensive blueprint for establishing, managing the LLs, and benefiting from them.

Methodology. The methodology used in this article is a Systematic Literature Review (SLR). We have chosen SLR since it is a trustworthy and rigorous methodology for assessing and understanding previous research relevant to a particular phenomenon of interest. We have followed the standard steps for conducting an SLR. First, we searched for relevant documents in the Scopus database. We used the word *living lab** as the main keyword because it covers all the related keywords such as *living lab*, *living labs*, *living laboratory*, *living laboratories*, and *living labbing*. We limited the search inquiry to articles and conference papers in scientific areas of business, management and accounting, social sciences, and economics published in English. We included conference papers since they unfold interesting and novel ideas in many ways. We believe that the chosen scientific areas better fit our aim to better understanding the underpinned theoretical backgrounds and LLs' core functioning traits and settings. This process yielded 883 results. We extracted the basic information, such as the article's title, the list of authors, the name of the journal, the publication year, and the abstract. Next, we read the abstract of each article and, if needed, the main text. In the next step, to ensure that living labs were the main focus of the article, we applied two exclusion criteria:

- Topics that try to respond to a specific societal or technical challenge without going in deep about the operational characteristics of utilized LLs. As our goal is to focus on the management processes and mainstream innovative outcomes unfolding within LLs, we excluded articles driven by technological perspective without referring to the functioning of LLs in terms of stakeholder engagement, regulatory mechanisms, outcomes, and unfolded impacts.
- Studies in which LLs are studied passively, for instance, exploiting LLs dataset to answer the research question.

As a result, we ended up with a final set of 155 journal and conference articles to be reviewed in this study. Then we applied content analysis to the remaining articles and coded them while reading the full texts of the papers. The coding work was performed iteratively by three authors separately, and any disagreement was resolved in iterative discussion sessions. In the final step, we fine-tuned the codes and clustered the articles into 6 groups.

Results. Studies of LLs have appeared in a broad range of journals and conference proceedings. The journals hosting the largest number of papers are *Sustainability* and the *Journal of Cleaner Production*. The LL studies gained popularity after 2014; the peak year was 2021, with 136 published papers. We looked at the most frequent keywords in the resulting articles, and, besides the primary keywords (e.g., *living lab* and *living labs*), the most frequent keywords are *innovation*, *sustainability*, *smart city*, *sustainable development*, *cocreation*, and *Open Innovation*. Diving deep into 155 articles, we grouped them into five groups. These clusters answer six main questions associated with LLs.

1. What are the definitions and theoretical underpinnings?

More than 20 years after the emergence of LLs in scholarly literature and practice, there is still no agreed-upon definition. A bulk of studies see LLs as real-life testing environments in which new technologies, products, services, and processes are co-created, tested, and evaluated (Leminen and Westerlund 2016) with the crucial role of users as stakeholders. Other studies define LLs as the "network" or "ecosystem" because they include multiple stakeholders in innovation and development activities (Hossain et al., 2019; Leminen and Westerlund 2016). Other scholars view LLs as "tools," "methods," or "intermediaries" that can be used to favor public and user involvement (Hakkarainen and Hyysalo 2013; Leminen & Westerlund 2012) or an agile approach for fast testing and validating based on user feedback and data (Andone et al. 2022). An overarching definition of LLs is the one proposed by a network of Living Labs (ENoLL), which defines a LL as "a user-centered, open-innovation ecosystem, often operating in a territorial context (e.g., city, agglomeration, rural area), integrating concurrent research and innovation processes within a public-private-people partnership."

The theoretical foundations of living labs mainly draw on two theoretical grounds: "Open Innovation" and "User Innovation," which are premised on two fundamental principles of "User-centeredness" and "Co-creation". From a design perspective, LLs draws on various disciplines, including User Centered Design (UCD), participatory action research, and systems thinking.

2. **Who are the stakeholders, and how do they get engaged?** The main focus of this group of studies is the multi-stakeholder nature of LLs in which a broad range of stakeholders, from users, companies, public agencies, universities, and various institutions, participate (Ballon and Schuurman 2015). The multiple stakeholder argument in this literature builds on the triple helix model of innovation based on the partnership among university, industry and public administration (Feurstein et al. 2008) or the quadruple helix model, which considers also the role played by civil society (Del Vecchio et al. 2017; Vallance et al., 2020). Although participants' roles vary from enablers, providers, users (Westerlund and Leminen 2011), many recent articles have studied the role of users and the attributes associated with their characteristics and level of involvement as well as innovations being developed by them (Leminen et al., 2015; Sadowski 2017). Given that choosing the right stakeholders for a specific challenge that

LL seeks to respond to is of utmost importance, studies focus on mapping the right stakeholders and their interests (Chen and Musango 2022), the best practices and enablers for in-depth involvement (Lupp et al. 2020), identifying users' real needs, expectations, and motivations (Callari et al. 2019; Marone et al., 2020), along with the role patterns within LLs (Leminen et al., 2014; Nyström et al. 2014).

3. **For what aims are LLs created?** LLs have been shown to foster innovation outcomes in a variety of domains, such as health, smart cities, mobility, and education. The innovation outcomes of LLs can take various forms, including:
 - 1) New or improved products or services, or technologies: LLs can lead to the development of new products, services, and technologies or improve existing ones that meet the needs and preferences of end-users (Ballon et al., 2005; Rodrigues and Franco 2018);
 - 2) New business models: LLs can generate new business models that are more user-centric and better aligned with the needs and preferences of end-users that can be more sustainable and profitable in the long run (Mastelic et al., 2015; Rits et al., 2015);
 - 3) New policies or policy changes: Living labs can influence policy aiming to support innovation and the adoption of new products or services. Policy changes can include new regulations, standards, or incentives (Mulder et al., 2008);
 - 4) Enhanced user experiences: LLs can improve the user experience with products or services by involving end-users in the design process that can lead to products or services that are more user-friendly, intuitive, and enjoyable to use (Almirall and Wareham 2008);
 - 5) Increased social and economic impact: LLs aim to solve real-world problems, and therefore the innovations developed in LLs have the potential to generate significant social and economic effects, such as improved public value, and increased sustainability (Compagnucci et al. 2021; Hansen and Fuglsang 2020).
4. **Which co-creation methods are applied in LLs?** LLs typically employ a variety of co-creation methods to involve users and other stakeholders in the innovation process, including UCD and co-designing processes. In LLs, users can have both active and passive roles, depending on their level of involvement and the specific goals of the LL. Active engagement of users are facilitated by following methods:
 - User workshops: LLs often hold workshops to engage users in co-creation. These workshops can take many forms, such as ideation sessions, design sprints, and user testing sessions (Kayaçetin et al., 2022; Sarabi et al. 2021);
 - Surveys and feedback: LLs may also use surveys and feedback forms to gather input from users and stakeholders. These methods can help collect qualitative and quantitative data and identify patterns and trends (Kayaçetin et al., 2022; Sarabi et al. 2021);
 - Prototyping and testing: Prototyping and testing are critical co-creation methods used in LLs for fast experimentation and validation of new ideas and technologies in real-life contexts, which accelerates the innovation process and reduces the time-to-market for new products and service (Gordon et al. 2023; Schaffers et al. 2007);
 - Co-design sessions: Co-design sessions are collaborative design sessions that involve users, stakeholders, and designers working together to create new solutions (Zingraff-Hamed et al. 2020);
 - Living lab experiments: Living lab experiments involve real-world testing of new products or services in a controlled environment allowing LLs to gather data on how users interact with the innovation and identify areas for improvement (Engels et al., 2019; Kronsell and Mukhtar-Landgren 2018); and, more recently, with digitally aided co-creation techniques (Mačiulienė and Skaržauskienė 2020).

Yet, there is not a clearcut boundary between the active and passive role of users in such methods. Generally, passive users are more of observers or beneficiaries of the LLs. They may provide some input and feedback on the design and implementation of new products, services, or systems, but they are not directly involved in the co-creation process. Instead, they may use the new products, services, or systems in their daily lives and provide feedback on their experiences and satisfaction.
5. **How are LLs implemented and managed over time?** LLs are formed and managed in various ways depending on the goals and objectives of the initiative, as well as the resources and stakeholders involved. However, by categorizing the results of studies we identified seven steps from creation of LL to the achievement of specific outcomes. In the first step of designing a LL, the scope and objectives of the targeted initiative should be defined, including determining the living lab's purpose and goals and identifying target stakeholders (Gordon et al. 2023). Planning the living lab infrastructure and developing the necessary infrastructure for the LL, including the physical space, technology, and resources, are among the primary building blocks of LLs that are very much context-related (Chronéer et al., 2019; Della Santa et al., 2022; Grotenhuis 2017). Engage stakeholders and enable their participation and ensure that their needs and expectations are considered throughout the process by, for example, overcoming communication barriers (Robaeyst et al. 2021). Once the living lab infrastructure is in place and participants have been engaged, the next step is experimenting, collecting data, and learning from stakeholders to test hypotheses and gather insights (Habiyaemye 2020; Wade et al., 2022). A LL requires proper management methods and tools to ensure it operates smoothly and effectively. This includes ongoing communication with stakeholders, regular data collection and analysis, establishing intermediary roles to smooth the communications and orchestrate processes, establishing mutual trust among collaborators, and governance arrangements, including managing Intellectual Property Rights (IPRs) for identifying collective goals between living lab actors and aligning joint activities across different stages of living lab development (Cantù et al. 2021; Cellina et al. 2020; Hakkarainen and Hyysalo 2016; Pitkänen and Lehto 2012). The results of experiments are then analyzed and, if needed, disseminated to inform policy and decision-making.

6. **How to evaluate the impacts and effects of LLs?** Although the experience with LLs has been growing along different avenues, the literature has not kept pace with these advances. In particular, the outcomes of LLs are still poorly understood because of limited evidence reported in empirical studies (Paskaleva and Cooper 2021). Measuring the outcomes of LLs is essential to evaluate their effectiveness, identify areas for improvement, and justify investments. A group of studies considers quantitative performance indicators to define and track the performance and impact of a LL. These indicators mainly measure the diffusion of innovations developed in the LLs, consisting of the number of prototypes developed, the number of participants engaged, the number of new partnerships formed, or the level of satisfaction among stakeholders. In contrast, other studies take a more qualitative approach to measuring the LLs' impacts, namely the economic and social effects on job creation, increased revenue for local businesses or the environment and community (Ballon et al., 2018; Kayaçetin et al., 2022; Schuurman et al., 2016). Another gauge for measuring LLs' impact is analyzing case studies that showcase the success stories of the living lab and its impact on the community (Kayaçetin et al., 2022). Other studies are based on network and participatory evaluation that measure the relationships between participants, within and outside collaborations and knowledge exchange effectiveness, and satisfaction among actors (Ståhlbröst 2012; Van Geenhuizen 2018).

Research limitations. This systematic literature review suffers from some limitations. Some papers could have been left out from the review of this study because we chose only Scopus, the primary database for selecting related articles, and also due to selecting specific subject areas.

Managerial implications. Initially, LLs were set up by companies to get end-users to do their design work under the banner of "co-production" (Paskaleva and Cooper 2021, p. 2), which suggests that managers are probably aware of the benefits and challenges of LLs. However, the concept LL is now associated to "innovation ecosystems", a dimension that might be not well understood to managers. Hence, scrutinizing and evaluating various aspects of LLs is paramount for practitioners and managers. The results of this study offer managers an organized framework of internal and external characteristics and practices of LLs that can help them set up and manage LLs for innovative targets and different contexts and profit from them.

The originality of the paper. The results of this study extend the inquiry of LLs beyond only characterizing the definitions and most applied methods by broadening the scope of the research to the managerial mechanisms, micro-foundations, and impacts. This study reviews the most recent published articles within LL literature and, unlike the previous reviews, is broad in scope by diving the phenomenon into different dimensions of stakeholder engagement, management processes, and co-creating methods, as well as outcomes and impacts.

Innovation and Peripheries: cross-disciplinary evidence from a bibliometric review

ALBA MARINO* GIOVANNA TERRIZZI* MARIA CRISTINA CINICI* DANIELA BAGLIERI**

Framing of the research. *The debate on innovation implicitly departs from stories of success, either from an individual, business, sectorial or place-based perspective. On the one hand, the academic discourse has traditionally leaned towards the analysis of innovation processes linked to conditions found in well-functioning core regions (Dawley, 2014; Isaksen, 2015), dynamic high-technology sectors (Asheim et al., 2011) or out-of-the-ordinary and central individuals (Hohberger, 2016). On the other hand, insights on peripheral actors seem to lie outside major theoretical debates and empirical generalizations on innovation, either from a geography perspective (Petrov, 2011), social networks (Cattani and Ferriani, 2008) or business strategy (Santangelo, 2009). In particular, the mainstream debate has been centered around innovative actors in core regions or, at most, geographically segregated locations of emerging economies. On the contrary, innovators active in the periphery have been mainly studied as recipients of subsidies in an economic convergence policy framework or single cases of success in deprived areas.*

We recognize that “peripherality” is a fuzzy terminology that might refer to different concepts of distance in terms of geography, economy, politics, technology or network composition - among other dimensions - . As such, the “periphery” appears to be more a relative than an absolute concept: the peripheral and core statuses exist as opposed to each other and might change over time even though relative disparities persist over time. However, when deepening our understanding of “peripheral areas”, an evident link seems to exist among them: locations that are physically distant from the economic core (geography) and usually manifest poor connections with the central and vibrant environment of the leading regions (networks) where central government offices are usually located (politics), thus further hindering the development process (economy). Indeed, these locations might be mainly characterized by a lack of a critical mass of innovative firms, the dominance of SMEs operating in traditional and resource-based industries, low levels of R&D and innovation, weak absorptive capacity from outside the region and thin and less specialized structures of knowledge and support organizations (Doloreaux and Dionne, 2008; Karlsen et al., 2011; Todtling and Trippel, 2005; Virkkala, 2007).

Even in the global periphery, innovative centers might arise and be source for further upgrading (Nilsen et al., 2022; Santangelo, 2009). However, they are more likely to be the “special case” rather than the “general case” (Isaksen and Karles, 2016). In fact, for innovative firms to flourish outside a solid local industrial cluster in the peripheral regions, they must compensate for the lack of resources (Grillitsch and Nillson, 2017). The organizational thickness, openness and connectivity of the territorial systems - and their economic actors -, and the consequent flow of knowledge and expertise has become increasingly central to the economic success and technological development - especially for the “periphery” - at several levels, including individual entrepreneurs, organizations, industrial clusters, and even broader geographic regions. Although the availability of traditional local advantages is still a critical condition for success, it is no longer a sufficient condition in the race to achieve and sustain a leading innovative position. Besides, globalization forces continue to push towards an organization of the regions along a core-periphery structure to the detriment of economic activity in the periphery (Benito and Narula, 2007).

In light of this consideration, a more systematic understanding of both achievements and dysfunctions faced by organizations in these contexts would be helpful to deepen our understanding of the factors that shape innovation capabilities and strategies to move upward in the global value chains.

Purpose of the paper. *This project aims to understand how knowledge of innovation processes in the peripheries is organized, where it is sourced and co-created and which are its main pillars. In particular, the goal is to sketch a chart that enables a better understanding of the published scientific literature and how it has evolved over time. To this end, we apply a combination of bibliometric techniques such as citations, co-citations and social network analysis. Such*

pressing interests originate from the long-standing research tradition and the heterogeneous interests in the topic, which has been moving along multiple social science fields (mainly economics, geography and management studies). The knowledge produced has been building up quickly, spreading its roots deeply and broadly. Despite sharing much in common, each field has progressed mainly in parallel for over 50 years while enjoying the occasional scholarly efforts to foster interconnections. Then, we believe times are mature for a comprehensive sum-up of the existing knowledge base.

Methodology. In line with previous applications in management, we employ scientific methods to analyze and synthesize prior research to develop research inquiries which integrate the field of management with other non-management disciplines. Specifically, we leveraged bibliometric techniques (Zupic and Čater, 2015) to investigate the formal properties of knowledge domains (Donthu et al., 2021). We employed four bibliometric techniques using VOSviewer software (Van Eck and Waltman, 2009: co-citation, bibliographic coupling, co-occurrence, and co-authorship). Co-citation analyzes the relationship between two items based on the frequency with which they are cited together in the literature (Small, 1973). It reveals the intellectual roots of a research field by identifying its fundamental works (Vogel and Güttel, 2013). Unlike co-citation, the bibliographic coupling is based on the identification of bibliographic references common to two documents (Egghe and Rousseau, 2002). As it can capture the most recent contributions not yet cited, it is well suited to determine the state of the art of young subject areas characterized by vigorous publication activity and to identify emerging research trends (Zupic and Čater, 2015). Co-citation and bibliographic coupling are complementary methods that complement rather than replace each other because they produce considerably different results (Jarneving, 2005). Co-occurrence analysis is a content analysis technique that identifies the most frequently addressed topics in literature by mapping the interactions and strength of association between keywords (Callon et al., 1983). Finally, co-authorship describes intellectual collaboration in scientific research (Acedo, Barroso, Casanueva, Galan, 2006).

We relied on Clarivate Analytics' Web of Science (WoS) database to select relevant documents in relevant fields. Since we want to implement a search strategy that would be as broader and more inclusive as possible, we identified all English articles containing the keywords "innovation*" and "periph*" either in the title, abstract or keywords. We will refer to such string query as "focal construct" moving forward. We also included all publications from 1985 to 2022 falling under business, economics, and management categories. This search strategy has produced a final sample of 572 papers (for the detailed process, see Table 1). All the main relevant characteristics are reported in Table 2, while distribution of publications and received citations are included in Figure 1.

Results. In our bibliometric analysis, we first establish a picture of the current state of accumulated knowledge on the topic, focusing on "how", "whose" and "where" related scientific literature has been published. Building on bibliographic coupling, we analyze the connections and similarities among the most impactful publications. In detail, we set a threshold at the value of the sample-average citations per publication (32) to qualify for inclusion into the analysis and impose to cluster the 118 items into five groups to improve readability. As shown in Figure 2, the resulting network does not offer a clear clusterization pattern. Some clusters show slightly more clear-cut edges (green, yellow), while others overlap entirely (red and blue). However, an in-depth analysis of the content of each cluster confirms the validity of the analyses in terms of similarity within the same color-coded group (see Table 3 for details). This configuration suggests that the cumulated academic knowledge shows some degree of similarity and co-localization in the knowledge space within certain groups. However, the documents do not differentiate from each other. Results are similar when restricting the analysis to the last ten or five years or moving the thresholds. We can identify a meaningful pattern only when significantly raising the bar in terms of impact (threshold above 85 citations per document), meaning the "average (or more recent) paper" still struggles to locate in a specific strain of literature and instead holds middle-ground positions.

One possible explanation could derive from the extreme heterogeneity in the field of research involved in the topic in terms of publication sources (Table 4). Indeed, looking at the distribution of focal documents in widely recognized journals - namely, those included in the ABS Journal Guide -, we can derive some general information (Figure 3). Among the most prolific fields overall, publication in Innovation (INNOV), and Organization (ORG STUD) and General Management (ETHIC-CSR-MAN) seems to have reached their maturity stage. On the other hand, publications in Regional Studies, International Business (IB&AREA) and Entrepreneurship (ENT-SBM) continue to increase significantly. Strategy (STRAT) and marketing (MKT) are also increasing, but their overall contribution is minor. Looking at the bibliographic coupling between journals, we can extract further insights regarding the distribution of specialization/similarity in the field, thus inferring field-specific interest in the topic. Then, we map the network of all the journals with at least two documents and ten received citations (70 items over 239). In Figure 4a, journals in the same-colored cluster reveal a higher similarity, while groups closer to each other share stronger association linkages. The size of each node indicates the average normalized number of citations as a proxy for impactful research production, while the thickness of edges measures link strengths. In Figure 4b, the size of each node measures the number of sample papers published in the journal, while the color gradient tends to be yellow for the most impactful sources as measured by average normalized citations. We can infer several results from these network configurations. First, management-related journals tend to be concentrated on the left-hand side and more impactful in terms of citations received, while publishers in economics, regional studies and geography are located in the other half of the quadrant and they are more productive but less impactful. However, two central nodes - namely, «Research Policy» and «Technological Forecasting and Social Change» - arise as main gatekeepers among all the clusters. In contrast «Regional Studies», despite being the more connected node in the network, lies in a more decentralized position

(Fig.4a). All in all, the journal bibliographic coupling seems to confirm that interest in our focal construct is widespread across different scientific fields with a rich and intricated web of connections. In management, top-tier generalistic journals lead the way over publications specialized in technology and innovation.

Another possible explanation for the depicted fragmentation of knowledge might derive from the nature of authors' networks. We then sifted through the authors to identify the most impactful ones (having at least two documents) and analyze their collaboration patterns. In Figure 5, we mapped the co-authorship relationships of all the scholars with at least two publications in the sample, weighting the results by normalized citations to control for impact. The bibliometric analysis identifies eight clusters (over 47 total) with at least three authors (more details in Table 5). The compelling un-connected multiple clusters highlight the weakness and disaggregation of collaboration networks. No significant changes appear when restricting time frames or inclusion criteria. On the same train of thought, in Figure 6 the analyses of author citations underline that scholars interested in our focal construct do not cite each other if they are on the external boundaries of the network. Only the central groups (which are also among the most impactful), cite each other.

On the final steps of this journey, we turn back to identify the roots of this ensemble of publications. Co-citation analyses provide a picture of which fields constitute the literature's backbone, measuring the similarity between two documents based on the number of times the focal sample publications simultaneously cite them. In Figure 7, the resulting map emphasizes the existence of a common, balanced and interconnected knowledge base organized in four clusters: social network theories (blue), economic geography (blue), roots of the economics of innovation (red) and fundamental theories in strategic management (yellow). For the details for each cluster, see Table 6.

Research limitations. Our study has limitations arising from the methodological choices and the idiosyncratic nature of the research question. As per the latter, we stressed that the word "peripheral" lacks a clear definition and taxonomy, not only across disciplines, but also over time and often within the same academic field. This can potentially bias the research finding, especially since we did not adopt any subjective exclusion criteria to select our sample. Despite this choice generating noise in the results, a comprehensive overview of the consolidated knowledge on the topic requires minimally altering the selection of sources, at least at an early stage. In this regard, using allows to a broader search scope thus reducing researcher bias. Future improvements might consider filtering the sample through a multi-stage process to exclude those articles which deviate from our concept of "peripherality". This additional step might result in a convergence process through a systematic review of the contents, which would require extensive effort and introduce extreme subjectivity. However, due to the complexity of the constructs we are trying to investigate and the multi-disciplinary nature of our investigation, the best solution could be to exploit a rational convergence process to improve the search algorithm (in terms of sources, keywords or other elements) to feed additional divergent analyses. In this case, the natural complement of the analysis would be to adopt content methods to analyze the rich corpus of literature. As per our methodology, bibliometric techniques reduce researchers' bias in interpreting the literature content, risks of exclusion of relevant publications or fundamental citations. However, they do not entirely eliminate the subjectivity from the analysis and require an additional effort to deepen the understanding of the corpus, asking the right questions and pushing forward the research inquiries. Finally, they do not allow to systematically analyze the paper's content, but only identify connections at the word level.

Managerial implications. This project shows long-term indirect managerial implications related to the novel research questions and systematization of existing knowledge on leveraging specific resources - i.e., capabilities, skills, human capital or connectedness - for knowledge creation and exploitation in peripheral areas. Understanding the relative importance of local and non-local resources, how they interact, and the factors that affect the competitiveness of organizations operating in particular places is pivotal to identifying successful strategic approaches for practice-oriented implementation.

Originality of the paper. We contribute at the current academic debate on innovation processes in the peripheries under multiple perspectives. First, we sketch a comprehensive map, which analyzes and synthesizes prior literature, that can help navigate existing knowledge about our focal construct. Mapping and consolidating knowledge on our focal construct constitutes the first step to creating a common foundation for advancing knowledge, stimulating novel research questions and hopefully developing novel [unifying] theoretical lenses. Second, while previous similar literature reviews have mainly handled one specific issue at a time or focused on the most impactful and acknowledged literature, we implement a search strategy that is as inclusive as possible. Finally, while other scholars restrict their analyses to a single scientific field, we aspire to learn from all the many shades of expertise involved in innovation studies to decline knowledge into a novel strategy framework.

Keywords: innovation; periphery; bibliometric analysis; literature review; strategy.

A bibliometric analysis of the effect of emerging technologies on management theories: current themes and research agenda

VALERIO NATALE* NICCOLÒ FIORINI[•]
TOMMASO PUCCI[▲] ELENA CASPRINI^{**} LORENZO ZANNI^{••}

Framing of the research. *The debate about new technologies in all areas of business management (management, marketing, accounting, finance) has been present for many years, it concerns many aspects and takes place in different ways. Already 20 years ago, Patterson et al. (2003) says that technology changes almost every day and its applications in business as well, the companies need to adopt these new technologies in many areas of the business to avoid the loss of competitive advantage.*

This debate has had a dividing line with the advent of industry 4.0 (Optimal, E, 2020)., a paradigm that, in fact, uses technologies that already existed previously.

With the advent of industry 4.0, studies regarding new technologies in management have multiplied. One of the most important first article about the topic (Shrouf et al, 2014) says that, after the creation of IoT, governments and companies will launch an evolutionary journey. It predicts that industrial production of the new era will be highly flexible, and it consists in extensive integration between customers, companies, and suppliers, and above all sustainable.

However, all this debate always focused on the use and impact of new technologies in companies: for example, Flavian et al. (2019) analysed the impact on the customer experience; Guo and Liang (2016) analysed the impact in the banking industry and Zhu et al. (2012) analysed the managerial application in different industries. New technologies and paradigms are not only changing how companies are managed and their strategies, but also relations and collaborations between them (Pucci et al., 2023). Furthermore, firms' relations and technologies adoption and related effect also influences industrial districts (Fiorini et al., 2022). There are many studies about the application of this technology (Li et al., 2020) but is not clear how these technologies created new management theories. Alfano et al. (2020) say that several readiness and maturity models have been proposed in recent years, but an accurate analysis and classification of these models are not yet available. Furthermore, in 2021 Klingenberg et al. say that value-creating technologies, which apply data in order to develop new solutions, are still rare in the literature.

Purpose of the paper. *The introduction of new technologies and above all the changes in the technological paradigm have always prompted management scholars to question themselves about the changes that these phenomena produce on the way and of doing business (especially in terms of effectiveness and efficiency: the possibility of new processes, improvements performances, etc.). Nevertheless, scholars have more rarely question themselves about the possibility that some emerging technologies could have changed the same conceptual schemes and theories that explain the way of doing business. For these reasons, in the wake of the importance of the fourth industrial revolution and the digitalization processes that companies are going through, this work questions which new managerial theories have been pushed and promoted by the emergence of new technologies.*

Given the importance that technologies assume in the society and, more specifically, in business we believe it is appealing to examine the studies in management concerning new technologies. The purpose of this research is twofold: to record the development of the works related to new technologies and to investigate the theoretical branches that they contribute to create.

Methodology. *As for many studies with similar purposes, we decided to use the bibliometric analysis (e.g. Casprini et al., 2020). We are interested in analysing the communities of scholars and the theory that comes out from research on the shared references of the documents. This is why the bibliographic coupling represents the best analysis to*

perform. Thus, we used the VOSviewer 1.6.19 software (Van Eck e Waltman, 2010), being the perfect solution for our purpose.

In table 1 the procedures followed for conducting this study are reported in brief.

SCOPUS has been chosen as the database, while keywords derived from the study conducted by Bonaccorsi et al. (2020): we decided to take this article because the authors made a deep analysis of words related to new technologies. In order to incorporate the new technologies as much as possible, we decided to take all the words they have found, so we chose the words in the Table A1 (Coverage of emerging technologies by Wikipedia pages. Part 1: Academic papers (all year) and in the Table A2 (Coverage of emerging technologies by Wikipedia pages. Consultancy reports and official documents. Year 2018-2019). We included contributions from 2003 to 2022: we chose this range of years because the fourth industrial revolution is generally traced back to 2011 (Kagermann, 2015). We have considered 8 more years because some technologies were already being used. It can also be seen from the timeline graph below: we have had the shot since 2011, but before that something was already there. At first, we limited our analysis to the top journals (4 and 4*) identified by the Academic Journal Guide-ABS. We obtained a total of 5,778 documents, with 43,1408 total citations. We then restricted the analysis to top theoretical journals of management. The number of documents obtained after this restriction was 1640, while citations were 114,155. We then decided to focus our research on top journals of management and strategy.

Source: Authors' elaboration

Results. As expected, there is an increasing trend of publications. (Figure 1).

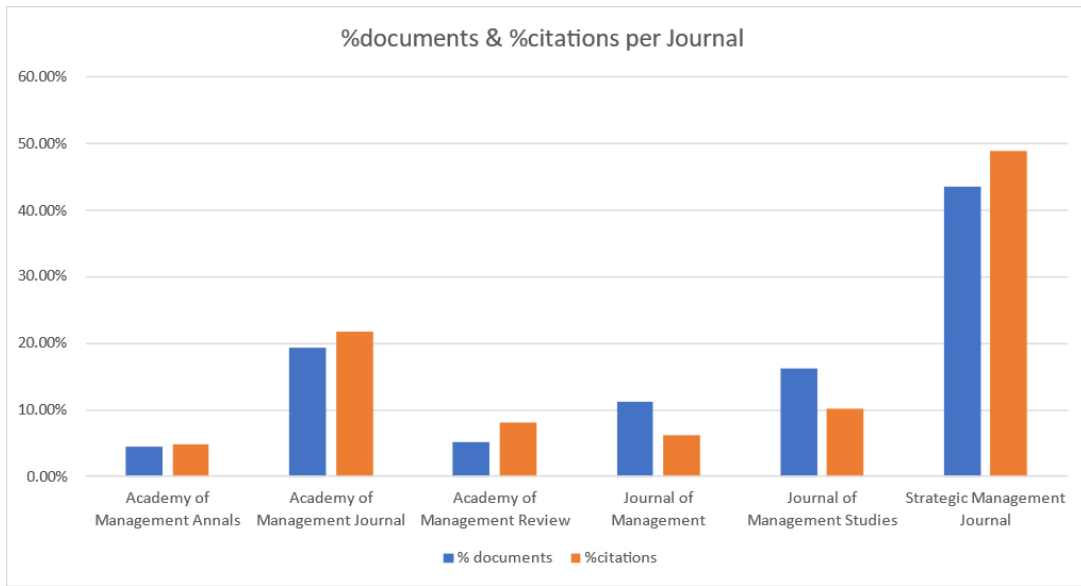

Fig. 1: Trend of intellectual core

Source: Authors' elaboration

The top journals identified are reported in the following figure and table (Figure 2, Table 2). We notice that some of them published a significant higher number of papers dealing with new technologies from a management's perspective.

Fig. 2: documents and citations per journal

Source: Authors' elaboration

Not all the journals publishing the highest number of documents researching on new technologies receive the same proportional quota of citations. As expected, when analysing the countries from which those researches originate, two countries show the highest contributions: UK and USA (Figure 3).

Fig. 3: Authors' country of provenance

Source: Authors' elaboration

We then analysed the recurring keywords and we choose those used at least three times (Table 3). Amongst them it is worthy to notice that one specific technology has an occurrence of 9, even if it emerged less than 2 years ago in the literature: machine learning. Co-occurrence and period of appearance are shown in figure 4.

Finally, we performed the bibliographic coupling analysis. This helped us in clustering documents in thematic groups that emphasise the existence of a management theory link with new technologies. 5 clusters were identified. (Figure 5).

Fig. 5: Bibliographic coupling

Source: Authors' elaboration

The thematic blocks emerged from citation analysis can be represented as in Figure 6.

Tab. 4: Bibliographic coupling clusters

Cluster	time	N*	Main articles	main topics

Source: Authors' elaboration

From this analysis emerges that scholars are mostly referring and adapting the traditional strategic-managerial theoretical lenses for analysing new technologies in management. In all the clusters the topic studied are not discussed through new proposed theories, instead authors refer to (adapted) traditional theories. We can identify, amongst others, theories from the 80's: the Resource Based View proposed in 1984 by Wernerfel, the theory about competitive strategies that dates back to 1985, by Porter. Moreover, there are theories deriving from mid-90's and the beginning of 2000, as the Knowledge-based theory (Grant, 1996) or, Corporate Social Responsibility and Sustainability (here we can identify even "older" theories, as Bowen, 1953, together with more recent ones: McWilliams and Siegel, 2001). Furthermore, there is a significant number of papers dealing with strategic management and business models. Even if we could expect new theories regarding strategic management and business models deriving from the adoption of new technologies, scholars are still using "old" theories, with some adaptations, to explain and study how those technologies affect firms and strategic management. Thus, we can identify that scholars still adapt theories that, maximum, were published in the first decade of this century (Chesbrough and Rosenbloom, 2002; Osterwalder et al., 2005; Zott and Amit, 2007; Baden-Fuller and Morgan, 2010). However, from the second decade of the XXIst century disrupting technologies and paradigm has been emerged (e.g. Industry 4.0 and related technologies, Kagermann et al., 2013), scholars did not propose new theories to capitalize on them from a managerial and strategical perspective. There is a need for new conceptual tools. Raisch and Krakowski (2021) pointed out that, with new technologies (Artificial intelligence, specifically for their research) a substantial change is required in how new technologies are currently conducted in order to develop meaningful theory and to provide practice with sound advice: "we also argue that a substantial change is required in how AI research is currently conducted in order to develop meaningful theory and to provide practice with sound advice" (Raisch e Krakowski, 2021, p. 192).

Therefore scholars are still using old theories for studying new technologies, while it would be needed new theories that can fully explain to both scholars and practitioner the impact on management. The need of new theories is also mentioned in older studies (i.e. Pahnke et al., 2014).

To propose some examples deriving from the topic emerged from the clusters, we can analyse the case of new technologies that empowered the possibility to share information and knowledge. They also enabled the employment of distant and external knowledge that could be beneficial for the company if appropriately managed. Therefore, management scholars investigated if and how crowdsourcing and innovation sharing should be effectively managed. However, this has been done referring to "old" theories while new ones should have been proposed.

The choice of choosing leading and renewed journals in the management and strategy fields has been done because we expected that new theories would have been proposed in these top journals. It could happened that new theories emerged in other fields, but we await to find the management theories in the analysed ones

Research limitations. This research has some limitations. The first is the selection of only the most important journals about management. Future developments of the work should also take into consideration more journals. Widening the number of contributions under analysis could also decrease the heterogeneity of smaller clusters where the sharing of some references can derive from individual articles with very different focuses. For the same reason, the second limitation is related to the choice of scientific fields of investigation. This does not exclude that there may be interesting and useful works for the purpose of this study also within different disciplines (e.g. marketing). A final limitation refers to the analysis of the results. Although the use of bibliometric methods helps to reduce subjectivity, this does not exclude the possibility that the analysis of the main topics covered is limited by interpretative distortions.

Managerial implications. Since we expect new and disruptive technologies and paradigms to strongly affect management and strategies, but it does not emerge from the analysis of academic documents any significant new theory, this study points out the need for new theories emerged from the rise of new technologies. New theories not only would be effective for scholars, but they would also provide fruitful insights for managers. Practitioners would benefit from learning new theories because they would help them in capitalizing on the adoption of new technologies. Adopting new technologies with an "old" approach might diminish their effect.

Originality of the paper. The literature has always extensively analysed new technologies. However, to the best of our knowledge, there are not systematic literature reviews trying to study the effect of new technologies on management and strategy and the existence of theories promoted by them.

Keywords: new technologies, management, strategy, theory, review

The impact of technological improvements in the agri-food sector: a literature review from a managerial perspective[♦]

ALBERTO MASSACCI^{*} MERIAM TRABELSI[♦]
ELENA CASPRINI[▲] TOMMASO PUCCI^{**} LORENZO ZANNI^{**}

Framing of the research. *Emerging technologies have been leading the industrial revolution in the past few decades. However, the magnitude of their integration and adoption to different sectors is still heterogeneous. Despite all the efforts to facilitate and to boost technology understanding, adoption and acceptance, the concept of “emerging technologies” remains complex, untapped and challenging (Small et al., 2014, Carroll, 2017). Many highlight the potential of these technologies to revolutionize the economy (Porter et al., 2002). Indeed, technological breakthroughs refine every industry today, from traditional ones like agriculture (Rudi, 2009) and food (Misra and Mention, 2022), to more modern ones, as oil and gas (Monteiro, 2019).*

Notwithstanding the challenges facing agriculture and food sectors, such climate change (FAO, 2017), the need to fully understand, explore and benefit from these technologies is critical to address them. However, many literature broach the subject of technology intertwinement to agrifood, such as artificial intelligence and sustainability (Sood et al., 2022), digitalization and sustainability (Abban et al., 2022), agrifood supply chain and technological innovation (Dadi et al., 2021, Cricelli et al., 2022). Nonetheless, comprehension of emerging technologies and agrifood remains limited.

This paper discusses the concept of emerging technologies and their implications to the agrifood sector presenting an overview of the state-of-art of management studies over the past two decades and providing a detailed future research agenda to guide researchers, policy makers and stakeholders.

Purpose of the paper. *The aim of this research is to provide a widespread overview of the scientific awareness on how new technologies impact the production, distribution and consumption of goods in the agrifood sector. The paper has several economic and political implications; while providing an overview on the growth trends of new models and methods of doing business, it also outlines a strategic and political guide towards a more sustainable world, both from an economic, environmental and social perspective.*

Methodology. *We decided to adopt two bibliometric techniques. The first refers to the analysis of bibliographic coupling “to group papers based on their shared references. The higher the reference overlap between the two papers, the more these two papers were deemed to belong to the same community” (Casprini et al., 2020, p. 4). The other relies on keywords analysis, where the authors have analysed the linkage among the authors keywords in the observed papers. In other terms, this second technique refers to the co-occurrence analysis on authors’ keywords. These two investigations allow us to identify research mainstreams.*

We recurred to VOSviewer 1.6.8 software (Van Eck e Waltman, 2010) since it is among the most flexible and useful to the research aim.

The whole procedure is implemented following different steps. We used SCOPUS database, recurring to keywords linking the concept of «new technologies» for the agri-food sector. In order to identify the keywords implemented in the research query on SCOPUS we followed a rigorous and objective criterion based on two different definitions:

- *The concept of new technologies was defined following Chiarello et a. (2018) where they build an algorithm to identify the most relevant technological innovations;*

- The agri-food sector was defined through the analysis of the main research lines which have been defined by the PNRR project.

The analysis was limited to publication sources published between 2003 and 2022 (included) since, despite the arrival of industry 4.0 can be collated around 2010, the arrival of technologies related to this industrial revolution was, in some case, earlier than this date.

Results. Starting from the descriptive analysis of scientific production, the temporal distribution of the contributions covered by the intellectual core has shown a growing trend, although the growth rate has only been remarkably increasing in the last ten years. (Figure 1).

Figure 1: Trend of intellectual core

Source: Authors' elaboration

With respect to the Journal distribution on the debate on technological improvements in the agrifood sector, Table 1 shows that 7 journals summarise more than half of the discussion.

Tab. 1: Main journals

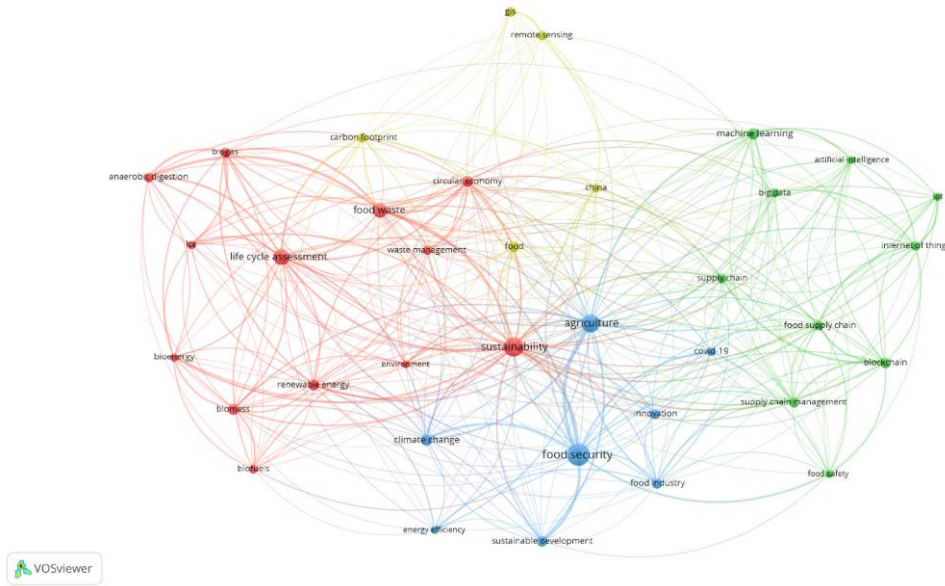

Source	Documents	Citations
Applied Geography	224	10637
British Food Journal	241	4855
Eastern-European Journal of Enterprise Technologies	57	161
Food Science and Technology Research	64	367

Journal of Cleaner Production	1956	70060
Journal of Environmental Management and Tourism	53	239
Technological Forecasting and Social Change	87	3790

Source: Authors' elaboration

The analysis of the linkage across keywords shows the key role of sustainability to foster technological innovation in the agri-food sector. Indeed, as well as being one of the predominant elements of the network, it plays a key role in the connection across the different areas of analysis.

The network identifies 4 main categories: the red part relates to food waste management and related recycle systems, the blue area is concerned with food security and traceability, the green side provides an overview of all the systems and applications of new technology to the area of management and marketing, while the yellow area relates to system for reducing carbon-emissions.

Fig. 2: Keywords co-occurrence

Source: Authors' elaboration

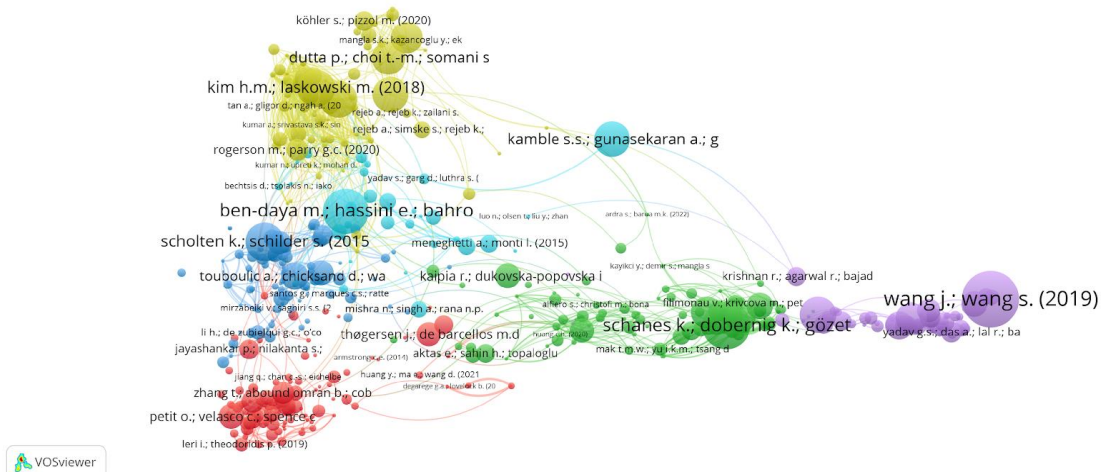

The bibliographic coupling analysis provides similar results to the keywords analysis and it divides the sample in 6 different clusters, as illustrated in Figure 3.

Tab. 2: Most recurring keywords

term	occurrences	term	occurrences
Sustainability	317	Anaerobic digestion	89
Food security / safety	430	Carbon footprint	73
Life cycle assessment	213	Artificial intelligence	60
Food waste	177	Waste management	81

Fig. 3: Bibliographic coupling

Source: Authors' elaboration

Relying on the most common method used in analysis, bibliographic coupling (Gao and Ding, 2022), we identified 6 distinct clusters, illustrated in Figure 3.

Cluster 1 comprises 115 publications (timespan 2004-2022) and discusses consumer perception of restaurants on social media (Park, et.al, 2016), consumers loyalty (Wu and Chen, 2018), food tourism (Richards, 2021), food advertising (Wong, et.al., 2019), food waste and consumers (Scarpi, et.al., 2021) and food purchasing (Ma, et.al., 2021).

Cluster 2 contains 92 articles, and explores food waste related topics (timespan 2013-2022). This cluster analyzes supply chain and waste management (Kaipia, et.al., 2013), food waste governance (Warshawsky, 2015) and food waste prevention (Mullick, 2021; Kör et.al., 2021).

Cluster 3 combines 89 articles (timespan 2008-2022), it discusses supply chain food quality (Juan Ding, et.al., 2014), supply chain innovation (kronborg, 2014), sustainable supply chain management (Mehdikhani and Valmohammadi, 2019) and information sharing in food supply chains (kiil, et.al., 2019) .

Cluster 4 is composed 85 articles (timespan 2018-2022) and discusses blockchain technology related topics, either for precision agriculture (Liu, et.al., 2021), blockchain and sustainability (Tripti, et.al., 2021), food tracibility (Aldrighetti, et.al., 2021), and blockchain for food service distribution (Vivaldini, 2021).

Cluster 5 contains 71 publications (timespan 2014-2022) and discusses cleaner production strategies (Gruda, Bisbis and Tanny, 2019), circular economy practices (Do et al., 2021), environmental sustainability (Yadav et al., 2020) and life-cycle assessments in sustainability (Notarnicola et al., 2017).

Cluster 6, has 38 contributions (timespan 2015-2022) and discusses IoT for food supply chain (Yadav, Garg and Luthra, 2020), IoT for agriculture (Singh et al., 2020), artificial intelligence for food supply chains (Dora et al., 2021) and data analytics for perishable food products decision making processes (Chaudhuri et al., 2018).

Tab. 3: Bibliographic coupling clusters

Cluster analysis	
• Cluster 1	Marketing
• Cluster 2	Food waste
• Cluster 3	Supply chain
• Cluster 4	Blockchain
• Cluster 5	Life cycle assessment
• Cluster 6	Internet of Things-AI- Data analytics

Source: Authors' elaboration

Figure 3 provides a summary of the results of the bibliometric analysis by proposing a grouping of the thematic blocks and clusters identified through bibliographic coupling according to the analysis perspective adopted: individual dimension, organizational dimension, and contextual dimension.

Research limitations. The research aim was to identify and to map new and emerging technologies' role in the agri-food sector development which has led us to adopt a very inclusive approach both in terms of keywords to be used for SCOPUS research query, and in terms of research streams. An inclusive approach endows us with a fair degree of confidence on the linkages significance and networks identified in the analysis. Such a wide overview may not allow us to correctly assess the pure goals of each assessment included in the analysis. However, this is only an initial step in a research journey and our future goals will include more focused analyses on the single domains, both from the point of view of discipline, technologies and fields.

Managerial implications. The understanding of how new technologies can improve the efficacy and efficiency of production processes is a key aspect in the sciences of management. Society and the global political agenda are characterized by an increasing attention toward sustainability goals, both from an environment and a social perspective. The systems of production will face the challenge to preserve the cost-effectiveness of their business while meeting this ideological shift. The role of new technology, if correctly addressed, could be crucial in such a mission and, in order to identify the possible future steps, we must be aware of the successes and failures that have occurred in the past.

Originality of the paper. The literature on the impact of new technologies in the agri-food sector has been increasing in the last decade. However, at least to our knowledge, there has not yet been an effort to map the whole basket of technologies in single research for this sector. This will provide a general overview that may be useful to understand and compare the agri-food sector with other fields, in order to define possible future directions.

Keywords: emerging technology; innovation; agri-food; literature review; bibliometric coupling

Determinants of Digital Financial Behavior

CANDIDA BUSSOLI* LUCREZIA FATTOBENE• SILVIA INTINI[▲]

Framing of the research. *Since decades, the financial industry has experienced a continuous evolution in service delivery due to digitalization (Gombert, 2017). In the last years there was a shift in the focus of digitalization from enhancing the delivery of traditional tasks to implementing new business models and opportunities for financial services companies. Recently, the digitalization of the financial system is also changing the financial consumers' habits and the behavior.*

The investigation of financial behavior is a crucial topic since a poor financial behavior has fatal consequences not only for individuals but also for the global economy (Goyal, 2021). Previous studies have demonstrated that financial literacy (FL) is a key tool to improve the overall financial behavior (Kim et al. 2019). In particular, Gutierrez-Nieto et al. (2017) demonstrate the effect of FL on debt behavior. Deuflhard et al. (2019) discovered a positive effect of FL on wealth accumulation, savings, and investment behavior. The same positive effect was found on stock market participation (Sivaramakrishnan et al., 2017), retirement planning (Clark, et al. 2017), insurance participation (Lin, et al. 2017), and financial well-being (Lee, et al. 2019). Grohmann et al. (2018) highlight that a higher level of FL increases financial inclusion, while poor decisions relating to mortgage refinancing are related to financial illiteracy (Bajo, et al. 2018).

During the last decade, technology-driven transformation has created emerging challenges for education systems worldwide to adequately prepare future generations to meet the demands of a changing environment. The complex problem of the 21st century society require the development of a wide set of digital skills for life and work (Lyons, et al. 2019). Aleke et al. (2011) underline that if individuals of a country are digitally literate (DL), they will be able to effectively and efficiently use ICT to perform tasks and achieve goals. In recent years, digital financial services (DFS) have rapidly expanded mainly driven by fintech and further accelerated by the Covid-19 pandemic Lyons et al. (2021). Starting from the idea that maybe the traditional FL is insufficient to empower individuals to access and use DFS, the authors investigate the concept of digital financial literacy, which includes some aspects of FL and DL. Lo Prete (2022) motivates her study by the idea that people need both DL and FL to share the benefits of the digitalization of banking and financial markets. This study underlines as the use of digital payments are associated to the ability to use digital technologies, at all levels of FL, while personal financial choices are linked to FL, at all levels of DL. In their study, Kass-Hanna et al. (2022) have developed an index to measure the level of DL. The digital literacy index was constructed by summing the scores across three different dimensions: mobile technology access, mobile phone proficiency; and mobile money proficiency. The total score of this index ranges from 0 to 15. The finding of the study by Kass-Hanna et al. (2022) are in line with the idea that both FL and DL are key factors to building inclusiveness and financial resilience. Differently from the case of FL, studies that specifically focus on DL and financial behavior are virtually non-existent (Kass-Hanna et al. 2022). Some studies have analyzed the impacts of DFS on saving behavior finding that mobile money increased the probability of savings and money transfers and reduced the propensity to use informal savings channels (Apiors et al., 2018; Demombynes et al., 2012; Mbiti et al, 2015; Ouma et al., 2017). Bharadwaj et al. (2019) and Seng (2017) have found a positive relationship among mobile money and informal borrowing.

In this framework of innovation and digitalization of the financial system, in 2019 the Dutch bank ING has published a report in which investigates a new technology tool, cryptocurrencies. Cryptocurrencies are the digital money that, in theory, allows everyone to economically and transparently transact or invest around the world with a click. The ING International Survey conducted on cryptocurrencies ask what people know about cryptocurrency and whether they have a view of what the future holds. This study reveals that while most Europeans had heard of cryptocurrencies and know what they are, many of them did not understand how they work. The sample of the survey was 12813 respondents that were asked to assess the validity of five statements about this tool. The level of knowledge was evaluated measuring the frequency of correct answer given to the five statements. This survey can be considered the first mapping of the level of knowledge of the European population regarding cryptocurrencies. Rázvan (2021)

investigate the level of FL and digital financial literacy in the European Union observing general attitudes towards novel Fintech solutions, cryptocurrencies, and digital money. The result of the study supports the idea that FL and DL must be combined together in order to guarantee the individual's financial well-being.

In this analysis is important to consider what happens at cognitive level when a person faces a high-tech service or product. Previous literature introduced the concept of perfect automation schema (PAS), defined as a cognitive scheme containing beliefs about the performance of automated systems. Dzindolet et al. (2002) proposed two aspects of PAS. First, they proposed that the schema is associated with high expectations for automation performance. In other words, users with strong PAS should report expectations that the automated aid will perform with near-perfect reliability. Second, they hypothesized that users would be less prone to forgive automation mistakes than human mistakes. While human mistakes can be attributed to variable factors such as momentary inattention or fatigue, users may make more stable attributions for aid errors. Thus, individuals with strong PAS may exhibit all-or-none thinking regarding aid performance: either it works perfectly or not at all. The PAS personal beliefs influence human-automation interaction (Merritt, et al. 2015), which is an important element to consider when investigating the behavior of consumers in relation to digital financial services. These cognitive aspects are also important in order to evaluate if the individual differences in the PAS could be reflected in different behaviors towards digital financial services.

Purpose of the paper. The main purpose of the paper is to investigate which could be the determinants behind the digital financial behavior. In particular, we aim to evaluate whether and how digital financial behavior is affected by individuals' difference in FL and DL, and further explore the role played by cryptocurrency literacy (CL), and (PAS). In the analysis individual's sociodemographic and socioeconomic characteristics are also taken into account.

Methodology. The analyses were conducted developing and administering a survey to Italian consumers. The sample consists of 502 individuals equally distributed on the territory. The survey is composed of 47 questions which investigate various aspects including questions of financial literacy, digital literacy, cryptocurrency literacy, perfect automation schema, demographic and socioeconomic.

The digital financial behavior (DFB) which is what we want to investigate is the dependent variable of our study and is identified as the proxy of the tendency of subjects to prefer the digital delivery channel over the traditional one. To develop this indicator eleven questions were posed about different products and services, such as stocks, bonds, cryptocurrencies, payment cards, online banking accounts, and virtual advisor, asking which channel was used by the individual to buy or activate a product / service. Two different channels were identified. The first, called "traditional channel", refers to the physical bank branch, financial consultant, banking consultant, or independent consultant. The second, defined as "digital channel", includes online platforms and online banking. So, for each of the eleven questions the respondent must select which channel he/she used to purchase the specific service or product, if they have used it at least once. For example, the question about stocks asks "Have you ever bought stocks?", and if the respondent answers "yes" the following questions is "Which channel have you mainly used?". At this point the respondent must select the channel he/she has used, i.e., the traditional or the digital one. The DFB is calculated as the sum of the time where the answer provided was "digital channel". We also calculate the digital financial behavior extended (DFBextended), which is the result of the previous sum plus the answer given to the question which investigates which innovative services a person would use. This latter question was developed in order to capture the respondents' appetite for new possible digitally advanced financial tools and services. The question proposes three digital services. The respondent has the possibility to choose more than one alternative. At the same time, subjects can show their non-interest by answering "none of the above".

As explanatory variables we considered FL, DL, CL, and PAS. To evaluate the level of FL we have used the big five questions developed by Lusardi and Mitchell (2011, 2013). One of the hypotheses formulated is that a higher level of FL positively affects the DFB of a subject given that the individual with high FL could feel more confident in their decisions to prefer a digital channel over the traditional one. The DL was calculated using the index created by Kass-Hanna et al. (2022); the relative hypothesis is that the higher the level of digital literacy the higher is the implementation and use of the digital channel. The level of CL is calculated as the sum of the correct answers given to the question which asks about the characteristics of cryptocurrencies. This question is composed of five statements regarding the characteristics of cryptocurrencies and was created and used in a report conducted by ING bank (2019). Each statement provides three possible alternatives "yes", "no", and "I don't know", and the respondent must choose the correct answer based on their knowledge. The idea is that greater is the value of this indicator greater is the confidence with technology. We expect a positive relation between the dependent variable, DFB, and CL. The last independent variable is PAS, which is a cognitive schema focusing on an automated system (Tschopp and Ruef, 2020). This question wants to evaluate the trust of a subject in a technology and in the automated system. The idea is that the higher the trust in algorithms, the greater the predisposition to rely on technological tools and services. Therefore, PAS should have a positive impact on digital financial behavior.

In order to investigate the determinants behind the DFB, the relation between the dependent and independent variables are investigated using an OLS (Ordinary Least Square) multivariate regression model, where the dependent variable is DFBextended, the independent variables, added one by one, are FL, DL, CL and PAS. Moreover, the educational level, the marital status, the income level, and the age of the respondents are added in each regression as control variables.

Results. *The descriptive results show that the sample is composed by women (52%) and man (48%) equally distributed on the Italian territory.*

From the preliminary analysis emerges that only 23% of the population is considering investing in cryptocurrency in the future and only 10% is able to answer correctly to all the five statement of the cryptocurrency literacy. These results highlight how the Italian population is interacting with one of the newest technological tools applied to the financial world.

Another relevant result is what emerge from the question that wants to test the digital appetite of consumers. This question asks which of three different potential high-tech financial services the consumer would use. Results show that the majority (56%) of the population would not use any of the proposed tools. On the other hand, only 8% would be interested and would like to use all the proposed three services. The idea behind this question was to understand how much Italian consumers want and are interested in the introduction of highly technological financial instruments and services that are currently not yet available but potentially implementable. Results show that just a small part of the population has a high financial appetite and is aware and interested in possible new frontiers. At the same time, results show that the majority have no interest and curiosity in experimenting with new potential high-tech financial services, such as financial advice in the metaverse.

Given these initial results, this study wanted to go further investigating what could be the determinants of DFB of Italian consumers. The first multivariate regression looks to the relationship between DFBextended and the FL. Results show that the FL positively affects the DFB. So, a higher level of FL has a positive impact on the propensity to have a financial behavior more digital oriented. This result is in line with our initial hypothesis.

The second analysis focuses the attention on the impact that DL has on the dependent variable. The level of DL is positively related to the propensity to be more incline to use digital financial services and instruments. This result is in line with the expectations, indeed, having greater knowledge and familiarity with digital tools lowers the barriers to using the technology in new sectors, such the financial one.

Moreover, the third step studies the relation between DFBextended and the level of knowledge of cryptocurrencies (CL). Also, in this case the relation is positive. This means that the higher the level CL the higher the propensity to have a DFB. This result may mean that greater knowledge of a highly technological financial tool increases the propensity to use digital products and services in the traditional financial system.

The last step of this study investigates which is the role played by the level of trust that a person has in the automation schemes and algorithms (PAS). The significant and positive relationship between the two variables is in line with the expectation: a person with greater trust in automatic schemes and algorithms is more predisposed and more inclined to use digital and technological tools. In other word, results support the hypothesis that a person who has more faith in automated system will have more active digital financial behavior.

The results emerging from the analysis conducted in this study reveal that together with socio- demographic and socio-economic variables, DFB of Italian consumers is positively influenced by FL, DL, CL and PAS. These results highlight that DFB is thus influenced not only by the level of FL but also by other abilities and knowledge, underpinning that also DL, CL and PAS could be improved to foster consumers' ability and confidence in this new age of finance. Since the digitalization of financial products and services is a consolidated reality with which consumers will have to deal with every day, these findings are useful in order to understand which are some of the abilities relevant to support a financial behavior more in line with the new era.

Research limitations. *One of the main limitations of this study could be related to the limited geographical area of the study. In particular, it could be interesting to administer the same questionnaire in other countries and compare the results obtained in two or more different countries.*

Moreover, this study does not take into consideration the real and perceived risk appetite of the consumers. The risk propensity could be another element that affect the DFB, that should be considered in future analyses.

Managerial implications. *This paper focuses the attention on how consumer behave in relation to the implementation of new digital solutions available from the financial industry. Banks and financial institutions can use the results of this study on different tracks. First, by analysing their consumers, they will be able to segment them and offer services and products in line with their client's skills and knowledge. Secondly, they could participate and incentive initiative aimed at increasing the skills and knowledge that positively influence digital financial behaviour, to improve the adoption of new digital solutions by customers. Finally, the expectations and new needs of customers that manifest themselves in an evolution of traditional financial behaviour to digital oriented financial behaviour can be an opportunity for the offer to promote new service and develop new businesses.*

Originality of the paper. *Previous literature has demonstrated how financial consumers' behavior is affected by individuals' sociodemographic and socioeconomic characteristics and literacies such as financial literacy and digital literacy. Anyway, no study has yet investigated the concept of Digital Financial Behavior and in particular the determinants of digital financial consumer's behavior (DFB). This study is the first work that analyses a new form of financial behavior that is the digital financial behavior. Since, the impact of digitalization of financial system is changing habits and behaviors of financial consumers, it is important to understand which could be the determinants of digital financial behavior. So, this work is a first investigation about the financial behavior of consumers in a digital era and about the implementation and use of digital tools.*

Evoluzione del modello di business nella filiera agroalimentare: l'impatto degli investimenti tecnologici

DILETTA PILOCA* BERNARDINO QUATTROCIOCCHI*
SABRINA RESTANTE^ FRANCESCO MERCURI**

Inquadramento della ricerca. *La quarta rivoluzione industriale ha indotto le imprese ad adattarsi ad un nuovo paradigma basato sull'interconnessione digitale e sulle capacità di rispondere in maniera sempre più rapida alle esigenze dei consumatori e degli utenti. Nello specifico, l'Industria 4.0 cambia il modo di fare impresa, tramite l'impiego di soluzioni tecnologiche che influenzano l'intera filiera produttiva e distributiva (Quattrococchi et al., 2022). In questo contesto, la filiera agro-alimentare è stata investita da una crescente attenzione inerente all'utilizzo delle tecnologie digitali e l'impatto che queste hanno sulle dinamiche operative ed ambientali. Al presupposto di sviluppo tecnologico è associato, invero, quello di sostenibilità. Basti pensare all'impatto che la filiera agroalimentare produce in termini ambientali, responsabile nel suo complesso di una quantità rilevante di emissioni di CO2 pari al 20% dell'intero Food System (Quaranta, 2021). In coerenza, dunque, con gli obiettivi fissati dall'Agenda 2030, la quale demanda ai Paesi membri l'adozione di strategie volte a ridurre gli impatti ambientali e le emissioni derivanti dai processi industriali, il settore agri-food deve necessariamente essere considerato come uno dei (principali) settori coinvolti al contempo nel processo di green and digital transformation.*

In questo scenario, la letteratura ha individuato nell'Agricoltura 4.0 una delle principali allecite tematiche, quale modalità di sviluppo che mira a definire l'integrazione di diverse tecnologie per automatizzare attività e processi cyber-fisici, consentendo una migliore pianificazione e controllo dei sistemi agricoli (Lezoche et al., 2020). Uno degli obiettivi di Agri 4.0 è da ricondursi alla riduzione degli impatti ambientali che potrebbero scaturire dalle attività agricole (Lytos et al., 2020). Nell'ambito della trasformazione digitale del settore agricolo, le nuove tecnologie sono considerate importanti per la gestione dell'intera filiera contribuendo in termini di tracciabilità, sicurezza, qualità, trasparenza e scalabilità (Dal Mas et al., 2023). L'analisi della letteratura evidenzia, altresì, teorie opposte; Rijswijk et al. (2021), ad esempio, hanno affermato che le attuali tecnologie digitali possono generare diversi impatti negativi che diverranno visibili solo quando effettivamente questi strumenti verranno utilizzati.

Sebbene si registri un trend crescente di investimenti digitali, l'Agri-food presenta al momento un basso tasso di investimenti tecnologici rispetto ad altri settori (Bjerke e Johansson, 2022) e una limitata centralità delle politiche di innovazione europee (Knudson et al., 2004, Andrade et al., 2020).

Al fine di stimolare maggiormente l'adozione di tecnologie digitali nella filiera agro-alimentare, la presente ricerca si propone di indagare i fattori che ne determinano l'adozione mediante un'indagine in profondità. La ricerca si propone come un primo test sul più importante mercato d'Italia, il secondo in Europa per movimentazione merci, per successivamente procedere ad un'analisi più profonda coinvolgendo tutti i principali mercati italiani.

Obiettivo del paper. *Sebbene diversi studi abbiano investigato specifici aspetti inerenti all'adozione delle tecnologie nel settore agri-food, ancora poco indagate sono i driver che ne determinano l'adozione; inoltre, non si rilevano in letteratura ricerche che relazionano tali fattori alla reale conoscenza, da parte degli imprenditori agricoli, degli effetti generati da queste tecnologie. Sulla base di queste premesse, il presente contributo si propone di indagare le principali tecnologie adottate nell'ambito della filiera agro-alimentare, nonché i fattori che ne influenzano l'adozione. Più in dettaglio, il lavoro si propone di fornire implicazioni di carattere teorico e manageriale; dal punto di vista teorico, mediante una revisione della letteratura il paper si propone di definire un framework teorico inerente agli effetti che le nuove tecnologie digitali possono innescare a livello strategico, operativo e relativamente ai valori aziendali. Sotto il profilo empirico, la ricerca tenterà di analizzare i driver o le barriere che concretamente influenzano l'adozione delle tecnologie digitali da parte degli imprenditori operanti nella filiera agri-food, allo scopo di definire implicazioni per manager e policy makers utili ad incentivarne l'adozione.*

e-mail: francesco.mercuri@uniroma1.it

Metodologia. La ricerca in fase di sviluppo muove da un'analisi della letteratura volta ad indagare i principali effetti legati all'adozione delle tecnologie digitali, con particolare riferimento al settore dell'Agri-food, per poi investigare i fattori che costituiscono driver o barriere all'adozione. In particolare, la presente ricerca consta di due principali fasi. Dopo aver condotto una literature review mediante un rigoroso scrutinio dei contributi scientifici nel periodo 2012-2023, nella seconda fase è stato sviluppato un questionario suddiviso in più sezioni, con domande miste aperte e chiuse. Il questionario è stato somministrato alle figure apicali delle principali aziende aderenti al MOF. L'obiettivo di tale analisi consiste nell'indagare, come esposto, i fattori attraverso i quali è possibile incentivare l'adozione e l'integrazione delle tecnologie digitali nel settore agri-food ed evidenziare il grado di conoscenza degli imprenditori agricoli verso tali tecnologie.

Risultati. Il lavoro tenterà di misurare il grado di adozione e di conoscenza delle nuove soluzioni tecnologiche nonché i fattori che ne influenzano o inibiscono l'adozione. Il campione osservato è composto da 40 imprese, sui complessivi 85 operatori concessionari del Mof. Il primo item di rilevazione riguarda la composizione anagrafica del board; ciò in quanto uno dei fattori significativi per l'adozione delle tecnologie nel settore agri-food è legato all'età dell'agricoltore. L'analisi della letteratura, invero, evidenzia una relazione inversa tra l'età dell'agricoltore e la propensione dell'impresa a effettuare investimenti di medio-lungo termine, poiché, dati i ritorni economici più lontani nel tempo, tali operazioni risultano ad essi di scarso interesse economico. Ciò a significare che quanto più la composizione del board è giovane, maggiore è l'attitudine dell'impresa a adottare tecnologie innovative (Barham et al., 2004, Diederer et al., 2003). Ulteriore variabile è connessa al grado di istruzione; gli agricoltori più anziani tendono ad avere un grado di istruzione formale inferiore rispetto a quelli più giovani, ma possiedono un livello di esperienza lavorativa tale da renderli meno inclini alla ricerca di conoscenze e informazioni nuove provenienti dall'esterno (Bjerke e Johansson, 2022). Le conoscenze che l'azienda agricola possiede sulle nuove tecnologie sviluppano una correlazione positiva con la loro adozione, così come l'esperienza dell'agricoltore (Ayenew et al., 2020). L'analisi dei dati evidenzia che, sebbene il 45% degli intervistati abbia un'età compresa tra i 30 e i 40 anni, solo il 13% delle imprese intervistate hanno introdotto o stanno introducendo progetti basati sulle tecnologie abilitanti dell'Agricoltura 4.0 e Industria 4.0; ciò evidenzia come il settore agri-food sia ancora fortemente influenzato da logiche tradizionaliste che lasciano ancora poca apertura all'introduzione ed implementazione delle tecnologie abilitanti.

Il secondo item mirava ad indagare l'attività svolta dalle aziende intervistate nella value chain di riferimento. Dalle rilevazioni, le imprese del campione svolgono principalmente la funzione di "grossisti" (66%), mentre, quale categoria residuale, si rilevano imprese che operano in qualità di commissionari. Le interviste evidenziano come gli investimenti in tecnologia siano legati maggiormente alla volontà delle imprese di ampliare e rafforzare i canali commerciali o di distribuzione, a crearne di nuovi e più strategici (60% degli intervistati). È ulteriormente emerso che l'adozione di tecnologie innovative sia correlata alla necessità di incrementare la qualità della produzione ed ad una riduzione dei costi (46% degli intervistati). Solo il 26% investe in tecnologia con finalità di riduzione dell'impatto sociale, inteso come il miglioramento delle condizioni di vita e di lavoro degli addetti; da ciò ne si deduce come la dimensione sociale della sostenibilità non rappresenti, per ora, un obiettivo primario.

Un fattore che incide sulla bassa propensione all'investimento è dato dai legami di tipo sociale poiché la condivisione della conoscenza rappresenta una delle fonti di informazione più importante (Blash et al., 2022). La ricerca verso la transizione 4.0 si è sviluppata maggiormente in ambito di innovazione di processo, riferita alla funzione produttiva (60%) a fronte di un 40% che ha investito sull'innovazione di prodotto (beni e/o servizi). Gli investimenti connessi all'implementazione della tecnologia Industria 4.0, nella filiera agroindustriale nazionale, sono costituiti principalmente dal Cybersecurity e dal Cloud (Quattrococchi B. et al., 2022), tendenza confermata dalla survey con l'adozione di sistemi cloud per il 20% degli intervistati. Nonostante la tecnologia blockchain possa contribuire a garantire una maggiore tracciabilità di filiera ed una riduzione dei costi di transazione (Mercuri F. et al., 2021), l'indagine ha registrato la totale assenza di adozione di questa tecnologia. È plausibile affermare che esiste un legame tra la mancanza di formazione/competenze sulla tematica connesso alla diffidenza ad integrare la tecnologia nei processi aziendali. Infatti, il 30% dichiara che le maggiori criticità sono legate appunto alla mancanza di figure professionali adeguate ed alla scarsa o insufficiente assistenza in materia. Secondo l'indagine la fase produttiva maggiormente attratta dalla tecnologia è la logistica, in particolare le fasi di trasporto, l'immagazzinamento e la distribuzione dei prodotti alimentari. La corretta gestione della logistica permetterebbe di ridurre gli sprechi e i costi associati al trasporto e alla conservazione dei prodotti, aumentando al contempo l'efficienza del sistema e garantendo la massima qualità dei prodotti alimentari (Remondino et al., 2022). Saetta e Caldarelli (2020), per esempio, dimostrano come l'adozione di tecnologie digitali determini una maggiore efficienza nella catena del freddo, garantendo il mantenimento di una temperatura ottimale dei prodotti durante le diverse fasi operative.

Inoltre, l'utilizzo delle tecnologie 4.0 in agricoltura riduce l'uso di sostanze inquinanti per l'ambiente, apporta benefici a livello atmosferico, migliora la qualità del suolo e riduce l'inquinamento nelle falde acquifere (Mazzevoli et al., 2022). I limiti maggiori nell'adozione si riscontrano nella mancanza di adeguate competenze professionali in azienda, che pongano attenzione agli aspetti ambientali e che, in base al tipo di coltura, identifichino soluzioni tecnologiche che meglio si adattano al rispetto dell'ambiente (Sott K. et al., 2020). Una più sostenibile gestione della logistica contribuisce a ridurre l'impatto ambientale della produzione e distribuzione di prodotti alimentari, attraverso la riduzione della Carbon Foot Print (riduzione delle emissioni di CO₂) (Aloui et al., 2021).

Quanto su induce ad affermare che l'adozione di tecnologie digitali contribuisce all'aumento della redditività dei prodotti agricoli lungo l'intera catena del valore (Saini et al., 2022). Tecnologie, ad esempio, quali i droni, i sensori e

le immagini satellitari permettono agli operatori agricoli di monitorare con maggiore precisione i campi e di adottare decisioni operative informate sulla gestione delle colture. L'uso di tecnologie digitali può aiutare i produttori agricoli a gestire meglio le risorse idriche, che sono spesso limitate. I sensori possono rilevare l'umidità del suolo, consentendo ai produttori di irrigare solo quando è necessario, riducendo lo spreco di acqua e il costo dell'irrigazione (Spanaki et al., 2022). Ciò, associato ad un migliore utilizzo delle risorse, genera una maggiore produttività dell'impresa e, contestualmente, una più elevata redditività.

Inoltre, la tecnologia digitale può aprire nuove opportunità di mercato per i produttori agricoli. Ad esempio, i mercati online consentono ai produttori di attrarre clienti che altrimenti non sarebbero in grado di raggiungere, mentre le tecnologie di confezionamento e conservazione possono aumentare la shelf life dei prodotti, consentendo ai produttori di esportare in nuovi mercati.

Infine, è stato condotto uno studio, il quale dimostra che le dimensioni dell'impresa, le aspettative di ritorno della tecnologia, la disponibilità finanziaria posseduta e l'atteggiamento nei confronti dei progetti di ricerca, giocano un ruolo fondamentale nell'adozione delle nuove tecnologie (Barnes et al., 2019) infatti l'elevato costo iniziale d'investimento rappresenta un ostacolo così come confermato dai dati rilevati (41%).

È possibile affermare che la scarsa adozione di nuove tecnologie digitali che si riscontra nel settore agroalimentare può essere associata soprattutto alla mancanza di mezzi finanziari per sostenere l'investimento, alla scarsa redditività economica dovuta alle dimensioni del terreno o, infine, all'incompatibilità delle attrezzature (Zarco et al., 2014; OCSE, 2016).

Limiti della ricerca. Il presente contributo si basa su una analisi esplorativa qualitativa basata sui dati derivanti da una survey distribuita dagli autori. La somministrazione dei questionari e le interviste si trovano in una fase iniziale e si auspica si concluderanno nell'estate 2023. Il primo limite della ricerca è senza dubbio descritto nella rappresentatività del campione, la ricerca coinvolge per ora un numero limitato di partecipanti e quindi potrebbe non essere rappresentativa del gruppo che si sta analizzando. Poiché la ricerca coinvolge un campione limitato, i risultati potrebbero non essere generalizzabili ad altri settori o situazioni. La ricerca si basa sulla raccolta di informazioni soggettive dai partecipanti e quindi potrebbe non essere oggettiva come una ricerca quantitativa. Si propone una discussione di dati che derivano da aziende similari in termini economici e tutte localizzate nella provincia di Latina.

Questa ricerca richiederà tempistiche più lunghe e maggiore utilizzo di risorse rispetto ad una ricerca quantitativa, poiché coinvolge interviste, focus group e analisi del contenuto che vengono realizzate sul campo dagli autori stessi. Infine, a causa della natura altamente contestuale e situazionale della ricerca qualitativa, potrebbe essere difficile riprodurre gli stessi risultati in situazioni simili.

In ottica futura, si ipotizza di affiancare alla ricerca qualitativa uno studio quantitativo che amplierebbe la comprensione del fenomeno consentendo di esplorare in modo approfondito quanto in esame, poiché si combinerebbe l'approccio qualitativo, che si concentra sull'interpretazione e la comprensione dei significati, con l'approccio quantitativo, che si concentra sulla raccolta e l'analisi di dati numerici.

L'utilizzo di tecniche qualitative e quantitative in combinazione aiuterebbe a garantire la validità dei dati raccolti. Infatti, ricerche future potrebbero indagare un campione di aziende più ampio e diversificato. Infine, gli autori segnalano un'importante domanda di ricerca futura che potrebbe invertire il punto di vista dell'analisi ripartendo da una visione post-antropocentrica dettata dalla visione della natura non considerata più come una risorsa da cui trarre vantaggio ma come un sistema collaborativo in cui tre trend principali quali lo spazio fisico, lo spazio digitale e lo spazio psicologico coesistono e si implementano vicendevolmente per rispondere alle sfide di un futuro maggiormente desiderabile. Quindi, gli autori intendono stimolare la consapevolezza critica e la riflessione strategica, immaginando e definendo strategie e soluzioni anticipanti (prodotti, processi e servizi) volte a "ricostruire" i legami persi tra uomo e natura, tecnologia ed ecologia.

Implicazioni manageriali. L'adozione delle tecnologie nell'agricoltura e nella produzione alimentare ingloba in sé implicazioni manageriali che possono influenzare l'efficienza, la sostenibilità e la competitività dell'intera catena di approvvigionamento alimentare. Innanzitutto, l'adozione delle nuove tecnologie può consentire un miglioramento dell'efficienza operativa. Ad esempio, l'uso di strumenti di automazione e robotica può aumentare la velocità e la precisione delle operazioni di raccolta, semina, potatura, irrigazione e movimentazione delle merci. Inoltre, l'uso di sensori e dispositivi di monitoraggio può fornire ai manager informazioni in tempo reale sui dati di produzione, consentendo una migliore pianificazione e gestione delle risorse. In secondo luogo, le nuove soluzioni digitali possono contribuire a migliorare la sostenibilità ambientale dell'agricoltura e della produzione alimentare (Delgado et al., 2019). Ad esempio, le tecnologie di precisione possono aiutare a ridurre l'uso di pesticidi, fertilizzanti ed acqua, riducendo così l'impatto ambientale delle attività agricole. Inoltre, le energie da fonti rinnovabili possono aiutare a ridurre le emissioni di gas a effetto serra. In terzo luogo, l'adozione di tecnologie può giovare alla qualità e alla sicurezza degli alimenti (Feng et al., 2020). Inoltre, i sensori ed i dispositivi di monitoraggio possono aiutare a rilevare eventuali contaminazioni o difetti nella produzione alimentare, consentendo un'azione tempestiva per ridurre i rischi per la salute dei consumatori (Quattrocchi et al., 2022).

Infine, l'implementazione di soluzioni Agri4.0 induce le imprese ad essere maggiormente competitive sul mercato (Hermundsdtir et al., 2021). Infatti, l'uso di tecnologie innovative può consentire alle imprese di differenziare i propri prodotti rispetto alla concorrenza, aumentando la loro quota di mercato e la fedeltà dei clienti.

In conclusione, i manager del settore agri-food dovrebbero essere in grado di identificare le tecnologie che meglio si adattano alle esigenze della loro azienda e del mercato, sviluppando una strategia aziendale orientata alla creazione di valore.

Originalità del paper. *L'originalità del paper si fonda in primis sull'unicità dei dati raccolti presso le aziende afferenti al "sistema" MOF, la cui analisi potrà offrire un contributo e spunti di riflessione su diversi aspetti legati alla tematica trattata, tra cui:*

- *Innovazione tecnologica come mezzo utile ad una progettazione di nuovi metodi di produzione o di trasformazione degli alimenti che consentano di migliorare la qualità, la sicurezza e l'efficienza.*
- *Approccio integrato alla gestione dell'azienda agrifood. Gli autori hanno inteso considerare non solo gli aspetti tecnici della produzione, ma anche quelli finanziari, organizzativi, di marketing e di gestione delle risorse umane.*
- *Possibilità di svolgere un'analisi volta ad identificare le best practices e le sfide del settore, fornendo spunti per migliorare la gestione aziendale.*

In generale è intenzione degli autori delineare nuove sfide ed opportunità del settore, al fine di applicare metodi e strumenti di gestione innovativi e di fornire soluzioni pratiche e sostenibili per migliorare la gestione aziendale.

Parole chiave: *Agrifood, Industria 4.0, Sostenibilità, Nuove tecnologie digitali*

International Marketing and Spirituality: is there a relationship?

RAFFAELE CAMPO* PIERFELICE ROSATO* SAVINO SANTOVITO[♠] SILVIA GRAVILI**

Framing of the research. Defined by Cleveland et al. (2013) as the most pervasive and thorny element which affects consumer behavior, culture has significantly emerged as a decisive factor in international business. In fact, awareness of cultural differences across the world is essential in order to successfully penetrate different markets in the world (Steenkamp, 2001): on one side, international marketing strategies cannot be implemented, especially in some areas, with a lack of knowledge of local cultures; on the other, disregarding these differences can cause damages to a product or brand image.

Involving the most intimate part of a human being, religion is an important component of a people's culture (Cohen, 2009), as it embraces a system of values which affect cognition, attitudes, and behavior (Saroglou and Cohen, 2011). Research, to this end, has shown the influence of religion on consumer behavior (Essoo and Dibb, 2004): Owens (2015) studied religion as a determining factor for global strategies, while Agarwala et al. (2019) highlighted that faith affects some behaviors linked to materialism, intolerance, ethics, risk aversion and consumer attitude toward religious products and economic shopping behavior.

Insights of this relationship are provided by Izberk-Bilgin and Nakata (2016), who name this phenomenon as faith-based marketing and highlight the opportunity it provides for companies, and by Mathras et al. (2016), who reveal that religion affects consumer psychology and behavior through four dimensions: beliefs, rituals, values and community.

Interestingly, Singh et al. (2021) stress the differences between intrinsic and extrinsic religiosity, with the first one discouraging consumer indulgence in unrestrained buying, and similarly Arli et al. (2016) investigate how these kinds of religiosity impact on the attitudes towards luxury brands. Impact of religion is further visible on marketing mix, according to Hashim and Hamzah (2014), who asserts that the same mix can differ from the traditional one if applied to Islamic marketing; this, confirming Cornwell et al. (2005), who underline cross-cultural differences in terms of ethical positions among Christian, Muslim and Buddhist consumers. Religious percepts also impact on food habits and preferences (Pettinger et al., 2004) and this is particularly evident in Islam and Judaism, where the relevance of faith is further shown by different product characteristics required by consumers.

Purpose of the paper. Research on the relationship between religion and marketing is growing (Ogden et al., 2004) although it still is an under-researched topic in marketing (Cleveland et al., 2013). Research is also fragmented (Kumar et al., 2022), focused on single religions only and not on religion in general, or connected to social sciences, medicine and psychology, rather than marketing (Oviedo, 2016). To our knowledge, existing systematic reviews (Christofi et al., 2021) focused on international marketing does not explore the relationship with spirituality: specifically, the performance of religion and international marketing as a field of research remains unknown. On these premises, this research aims at systematically reviewing current research on international marketing and faith, considering the role of religion in driving marketplaces dynamics (Cruz et al., 2018), and that of culture in international business (Lopez-Duarte et al., 2016). This, to generate new knowledge on the state of art for academics and practitioners, identify eventual research gaps and suggest future research perspectives. On these premises we selected articles that:

- 1) specifically interconnect international marketing with religion;
- 2) describe how faith impact on international marketing strategies;
- 3) focus on Christianity, Islam, Judaism, Hinduism and Buddhism;
- 4) are published in top marketing journals.

Articles focused on culture in general were not considered, as well as those with no international perspective. No differences were applied between the companies and consumers sides.

Methodology. To investigate the existing evidence, we applied the methodology of systematic review, following the stages described by Tranfield et al. (2003): planning, conducting, reporting, dissemination.

Once defined our research question, whose answer has to clarify how current literature explains the relationship between international marketing and religion, we started to select the papers on EBSCOhost Research Database, due to its coverage of relevant disciplines (Christofi et al., 2021; Bhimani et al., 2019). The research strings we considered are these ones: religion OR religious OR church OR mosque OR synagogue OR temple OR Christian OR Muslim OR Islam OR Jewish OR Sikh OR Buddhism OR spirituality OR religi* OR faith AND marketing OR customer OR consumer OR export OR market OR entry OR internationalization OR network OR innovation OR product OR price OR promotion OR distribution OR channel OR brand OR Internet OR international marketing OR finance OR banking.

Tab. 1: Source of the selected keywords

Keyword used (in detail)	Source
“religion”, “religious”, “church”, “mosque”, “synagogue”, “temple”, “Christian”, “Muslim”, “Islam”, “Jewish”, “Sikh”, “Buddhism”, “spirituality” are from	Tracey (2012)
“religi*”, “faith” and “spiritual”	Kumar et al. (2022)
“marketing”, “customer”, “consumer”, “export”, “market”, “entry”, “internationalization”, “network”, “innovation”, “product”, “price”, “promotion”, “distribution”, “channel”, “brand”, “Internet” are from	Christofi et al. (2021)
“international marketing”, “finance” and “banking”	Battisti et al. (2021)

Results. Once selected the keywords, we established the following inclusion and exclusion criteria, in coherence with the leading systematic review (Vrontis and Christofi, 2019):

- 1) academic peer-reviewed articles related to marketing area were included, excluding books, book chapters, magazines, and editorials;
- 2) academic papers written in English and published on peer-reviewed top journals were selected, with reference to ABS (Association of Business Schools' Academic Journal Guide, www.charteredabs.org) 3, 4 and 4* ranking. This, in order to be methodologically rigorous and guarantee the selected papers are the best in terms of quality and in terms of debate among scholars (Christofi et al., 2019).

Finally, all the data were extracted and analyzed systematically by an analytical and deductive approach. This suggests that research is at an early stage (Younis et al, 2022; Kumar et al., 2022).

Our final sample consists in 36 articles (35 from database research + 1 from cross-reference).

With regards to publication outlets, the Journal of Business Research is the host journal for religion and international marketing papers (n=8, 20.5%), followed by the Journal of Business Ethics (n=5, 12.8%), and the Journal of Consumer Research, which published 3 articles (7.7%); then, the International Marketing Review, Marketing Theory, the European Journal of Marketing and the Journal of World Business, both hosting 2 manuscripts (5.1%). In details, the Journal of Business Research published on Religion and Consumption and Consumer Behavior in International markets (Sood and Nasu, 1995), International Marketing Communication (Iyer et al., 2014), Ethnic identity and religiosity (Cleveland and Chang, 2009) and Religion in multicultural marketplaces (Cruz et al., 2018). The Journal of Business Ethics published papers on the role of Spirituality in International Business Ethics (Jackson, 1999), Religion and International Market Entry (Ning, 2008), the role of Moral for Business Leaders (Thompson, 2010) and, like the previous journal, Consumers' faith and International business decision (with a Christian perspective in Swimberghe et al., 2011, and a Muslim one in Tsalikis and Lassar, 2009). With regards to the Journal of Consumer Research the focus is Religion and International Firms or Brands (Hyodo and Bolton, 2021). We identified 71 different authors from 15 different countries. Only three authors appear to have published 2 papers based on religion, that are Jafari Aliakbar, Özlem Sandıkçı, and Mark Cleveland. Considering the first author's institutions, we find that American Universities are the most represented (15.49% n= 11 authors), followed by the United Kingdom (14.08%, n= 10 authors) and Canada (5.63%, n= 4 authors). Other contributions come from Pakistan, Australia, Egypt, Malaysia, Turkey, the Netherlands, China, Qatar. With reference to the number of authors, most of the papers are co-authored by two authors (36.1%, n=13) or are one-author article (33.3%, n=12). In 25% of the sample the authors are 3, while only 5.55% of the papers are coauthored by 4 scholars.

Not surprising, considering the topic, that most of the papers are written by authors based in different countries (44.4%, n=16), then there are the articles written by only 1 author (33.3%) and those published by scholars who work in the same country (22.2%, n=8).

In terms of citation index, which is a relevant tool of measurement of manuscript quality and its contribution to current knowledge the most cited papers are:

- 1) Belk et al. (1989): 963
- 2) Dow and Karunaratna (2006): 432

In terms of methodologies adopted, most of the considered papers are quantitative studies (44.44%), followed by qualitative ones (27.78%), conceptual/theoretical papers (19.44%), literature reviews (5.55%) and editorial (2.78%). It is evident that quantitative studies are well distributed along the period 1987-2021, with a peak in 2013, despite concentrated to two main journals, which are Journal of Business Research and Journal of Business Ethics. Qualitative papers are, furthermore, present especially in the two-years period 2006-2007 and 2013-2014. In terms of journals, there are few publications on this topic (per journal) and, usually, limited to 1-2 articles since 1987 to 2021. Empirical evidence along with theoretical insights suggest the important role of religion in international marketing processes among different cultures. Despite this, research seems to be concentrated to Christianity and Islam and there is little

work in marketing or management (Li, 2008). It is relevant, therefore, to push the research to a more focused investigation on implications for companies, also considering the increasing number of them entering the global market through cross-borders alliances (Li, 2008) and the particular sensitivity required for accessing markets by leading on faith and spirituality (Longenecker et al., 2004). As underlined by Cleveland et al. (2013), religion affects consumers towards brands and products, even though Cruz et al. (2018) revealed that some companies avoid considering its marketing influence and ignore its role in facilitating entry in different marketplaces. Younis et al. (2022) considered religion as one of the most relevant forces of internationalization, especially for SMEs; in the same way, Richardson (2014) underlined the role of religion in reducing cultural distances between countries in the internationalization process, specifically in this case with reference to Islam, and Beugelsdijk et al. (2017) demonstrated how cultural differences could affect subsidiary performances. Kuzma and Kuzma (2009), moreover, indicated the need for further research, especially with regards to the role of spirituality in driving consumers' choices.

To better comprehend the international marketing content of our sample we applied the pattern-matching technique (Crossan and Apaydin, 2010), finding subjects to match to international marketing. Considering that marketing is a large field of research, we used the scheme developed by Rodriguez Cano et al. (2004) and by Christofi et al. (2021). This is useful to explore the aspects of religion present in international marketing strategies. Morality (Horner and Bordelon, 2006; Thompson, 2010) and spirituality (Jackson, 1999) are founded to be the drivers that affect international strategies, with their role in discriminating what actions are tolerable and what not. Specifically, the topic of morality is linked to globalization (Demangeot et al., 2015), which presents moral challenges connected to social issues, such as economic inequity, human rights, in particular for the Hebrew, the Arabic and the Hindu faith.

Spirituality, on the other side, is conceived as the foundation of freedom and creative imagination in international business ethics (Jackson, 1999) given its influence on consumer behavior (Kumar et al., 2014).

Both morality and spirituality play a key role in the implementation of international marketing process and in managerial practices, in particular relating to decisions on market entry.

As a matter of fact, Li (2008) highlights that when partners are from Christian countries, they should consider religious moral restraints, which may limit opportunism and, of consequence, transaction costs, and improve trust between them. On the contrary, when partners are from atheist countries, opportunistic behaviors could be mitigated through organizational control (e.g. joint ventures). Moreover, spirituality impacts on networks' participants, specifically on their contribution and demand (Kurt et al., 2020) as spiritual values can develop trust and reducing differences in case of home and host countries context (Lo Turco and Maggioni, 2018). In terms of consequences, different religions can impact differently on consumer behavior (Sood and Nasu, 1995) and advertising effects (Fam et al., 2004), with brand concept being influenced by religious values (Hyodo and Bolton, 2021; Minton et al., 2022). Scarce attention has been given to American and European contexts, which means that there is room for further research. Unfortunately, there is not abundant presence of comparative studies, and papers on the impact of Islam represent the majority of the selected articles.

Research limitations. This systematic review is not without limitations. The same nature of the systematic review has its own limits, first of all because it is not a detailed review, and this should inspire new research to deepen the findings of this articles. In addition, we selected the articles by using only three databases (Science Direct, Emerald and Web of Science) which cannot represent the whole scientific production about religion and international marketing. Besides, we excluded articles written in languages different from English, meaning that some important articles could have been ignored.

Moreover, some papers could have been overlooked, especially in the filtering phase. Finally, we selected articles which strictly reported precise references to religion and international marketing in the title and in the abstract: however, this does not ensure that all the relevant articles have been selected.

Once clarified the limitations, it is evident that this study can provide theoretical and practical implications.

Managerial implications. Opportunities for international marketers also emerge from this systematic review. In particular most of the selected studies highlights the sensitivity to religious norms in Muslim countries, even though differences could be among them, while having marketing relationships (Cosgrave and O'Dwyer 2020, underline that, by comparing different religious subjects, Muslims were the most influenced by faith-deriving beliefs). This is particularly important also considering that Islam is one of the most widespread faiths in the world, covering different geographical areas, from some parts of the Balkans to North Africa, from the Middle East to South-East of Asia.

Other religions should also be considered when relating to other cultures (Sood and Nasu, 1995) whose research highlight the relevance for American Protestants, also in terms of environmental concern (Felix et al., 2018).

It is clear that marketers should not ignore religion effects when concretizing international marketing strategies and, practically, faith is a key factor to relate with different cultures.

Originality of the paper. The connection between international marketing and religion, through a systematic review, represents the originality of this study. As a matter of fact, there is scarce attention, currently, to study this relationship with this methodology. Research on the impact of culture for marketing is fundamental, and this is particularly true with regards to religion as well. This is the reason why research on religion and international marketing is increasing, despite there is need for further research, also observing the variety of faiths in the world and the different impact they can have. In an international perspective, studies on Christianity influence would play an important role, considering that it is widespread in Europe, Northern and Latin America, Oceania, and Philippines.

Deeper research should also regard Eastern religions, considering the emerging role of the Eastern economies (e.g., China, Japan and India) in world economy. For example, Lu and Wu (2020) studied the impact of Buddhism in

private firms in China, with findings revealing that religious entrepreneurs have higher accounting performances and spend more in safety for employees: further research should consider a similar analysis, from Chinese consumers' point of view of.

The role of spirituality and religion, in addition, is deeply felt in India (Suchday et al., 2018, Kattimani, 2012): spirituality is an essential part of Indian culture, and this is visible also in tourism marketing (the state of Kerala markets itself as "God's own country", as observed by Bandyopadhyay and Nair, 2019) and India is considered the favorite spiritual destination for Western tourists (Norman, 2012).

Keywords: Spirituality, religion, International marketing, International Business, culture

Investigating the interdependence of innovation and internationalization

MARIASOLE BANNÒ* EMILIA FILIPPI* CHIARA LEGGERINI[♠]

Framing of the research. *Innovation and internationalization are two key strategies for firms to achieve success and stable and sustainable long-term growth (e.g., Audretsch et al., 2014; Filipescu et al., 2009; Golovko and Valentini, 2011; Zona et al., 2022). According to some authors (e.g., Ruzzier et al., 2013), innovation and internationalization are “inseparable paths”.*

Innovation encompasses the investments and activities aimed at the implementation of a new product (good or service), or process, or firm organizational method, or relationships with stakeholders and is related to the firm’s ability to utilize its existing knowledge base and to acquire knowledge from external sources by means of imitation, licensing, partnerships or acquisitions (Baregheh et al., 2009). Instead, internationalization refers to decisions and operations through which a firm expands its business abroad or its involvement in international markets (Johanson and Vahlne, 1990).

Previous literature indicates that innovation is a driver for internationalization as well as internationalization is a driver for innovation.

Innovation as a driver for internationalisation. Innovation promotes firm internationalization and performance (Henley and Song, 2020; Kyläheiko et al., 2011).

Innovation is essential for competing abroad given the higher competitiveness in international markets (Bannò et al., 2011). In fact, innovation increases firms’ global competitiveness and facilitates foreign market penetration through higher proprietary advantages, the creation of new and superior products, and the development of useful skills (e.g., Filipescu et al., 2009).

At the same time, innovation favours internationalization: innovation provides firms with unique competitive and cost advantages, which can be exploited when internationalizing (Kafouros et al., 2008, Bagheri et al. 2019). Moreover, innovation also increases opportunities and competitiveness when internationalizing (e.g., Ciocanel and Pavelescu, 2015). Finally, successful product innovation increases a firm’s involvement in international markets (Cassiman and Golovko, 2011, Falahat et al., 2020).

Innovation may require inputs from abroad eventually through partnerships with foreign firms, which in turn may increase market information and encourage exports (Hessels, 2007, Moreno-Menéndez, 2018).

Internationalization as a driver for innovation. Internationalization enhances firm experience, innovation capacity and innovation performance since it enables firms to access a wide range of resources, knowledge, and ideas (e.g., Golovko and Valentini, 2011; Boermans et al. 2015). These inputs flow from several countries and a broader group of experts and can also be acquired from the cheapest available sources (e.g., Dabic et al., 2012, Kordos et al., 2016).

Internationalization helps firms to reduce business risks (e.g., risk of economic recession) as well as the risk associated with innovation (e.g., risk of unsuccessful outputs) since firms serve several markets and offer their products to a wider range of customers (Kafouros et al., 2008). Firms can also enhance their profits from innovation efforts and spread innovation costs as well as maximize the benefits derived from R&D investments (Kafouros et al., 2008, Si et al., 2020).

However, internationalization may negatively impact innovation by increasing the risk of knowledge leakage (i.e., the costs of outgoing spillovers may outweigh the benefits from incoming spillovers) and by increasing the costs of coordinating and controlling a global network (Álvarez et al., 2016).

Purpose of the paper. *The causal relationship between innovation and internationalization is controversial (Damijan et al., 2010, Li, 2020). According to some authors, these two strategies are mutually reinforcing in the sense that innovation eases internationalization as well as internationalisation induces innovation (e.g., Hagen et al., 2014; Halilem et al., 2014). Instead, other authors find an insignificant or even negative relationship between the two strategies (e.g., Hitt et al., 1997).*

A clear and well-recognized causal relationship between innovation and internationalization has not been identified and there is not consensus on the direction of such association: these two strategies are important and determinant for each other and neither of the two seems to prevail on the other (Alarcón Osuna, 2014). Given that previous studies are inconclusive regarding the relationship between innovation and internationalization, further research is desirable.

This research aims to investigate the mutual relationship between innovation and internationalization by applying a structural equation modeling to a database of 20,509 Italian firms. Preliminary results show that innovation has a positive and significant effect on internationalization and vice versa.

Methodology. To examine the relationship between multiple dependent variables the Structural Equation Modeling (SEM) can be used (Ullman and Bentler, 2012). SEM is a type of statistical model that is made up of multiple equations. These equations involve different types of variables, such as random variables (like latent variables, observed variables, and disturbance variables), non-random variables, and structural parameters. In other words, SEM models are composed of a set of equations that describe the relationships among multiple variables, some of which are randomly determined and some of which are not (Bollen, 1989).

Our purpose is to assess how innovation and internationalization affect each other, and so they will be considered as both dependent and independent variables. The study could be complex, but through the SEM model it is possible to take into account the presence of latent variables (unobservable and unmeasurable variables) and carry out a bidirectional study (Maruyama, 1997).

To assess the mutual effect between innovation and internationalization, we decided to use cross sectional data containing the information of 20,509 firms in 2019 and 2020. The data concerning the degree of internationalization of Italian firms were taken from Reprint (Mariotti and Mutinelli, 2017) and the specific data of a firm (e.g., age, location, economic and financial data) were extracted from the Orbis Bureau van Dijk database (Orbis Intellectual Property for data regarding innovation). Table 1 shows the dependent and independent variables of the realized models with indication of the definition and source.

Tab. 1: Description and sources of variables used

Variable	Definition	Source
Dependent Variables		
Innovation <i>t</i>	Logarithm of the number of patents registered by an enterprise until time <i>t</i>	Orbis Intellectual Property
FDI <i>t</i>	Logarithm of the number of FDI made by an enterprise until time <i>t</i>	Reprint
FDI acquisition <i>t</i>	Logarithm of the number of FDI acquisition category made by an enterprise until time <i>t</i>	Reprint
FDI greenfield <i>t</i>	Logarithm of the number of FDI greenfield category made by an enterprise until time <i>t</i>	Reprint
Independent Variables		
Innovation <i>t-1</i>	Logarithm of the number of patents registered by an enterprise until time <i>t-1</i>	Orbis Intellectual Property
FDI <i>t-1</i>	Logarithm of the number of FDI made by an enterprise until time <i>t-1</i>	Reprint
FDI acquisition <i>t-1</i>	Logarithm of the number of FDI acquisition category made by an enterprise until time <i>t-1</i>	Reprint
FDI greenfield <i>t-1</i>	Logarithm of the number of FDI greenfield category made by an enterprise until time <i>t-1</i>	Reprint
Firm dimension	Logarithm of the revenue	Orbis
Firm age	Logarithm of number of years since firm foundation	Orbis
ROE	Return on equity, given by net income on equity	Orbis
Tangibility	Tangible fixed assets out of total	Orbis
Labour cost per employee	Logarithm of labour cost per employees	Orbis
North Italy	Dummy variable equal to 1 if the firm is located in North Italy, and 0 otherwise	Orbis
Pavitt science based	Dummy variable if the firm is in a science based industry, 0 otherwise	Orbis
Pavitt specialized supplier	Dummy variable if the firm is in a specialized supplier industry, 0 otherwise	Orbis
Pavitt scale and information intensive	Dummy variable if the firm is in a scale and information intensive industry, 0 otherwise	Orbis
Pavitt suppliers dominated	Dummy variable if the firm is in a supplier dominated industry, 0 otherwise	Orbis

Source: Our elaboration

As a dependent variable for the first equation, assessing the impact of internationalization on innovation (Model 1a, 1b and 1c), we considered Innovation, corresponding to the logarithm of the total patents registered by the firm until 2020 (De Beule et al., 2007). To measure the degree of Internationalization, we considered the logarithm of the total FDI performed by a firm until 2019 (Zona et al., 2022). In particular, we used the total FDI in Model 1a, the total FDI in the acquisition category in Model 1b, and the total FDI in the greenfield category in the Model 1c. We took into account the characteristics of the firms under study using the following variables: Firm dimension representing the logarithm of firm revenues in 2020 (Riahi-Belkaoui, 2001), Firm age representing the logarithm of the number of years since firm foundation (Hölzl, 2014), ROE (return on equity, given by net income on equity) in 2020 as an indicator of firm performance, Tangibility given by the ratio of tangible fixed assets to total fixed assets in 2020 (Albaity and Ho Sel Chuan, 2013). To consider the context where the firm is located, the variable North Italy (dummy variable equal to 1 if the firm is located in Central Italy, and 0 otherwise) was used in line with Wright et al. (2007). We also considered a dummy variable to indicate the affiliation of a particular industry sector by following the Pavitt Taxonomy (Bogliacino

and Pianta, 2016; Pavitt, 1984): Pavitt suppliers dominated, Pavitt scale and information intensive, Pavitt specialized supplier and Pavitt science based.

In the second equation, we considered FDI (Model 2a), FDI acquisition (Model 2b) and FDI greenfield (Model 2c) as dependent variables. These three variables represent respectively, the logarithm of the total FDI performed by a firm until 2020, the logarithm of the total FDI performed in the category acquisition by a firm until 2020 and the logarithm of the total FDI performed in the category greenfield by a firm until 2020. To take into account the characteristics of the firms under study, the following variables were considered: Firm dimension, Firm age, ROE, Tangibility, measured as in equation one, and Labour cost per employee measured as the logarithm of the cost of a worker incurred by the firm in 2020. As in the first equation, we considered North Italy and Pavitt Taxonomy classification.

Formally, we use the following interaction models:

Model 1 Innovation = f(Internationalization t-1, Firm dimension, Firm age, ROE, Tangibility, North Italy, Pavitt science based, Pavitt specialized supplier, Pavitt scale and information intensive, Pavitt suppliers dominated)

Model 2 Internationalization = f(Innovation t-1, Firm dimension, Firm age, ROE, Tangibility, Labour costs per employee, North Italy, Pavitt science based, Pavitt specialized supplier, Pavitt scale and information intensive, Pavitt suppliers dominated)

Results. Table 2 shows the regression results of the preliminary analysis.

Tab. 2: Regression results

VARIABLES	Model 1a First equation Innovation t	Model 2a Second equation FDI t	Model 1b First equation Innovation t	Model 2b Second equation FDI acquisition t	Model 1c First equation Innovation t	Model 2c Second equation FDI greenfield t

Source: Our elaboration

Considering the first equation in Model 1a (impact on Innovation), it emerges that FDI t-1 has positive and significant coefficient (b=0.367 and p<0.01), in Model 1b (impact on Innovation) FDI acquisition t-1 has positive and significant coefficient (b=0.418 and p<0.01) and in Model 1c (impact on Innovation) FDI greenfield t-1 has positive and significant coefficient (b=0.415 and p<0.01).

Considering the second equation in Model 2a (impact on FDI) it emerges that Innovation t-1 has positive and significant coefficient (b=0.049 and p<0.01), in Model 2b (impact on FDI acquisition) has positive and significant coefficient (b=0.022 and p<0.01) and in Model 2c (impact on FDI greenfield) has positive and significant coefficient (b=0.045 and p<0.01).

Firm dimension has a positive and significant coefficient ($p < 0.01$) in Model 1a, 2a, 1b, 2b, 1c, 2c (respectively $b = 0.068$, $b = 0.027$, $b = 0.076$, $b = 0.010$, $b = 0.069$ and $b = 0.022$). Also Firm age has a positive and significant coefficient ($p < 0.01$) in Model 1a, 2a, 1b, 1c, 2c (respectively $b = 0.041$, $b = 0.010$, $b = 0.046$, $b = 0.041$ and $b = 0.009$) in Model 2b is non significant. ROE has a positive and significant coefficient in all the Models and Tangibility has a negative and significant coefficient in all the Models.

Labour cost per employee was considered only in the second equation and it has a positive and significant coefficient ($p < 0.01$) in Models 2a, 2b, 2c (respectively $b = 0.084$, $b = 0.024$ and $b = 0.064$).

As regards the other variables, North Italy has a positive and significant coefficient in Models 1a, 2a, 1b, 1c, 2b, while in Model 2b is positive and non-significant. The differences in terms of Pavitt Taxonomy classification have an effect on performance, Pavitt science based has a positive and significant coefficient in all the Models except for Model 2a where it is negative and non-significant. Pavitt specialized supplier and Pavitt scale and information intensive are positive and significant in all the Models. In the end, Pavitt suppliers dominated is non-significant in all the models.

Research limitations. This research has some limitations. First, our research relies on cross sectional data to examine the mutual relationship between innovation and internationalization. The use of this type of data does not allow to examine the relationship over time and thus understand the timing with which innovation and internationalisation promote and influence each other. Second, the database comprises only Italian firms and their subsidiaries. Therefore, our results may not be extendable to firms operating in other countries. These firms face a different institutional and economic context that may induce or hinder them to innovate and internationalize to a different extent than Italian firms. Second, the impact only on acquisition and greenfield FDI was analysed. Future studies might also consider the impact on majority and minority FDI.

Managerial implications. From a managerial perspective, innovation and internationalization are key strategies for the long-term growth and prosperity of firm. Firms are faced every day with making strategic decisions to expand their business, taking into account the positive and negative effects that internationalisation and innovation can have on business development. This research aims to support the manager in making strategic choices by studying the simultaneous interaction of these two phenomena and demonstrating that investing simultaneously in innovation and internationalization can bring concrete benefits in these two aspects that are fundamental to maintaining competitiveness in the market. In particular, this phenomenon is found in both acquisitions and greenfields, the main methods of internationalization found in the selected sample.

Originality of the paper. Previous studies show that the relationship between innovation and internationalization is not clear. Moreover, these two factors have always been studied unidirectionally. Given the growing importance of innovation and internationalisation as strategic factors for firm growth, it is important to understand their mutual interaction. This research started from these considerations to investigate the mutual relationship between innovation and internationalization by applying a structural equation modeling to a database of 20,509 Italian firms. We found that innovation has a positive and significant effect on all types of foreign direct investment and total investment, indicating how innovation is an important and competitive factor for growth in foreign markets. On the other hand, it can be seen that foreign direct investment also has positive and significant effects on innovation. This indicates the fact that new opportunities and new knowledge can be found abroad due perhaps to a different cultural.

This research is among the few that examine the mutual relationship between innovation and internationalization, an issue that deserves further investigation.

Key words: innovation; internationalization; mutual relationship; structural equation model

The role of country-of-origin in the relationship between sustainability and consumers' willingness to pay for a brand

MARIA GABRIELA MONTANARI* MICHELA MATARAZZO* ADAMANTIOS DIAMANTOPOULOS[♠]

Framing of the research. *This research integrates two influential research streams in marketing: country-of-origin (COO) and sustainability.*

Purpose of the paper. *This paper investigates the impact of sustainability labels and COO on consumers' willingness to pay (WTP) for a brand.*

Methodology. *Two experimental studies with apparel as the focal product category (Study 1: T-shirts; Study 2: Sneakers) are conducted.*

Results. *Findings show that differences in country image favorability do not always translate into significant differences in consumers' WTP. While a positive effect of COO favorability on WTP is found in Study 1, this effect is not replicated in Study 2. However, in both studies, a sustainability label increases consumers' WTP for the less favorable COO but does not affect consumers' WTP for the more favorable COO.*

Research limitations. *The current study is inevitably limited by the set of respondents, COOs and sustainability labels chosen. No moderators (e.g., consumers' skepticism or credibility of the label) were included in this paper.*

Managerial implications. *Managers can easily communicate a favorable COO at a low cost; however, not always a price premium can be implemented. Sustainability labels should be communicated particularly for brands from less favorable COOs and these brands should consider implementing a price premium strategy based on the use of this label.*

Originality of the paper. *Despite the relevance of sustainability to consumers, companies and countries, empirical evidence on its interaction with country-of-origin (COO) is still limited, particularly considering consumers' price responses.*

Keywords: *sustainability; country of origin; willingness to pay*

1. Introduction and Objectives

The importance of sustainability, that is, the focus to deliver value to consumers based on economic, social and environmental aspects (Elkington, 2004) is increasing. Consumers are demanding sustainable products (Petro, 2022), companies are adopting sustainability initiatives (Chernev and Blair, 2021) and countries are promoting sustainable development (Dekhili et al., 2021). In this context, country-of-origin (COO), namely "the country in which the product is manufactured or assembled" (Hamzaoui-Essoussi and Merunka, 2007, p. 412) is increasingly becoming part of consumers' evaluations of sustainable products (Dekhili and Nguyen, 2021) since the provenance of a product may directly involve sustainability issues (e.g., long-distance shipments or working conditions in different countries).

As a result of these developments, there has been growing interest on the link between COO and sustainability in recent years. Research has focused on country green/ecological image (e.g., Chan, 2000; Dekhili et.al, 2021), country-of-origin sustainability reputation (e.g., Cowan and Guzman, 2020), and eco-certification origin (Dekhili and Nguyen, 2021). The relative importance of COO versus sustainable product attributes in consumer decision making (e.g., Brand and Rausch, 2021) and the interaction between COO and social corporate responsibility (e.g., Magnusson et al., 2015) have also been investigated.

Most studies linking COO and sustainability employ "soft" consumer responses (e.g., brand attitudes or purchase intentions) as outcome variables. Using such outcomes, however, ignores the so-called 'attitude-behavior gap' in sustainable purchasing behavior (Wiederhold and Martinez, 2018) since "sustainability attributes do not always drive consumer choice even when consumers value sustainability attributes positively" (Bangsa and Schlegelmilch, 2020, p.2, added emphasis). Price-related outcomes, on the other hand, are closer to actual behavior and include the sacrifice

incurred by the consumer when actually purchasing a brand (Monroe, 2003). This is important as consumers can have positive attitudes towards sustainable products, but may not be willing to bear additional costs to obtain them.

Against this background, we empirically examine the impact of sustainability and COO on consumers' willingness to pay (WTP), namely "the maximum amount of money a customer is willing to spend for a product or service" (Homburg et al., 2005, p. 85). Specifically, we add to extant literature by investigating whether consumers are (un)willing to pay a price premium for a sustainable product and whether the relationship between sustainability and WTP is influenced by COO favorability. Our findings should be of value to international marketing managers seeking to capitalize on sustainability claims and product origin associations when developing their pricing strategies.

2. Conceptual framework

We draw on signaling theory (Erdem and Swait, 1998) to develop our hypotheses. According to this theory, due to imperfect and asymmetric information, individuals make decisions based on the signals (i.e., informational cues) they receive. Companies convey information about their specific characteristics, such as reputation and product features, to achieve competitive advantage and consumers examine such signals when making their purchase decisions (Erdem et al., 2006). Signals should be credible, non-ambiguous and consistent over time and over markets (Erdem and Swait, 2016).

COO is as an extrinsic cue that acts as a signal and affects consumers' responses (Lu et al., 2016). Therefore, a more (less) favorable COO should increase (decrease) consumers' willingness to pay (WTP) as a result of a positive (negative) signal reaching the consumer. Several studies also indicate a positive relationship between country image favorability and consumers' price responses (e.g., Drozdenko and Jensen, 2009; Koschate-Fischer et al., 2012; Siew et al., 2018). We thus expect that:

H1. COO favorability will have a positive effect on consumers' WTP for a brand.

Sustainability labels are also extrinsic cues used by consumers when making decisions regarding sustainable products (Lee et al., 2020). As consumers value sustainability attributes (Bangsa and Schlegelmilch, 2020), we argue that using a sustainability label should increase consumers' WTP because the brand is conveying a positive signal to the consumer. Furthermore, we posit that this positive effect depends on country image perceptions in that eco-labeled products are not expected to be equally evaluated for brands originating from a more versus a less favorable COO. In line with signaling theory, we propose that a sustainability label will provide a boost to consumers' WTP for brands from a strong COO as it adds to an existing positive signal, enhancing credibility. In contrast, a sustainability label (positive signal) provides a conflicting information to that provided by a weak COO (negative signal), creating ambiguity and a less credible signal overall as incompatible information signals are juxtaposed.

The above argument is reinforced by extant literature, that not only suggests a positive impact of eco-labeled products on consumers' WTP (e.g., Del Giudice et al., 2018; Laroche et al., 2001) but also shows that a brand engaged in corporate social responsibility is evaluated more favorably if it originates in a more (versus a less) favorable COO (Magnusson et al., 2015). We thus hypothesize that:

H2. The use of a sustainability label will increase consumers' WTP only for a brand from a more favorable COO.

3. Method

To test our research hypotheses, we conducted two online experimental studies with Austrian consumers ($N_1 = 123$; $N_2 = 124$). Both studies employed a three-group, between-subjects design. However, within each group, respondents were exposed to two brands differing in their COO and/or presence/absence of a sustainability label (see Figure 1). Specifically, the first experimental group was exposed to two brands differing in their product origin (more favorable vs. less favorable) but including no sustainability information. The second group was exposed to a brand from a more favorable country without a sustainability label and a brand from a less favorable country but with such a label. Finally, the third group was exposed to a brand from a more favorable country with a sustainability label and a brand from a less favorable country without any label.

Fig. 1: Experimental design

	Country-of-origin		Sustainability
Experimental group 1	Less favorable country +	More favorable country +	
	No label	No label	
Experimental group 2	Less favorable country +	More favorable country +	
	Sustainability label	No label	
Experimental group 3	Less favorable country +	More favorable country +	
	No label	Sustainability Label	

We selected apparel (Study 1: T-shirts; Study 2: Sneakers) as the focal product category since companies' sustainability initiatives and consumers' interest in purchasing from ethical and transparent businesses are growing in this industry (Byrd and Su, 2021). We opted for fictitious brand names (Study 1: "D2A" and "L7P"; Study 2: "D2R" and "Y2K") to eliminate confounding effects on WTP due to brand equity and familiarity (Dimofte et al., 2008).

Sustainability information was manipulated with a Fairtrade label in Study 1 and a Carbon Trust Footprint label in Study 2. We selected these labels in an effort to cover both social and environmental aspects of sustainability. The Fairtrade label stands for fairly produced and fairly traded products (Fairtrade, 2022). While buying these products, consumers support both environmental and social causes, such as responsible water and waste management, fair wages, and prohibition of child labor (Fairtrade, 2022). The Carbon Trust Footprint label, on the other hand, is strictly associated with environmental concern, as it captures the total greenhouse emissions generated by a product, from extraction of raw-materials through its whole life cycle (Carbon Trust, 2022).

To manipulate COO information, a "made in" claim was employed.

The chosen country pairs (Study 1: Italy and China; Study 2: USA and Greece) were expected to differ substantially in terms of their country images (subsequently confirmed by manipulation checks) and have indigenous production of the products under study, making them realistic origins for the stimuli brands.

Following random allocation to the experimental conditions, consumers answered the four price questions (too cheap, cheap, expensive and too expensive) on Van Westendorp's (1976) Price Sensitivity Meter, stating the relevant amounts in Euros; WTP was computed as the average of the expensive and too expensive prices (see Diamantopoulos et al., 2021).

Next, only in those experimental conditions which did include a sustainable label, participants stated their recognition of, and familiarity with the label. They also completed established scales on country image (Roth and Romeo, 1992; $\alpha_{ITALY} = 0.53$, $\alpha_{CHINA} = 0.58$, $\alpha_{USA} = 0.82$, $\alpha_{GREECE} = 0.77$); product category involvement (Mittal and Lee, 1988; $\alpha_{STUDY1} = 0.87$, $\alpha_{STUDY2} = 0.85$); price sensitivity (Wakefield and Inman, 2003; $\alpha_{STUDY1} = 0.82$, $\alpha_{STUDY2} = 0.82$); and cause involvement (Hill and Lee, 2015; $\alpha_{STUDY1} = 0.93$, $\alpha_{STUDY2} = 0.87$), the latter construct capturing the significance attached by consumers to environmental and social issues.

4. Findings

4.1. Study 1

A paired-samples *t*-test across all experimental conditions showed that Italy's country image ($M_{ITALY} = 5.67$) was perceived as being significantly more favorable than China's ($M_{CHINA} = 3.42$; $t(98) = 19.83$, $p < 0.001$); thus the COO manipulation was successful. Also consistent with expectations, respondents were found to be familiar with the Fairtrade label, scoring well above the mid-point on the relevant seven-point scale ($M = 6.09$, $SD = 1.15$). Moreover, the majority (81.9%) accurately associated the label with both social and environmental concerns, thus further confirming the successful manipulation of sustainability through this label.

To investigate the COO effect on consumers' WTP, we conducted a paired samples *t*-test within the first experimental group, which allowed the comparison of the WTP for the two T-shirt brands differing only in terms of their origin (Italy and China). As expected, consumers showed a significantly higher average WTP for the Italian T-shirt as opposed to the Chinese one ($t(31) = 5.47$, $p < 0.01$; $M_{ITALY-NO LABEL} = 35.19$, $M_{CHINA-NO LABEL} = 25.00$), thus supporting H1.

To test the effect of sustainability on WTP, we performed independent-samples *t*-tests¹, but now comparing the versions with and without the Fairtrade label, while keeping the product origin constant. No sustainability effect on WTP was revealed for the more favorable COO as, on average, consumers were willing to pay the same amount of money for a T-shirt made in Italy with or without a Fairtrade label ($t(60) = 0.59$, $p > 0.05$; $M_{ITALY-NO LABEL} = 32.95$; $M_{ITALY-WITH LABEL} = 35.19$). On the other hand, significant differences in WTP were found for the less favorable COO; against expectations, consumers were willing to pay more for a T-shirt made in China with a Fairtrade label than a T-shirt made in China with no such label ($t(66) = 3.94$, $p < 0.01$; $M_{CHINA-NO LABEL} = 17.90$; $M_{CHINA-WITH LABEL} = 25.00$). Thus, we could not support H2 in this study.

4.2. Study 2

A paired-samples *t*-test across all experimental conditions revealed a significantly more favorable image of USA ($M_{USA} = 5.27$) compared to Greece ($M_{GREECE} = 3.92$; $t(99) = 8.94$, $p < 0.001$); thus the COO manipulation was successful. However, respondents reported lower familiarity with the Carbon Trust Footprint label ($M = 1.98$, $SD = 1.51$) than with the Fairtrade label in Study 1. Even so, they still accurately associated this label with environment issues (83.60 % correct associations). Thus, the manipulation was still considered acceptable.

Unlike Study 1, a paired-sample *t*-test within the first experimental condition (i.e., the condition with the two

¹ Initially, product involvement, price sensitivity and cause involvement were included as covariates in an analysis of covariance (ANCOVA). However, as none of them turned out to be significant, they were dropped from further analysis and independent samples *t*-tests were performed instead.

sneaker brands differing only in their origin - Greek or American) showed no COO effect on WTP ($t(35) = 0.37$; $p > 0.05$; $M_{USA-NO LABEL} = 87.90$, $M_{GREECE-NO LABEL} = 86.64$). Consequently, H1 is not supported in this study.

On the other hand, consistent with Study 1, a series of analysis of covariance (ANCOVAs)² comparing the two brands with and without the Carbon Footprint label showed a positive sustainability effect on WTP only for the less favorable COO ($F_{1,66} = 7.86$; $p < 0.01$; $M_{GREECE-NO LABEL} = 86.60$; $M_{GREECE-WITH LABEL} = 106.98$). No differences in consumers' WTP were found for the more favorable COO ($F_{1,63} = 0.01$; $p > 0.05$; $M_{USA-NO LABEL} = 88.26$, $M_{USA-WITH LABEL} = 88.89$). Thus, once again, H2 was not supported.

5. Discussion and Conclusion

The current study sought to offer empirical evidence on the interplay between COO and sustainability as informational cues influencing consumers' WTP. First, while COO literature suggests a positive effect of country image on WTP (e.g., Hulland et al., 1996; Koschate-Fischer, et. al, 2012), our results show that country image favorability does not always affect consumers' WTP. Study 1 (T-shirts) confirmed the positive link between country image and WTP while Study 2 (Sneakers) did not reveal a COO effect. However, the latter varies across different products (Tseng and Balabanis, 2011) and consumers do not necessarily allocate price premiums or discounts based on COO differences (Agrawal and Kamakura, 1999). In this context, one could speculate that the lack of influence of COO on WTP on Study 2 is due to the smaller difference between USA's and Greece's country image (1.35) compared to the larger difference between Italy's and China's image (2.25). Further research is needed to throw light on this issue.

Second, despite the documented positive influence of an eco-labeled product on consumers' WTP (e.g., Del Giudice et al., 2018; Laroche et al., 2001) and the predictions of signaling theory (Erdem and Swait, 1998), our findings (in both studies) reveal that such an influence is limited to weaker COOs; sustainability labels had no effect on WTP for the more favorable COOs. This might be because a strong country image is more stable and consumers are not very prone to update their evaluations based on new information (e.g., a sustainability label) whereas a weak country image may be more malleable based on new information (Magnusson et al., 2014). An alternative explanation is that consumers' evaluations increase when they face underdog brands (Paharia et al., 2011). Thus, consumers could have perceived a brand from a less favorable COO as an underdog and perhaps sought to reward such brand for being sustainable by increasing their WTP.

In practice, managers should try to take advantage of a more favorable COO, as COO communication can be easily implemented at a relatively low cost (Diamantopoulos et al. 2021). A more favorable COO might be important in some product categories in terms of influencing WTP (see Study 1) and the implementation of a premium pricing strategy should thus be considered in such product categories. Our findings are also good news for marketers of brands originating in less favorable COOs, as their sustainability efforts are likely to be rewarded with a higher WTP.

There is a clear need for replications of the current study with different product categories (e.g., food, cosmetics), other COOs as stimuli, and different eco-labels (e.g., recycling) to confirm (or otherwise) the observed absence/presence of COO effects on WTP and the lack of an effect on WTP of the sustainable label in more favorable COOs. Attention should also be paid to potential moderating influences such as consumers' skepticism or credibility of the label as these could interact with COO (Dekhili et al., 2021) and potentially influence the effect of sustainability on WTP.

Resilience of Global Value Chains: A multiple case study of MNEs in the healthcare industry

FEDERICA SACCO* GIOVANNA MAGNANI[•] PIETRO PREVITALI[▲]

Framing of the research. Since the 1980s firms' value chains have become increasingly fragmented and dispersed across the world, giving rise to the so-called Global Value Chains (GVCs): multinational enterprises (MNEs) often act as lead firms coordinating production and distribution activities along the chain. GVCs have so far characterised the backbone of international trade (World Bank & World Trade Organization, 2019).

However, recent global developments have brought attention to the shortcomings of having globally dispersed GVCs, such as reduced responsiveness and an excess of rigidity (Gereffi, 2020).

First, from a geopolitical point of view, the free trade imperative that has characterized the world economy in the last decades has weakened, with a rise of protectionist and nationalistic tendencies (The Economist, 2021). Even if we still experience a global economy, governments have been more inclined to the introduction of tariff and non-tariff barriers on imports and measures to reduce both trade and inward investments (Buckley, 2022). Moreover, political developments have exacerbated the level of uncertainty MNEs now face, with the collapse of long-standing assumptions. For example, the Brexit vote in 2016 has pointed out the fallacy of our static view of the economic and political integration of developed countries (Maidment, 2019). More recently, the invasion of Ukraine by Russian forces has opened a new, worrying chapter in modern history and has also impacted global economy: in fact, the Russian invasion has pushed up prices and highlighted the threat of raw materials becoming a foreign policy weapon (The Financial Times, 2022)

Second, climate change is considered the greatest challenge of the century for both businesses and society at large (Schneider, 2011). This aspect is particularly relevant for GVCs since the increasing threat of natural disasters (i.e. geophysical, meteorological, hydrogeological, climatological, and biological) poses a distressing risk for business continuity and logistics (Ghadge et al., 2020; Oh and Oetzel, 2022). An example is the devastating ripple effect the Fukushima earthquake of 2011 had on the global semiconductor value chain (Lohr, 2011).

Third, the recent COVID-19 pandemic has dramatically exposed the fragility of international production systems vis-à-vis the condition of environmental uncertainty (Saurav et al., 2020; UNCTAD, 2020).

Consequently, Buckley (2022) argues that it is not possible to assume that there is a single "environment" for MNEs to operate into and we should not treat disruptions as temporary events, but as the symptom of a "new normality". This new condition requires a long-term shift in how both practitioners and researchers approach how MNEs strategize.

For these reasons, a growing interest has sparked in value chain resilience (e.g. Barbieri et al., 2020; Gereffi, 2020; Strange, 2020), particularly within the international business (IB) research area (Ku & al., 2020; Buckley, 2021).

Resilience in international business

Resilience has been mainly investigated at the firm level (Annarelli and Nonino, 2016; Conz and Magnani, 2019) and from the supply chain management perspective (Christopher and Peck, 2014; Brandon-Jones et al., 2014).

From the IB perspective, the study of how MNEs can cope with risks is not new (Cheng et al., 2013). Rugman (1976) applied the concept of portfolio diversification to foreign direct investment, showing that engaging in foreign operations reduces the MNE's corporate risk. Subsequently, numerous studies have investigated how, in an uncertain environment, international diversification reduces risk without sacrificing performance (Dess et al., 1995; Grant et al., 1972; Levi & Sarnat, 1970). Also real options theory (Myers, 1977) represents a consolidated theoretical perspective in IB: it suggests how the MNE can benefit from internationally dispersed subsidiaries by having the right to shift value chain activities among subsidiary locations in uncertain times (Allen and Pantzalis, 1996; Chung et al., 2010). Nevertheless, these two theoretical approaches have mostly addressed disruptions of economic nature

e-mail: pietro.previtali@unipv.it

adopting the firm level of analysis and they do not consider how diversification benefits can vary across different governance mechanisms (Ioulianou et al. 2021)

Conversely, the study of resilience in IB is more recent. In fact, to the best of our knowledge, it is not possible to identify a widely shared definition of resilience in IB: the most recurring definition is derived from the supply chain literature, according to which resilience is the ability of a system to return to its original state or move to a new more desirable state after being disturbed (Christopher and Peck, 2004). In the past, studies have addressed resilience in the context of uncertain environment within developing countries (Ali et al., 2011; Branzei and Abdelnour, 2010) or as a desired managerial capability (Fainshmidt et al., 2017; Al-Atwi et al., 2020). Following the covid-19 pandemic, however, more recent studies have contributed to this stream of research by conceptualizing how resilience relates in particular to the GVC framework (Gereffi et al., 2022; Mouzas and Bauer, 2022; Dilyard et al., 2021).

GVCs and resilience

In the perspective of the “global factory” as formalized by Buckley (2004), MNEs are identified as the “orchestrators” of GVCs: they coordinate globally dispersed value chain activities through more precise use of ownership and location strategies (Buckley, 2011). MNEs constantly strive to find their optimal balance between the pressures to globalise and the need to stay local. In their seminal paper, Buckley and Ghauri (2004) discuss how global operations increase cost efficiency - i.e. they maximise economies of scale and reduce duplication- while localisation provides revenue based benefits - i.e. differentiation to reach all customer niches and the achievement of responsiveness. In fact, MNEs are increasingly pursuing market-seeking rather than asset-seeking (Makino et al., 2002) or knowledge-seeking (Chung and Alcacer, 2002) strategies.

MNEs also have a crucial role in determining who has control over value chain activities. According to Transaction Cost Theory, MNEs assign “transactions (which differ in their attributes) to governance structures (the adaptive capacities and associated costs of which differ) in a discriminating way” (Williamson, 1985: 18) with the aim of maximising the gains. Cuypers et al. (2021) argues how, although relevant, there is little systematic evidence on the direct effect of environmental uncertainty on governance choices: for example, uncertainty makes it more difficult to contractually specify *ex ante* all the circumstances surrounding a specific exchange.

Because of the complexity of GVCs, we differentiate how three key dimensions can interact with its resilience (Bair, 2009; Gereffi and Fernandez-Stark, 2011): the input-output structure, the geographical configuration of activities and the governance structure.

The input-output structure

The input-output structure allows to identify the main activities and segments of the GVC and typically includes R&D, inputs of production (i.e. sourcing practices), manufacturing, distribution, marketing, and sales (Gereffi and Fernandez-Stark, 2011). This level of analysis is the closest one to the operational level and, in matters of resilience, can exploit useful touchpoints with SC literature (Tortorella et al., 2021; Tang, 2006; Pettit et al., 2010; Wieland and Wallenburg, 2013).

Geographical configuration of activities

A key characteristic of GVCs is the offshoring of activities, i.e. the relocation of parts of production processes to locations abroad irrespective of the ownership mode (Kinkel and Maloca, 2009). For what concerns resilience, it is widely recognized that the geographical configuration of activities can influence the GVC capacity to limit the negative effect of disruption (Gereffi, 1995; Ivanov et al., 2010). However, if on one hand there is a current of thought that considers reshoring or near-shoring of value chain activities as a strategy to build resilient GVCs (Barbieri et al. 2021), on the other hand, scholars support the idea that redundancy of value chain activities may create more responsive GVCs, avoiding overreliance on few locations (Gereffi, 2020; Cohen and Kouvelis, 2020; Strange, 2020). How geographical configuration of activities can influence resilience has been addressed also by practitioners, following the COVID-19 pandemic. In particular, in 2020 UNCTAD proposed four main alternative avenues for the restructuring of value chains worldwide; (i) reshoring, i.e. the rebundling of supply chain and production stages; (ii) diversification i.e. involving more locations and suppliers in the value chain; (iii) regionalization, i.e. fragmented and vertically specialized value chains at the regional or local level; (iv) replication, i.e. distributed manufacturing close to the point of consumption and supported by new production technologies (UNCTAD, 2020).

The governance structure

Gereffi (1994: p. 97) defines the governance structure as the “authority and power relationships that determine how financial, material and human resources are allocated and flow within a chain”. MNEs can choose to outsource some or all of their VC activities, i.e. to obtain semi-finished products, finished products, or services from an outside company if these activities are traditionally performed internally (Simchi-Levi et al., 2004).

For what concerns GVC resilience, previous studies have mostly adopted the internalization theory perspective, positing that in the long-term MNEs will select, adjust and retain GVC configurations that are most efficient (Buckley and Casson, 1976; Kano, 2018). More recently, relational dynamics within governance modes have increasingly captured researchers’ interest, emphasising the ongoing nature of the ongoing transactions among actors (Carson et al., 2006). For the specific case of managerial governance mechanisms associated with GVC resilience, Kano et al. (2022) identifies three groups: inter-firm adaptations, i.e. of relationships among GVC actors; extra-GVC

adaptations, i.e. of relationships with actors outside of formal GVC boundaries; intra-firm adaptations, i.e. of routines, processes, and decision rules inside the lead firm. In particular, recent developments in the study of inter-firms adaptations demonstrate that even under quite stable hierarchical governance, the GVC constantly evolves and transforms whereby internal subsidiaries' configurations, activities, and responsibilities change (Ryan et al., 2022).

Previous studies show how forms of governance in GVCs can change and evolve over time: they are inherently dynamic in nature (Gereffi and Fernandez-Stark, 2016; Magnani et al., 2019) and they can change according to evolving external circumstances (Cuypers et al., 2021). This idea is testified by the recent interest in insourcing tendencies of MNEs (Albertoni et al., 2015) and a new pivotal role attributed to larger suppliers within GVCs (Azmeah et al., 2015). Nevertheless, few studies have addressed the dynamic nature of governance structures (Holcomb & Hitt, 2007; Strange and Magnani, 2017).

Purpose of the paper. The present study tries to contribute to the persistent call for research on resilience in IB, by answering the following research question: "How do MNEs structure their GVCs to foster resilience? How do the dynamics between the lead firm and other GVCs actors contribute to GVC resilience?"

Methodology.

Context of analysis

We chose to contextualize our analysis within the healthcare industry and to investigate how the actors within GVCs contribute to the chain's resilience during crises, such as the Covid19 pandemic. This choice of selecting firms belonging to the healthcare sector had the following rationale:

1. The healthcare sector is traditionally characterized by high international geographical fragmentation of value chain activities (UNCTAD 2020; Gereffi, 2020);
2. In recent years, the healthcare sector was impacted by multiple external disruptions (e.g. Covid-19 pandemic, the Ukraine war) on multiple levels - i.e. demand, supply and logistics (Deloitte, 2022a; Premier, 2022; Deloitte, 2022b);
3. Because of the nature of their business, it is crucial for MNEs in the healthcare industry to maintain business continuity in order to provide the final consumer, i.e. patients, with the necessary medical treatments (Bierenbaum et al., 2009). Therefore, we assume that companies in this sector prioritize resilience of their GVC;

Sampled cases

Case sampling has been carried out according to a set of four purposeful sampling criteria (Patton, 2014):

1. The MNE is a leading actor in a GVC within the healthcare industry;
2. A knowledgeable person, i.e. directly involved in the inner workings of the company value chain, was available to participate in the data collection.

Companies were identified within the authors' personal network and they were preliminarily contacted by email. At the moment of writing, 9 companies have been contacted and 5 agreed to be interviewed, with a response rate of 55%.

Tab. 1: Key cases information

Company	Size (N. of employees)	Turnover (2021, million \$)	Main business	Role in the GVC	Governance structure	Location strategy
Amgen Inc.	24,2	25,979	Human therapeutics	Lead firm	Internalization	Global
General Electric Company	168	74,196	Power, Renewable Energy, Aviation and Healthcare,	Lead firm	TBD	TBD
Pfizer Inc.	79	81,288	Biopharmaceutics	Lead firm	Internalization	Global
Roche	100,92	72,148	Healthcare solutions for disease prevention, diagnosis, and treatment	Lead firm	Internalization	Global
Medtronic	95	31,686	Surgical, medical and dental instruments and supplies	Lead firm	TBD	TBD

Data sources

The principal tool for data collection are semi-structured interviews consisting of 13 open-ended questions. The interview focused on three main aspects: i) the description of the firm's GVC (i.e. input-output structure, the geographical dispersion and governance of value chain activity); ii) the main uncertainties connected to the value chain activities; iii) how geographical and control relationships between the lead firm and other GVCs actors come into play during disruptions (e.g. Covid 19 crisis and Ukrainian war).

All the informants were first approached through email, providing an overview of the research project and a participant informative concerning data treatment. Moreover, whenever requested, also the interview questions were shared beforehand. In-depth interviews took place either in person or through VoIP technology, that were audiotaped

and transcribed. All interviews are double-checked by the authors and sent back to managers for feedback and integrations, where necessary, and then translated into English.

The data analysis is also supported by the triangulation of secondary data (Fielding & Fielding, 1986) collected from proprietary websites (including financial reports and sustainability reports), Form 10-K when available, and ORBIS reports.

Tab. 2: Data collection

Company	Number of interviews, time	Informants (role)	Secondary data
Amgen Inc.	2 interviews 1h 25 min	Portfolio Contract & Distribution Sr. Manager, Italy Head of Value Chain Management EMEA	2022 Form 10-K Company reports ORBIS report
General Electric Company	1 interview 56 min	Order operations manager IMI, GE Medical Systems Italia	
Pfizer Inc.	1 interview 58 min	Supply chain and operational excellence manager, Ascoli Piceno production site, Italy	
Medtronic	1 interview 1h 12 min	Director Logistic Italy, Greece & Israel, Deliver Operations	
Roche	1 interview 1h 2 min	Supply Chain & Customer Care Lead, Roche Italia	Company reports ORBIS report

Data analysis

Consistent with the multiple case study approach (Eisenhardt, 1989), we first conduct a single case analysis for each firm and then proceeded with a cross-case comparison. We build single case histories, used as a basis for the single case analyses focused on the following aspects: (i) the company; (ii) a description of the value chain, with a focus on governance and geographical dispersion of activities; (iii) how control and geographical choices in lead firm relationships with other GVC actors contribute to resilience building in case of a disruption. In the second stage, we will cross-compare the cases to identify similarities, differences, and potential recurring patterns. In both stages, to identify instances of these constructs, we will codify evidence stemming from interviews (the quotations). The final aim of the data analysis is the elaboration of a set of propositions and a model for subsequent quantitative enquiry. This aim will be reached with an abductive approach by systematically combining empirical observations and existing theory (Dubois and Gadde, 2002; Magnani and Gioia, 2022).

Results. The present study’s data analysis is in progress. At the moment of writing, the following single case studies have been developed: Amgen, Roche and Pfizer.

Amgen

Company overview

Amgen is a biotech company that operates in the following therapeutic areas: oncology, hematology, cardiovascular diseases, inflammatory diseases, osteoarticular diseases and nephrology.

Amgen has a commercial presence in approximately 100 countries worldwide reported a turnover of 25,979 million dollars for the 2021 fiscal year.

Value chain structure

For what concerns control of value chain activities, these are mostly internalized. The production process is carried out primarily in eight company-owned plants, located in U.S.A., Puerto Rico, Brazil, Ireland, The Netherlands, Singapore and Turkey. This internal manufacturing network has commercial production capabilities for bulk manufacturing, formulation, fill, finish, tableting and device assembly.

However, certain raw materials and components necessary for product manufacturing are provided by and are the proprietary products of unaffiliated third-party suppliers, certain of which are only sources for such materials. In addition, Amgen uses third-party contract manufacturers to supplement the capacity or capability the internal manufacturing network.

Overall, company-owned distribution centers are located in U.S.A., Puerto Rico, Brazil, Netherlands and Turkey. In the United States, substantially all sales are to pharmaceutical wholesale distributors, which are the principal means of distributing products to healthcare providers. Outside the United States, Amgen sells principally to healthcare providers and/or pharmaceutical wholesale distributors depending on the distribution practice in each country.

On a combined basis, wholesalers accounted for 82% of worldwide gross revenues for 2021.

Therefore, while manufacturing of product lines is global, distribution is regionalized, with regional hubs that serve individual country markets.

Resilience building processes during disruptions

At the operational level, Amgen has long invested in organizational capabilities to enhance responsiveness of the value chain. As reported from our informant:

“We try to improve our value chain with targeted investments in infrastructure, to ensure that production sites can always be operational [...]; in technology, such as centralized control, which is aimed at maintaining constant 24/7 monitoring of inventory management; even with the inventory we manage the stock levels of raw materials, always maintaining adequate inventories for the sales and distribution forecasts”

However, on a more strategic level, Amgen addresses two pivotal aspects. First, the company considers valuable for value chain resilience the dual sourcing approach:

“We spent time and money to ensure that we have dual sourcing in place and that we can switch if needed or change volumes from one source to another very quickly”.

Secondly, Amgen seems to highlight the positive implication that centralised control has over value chain resilience:

“We need to have a function that oversees the value chain [...] There needs to be an overarching framework to take decisions and to understand whether those choices are beneficial for the customer”.

Data analysis also revealed how the relationship with other value chain actors is considered relevant to build resilience.

In the case of suppliers, this relationship is built with a long term approach, based on shared practices and provision of specialized training by Amgen:

“We hold a number of training courses on our procedures, both for production and for distribution, which are also attended by third parties”

Moreover, according to our informants, the investments the company allots to build this relationship is conditional on how important the supplier is for the production continuity:

“Depending on how important the supplier is, there is an engagement program to share forward looking ideas that Amgen has, and those of the supplier in turn [...] This priority is based on the volume of business we are doing and how easily you could switch to another supplier”

Likewise, relationships with distributors are considered crucial for developing a resilient value chain:

“Precisely with the distributor we hold recurring meetings and business reviews [...]. We constantly work together to find solutions to improve processes”

Finally, according to Amgen’s case, the company’s business model adaptation can enhance resilience of the value chain. Resilience appears to be determined by the lead firm ability to adapt its business model in case of altered circumstances:

“Among the various things we did when the Covid started, in March we had already set up a home delivery process: delivery of some medicines directly to patients' homes through external suppliers [...] We did it in the ASL (Local Health Authorities, ed.) that asked for it.”

Roche

Company overview

Roche is a health-care company active in the discovery, development, manufacture and marketing of novel healthcare solutions. Its products and services address prevention, diagnosis and treatment of diseases. Roche has two operative divisions: the pharmaceuticals division and the diagnostics division. In the pharmaceuticals division, the company's portfolio of brands of self-medication products is designed to meet the growing demand for non-prescription remedies. Roche reported a turnover of 72,148 million dollars for the 2021 fiscal year.

Value chain structure

For what concerns control of value chain activities, these are mostly internalized. Roche only engages with contract manufacturers for cost advantage in case of marginal non-strategic activities or to manage demand peaks that cannot be satisfied by internal productive capacity. R&D, manufacturing of products and packaging, and distribution, are managed internally. However, Roche relies on third parties for production inputs. In 2021, the company’s total spend with suppliers and service providers was approximately CHF 20.3 billion: CHF 15.3 billion by the Pharmaceuticals Division and CHF 5.0 billion for the Diagnostics Division. The spend with the top 1000

suppliers accounted for 81% of Roche's total spend. These expenses are so distributed: 60,6% in the EMEA region, 31,5% in North America, 5,9% in the APAC region and 2% in the LATAM region. Approximately 15% of the total spend was with suppliers in non-OECD countries. Manufacturing activities are carried out at the global level through wholly owned FDIs. Distribution is instead localized, with bigger wholly owned regional hubs.

Resilience building processes during disruptions

According to our informant, the main issue that Roche has faced during the phase after Covid 19 peak is the expected demand peak for specific elements in its product portfolio. In particular, the company faced excess demand compared to its manufacturing capacity during covid-19 pandemic. Three main insights on GVC resilience emerged from the company's experience. First, also in this case, it appears that the company's business model adaptation can enhance resilience of the value chain. Roche had tried to implement product distribution directly to the patient rather than intermediaries (e.g. pharmacies) for those products that allowed a correct administration at home. This became possible only during the Covid-19 pandemic, when access to hospitals was limited:

"This determined a first step that Roche implemented on certain types of drugs, creating a home delivery service. We had tried in the past but never succeeded. With this situation, various possibilities have opened up and we have been able to bring the drug to the patients' homes".

In this sense, by adapting its business model, Roche was able to take advantage of an opportunity in the changing environment, therefore compensating for the impossibility to proceed normally with its operations.

The second insight is the need to collaborate with third parties in case of disruptions. In particular, in the case of Roche it was crucial to keep open communications with customers, managing their expectations and sharing timely information with them. This approach allowed customers to re-plan their operations and therefore minimize disruption along the value chain. For example, different modes of administration for the same drug allowed the company to allocate better its production based on the specific needs of the customer:

"For example, if the intravenous formulation (of the drug, ed.) worked well for covid, an attempt was made to understand with the doctors if it was possible to switch patients with rheumatoid arthritis to the subcutaneous formulation, in order to ensure that the intravenous formulation was available for the covid patients."

Finally, since value chain activities are mostly internalized, Roche manages the consequence of external disruptions through a centralized task force that manages resource allocation.

"It no longer becomes a normal inclusion in the planning and replenishment systems, but it is possible to create dedicated task forces which, if the criticality is on a global scale, somehow decide on a global scale to "allocate" the products correctly in the various countries, taking the requested specifications, evaluating them and re-assigning the production."

This approach allowed more efficient decision making because of the higher level of visibility across the whole value chain by the decision-makers.

Pfizer

Company overview

Pfizer is a research-based biopharmaceutical company. As a research-based and a global pharmaceutical company, it specializes in the discovery, development, manufacture and wholesale of prescribed medicines offered under the brand name Pfizer. The company has a leading portfolio of products and medicines that support wellness and prevention, as well as treatment and cures for diseases across a broad range of therapeutic areas. Pfizer reported a turnover of 81,288 million dollars for the 2021 fiscal year.

Value chain structure

Pfizer R&D activity is focused on both discovering new products and adding value to existing ones, i.e improving their effectiveness and ease of dosing and discovering potential new indications. The company's R&D activity is structured to deliver a highly differentiated product portfolio, also thanks to strategic partnerships that enhance creativity and flexibility. While a significant portion of R&D is carried out internally, the company also seeks promising chemical and biological lead molecules and innovative technologies developed by others to incorporate into their products. To this end, Pfizer enters into collaboration, alliance and license agreements with universities, biotechnology companies and other firms as well as through acquisitions and investments. These forms of collaboration allow the company to share knowledge, risk and cost.

Raw materials essential to manufacturing are procured from numerous suppliers worldwide. In particular, the Italian manufacturing plant in Ascoli Piceno has a global supply chain: suppliers are localized for 38% in Italy, 20% in Europe, 15% worldwide except for U.S. and 25% in U.S. The purchase of raw materials is partly managed locally by a local procurement service and by the factory buyers, while another part of the purchases, more strategic or with greater volume, are managed at the corporate level, by the category manager. For global materials, the company

refers to corporate suppliers, i.e. those that guarantee product quality and the required standards and that serve multiple sites globally.

The manufacturing of both products and packaging is carried out almost completely without outsourcing. Third parties' involvement in manufacturing is marginal and only related to specific products. Distribution is global too, in the sense that most wholly owned plants serve the global market: the company sells its products in over 125 countries, including emerging markets. In 2021, Pfizer revenues were so geographically distributed: about 37% in the U.S., 23% in Europe, 15% in the remaining developed countries, and 25% in emerging markets.

The company's prescription biopharmaceutical products are sold principally to wholesalers, but also directly to retailers, hospitals, clinics, government agencies and pharmacies.

Resilience building processes during disruptions

The company considers the procurement of raw materials the main issue in case of disruptions. According to our informant, for example, this issue emerged at the beginning of 2022, as the result of multiple events, such as the pandemic, the Ukraine war and the increase of energy costs. Our in-depth interview led us to uncover three aspects which contributed to Pfizer's GVC resilience in this circumstance: visibility along the value chain, information sharing, and product and supplier diversification on multiple levels.

First, it was critical for the company to have timely updates about the activities along the value chain, in order to re-plan production. In this sense, it was crucial for Pfizer to have an internally developed and customised digital architecture, to run simulations, identify issues and possible solutions in a timely manner. However, for the company it has been necessary not only to have this information, but also to be able to efficiently share it along the value chain, both internally and externally. On the one hand, Pfizer created a cross-functional team when procurement risks arose, in order to have a single comprehensive source of information within the company to re-plan production. Moreover, sharing information among production sites allowed to compensate for the lack of raw materials that were instead available in other locations. In this circumstance, the company considers a benefit that value chain activities are mostly internalized.

At the same time, it became relevant to establish a different relationship with suppliers:

"We started a more frequent communication with suppliers, weekly if not daily. The contact with the supplier has ceased to be a contact closely linked to a plant function and with a commercial relationship. It started to be a collaborative relationship for creating alternatives and sharing best practices"

Finally, the company considers product and supplier diversification relevant for GVC resilience. At the product level, the company enhanced the product portfolio flexibility by broadening the production range of the factory equipment, allowing for substitutability of raw materials:

"Always adhering to the mandatory specifications to maintain quality, the production range of the machines has been expanded (in paper weight, mm of ribbons, etc...). This is to increase the range of materials that can be used with the equipment".

At the supplier level, the company recognizes that multiple sourcing can enhance GVC resilience in case of disruptions. In particular, in the last period Pfizer production plants proceeded to expand the supplier range by identifying alternative suppliers among those already verified and qualified at the corporate level.

Research limitations. Since the study has been developed with a focus in the healthcare industry, its generalization is limited, especially considering the peculiar constraints (e.g. institutions) of the chosen sector. Therefore, future research could consist of either replication of the qualitative study in different sectors or the development of quantitative study to achieve generalizability of findings

Managerial implications. At the managerial level, the present study aims at providing practitioners - both managers in lead firms and suppliers - to identify critical aspects of the relationships with other GVC actors to take into consideration for building more resilient value chains.

Originality of the paper. To the best of our knowledge, this is among the first studies to address empirically how location strategies and governance structures are addressed by MNEs when strategizing for GVC resilience.

Keywords: global value chains; resilience; multinational enterprises; healthcare industry

Il ruolo di *bridging institutional actor* delle imprese multinazionali nella promozione della sostenibilità

CRISTINA LEONE* PASQUALE MASSIMO PICONE* ARABELLA MOCCIARO LI DESTRI[▲]

Inquadramento della ricerca. *La governance pubblica è chiamata a svolgere un ruolo chiave nel garantire l'implementazione dello sviluppo sostenibile a livello globale e locale, provvedendo a fornire infrastrutture e assetti istituzionali efficienti (Bulkeley e Betsill, 2005; Rotmans et al., 2001). Ciò richiede ai governi di attivare politiche e fornire incentivi che guidino le decisioni dei singoli cittadini, delle imprese e, più in generale, di tutte le organizzazioni verso temi di sostenibilità. Tuttavia, i confini delle giurisdizioni limitano i governi a emanare politiche a livello nazionale senza realizzare che l'interconnessione globale tra gli stati impatta sulle crisi ambientali e sociali e che un'azione comune e condivisa sarebbe oltremodo auspicabile (Scherer et al., 2014).*

Nel 2015, le Nazioni Unite hanno elaborato l'Agenda 2030 che rappresenta un piano per raggiungere un futuro sostenibile per tutti, definendo i 17 Obiettivi di Sviluppo Sostenibile (SDGs), come ad esempio "Decent Work and Economic Growth" (SDG8), "Responsible Consumption and Production" (SDG12), "Climate Action" (SDG13), "Partnerships for Goals" (SDG17), e fissando 169 target che ne guidano l'attuazione. Se da un lato, l'Agenda 2030 fissa obiettivi di sostenibilità universali e di ampio respiro, dall'altro lato, le differenze tra gli stati, in termini di istituzioni, livelli di sviluppo, politiche pubbliche e risorse (Campbell et al., 2012), devono essere considerate al momento della loro definizione e implementazione. A questo proposito, molti studi osservano che i governi nazionali, riconoscendo il carattere globale delle sfide di sostenibilità e possedendo un potere decisionale limitato ai propri confini nazionali, hanno cominciato a lasciare spazio ad attori internazionali privati e civili per la promozione di nuovi schemi regolatori (Abbott e Snidal, 2000; Doh et al., 2017).

Numerose regole di sostenibilità, quali codici di condotta aziendali, standard industriali, schemi di certificazione, schemi di reporting e leggi "soft", sono nate da iniziative di attori privati (imprese multinazionali, imprese no-profit, imprese sociali) e organizzazioni della società civile (organizzazioni non governative). Basti pensare ai codici etici elaborati all'interno delle imprese, agli standard e alle certificazioni ambientali elaborati dalla Forest Stewardship Council, agli standard sui diritti del lavoro sviluppati dall'International Labour Organization o ancora agli standard industriali ISO.

Dunque, sfide come il cambiamento climatico, le crisi umanitarie e i disastri ambientali non costituiscono preoccupazioni di singoli stati, ma coinvolgono tutti i governi nazionali, le organizzazioni intra-governative e non governative e tutti coloro che operano per il raggiungimento degli obiettivi sostenibili. Tra di essi, il ruolo svolto dalle imprese multinazionali sta acquisendo un interesse sempre più crescente (Montiel et al., 2021; PwC, 2019; Scherer et al., 2014). Le multinazionali, localizzando le proprie operazioni e attività in molteplici contesti nazionali, possono contribuire in modo significativo all'implementazione di pratiche sostenibili a livello globale e locale, specialmente nei paesi in via di sviluppo dove gli interventi pubblici sono deboli o del tutto assenti. Tuttavia, ciò richiede numerosi sforzi. Le multinazionali hanno bisogno di mobilitare risorse e capacità tra i paesi in cui operano e adeguare gli obiettivi di sostenibilità di portata globale, come gli SDG imposti dall'Agenda 2030, ai contesti locali, provando a creare un "contextual fit" (Argandoña e Hoivik, 2009; Husted et al., 2016; Lee e Gereffi, 2015; Rathert, 2016; Reimann et al., 2012). Ad esempio, da tempo le imprese multinazionali lavorano per formulare e implementare codici di condotta all'interno delle proprie catene globali di valore. Tuttavia, numerosi studi rivelano dei limiti. Kelling, Sauer, Gold e Seuring (2020) parlano di un problema di "decoupling" da parte di quei fornitori che non rispettano le regole di condotta a causa della "dualità istituzionale" tra il contesto in cui nasce l'impresa multinazionale e quello del fornitore. Per far fronte a problemi di tal genere, le imprese multinazionali hanno iniziato ad attivare partnership, così come anche richiesto dall'SDG 17, che coinvolgono attori globali e locali appartenenti alla società civile e alla governance pubblica. Tali partnership attivano processi di deliberazione democratica, in cui ciascun attore può prendere voce e contribuire alle decisioni sulla sostenibilità (Scherer e Palazzo, 2011).

Obiettivo del paper. *Questo studio in fieri ha l'obiettivo di costruire un framework concettuale che illustri i molteplici attori e i relativi ruoli coinvolti nella definizione degli obiettivi di sostenibilità e come le multinazionali, facendo leva sulla loro intersezione, possono ricoprire contestualmente un ruolo economico, politico e sociale e comportarsi da "bridging institutional actor".*

In particolar modo, proponiamo l'analisi del caso studio di IKEA che, da anni, lavora per integrare nella sua strategia obiettivi di sostenibilità e implementare pratiche sostenibili nei processi produttivi e nei canali di distribuzione. IKEA, operando in più di 50 paesi, non lavora in autonomia, ma richiede la collaborazione dell'intera sua catena di fornitura, nonché dei suoi co-workers e di attori esterni, quali governi nazionali, attori civili, imprese no-profit e imprese sociali.

IKEA non si comporta, dunque, da semplice attore economico ma, in sinergia ad altri stakeholder, può contribuire al benessere sociale e ambientale e ricoprire ruoli differenti. Alla luce di ciò, vogliamo mostrare i molteplici ruoli - economico, sociale, e politico - che una multinazionale può ricoprire per raggiungere obiettivi di sostenibilità e come, muovendosi tra di essi, possa creare una possibile intersezione che definiamo bridging institutional actor svelando promettenti esiti sulla sostenibilità.

Metodologia. *La ricerca si basa su un caso studio esplorativo (Yin, 2003), tale approccio offre la possibilità di acquisire una dettagliata conoscenza dell'argomento di ricerca che non sarebbe raggiungibile con un'analisi su un campione ampio (Golden-Biddle e Locke, 1993; Siggelkow, 2007). Selezionando il caso studio di IKEA e triangolando le fonti di dati primarie e secondarie (Gibbert et al., 2008; Yin, 2003), si presenta uno studio qualitativo per rispondere alla domanda di ricerca «Come le imprese multinazionali definiscono gli obiettivi di sostenibilità?»*

La selezione di IKEA come impresa oggetto di studio è motivata da diverse ragioni. IKEA è una delle imprese più internazionalizzate al mondo, possiede negozi e centri di distribuzione in più di 50 paesi e vanta il primato mondiale come rivenditrice di mobili. La stessa dichiara che "its success lies in both global integration and local responsiveness strategies" (sito web - IKEA).

Inoltre, IKEA è responsabile di circa l'1% del consumo mondiale di legno dal quale ricava i suoi prodotti commerciali e ciò la porta ad essere sotto i riflettori di molti attivisti ambientali (sito web - The Guardian). Tuttavia, la multinazionale svedese già da tempo si contraddistingue per le numerose iniziative sociali e ambientali e per la sua strategia di sostenibilità "People & Planet Positive" la cui implementazione le permette di contribuire al raggiungimento degli SDG dell'Agenda 2030. Dunque, poiché il nostro obiettivo è studiare come le imprese multinazionali coprano ruoli chiave nella definizione di obiettivi di sostenibilità a livello globale e locale, IKEA risponde in modo adeguato ai nostri interessi di ricerca.

Per ultimo, la possibilità di accedere ad un'ampia base di informazioni è cruciale affinché si possa adottare la metodologia di ricerca del singolo caso studio (Locke, 2000; Patton, 1990). A tal proposito, IKEA dà la possibilità di accedere ai suoi report di sostenibilità pubblicati dal 2004 fino ad oggi. Oltre ai dati di archivio che attestano il suo impegno ultradecennale verso la sostenibilità, la multinazionale pubblica sul suo sito web molte informazioni e articoli sulle iniziative di sostenibilità intraprese. Dunque, abbiamo accesso ad una base di dati ricca e variegata.

Riguardo alla raccolta di dati primari, attingiamo ai report di sostenibilità, alle guide specifiche riguardanti le iniziative sociali e ambientali di IKEA (ad es. "Guide - Developing and collaborating with social businesses connected to IKEA value chain") e ai video pubblicati sul suo sito ufficiale. Inoltre, selezioniamo fonti di dati secondari come interviste rilasciate da manager e impiegati della multinazionale e talks pubblicati su Youtube, articoli accademici, libri e capitoli di libri pubblicati in riviste scientifiche e articoli pubblicati sulle migliori testate giornalistiche (ad es. The Wall Street Journal) che trattano di IKEA e del suo impegno verso la sostenibilità. In ultimo, usiamo il teaching case study sviluppato all'Harvard Business School ("Sustainability at IKEA Group"; Rangan et al., 2014). A tal proposito, Ambrosini, Bowman e Collier (2010: 209) rivelano che i teaching case study costituiscono una fonte importante di dati poiché "enable the researcher to retain and explore the idiosyncratic detail of the trees while generating an understanding of the background forest".

Risultati. *Questo studio vuole far luce su come le imprese multinazionali, coadiuvate da altri attori, contribuiscano alla definizione di obiettivi di sostenibilità e al loro raggiungimento offrendo un framework concettuale che rappresenti i possibili ruoli - economico, sociale, politico - ricoperti.*

Le multinazionali, da attori economici, agiscono verso la sostenibilità quando, operando all'interno delle proprie catene di fornitura globali, richiedono ai fornitori di adeguarsi a codici di condotta dalle stesse imposti. Le organizzazioni della società civile, le imprese sociali, e le organizzazioni no-profit rappresentano attori sociali che, agendo sia a livello globale che locale, definiscono standard di sostenibilità, leggi soft e attivano programmi sociali con le comunità locali. Per ultimo, i governi nazionali, le organizzazioni intra-governative e le agenzie governative, in qualità di attori politici, intervengono con leggi nazionali e accordi internazionali su temi di sostenibilità. Recentemente, Schrempf-Stirling (2018) ha descritto alcuni tentativi da parte di governi nazionali che, estendendo la loro giurisdizione, hanno emanato leggi "hard" che limitano le condotte irresponsabili delle imprese e contribuiscono positivamente al raggiungimento di un modello aziendale sostenibile. Riportando esempi come il "Dodd Franck Act" introdotto negli Stati Uniti, il "Foreign Corrupt Practices Act" in Germania e il "British Bribery Act" in Gran Bretagna, Schrempf-Stirling (2018) dimostra che l'intervento statale assume ancora una posizione centrale e affida ad esso un "catalytic role" nell'implementazione dello sviluppo sostenibile.

La tabella 1 rappresenta gli attori coinvolti e i relativi ruoli ricoperti per la definizione degli obiettivi di sostenibilità.

Ruolo	Attori	Meccanismi impiegati per la sostenibilità
Attori economici	Imprese multinazionali e attori appartenenti alle loro catene di valore	Codici di Condotta aziendali Standard aziendali
Attori sociali	Organizzazioni non governative	Standard civili
	Organizzazioni no-profit	Leggi soft
	Imprese sociali	Programmi con comunità locali
Attori politici	Governi nazionali	Leggi hard
	Istituzioni regionali e locali	Trattati e accordi internazionali
	Organizzazioni intra-governative	
	Agenzie governative	
Bridging institutional actors	Attori che riuniscono imprese, attori sociali e politici	Obiettivi e programmi definiti all'interno di partnership pubblico-private

Si sintetizzano di seguito i principali risultati attesi.

Forniamo un primo contributo alla ricerca di *International Business* offrendo un disegno dei possibili ruoli che agiscono per definire gli obiettivi di sostenibilità, degli attori coinvolti e dei meccanismi da essi impiegati.

Inoltre, l'analisi esplorativa del caso studio di IKEA ci permette di comprendere le modalità attraverso le quali le multinazionali, servendosi della loro presenza in differenti contesti nazionali, possono collaborare con attori pubblici, organizzazioni della società civile e altre imprese nell'implementazione di pratiche sostenibili a livello globale e locale. Nello specifico, mostriamo che, a livello corporate, le multinazionali lavorano attraverso strategie di sostenibilità e codici di condotta aziendali per limitare l'impatto sociale e ambientale delle loro catene di valore. Ampliando il livello di analisi, le multinazionali possono divenire attori sociali e politici. Nel primo caso, stringono partnership con organizzazioni della società civile e imprese sociali per contribuire positivamente al benessere delle società in cui operano. Nel secondo caso, agiscono nell'interesse pubblico e influenzano le decisioni politiche attraverso campagne di lobbying e attività politiche che mirano ad ottenere strumenti legislativi che promuovano lo sviluppo sostenibile. Possiamo, dunque, ritenere che le multinazionali non si comportano da semplici attori economici, ma diventano attori sociali e politici e, dunque, offriamo un ulteriore contributo agli studi di *International Business* sui molteplici ruoli che le multinazionali possono ricoprire per il raggiungimento della sostenibilità.

Per ultimo, creiamo un ponte tra gli studi di *International Business* e quelli di *Social Issues in Management*, concettualizzando il ruolo svolto dalle multinazionali come *bridging institutional actor*. Tale concetto evoca quello di "bridging institutional entrepreneurship" ma senza concentrarsi sulla scoperta e/o il riconoscimento di opportunità (Tracey et al., 2011). Da un lato, svolgendo il ruolo di *bridging institutional actor*, le multinazionali forniscono soluzioni innovative per la sostenibilità, impiegando capacità e risorse di tutti gli attori coinvolti. Ad esempio, gli attori pubblici forniscono autorità e legittimità pubblica, le imprese multinazionali offrono capacità finanziarie e tecniche e le organizzazioni della società civile conferiscono conoscenze scientifiche e una profonda esperienza di collaborazione con le comunità locali (Doh et al., 2019). Dall'altro lato, il ruolo di *bridging institutional actor* permette alle multinazionali di conciliare le diverse logiche istituzionali, gli interessi divergenti e gli sforzi indipendenti dei ruoli economico, sociale e politico e di rimuovere i vincoli di ciascuno di questi. Ad esempio, i governi soffrono di una burocrazia lenta, le organizzazioni della società civile non hanno capacità di regolamentazione e non possiedono know-how manageriale, mentre le multinazionali possiedono una conoscenza poco approfondita dei contesti locali e dei bisogni della società nei paesi in cui operano (Doh et al., 2019; van Aalst et al., 2008).

Limiti della ricerca. Questo lavoro presenta alcuni limiti che costituiscono la base di partenza per sviluppare studi di ricerca futuri.

Il nostro studio usa dati raccolti da fonti online, al contrario, effettuare una ricerca sul campo potrebbe offrire dati più dettagliati e specifici al contesto e una migliore comprensione del fenomeno oggetto di analisi. Sebbene questo costituisca l'approccio più adatto per eseguire un caso di studio, tuttavia, lo svolgimento di interviste e osservazioni sul campo e l'analisi e la codifica di grandi quantità di dati richiedono uno sforzo ingente in termini di tempo e risorse, e non per ultimo, l'accesso interno all'impresa andrebbe negoziato e accordato.

Inoltre, il nostro lavoro si concentra su come le imprese multinazionali definiscono gli obiettivi di sostenibilità, ma sarebbe interessante considerare un insieme specifico di obiettivi sostenibili (ambientali o sociali o uno specifico SDG)

per meglio esplorare le diverse modalità attraverso le quali le imprese affrontano problemi ambientali e sociali, quali assetti organizzativi impiegano e con quali attori collaborano a seconda degli obiettivi selezionati da raggiungere.

Per ultimo, la nostra analisi su una singola multinazionale potrebbe essere estesa a molteplici casi studio, esplorando ad esempio come più multinazionali in una specifica industria agiscono per la sostenibilità.

Implicazioni manageriali. Questo studio suggerisce che le multinazionali hanno bisogno di adottare meccanismi di sostenibilità interni ed esterni. Tra quelli interni alla governance di un'impresa, i codici di condotta, i sistemi di controllo e auditing vengono implementati dai manager per monitorare l'impatto della propria catena di valore. Tuttavia, questi non sono sufficienti ed è necessario che i manager attivino partnership con attori esterni e integrino meccanismi di compliance con meccanismi di collaborazione in cui vengano coinvolti fornitori, co-workers, attori civili e pubblici. Studi futuri possono supportare i manager a individuare le modalità con cui creare tali collaborazioni e quali risorse, capacità ed expertise devono formare oggetto di scambio tra i differenti attori presenti in esse.

Originalità del paper. La letteratura esistente riconosce molteplici ruoli che le imprese multinazionali svolgono e attraverso i quali influenzano i contesti istituzionali e le società dei paesi in cui operano (Fortwengel e Jackson, 2016; Leca et al., 2008; Zietsma e Larence, 2010). Nell'affrontare tale tema, la ricerca è però avanzata nel tempo in modo separato, definendo talvolta le multinazionali come attori internazionali economici (Coviello et al., 2011; Morgan e Quack, 2005; Whitley, 1994), sociali (Brown et al., 2010; Hofferberth et al., 2011; Trittin-Ulbrich, 2022) e politici (Scherer et al., 2006; Scherer e Palazzo, 2011; Rasche et al., 2008).

Le imprese multinazionali, come attori economici, "shape their organizational and institutional contexts as their activities internationalize" (Morgan e Quack, 2005: 1765). Quando integrano obiettivi economici con obiettivi sociali contribuiscono positivamente al benessere sociale e vengono definite attori sociali (Brown et al., 2010). In questa prospettiva, esse possono talvolta ricoprire un ruolo politico e, agendo nel pubblico interesse, le loro attività "aim to shape government policy" in modi che possono favorire le stesse (Scherer et al., 2014: 147).

Sebbene, dunque, gli studi in letteratura contribuiscono a rivelare la natura composita delle imprese multinazionali, un chiaro disegno di come queste facciano leva sui molteplici ruoli, sulle loro possibili interazioni ed eventuale intersezione, nella definizione e raggiungimento degli obiettivi di sostenibilità, sembra mancare. Fare luce su come le multinazionali, sovente responsabili di scandali sociali e ambientali, possano diventare attori chiave nelle sfide di sostenibilità rappresenta un tema di ricerca molto discusso e che necessita di un maggiore approfondimento.

Brand Activism: A survey on the level of consumer awareness and involvement

FABIO MUSSO* FEDERICA MURMURA• ELISABETTA SAVELLI^ LAURA BRAVI**

Framing of the research. *Over the hyper-globalized society, companies and brands have become protagonists of billions of people's lives through their products and services, often orienting them only in a consumerist sense without considering the consequences of their actions. In the last decade the course seems to be timidly changed: companies are assuming a new role, becoming the spokesperson for requests concerning major global issues such as pollution and climate change, economic inequalities, poverty, immigration, the weakness of government systems, corruption, access to education (Mukherjee and Althuizen, 2020). Hence, companies are increasingly attempting to translate into action a tension that is very tangible in all societies and they do so because the new generations are ever more impervious to the allure of consumption and more attentive to the health of the planet. A large segment of the world's population are no longer consuming uncritically, but pays attention to their choices, day by day. In this context, Brand Activism (BA) is gradually emerging as a new, revolutionary way of interpreting the business idea (Kotler e Sarkar, 2020; Sibai et al., 2021). According to Kotler and Sarkar (2020, p. 23), BA is "the set of efforts designed to promote, prevent or influence social, political, economic or environmental reforms or states of inertia, with the aim of promoting or prevent improvements in society". Similarly, Vredenburg et al., (2020) consider BA as "a purpose- and values-driven strategy in which a brand adopts a nonneutral stance on institutionally contested socio-political issues, to create social change and marketing success".*

Starting from these definitions, it is possible to identify four key-characteristics of the phenomenon:

- 1. The brand is driven by purpose and values: under the BA concept, the brand does not exclusively pursue objectives of economic nature, but focuses on a wider public interest, through the realization of social and environmental benefits (Bocken et al. 2014; Kumar, 2020).*
- 2. BA addresses controversial or polarizing sociopolitical, economic, environmental issues; brands are choosing to engage with divisive sociopolitical causes, even at the cost of losing some of their customer base (Smith & Korschun, 2018; Pöyry and Laaksonen, 2022).*
- 3. The issue can be progressive or regressive in nature. The company engages in progressive activism when aiming to improve the world and actively pursues policies that support the common wellbeing. By contrast, regressive activism occurs when the company aims to maintain the status quo conservatively, and pursues policies that harm the common wellbeing (Kolter & Sarkar, 2020; Kozinets and Jenkins, 2022).*
- 4. The company contributes to a sociopolitical issue through brand messaging and practice: BA, indeed, involves both intangible (communication) and tangible (practice) tools for a given cause (Vredenburg et al, 2020).*

BA was born as the "natural evolution" of Corporate Social Responsibility (CSR), but distinguishes itself from it, representing a revolutionary business model where the company takes a position on social, political, economic and environmental issues and actively performs to create a social change (Eilert and Nappier Cherup, 2020; Moorman, 2020). According to Kotler and Sarkar (2020), CSR is no longer sufficient and it is no longer enough to declare oneself responsible, to tell one's story. The public is asking companies to take the field, to act and take a position on issues affecting world public opinion. Thus, BA differs from CSR in two ways. First, CSR activities are considered positive and beneficial by most of the society. Conversely, BA does not always enjoy this consensus because there is often no universally 'correct' answer to the sociopolitical issues involved (Nalick et al. 2016; Barko et al., 2017; Korschun et al. 2019; Miranda and Miguel, 2022). Furthermore, while CSR is mainly focused on internal processes, as the company imposes constraints to discipline itself and become socially responsible, BA is more outward oriented, as the company actively acts to change the external conditions, in addition to internal initiatives in relation to a specific social issue. In

other words, BA is a complex phenomenon aimed not only at increasing the level of customer satisfaction and trust in the brand, but above all at improving the conditions of the environment in which it is immersed through concrete actions and propaganda (Mukherjee and Althuisen, 2020).

Purpose of the paper. This empirical analysis aims to understand the level of public awareness and involvement in BA and to analyze the effects that brand positions arouse in terms of divisive and polarizing behaviours. In particular, an attempt was made to investigate the differences in the perception of BA between the new and old generations, by focusing the study on the following research questions:

RQ1: What consumers think about companies/brands taking a stand on certain social, environmental and political causes? Do they inform about these aspects before purchasing? Are they willing to pay a premium price for those brands supporting such causes?

RQ2: How do consumers generally consider the BA phenomenon (positive and urgent or negative and marginal)? Do they trust activist businesses, and how do they feel about their level of authenticity?

RQ3: How much consumers are willing to contribute to BA initiatives and what is their propensity to boycott or buycott brands?

Methodology. The survey was carried out through a self-administered questionnaire, using Computer Assisted Web Interviewing, shared by the e-mail channel and the social platforms (Instagram, Facebook, LinkedIn and TikTok). The data were collected in autumn 2022. A total number of 272 consumers took part voluntary in the survey.

The questionnaire was divided into 3 sections: the first section investigated the socio-demographic characteristics of the sample (age, gender, area of origin, educational qualification, profession, average income). The number of interviewees, albeit limited, proved adequate for the identification of a homogeneous sample in terms of gender, age, profession and educational qualification. The second section related to the purchasing habits of the interviewees and investigated which factors affect the product or service choice, the degree of information about the brand's commitment in social, environmental and political causes they request for orienting the decision-making process and their willingness to actually pay a premium price for those brands supporting such causes. This was useful to understand the overall position of consumers towards social, environmental and political causes and, therefore, their positive/negative attitude towards companies/brands involved in such issues. Finally, section 3 provided information on respondents' knowledge, perception and interest about BA. In particular, an attempt was made to investigate their opinion about BA and their perception about the real intentions of companies involved in such practices, i.e. whether they consider them authentic or simply "woke washing". Furthermore, the propensity to boycott or buycott brands (i.e. the consumer practice aimed at promoting the purchase of certain brands) was investigated, with the aim of verifying which of these actions is most commonly adopted today.

As far as data analysis is concerned, it was decided to immediately identify four different generational groups based on the age of the interviewees: generation Z (18-25 years), Millennials (26-41 years), generation X (42-57), and Boomers (58-76 years). These groups served to obtain more detailed results and to compare them in terms of attitude and perceptions towards BA.

Results. Considering the socio-demographic characteristics of the sample, most respondents are female (56.6%); the male interviewees are 42.3% while 1.1% prefer not to specify it. In terms of age, most of them are between 26 and 41 years old, therefore belonging to the Millennial generation (40.1%). The respondents belonging to the Z generation are 27.6%; those who belong to the X generation, from 42 to 57 years are 28.7%, while only 3.7% belong to the Boomer generation (from 58 to 76 years). With regard to the level of education, slightly more than half of the interviewees (51.1%) have obtained a high school diploma, more than 30% have at least a three-year bachelor degree and 14.3% have a middle school diploma. Finally, as regards occupation, most of the respondents have a job (>70%) and among these, 9.6% are student-workers. On the contrary, those who are not employed are 23%, and 18% of them are students.

In the second section, relating to purchasing habits, the BA-related factors influencing consumer choices and their purchasing and consumption behavior were analyzed, in order to address the specific issues of our RQ1. The various factors considered in the questionnaire obtained quite similar values. Notably, respect for workers' rights (mean 4.25; SD 1.09) and operating in a coherent way with the declared values (mean 4.13; SD 1.07) are the main variables influencing a product or service choice, as well as the respect for the environment (mean 3.81; SD 1.10). Commitment to social (mean 3.59; SD 1.21) and political (mean 3.01, SD 1.34) causes received less attention, as consumers expressed almost indifference towards them.

Among the different generations, it emerges that respect for workers' rights is considered as important to a greater extent by generation Zeta (mean 4.35; SD 1.09), followed by those who belong to generation X (mean 4.24; SD 1.09), Millennials (mean 4.19; SD 1.09) and, finally, Boomers (mean 4.00; SD 1.07). Overall, the new generations seem to give greater importance to all factors, including commitment to political causes, which obtains an average of 3.16 (SD 1.34) and 3.08 (SD 1.33) from the Z and Millennial generations respectively. These values are higher than those from the older generations (generation X: mean 2.81, SD 1.35; Boomers: mean 3.00, SD 1.34). Therefore, it is possible to conclude that the new generations pay attention to the causes supported by the brands from which they buy the products and services to a greater extent than generation X and Boomers.

Then, respondents were asked how often they inquire about environmental, social and political initiatives undertaken by companies before purchasing their products or services. Findings show that new generations, in particular the Millennials, get information to a lesser extent than the older ones. In fact, those who say they never or

only rarely get informed are mostly Millennials (57.1%). On the contrary, those who get informed often belong to a greater extent to generation X (32.8%) and those who answered they always get informed all belong to the Boomers generation.

Among the ways through which the interviewees obtain information on the environmental, social and political initiatives undertaken by companies, the social profiles are the most commonly used (53.3%), followed by the corporate website (36%), television (21.3%) and finally newspapers and magazines (12.9%).

As concerning the consumers' willingness to pay for purchasing brands supporting social environmental and political causes. What emerges shows that the new generations seem to be more inclined to pay a premium price for products or services of companies that support shared causes. Indeed, the majority of those who answered "yes" belongs to the Millennial generation (40.4%), followed by the Z generation (29.1%). Conversely, the majority of those who are not willing to pay a premium price belong to the X generation (36.7%). Even among Boomers, those who answered negatively predominate.

Next, *soughing to understand how consumers perceive the BA phenomenon and consider companies involved in BA practices (RQ2)*, the results show that respondents usually consider BA as a positive and urgent practice that companies should adopt (mean 4.00; SD 0.96), despite they often express some uncertainty about the effective ability of BA to bring about changes (mean 3.81; SD 0.97). Through a generational comparison, it is possible to observe how all generations declare themselves more in agreement in considering the activist position of companies as urgent. Particularly, generation Z (mean 4.11; SD 0.97) and Millennials (mean 4.05; SD 0.96) show greater agreement with this statement than generation X (mean 3.95; SD 0.96) and Boomers (mean 3.3; SD 0.98). By observing the data, it is possible to state that Generation Z also seems to be the age cohort expressing a greater level of trust in activist businesses, while Millennials and Generation X show greater skepticism about the effectiveness of activism carried out by companies. Finally, Boomers are the age group that expresses the greatest disagreement on the effectiveness of such practices. As concerning the level of trust/skepticism towards companies/brands engaged in BA practices, respondents were asked to indicate whether they consider such intentions as authentic or simply "woke-washing" (i.e. "activism façade", which occurs when actions are taken by companies that exploit current affairs and public discussion issues but do it just to make a profit) (Mirzaei et al., 2022).

The Z generation and the Millennials agree with the idea that the goal of companies is to generate awareness of certain social, environmental and political issues. Moreover, for both generations, the important thing is that companies act, regardless of whether they are driven by economic reasons or not. Therefore, the new generations, and in particular the Millennials, consider corporate activism important and urgent and show an overall attitude of trust towards them. On the contrary, the older generations express more uncertainty than agreement with the same statements. Another relevant aspect is that while the Z generation and the Millennials are not sure if corporate behavior is adopted only to appear more responsible and to obtain greater profits, thinking that companies carry on a facade behavior, while the older generations tend to trust them more. This might suggest that new generations, despite placing their trust in BA, compared to the older ones, tend to be more skeptical about the real motivations driving companies to act. The cause of this skepticism could lie in the fact that young people, being always online, are more exposed to a very high number of information, which allows them to be more aware of the social networks-related world of mouth – even if this can be often affected by disinformation – thus increasing their skeptical attitude. Therefore, compared to the older generations, Millennials and generation Z are better able to recognize the level of authenticity of the statements and actions taken by brands.

Finally, it was investigated how important the interviewees consider buying the products of companies to support their activism and, in general, the propensity to boycott or buy-cott brands, with the aim of verifying which of these actions is most commonly adopted (RQ3). From the generational comparison it emerges that Z generation agrees to publicly recommend a brand with which it shares the supported cause. Conversely, Boomers disagree with buycott practices. The older generations, unlike the Z generation and Millennials, pronounce themselves uncertain and agree in boycotting a brand with which they do not share the supported cause, by ceasing to purchase its products or services.

In general, it can be said that the new generations are more inclined to buy-cott than the older generations. Furthermore, among the buy-cotting practices, they prefer the more intense one, which involves the activation of positive word of mouth. In parallel, these generations express more strong disagreement than Generation X and Boomers with boycott practices.

Research limitations. It is possible to identify some limitations that may represent starting points for future research. This study was conducted through the administration of a questionnaire that made it possible to generally investigate BA without examining any brand. This could imply less objectivity of the phenomenon. Furthermore, the sample analyzed does not appear to be large enough to make these results completely generalizable. Therefore, in the future it would be appropriate to investigate with respect to a specific brand and identify a more representative sample of all the generational cohorts. Furthermore, it could be interesting to analyze the companies' point of view to understand what are the main challenges and difficulties they have to face when they decide to take a position.

Managerial implications. As regards the managerial implications, this study provides important insights into the BA issue, thus helping brand managers to understand which aspects of this phenomenon are most appreciated and despised by different generations. The survey carried out shows how Millennials and the Z generation mostly adopt a purchasing and consumption behavior that takes into account the BA-related position of the chosen brand. This is why marketing managers should define their communication campaigns and related contents according to the consumers' targets their products are addressed to.

However, being able to satisfy consumer demands is not a simple process, since it implies a radical change as regards the company image. It is no longer enough to declare social responsibility. What consumers are aware of, and in particular Millennials and the Z generation, are brands and companies that actively fight for causes that are in line with their values and beliefs. Moreover, consumers are demanding greater authenticity and consistency between what companies communicate and their current actions in support of the cause.

As it emerges from the results, the new generations are more skeptical about the real motivations that drive companies to act. However, if a brand can demonstrate its authenticity, the new generations would be more inclined to reward it through buy-cotting practices, not only by personally purchasing the products but also by activating a positive word of mouth.

To sum up, this study confirms that BA is positively considered by consumers, who are increasingly expecting brands to take a stand on the hot topics of society. However, companies are required to take specific actions for social, environmental or political causes that are in line with consumers' values, or risk being accused of woke washing by a public of consumers who are increasingly aware.

Originality of the paper. BA is a topic of interest, which has been taken into consideration by the literature very recently. The main publications have developed in the last 5 years, from 2018 onwards and many of the studies have developed from the side of companies and their practices, through the study of case studies. Therefore, this research has the advantage of enriching the literature on BA, providing the consumer's perspective by understanding its level of knowledge and involvement in BA and analyzing the effects that the positions taken by brands arouse in terms of divisive and polarizing behaviors. In particular, it has been investigated the differences in the perception of BA between the new and old generations of consumers, thus adding an intergenerational comparison to the scant literature on the subject.

Generation Z's reactions to brand activism: the role of self-identity and familiarity

ANTONELLA CAMMAROTA* GENEROSO BRANCA*
VITTORIA MARINO[▲] RICCARDO RESCINITI^{**}

Framing of the research. *Climate change, the Covid-19 pandemic, wars, and increasing poverty, exacerbated by a growing distrust in public institutions and governments (Radanielina Hita and Grégoire, 2023), have prompted consumers to question the significant role of firms (Cammarota et al., 2021), resulting in a demand for a greater social engagement. More and more often, marketing has been regarded as a problem-solving force (Martin and Burpee, 2022; Chandy et al., 2021; Mende and Scott, 2021), capable of confronting our era's urgent sociopolitical issues.*

In this scenario, brands began to play a political role (Korschun et al., 2020), becoming educators (Moorman, 2020), heroes, or even activists (Sibai et al., 2021) by exploiting their power and visibility. Brand activism is defined as an emerging marketing strategy (Shoenberger et al., 2021; Moorman, 2020) characterised by risk and complexity elements (Bhagwat et al., 2020), that is gaining rapid interest among both researchers and practitioners (Eilert and Cherup, 2020). Brands have begun to take positions on socio-political issues (Klostermann et al., 2022; Sibai et al., 2021) such as LGBTQIA+ rights, cannabis legalisation, abortion, environmental concerns, police brutality or gun control (Schmidt et al., 2022; Bhagwat et al., 2020) about which public opinion is highly fragmented (Vredenburg et al., 2020) making forecasting consumer responses difficult (Warren, 2021). In fact, the risk element of brand activism strategy is largely related to divided and unpredictable consumer responses. Adding to the unpredictability of consumer response is the difficulty of not knowing exactly what factors may influence this response. The impact of contextual factors such as type of cause, brand-cause fit, firm size, or donation amount on consumer response to brand activism strategies was examined in a recent study by Atanga et al. (2022). Additionally, the literature advances hypotheses and directs future research primarily on more personal factors that could influence this relationship. For instance, Ahmad et al. (2022) hypothesise that consumers can have varying levels of affinity or familiarity with different issues and this aspect could influence consumer response or Zhou and Dong (2022) use the degree of experience with a specific issue as a moderator, stating that this familiarity may have resulted from joining advocacy groups, volunteering, or protesting. According to the Social Identity Theory (Tajfel and Turner, 2004), consumers can also express their political orientation and sense of belonging by promoting or boycotting a brand. Activist brands could be able to forge strong and emotional connections with consumers (Schmidt et al., 2022), particularly if the values promoted by the brand and those of the consumer are congruent (Johnson et al., 2022). In this exploratory study, based on the extant literature on brand activism, we hypothesise that familiarity and self-identity with an issue could be influencing factors. We hypothesise that consumers who identify themselves with an issue and/or have familiarity with it will react differently to brand activism actions than consumers who are unfamiliar with the issue and do not identify themselves with it.

Brand activism can be accomplished through statements and/or concrete actions that, generally, can be financial or non-financial in nature (Bhargava & Bedi, 2022; Ahmad et al., 2022; Mukherjee and Althuisen, 2020). The aims of this strategy are diverse (Smaldone et al., 2023; Kapitan et al., 2022); by becoming engaged in delicate issues, brands seek to create a positive social impact (Radanielina Hita and Grégoire, 2023; Eilert and Cherup Nappier, 2020), increasing consumer awareness of the issue, attracting media attention, and putting pressure on policymakers and institutions (Weber et al., 2023). As highlighted by Sarkar and Kotler (2018), Generation Z is given special attention in the brand activism literature because they are thought to be more sensitive to social and environmental issues and thus respond more positively to brand activism actions. According to the generational theory (Schewe and Meredith, 2004), members of a cohort develop similar behaviours and personalities as they experience the same events at a given historical

moment. Generation Z, or Gen Z, refers to all individuals aged between 11 and 26 in 2023 (Dimock, 2019). This cohort will be the central workforce in society and will dominate the consumer market (D'Arco et al., 2023). They have experienced times characterised by a global recession, terrorism and wars, natural disasters, climate change, a global pandemic, rising attention to civil and social rights, and environmental questions (Branca et al., 2023). Members of this generation are often described as environmentally conscious and more aware of sustainability issues than previous generations (Casalegno et al., 2022). They engage in pro-social and green behaviour, while they look for brands and companies that behave responsibly (Bravo et al., 2019; Van den Bergh and Pallini, 2018). True digital natives are highly influenced by technology (Monaco, 2018). Members of Gen Z are also activists and committed to helping others (Bravo et al., 2019), and they show a propensity toward forms of ethical consumption (Casalegno et al., 2022). They fight for what they believe is important, such as justice, civil rights, and equality, and they wish to have a positive impact on someone's life (Seemiller and Grace, 2016).

Purpose of the paper. Based on these premises, this exploratory study aims to examine the response to the brand activism strategy by Gen Z. First, as pointed out by several studies, the majority of the literature on brand activism focuses primarily on employee and investors responses, ignoring the consumer side (Atanga et al., 2022; Hambrick and Wowak, 2021; Bhagwat et al., 2020). Second, considering the attention this generational cohort pays to activism and civil, social and environmental issues, little is still known about their response to brand activism campaigns. Third, despite the literature on brand activism evolving rapidly, there are significant gaps that should be filled, answering the call for future research emerging in the recently published articles on brand activism (Radanielina Hita and Grégoire, 2023; Weber et al., 2023). First, what are the effects of brand activism and how can they be measured? Second, are there any factors that can moderate consumers' response to brand activism? Understanding the outcomes of brand activism is critical for quantifying benefits and risks for a firm that decides to engage in this strategy. Furthermore, the search for consequential and moderating factors is required to begin operationalising the construct, which remains one of the most significant gaps in the brand activism literature to date.

Methodology. A focus group was conducted in March 2023, to collect qualitative information, not obtainable through a structured survey, and to get a broader range of experiences and thoughts simultaneously, compared to in-depth interviews (Millward, 2012; Wilkinson, 2008). The sample consisted of 8 Generation Z members, all aged between 21 and 26, 5 females and 3 males. At the beginning of the meeting, a brief introduction has been read to participants, presenting the purpose and the topic of the meeting. Participants were also informed that the audio would be recorded during the meeting to facilitate the content analysis. During the focus group, the moderators provided verbal stimuli, inviting participants to interact and argue their answers. The question concerned: the responses and reactions to brand activism campaigns; the influence of self-identity and the familiarity with the issue on individuals' responses. The meeting lasted for about an hour. To identify, investigate, and report the findings, thematic analysis was used; this method is considered central and well-structured in qualitative research (Braun and Clarke, 2006). First, the transcription of the focus group was carefully read and organised prior to data analysis (Ma et al., 2021). The authors immersed themselves in data during this familiarisation phase (Insch and Walters, 2018), taking notes (Braun and Clarke, 2006) and searching for the first inspiring phrases or interesting points. The initial and meaningful phrases, words, or full paragraphs highlighted in the first step were coded and used to extract key information from the text (Ma et al., 2021). Following that, axial coding assisted in recognising group similarity and potential linkages between categories. Finally, the thematic analysis offered the opportunity to code and categorise data into main themes (Saldaña, 2021; Alhojailan, 2012). This analysis used an inductive and deductive approach (Kensbock et al., 2013), thus, the inductive approach generated conceptual themes from the data, which were supported by the extant literature on brand activism and its prodromes. Researchers worked on the data analysis independently (Wang et al., 2021), then the coding process was checked and discussed to identify any typos and the results were discussed in groups.

Results. From the thematic analysis, the following three major themes emerged: brand activism outcomes; familiarity; self-identity. Meaningful insights emerged for the brand activism outcomes, which can be categorised as follows: consumer perceived authenticity, consumer curiosity, brand trust, brand love, brand attachment, consumer boycott, and consumer activism. Authenticity is a key variable in brand activism, and many studies focus exactly on this concept that it must still be operationalised. For instance, the focus group results revealed that an activism strategy is perceived as more authentic in relation to corporate management characteristics or the brand's participation in public events on the subject such as conferences, exhibitions, debates, or seminars. Curiosity is a strong category that has emerged in the theme of brand activism outcomes. Specifically, it appears that a brand that discusses certain issues arouses the consumer's curiosity, leading him to enquire about the topic; this result is evident foremost when the participants discussed issues with which they were unfamiliar. As a result, brand activism actions, even simple declarations, inform the consumer about an issue or prompt him to enquire, raising consumer awareness. Additionally, findings show that a brand engaged in activism with concrete, perceptible, and visible actions, hence perceived as more authentic by consumers generates greater brand trust, brand attachment and even brand love. The construct of the consumer boycott emerged among the categories of brand activism outcomes, i.e., participants declared that they wanted to boycott brands that carried out "negative" activism campaigns because they did not agree with them for the supported topic, the position taken, the type of communication, or the action taken. Finally, among the consequences of brand activism, consumer activism has emerged: an activist brand able to correctly communicate its social commitment, use a correct narrative and engage the consumer in this commitment, would seem to be able to "activate" the consumer himself by generating the phenomenon of "consumer activism".

Our research hypotheses about the personal factors that could influence consumer responses to brand activism seem to be confirmed from these first findings. First, the theme of familiarity emerges strongly, which could be regarded as a significant influencing factor. Indeed, it appears that a high level of consumer familiarity with the issue generates greater attention towards the content of the activist campaign; on the other hand, less familiarity generates less attention towards the content of the campaign, but with very interesting effects. In fact, if on the one hand, a lack of familiarity with an issue generates less attention towards the content of the activist campaign, on the other hand, it appears to increase consumer curiosity about the topic leading them to seek information on the same. In general, greater familiarity with the issue could result in increased brand attachment and, more importantly, consumer activism. Finally, the findings revealed that greater familiarity with the topic increased the brand's credibility in its activist role. Finally, even if in a minor way, the importance of self-identity as a possible influencing factor emerges from these preliminary findings. Greater self-identity with the issue seems to create greater brand attachment and engagement from consumers. A higher self-identity, on the other hand, generates a much more critical judgement towards the brand and its activist campaigns by consumers, consequently, it could be more likely to cause negative brand activism outcomes.

Research limitations. This research, which accounts for the first step in a larger project, has several limitations, which may represent developments for future research. First, from having focused on a specific generational cohort, it follows that the results of this study cannot be extended to other age groups. Furthermore, although the participants had heterogeneous profiles and characteristics, common demographic factors such as occupation and income could greatly influence consumption choices. Second, the sample included individuals of one nationality. Future research could compare studies conducted with samples of different nationalities to understand whether and how cultural differences impact the relevance of personal factors in the response to brand activism campaigns. Third, in addition to the above, the use of a single qualitative methodology could negatively impact the results' generalisability. Future research could exploit the outcomes of this research to structure quantitative studies, such as surveys or experiments, to be submitted to a larger number of participants.

Managerial implications. The present study has both theoretical and managerial implications. Knowing consumers' responses is important for both researchers and practitioners, as it is the basis for addressing firms towards an achievable and better implementation of activism and outlining insights for future research that can make the phenomenon more understandable, measurable, and implementable by brands in a manner consistent with consumers' expectations and the needs of society. From a theoretical standpoint, this study advances knowledge on the construct of brand activism by identifying potential influencing factors and outcomes that can be tested and adopted in future quantitative research. By contrast, from a managerial standpoint, this research highlights some consequences of brand activism, which could be numerous, diverse, and significant. Brand activism can carry relevant risks, such as consumer boycotts; however, if an activism campaign is well-defined and perceived as authentic by consumers, it could generate not only positive business impacts but also significant social effects, resulting in the social change desired by stakeholders and which should be the first goal of brand activism (Korschun, 2021; Moorman, 2020; Sarkar and Kotler, 2018). Besides, this first exploratory study emphasises the significance of factors such as familiarity and self-identity with the issue, which can strengthen or weaken the consequences of brand activism actions, hence, they should be carefully considered and evaluated by brand managers before initiating activism strategies.

Originality of the paper. Brand activism literature is still limited and lacks a comprehensive and measurable construct (Weber et al., 2023; Schmidt et al., 2022; Gulbrandsen et al., 2022; Pöyry and Laaksonen, 2022). To the best of our knowledge, few studies examine consumer responses, and none specifically target Generation Z. This preliminary study appears to be necessary to begin identifying potential variables that will contribute to the development of models for measuring brand activism, useful to both researchers in understanding the phenomenon and brand managers in developing authentic activism campaigns that satisfy the expectations of consumers and civil society in general.

Keywords: brand activism; generation Z; consumer response; authenticity; familiarity; Self-Identity.

Managing consumer-brand relationships on digital live streaming platform: a comparative study

FRANCESCO CALZA* GIUSEPPE LA RAGIONE[•]
MICHELE QUINTANO[▲] MARCELLO RISITANO^{**}

Framing of the research. *The use of digital media is radically changing the way consumers interface with the world. This change requires managers to adapt their marketing strategies to meet this new consumer behaviour (Hollebeek and Macky, 2019; Kumar and Gupta, 2016). In fact, the consumer's central role in the decision-making process is even more pronounced in the digital environment, as they can easily give feedback and become part of the value-creation process (Bharadwaj et al. 2013). The ease with which managers in digital platforms can disseminate content becomes an asset for value co-creation strategies with the consumer (Vrontis et al., 2021; Yang et al., 2022). The American Marketing Association (2021) defines digital marketing as using any digital tool for marketing on digital platforms (Krishen et al., 2021). The context in which we live has also pushed many people to spend time online on social media or digital platforms in general. The development of technology and communication systems has led to the emergence of a variety of digital marketing strategies (Tiago and Veríssimo, 2014; Busca and Bertrandias, 2020). This modern approach employs a range of cutting-edge tools including social media, email, applications, search engines, websites, social networks, and digital platforms (Bala and Verma, 2018). Moreover, it is worth mentioning that such tools empower businesses to distribute brand-related content, including photos, images, videos, and audio, among others (Muntinga et al., 2011). Digital content marketing involves disseminating digital content through online platforms to engage consumers, build their trust, and foster brand loyalty (Hollebeek and Macky 2019).*

In particular, live-streaming services are becoming increasingly popular, capturing the attention of various stakeholders (Statista, 2023). Well-known digital streaming platforms include Twitch.tv, YouTube, Facebook, and Vimeo.com. Live streaming can be described as the phenomenon of online content being broadcast in real-time (Wongkitrungrueng et al., 2020). This new phenomenon is similar to what we have become familiar with over time with influencers, in which an actor disseminates content online (Haenlein et al., 2020). The main difference between the influencer and the streamer (the actor performing the live-streaming activity) is that the latter conveys video content in real-time, resulting in more transparency and genuineness to the viewers (Al-Emadi and Yahia, 2020). This entertainment could take the form of a video, image, or a real-time discussion on digital platforms, in which viewers can react and feel as if they are participating in being part of the value creation process (Jodén and Strandell, 2021).

In summary, live streaming activities can be considered as the process in which there is a streamer (i.e. actor/person) that produces content in real-time to entertain viewers (i.e. content consumers) in live streaming (i.e. activities) (Johnson and Woodcock, 2019). These tools are more effective than traditional ones since they are less expensive and can reach more people while being more honest and truthful in communication (Krishen et al., 2021). Moreover, viewers have the possibility to comment, react and participate in creating content giving continuous feedback in real-time, which is vital for managers (Al-Emadi and Yahia, 2020).

From a brand management perspective, even if the digital environment is considered fertile ground for building relationships with consumers and being able to acquire new consumers, it is still a challenging field. Among the greatest difficulties for brand managers are those of creating an online community and establishing a lasting relationship with it (Gummerus et al., 2012; Martínez-López et al., 2017). Groups of individuals who share common interests, beliefs, attitudes, and methods, offline or online, are frequently called "community" (Cova, 1997; Davis et al., 2014; Fariva and Wang, 2022). Advancements in digital platforms and tools have led to the emergence of online communities. These communities are collaborative systems that operate through Internet technology and enable users to produce and interact with user-generated content regardless of their geographic location (Clark et al., 2017; Steinhoff et al., 2019). So, technology plays a crucial role in fostering a sense of community among users by facilitating

the sharing of similar worldviews and social interactions resulting from common activities (Hawkins, 2017).). Creating attractive content and consumer engagement remains the biggest challenge for brand managers (Ashley & Tuten, 2015). This challenge is mitigated in live streaming as it is the streamer who is in charge of content creation; it remains for brand managers to search for a channel in line with the values they want to convey. In fact, if the streamer gets a large community, this may interest businesses looking to market their brands (Carlson et al., 2019). Creating communities that can engage and prosper on their own on digital platforms is especially important for marketers since it may provide fertile ground for organisations' marketing efforts (Dessart et al., 2015; Clark et al., 2017). Liao et al. (2022) suggest that the challenge of engaging consumers is lessened on digital streaming platforms as it is the streamers, rather than the companies, who are responsible for fostering community involvement (Sun et al. 2019). Streamers are able to engage their viewers through three key dimensions: cognitive, affective, and behavioural (Dessart, 2017). Therefore, brands should focus their efforts on finding a streamer whose community shares similar values and interests, as this will require the most effort.

Therefore, this paper aims to understand how to manage consumer brand-relationship on digital live-streaming platforms. Coherently, our work aims to respond to the following research question:

RQ 1.1: How can digital live streaming platforms be utilised to create and sustain effective brand management strategies?

RQ 1.2: Moreover, what are the antecedents, drivers and consequences that characterise this phenomenon?

Consistent with what is stated above, Figure 1 shows the research design of this paper. The figure shows the digital marketing platform's role in the connection among live streaming, end-user community and the brand strategy. That connection can thrive the value co-creation process among the actor involved.

The structure of the article is organised as follows. Paragraph one introduces and frames the research, which analysed the most recent studies on digital media through digital live stream platforms. It also investigates the role of digital live streams in engaging the community from a brand management perspective. In the second paragraph, the methodology employed to investigate our various cases is elaborated. The third section provides a summary of our initial findings. The fourth paragraph elucidates the limitations of the paper. The paper's theoretical and managerial implications are presented in the fifth paragraph. Finally, the originality of the work is resumed.

Fig. 1: Research design

Source: Author's elaborations.

Purpose of the paper. Live streaming has become a popular tool for businesses to connect with potential consumers in real-time, and it provides an opportunity to engage with them more personally and authentically. Businesses can strengthen brand loyalty, increase customer engagement, and ultimately drive sales by effectively managing their brand's relationship with consumers on digital live streaming platforms.

This paper aims to understand how to manage consumer-brand relationships on digital live-streaming platforms to help businesses and marketers understand how to effectively leverage to build and maintain strong relationships with their target consumers. In this context, "managing consumer brand relationship" refers to a set of strategies and tactics that businesses can use to establish and maintain a positive, meaningful connection with their audience on digital live streaming platforms. These strategies can include things like creating engaging and relevant content, responding to viewer comments and questions in real-time, and using social media to promote live streams and

encourage engagement. Moreover, the work clarifies the antecedent, the driver and the outcome of the live streaming activities is the value creation process.

The objective of the research is twofold. First, to try to understand what the benefits are in the creation of brand management strategies on live stream platforms. Second, to try to understand the process of value co-creation between the actors involved that takes place on a live stream platform.

Methodology. This exploratory study is carried out by adopting a qualitative methodology following proceeding through four stages: (1) research design; (2) data collection; (3) data analysis; and (4) proposing an empirical model. In particular, a multiple case study is based on comparing three brands that are using marketing strategies on digital live streaming platforms (Yin, 2009). The brands that we have selected are Kellogg's, Lavazza and Mulino Bianco. These companies were chosen because they are among the first to have implemented these brand strategies on digital platforms, particularly the Twitch.tv live streaming platform.

Kellogg's is the leading American producer of ready-to-eat cereals and other food products that in 2021 had sales of 14.181 billion.

With a revenue of 2.308 billion euros in 2021, the Italian company Lavazza is one of the major players in the global market for coffee sellers. Mulino Bianco is a Barilla-owned Italian baked goods company that makes snacks and biscuits and had a sales of 3.936 billion euros in 2021. The selected business carried out their branding strategies on the digital platform twitch.tv respectively Lavazza Arena Roblox, Kellogg's Tony Tigro and Mulino Bianco Scacchieri.

We have selected Twitch.tv as a platform that is an Amazon-owned interactive digital platform that enables real-time content broadcasting. The platform has 15 million daily active users and in 2021, Twitch earned about \$2.6 billion.

Several data sources were used to thoroughly understand the phenomenon. The documentation included 1) semi-structured interviews, 2) company documents collected from the official firm website, 3) the official social network page, and 4) the proposed live streaming content. We triangulated data utilising multiple sources of evidence based on this qualitative research approach employing primary and secondary data (Yin, 2003). By comparing data acquired from the interview with data collected from other secondary sources, the validity of the data coding sources was increased (Patton, 1999).

In this work we have collected and analysed data in the following ways: we performed a textual analysis of the case study documents; we compared them to other information received from social networks and the brands' official websites. Using participative observation, the authors watched live streamed content in which brands were involved to study the reactions of consumers/viewers and how the streamers entertained them (Lee and Broderick, 2007). This enabled us to ask more precise questions throughout the interviews in order to elicit more facts and information.

Interviews of approximately one hour were conducted with managers responsible for the digital marketing strategy. The interviews were transcribed and analysed in depth in order to identify the branding strategies used by the managers of the companies analysed.

Finally, we triangulated the data to strengthen the contextuality of our analysis model. Moreover, we analysed the branding strategies adopted by companies on the digital platform to understand the effects on the different actors.

Preliminary results. The evolution of traditional marketing strategies has shifted brands' interest toward digital platforms. From our analysis of selected brands, similar approaches could be seen but with differences in the brands' approach to the twitch platform.

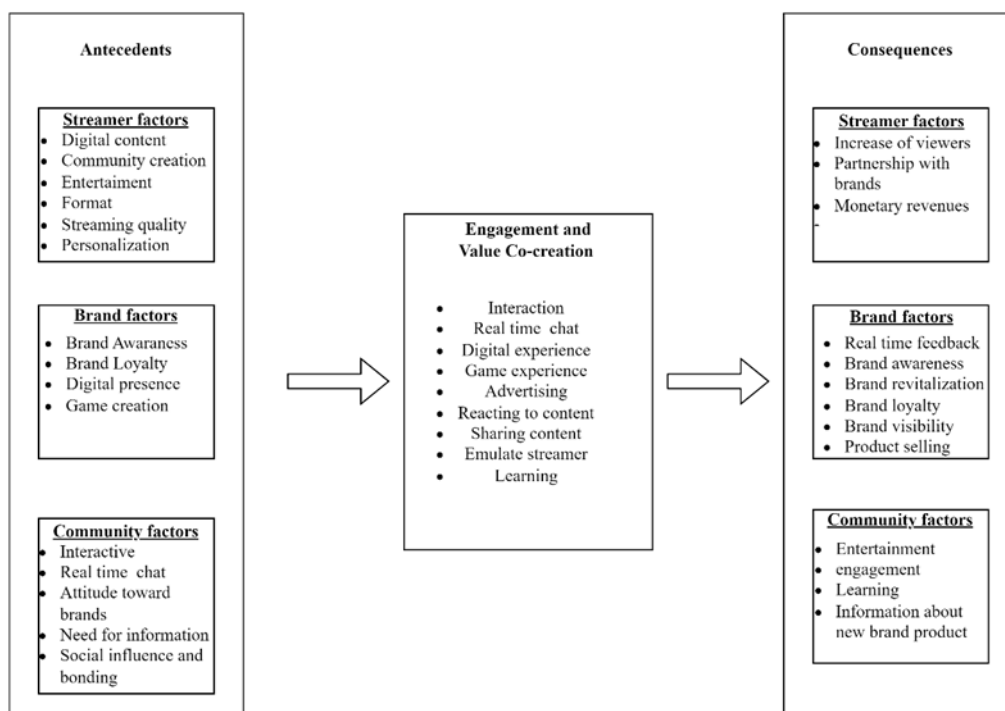

The strategies adopted by Kellogg's were to create an iconic character to perform live on Twitch.Tv. In particular, their famous mascot Tony the Tiger, was used and is the first to work with the video live streaming service Twitch. The live proposals last about two hours, allowing followers to have fun asking Tony things and participating in polls. In addition, Tony the Tiger in the live shows talks about the technology and hardware behind a powerful and functional PC, a tool with which followers connect the most.

The Lavazza case study revealed that the brand suggested on the Twitch platform developed an ad hoc digital campaign to increase customer awareness of environmental sustainability. It achieves so by combining its brand with the development of a game experience offered in a live streaming activity with streamers, which engaged a community that was already concerned about environmental sustainability. The game was created in the metaverse. It is basically a soccer game in which professional streamers and world-class soccer players were involved in the community to increase community engagement on Twitch. In order to get the community more involved, tournaments were organised with streamers and prominent personalities. In conclusion, it can be argued that Kellogg's used his strategies in order to create a show that would entertain followers. Indeed, by transforming its mascot from a drawing to a 'streamer' character, it attracted many consumers curious about this initiative.

Lavazza positioned its brand to enhance its visibility and exposure by promoting itself as a company that could educate the audience through a game experience they were able to access through Twitch's digital platform. In respect of Mulino Bianco's strategy, we could observe how it engaged streamers with an existing community that shared similar values as the brand. As a result, they proposed live-streaming to inform customers about the features and availability of their new product (i.e. Scacchieri). The aim of Mulino Bianco was to entirely carry out an advertising activity on the twitch platform via product storytelling by selected streamers. This action demonstrated how, throughout the live stream, the brand could measure prospective consumers' participation and interest via live chat and directed inquiries from the streamers. Finally, it was able to engage many customers by proposing an ad-hoc produced gaming experience, offered and narrated in live broadcasts by streamers who have a relationship and trust with the community. With these strategies, therefore, Kellogg's, Lavazza and Mulino Bianco were able to engage consumers in a cognitive,

ffective and behavioural way. The results show that the three actors involved in the digital platform all have a role in creating value, and this was found to be key to achieving outcomes. Specifically, the streamer must generate content that may engage, entertain, and engage the community in a way that allows for reciprocal discussion via real-time chat. This phenomenon is supported by the introduction of a novelty, such as a brand-created game experience. During the live broadcast, one may collect real-time data, opinions, and comments that can be used to co-create value for the three stakeholders. The result of the whole strategy has outcomes that target the different actors. Streamers, in addition to having a return in terms of followers/viewers benefit by creating partnerships with brands and a monetary return. The brands gain real-time feedback in addition to the positioning of their brands in a digital channel that has a growing community, thus fostering their awareness loyalty and the possibility of new sales. Consumers/viewers seeing brands positioned in a live streaming channel close to their interests makes them feel related and with similar values. The community on digital platforms has the chance to enjoy fresh and entertaining content, gain knowledge about the game world or social issues (such as Kellogg's and innovation, Lavazza and sustainability, Mulino Bianco and food habits), and stay up-to-date with product launches. The results described are summarised in Figure 1, underlining the relevance of the engagement and value co-creation processes on live streaming platforms supported by some antecedents to reach consequences. In particular, the antecedents of the phenomenon were analysed by looking at the three different levels (i.e. streamer, brand, community) and how they can co-create value with each other resulting in consequences for individual actors.

Fig. 1: Empirical model

Source: Author's elaborations.

Research limitations. The present study has revealed certain significant limitations that can provide a strong foundation for future research endeavours. Despite being an exploratory study that is centered on a particular perspective, the sample size was limited to three Italian companies, thereby limiting the scope of the research. To enhance the validity of the research, future studies could increase the sample size and extend the research to a global context. Furthermore, the research only focused on Twitch's digital platform, and hence, future research could explore other live streaming platforms. Additionally, given that the present study is qualitative in nature, it is recommended that a quantitative study be conducted in the future to identify drivers and variables. Finally, to establish the validity of the conceptual speculations, they are suggested to be applied to other industries as well.

Theoretical and managerial implications. In recent times, digital platforms are changing the lives of consumers and businesses by creating new business models and opportunities for companies. Entertainment on digital platforms, also favoured by the covid and post covid period, has become something that has accustomed people to spending time online in order to search for products and services in an easier and more transparent way.

Despite being in its preliminary stages, this study carries significant implications for both academics and managers. To the best of our knowledge, this is one of the pioneering studies to examine brand management within the context of

digital live streaming platforms. Consequently, this study can serve as a fundamental reference point for future research to develop a more comprehensive understanding of this phenomenon.

In particular, no studies explore the role of digital live streaming platforms in creating and sustaining consumer brand relationships.

Moreover, the study offers valuable insights into the potential of these platforms to facilitate the application of brand management strategies through innovative channels, ultimately engaging more millennials and Gen Z consumers. These findings have promising managerial implications that warrant further exploration and attention.

Originality of the paper. This study investigates the role of digital live streaming platforms in creating and sustaining effective brand management strategies to create consumer engagement. Additionally, the work presents a theoretical framework that illustrates the antecedents, drivers, and outcomes of the process of value co-creation among involved actors, despite being in its early stages.

To the best of the author's knowledge, this study is among the first to study brand strategies on the digital live streaming platform. So this study enlarges the literature about the digital live streaming platform from a brand management perspective. Finally, this study can be helpful for the manager to understand the potentiality of these platforms in creating and sustaining long-lasting consumer brand relationships.

Coping strategies and corrective actions to address consumer vulnerability in the digital context: a systematic literature review

VERONICA CAPONE* LETIZIA LO PRESTI* GIULIO MAGGIORE[♠]

Framing of the research. *Consumer vulnerability, defined as a temporary situation in which the consumer loses control in market interactions and makes decisions influenced by external factors (Baker et al., 2005), is an important topic. Deceptive business practices trigger consumer vulnerability, prompting consumers to lose control and engage in behaviours contrary to their interests. The prevalence of these practices is wider in the digital world, where the risk for consumers to be deceived is greater. New technologies and virtual reality are tools that can help those in bad faith manipulate consumers and push them to lose control over their choices in market interactions. Concerns have increased even more with the introduction of the metaverse, an immersive virtual world in which the differences with reality are so imperceptible as to make deception easier. In general, then, digitization has made unfair trade practices more common and consumer vulnerability a widespread phenomenon. Therefore, digitization has increased the responsibilities of marketing. Companies, in fact, have a digital responsibility, that is, the responsibility both to take into account the set of values and norms that govern an organization's judgments and choices in the digital context (Lobschat et al., 2019; Herden et al., 2021) and the situations of consumer vulnerability. Companies must, therefore, design strategies to protect the same to prevent potential negative consequences (Liyanaarachchi et al., 2020).*

In the literature, among authors who have addressed the issue of digital consumer vulnerability (e.g., Helberger et al., 2022; Lo Presti and Maggiore, 2021; Strycharz and Duivenvoorde, 2021), Helberger et al. (2022) define it as a universal state of helplessness and susceptibility in the face of power imbalances between consumer and seller. The main factors that trigger consumer vulnerability in the digital context, such as affective and social needs, personality traits, or website design, have been identified in the literature (Liyanaarachchi et al., 2020; Yap et al., 2021; Strycharz and Duivenvoorde, 2021) and the main consequences of vulnerability, such as harmful or compulsive behaviours, skepticism toward technologies, or loss of control (Williams et al., 2017; Batat and Tanner, 2021; Mahapatra and Mishra, 2022). However, vulnerabilities are not necessarily permanent (Helberger et al., 2022). The consumer does not always suffer the consequences of vulnerability, but there are cases in which he or she decides to defend himself or herself and actively respond by engaging in proactive behaviour. In this case, the vulnerable consumer develops so-called "coping strategies" (Kaufman-Scarborough and Childers, 2009; Mahapatra and Mishra, 2022). Few authors in the literature have addressed the issue of coping strategies in the digital context. Kaufman-Scarborough and Childers (2009) defined coping strategies as mechanisms for dealing with consumer vulnerability. Other authors (Batat and Tanner, 2021; Mahapatra and Mishra, 2022; Cloarec, 2022) have dealt explicitly with the topic and identified some coping strategies that the consumer can enact in the digital context, such as, seeking external support, no longer supporting the brand, not completing an online transition, and so on. Other authors (Nadler and McGuigan, 2018; Liyanaarachchi et al., 2020; Fox et al., 2022; Zahrai et al., 2022; Pallant et al., 2022), on the other hand, have identified some defensive actions that consumers may enact, but without identifying them as coping strategies. Therefore, there is difficulty in theoretically conceptualizing the topic and little attention from researchers.

While vulnerability is a state of mind that affects the consumer, it is also true that companies and public institutions are many times responsible for it. Companies often implement deceptive practices that make the consumer vulnerable in the digital; at the same time, vulnerability can be triggered by poor choices or regulations by public managers. However, marketers have a responsibility to protect consumers in the digital context from privacy violations, data misuse, and other unfair practices that cause them to be vulnerable (Lobschat et al., 2019; Liyanaarachchi et al., 2020; Herden et al., 2021). Therefore, consumer vulnerability in the digital context can be seen as a multistakeholder phenomenon. The consumer, who is the one experiencing the vulnerability, is not the only stakeholder involved, but so are companies, public decision makers, and the rest of society. Putting aside the consumer's ability or otherwise to defend himself or herself through coping strategies and proactive behaviour, it is, therefore, also incumbent on other stakeholders to help consumers cope with the state of vulnerability by taking the right corrective actions that can alleviate or avoid the consumer's vulnerability in the digital context. In the literature, some corrective actions have

been identified that companies could implement, such as educating the consumer or introducing inclusive technologies (Mogaji et al., 2021; Steinmetz, 2021). Public institutions could also alleviate consumers' vulnerability by educating them or introducing new regulations (Nadler and McGuigan, 2018; Batat and Tanner, 2021). Despite this, the literature on this issue appears to be still very fragmented and the results poorly integrated. Moreover, the authors do not consider vulnerability as a phenomenon that involves different stakeholders and, therefore, needs the contribution of all stakeholders to be addressed. The wide spread of the phenomenon of consumer vulnerability in the digital context urges, with urgency, scholars to understand its consequences and to frame the role in a multistakeholder perspective.

Purpose of the paper. The present work aims precisely to identify coping strategies that consumers can develop to protect themselves from vulnerability and corrective actions that can be implemented by other stakeholders involved, such as companies and public managers. This paper seeks to theoretically frame consumer vulnerability in the digital context as a multi-stakeholder phenomenon, involving the consumer, companies, institutions, and civil society at large. In this way, the paper offers an initial outline of strategies that can be adopted by various stakeholders to address vulnerability.

Methodology. This paper uses a systematic literature review to integrate the results of relevant studies on the topic. Systematic literature review, with its reproducible, transparent, unbiased, rigorous, and scientific approach (Cook al., 1997), allows for the identification, extraction, and synthesis of research papers available in the literature (Tranfield et al., 2003). A rigorous research protocol involving three phases was used to conduct the review: a data collection phase, a data cleaning phase, and a data analysis phase. Data collection took place in February 2023 on the Scopus and Web of Science (WoS) search engines, chosen for their broad scope, using a broad search query on the topic to avoid leaving out information important for achieving the research objective. The final search query was “customer vulnerability” OR “consumer vulnerability” AND “digital” OR “susceptibility” AND “digital” AND “marketing” AND (LIMIT-TO (DOCTYPE, “ar”)). The search yielded 341 articles, 309 from Scopus and 32 from WoS. During the data cleaning phase, duplicates (2 articles) were, first, removed and then two screenings were performed. The first screening, based on abstracts, resulted in the exclusion of 275 articles irrelevant to the achievement of the research objectives. In contrast, during the second screening, based on full reading of the articles, 22 articles were excluded that were deemed irrelevant and of little relevance to the research objectives. This systematic process led to the identification of a sample of 42 articles, relevant to the research topic, on which a systematic analysis was carried out. A comprehensive reading of the articles made it possible to extract key information about the coping strategies and corrective actions identified by the authors.

Results. Interesting findings emerge from the systematic literature review. Consumer vulnerability in the digital environment generates consequences that spill over into consumer behaviour. The consequences of vulnerability constitute undesired vulnerability effects that impact on the consumer. These undesirable effects may regard a particular state of mind (e.g. stress, low self-perception, scepticism towards technology) which the consumer suffers due to vulnerability. In other cases, undesirable effects may arise which affect market interactions (e.g. low trust in the company, misunderstandings, compulsive buying behaviour). In both cases, the consumer passively suffers the consequences of vulnerability in the digital context, allowing it to impact on his mood or affect his market interactions. However, the consumer does not remain “unaware” forever, and people who experience vulnerability often develop coping strategies as defence mechanisms (Kaufman-Scarborough and Childers, 2009). In these cases, even though it is true that the vulnerable consumer becomes dependent and not in control, he does however decide to be proactive (Kaufman-Scarborough and Childers, 2009). When the consumer implements coping strategies, he does not passively suffer the consequences but decides to defend himself and react. For most consumers, vulnerability is typically situational and temporary precisely because they eventually develop coping mechanisms to deal with it. However, at the other end of the spectrum there are individuals with enduring vulnerability, such as those with lifelong cognitive disabilities, who in some cases lack the ability to defend themselves (Batat and Tanner, 2021). Therefore, consumers who do not have pre-existing vulnerabilities upon becoming aware of the deception often adopt strategies to react, neutralize and resist deceptive marketing practices (Table 9).

Tab. 9: Coping strategies

Coping strategies	Authors
Seeking social support	Mahapatra and Mishra (2022)
Seeking outside help (es. Friends and family)	Fox et al. (2022), Zahrai et al. (2022), Kaufman-Scarborough and Childers (2009)
Gather information online	Batat and Tanner (2021)
Mental disengagement	Mahapatra and Mishra (2022), Liyanaarachchi et al. (2020)
Seek further assistance before completing the online transaction (e.g., telephone support)	Kaufman-Scarborough and Childers (2009)
Use of Tor and the blocking of ads	Nadler and McGuigan (2018)
Lack of intention to repurchase	Kursan Milaković (2021)
Stop supporting the brand	Pallant et al. (2022)
Moving away from the market	Kaufman-Scarborough and Childers (2009)
Not completing transitions	Kaufman-Scarborough and Childers (2009)
Falsification of information	Cloarec J. (2022)

Source: our elaboration

In the phenomenon of digital consumer vulnerability, the consumer is not the only stakeholder involved. The consumer is certainly the one who suffers digital vulnerability, but companies, public institutions and society in general are also involved in the phenomenon.

In fact, that not all factors that trigger vulnerability concern the individual and personal characteristics of the consumer. There are also trigger factors that derive from unethical and irresponsible behaviour on the part of company managers (e.g. data breaches and misuse) and of public institutions, whose behaviour could cause certain factors (e.g. economic problems) that trigger vulnerability in the consumer. Therefore, it is necessary to involve all the social actors, to engage in a broader and more open conversation about vulnerability and its impacts (Batat and Tanner, 2021). For business managers and policy makers it is essential to implement strategies and corrective actions to alleviate or eliminate consumer vulnerability in the digital context. Several corporate strategies can be used to support consumers and enable management to take a stronger lead in preventing and alleviating hardship for their consumers and society in general (Glavas et al., 2020). The literature examined has highlighted some conceivable corrective actions that company managers could implement. First of all, the company should adopt a radical change and embrace a consumer orientation (Zhang et al., 2022), making him the centre of the entire decision-making process (Liyanaarachchi et al., 2020). In fact, for the company, it is essential to help consumers make the right decisions, without errors, and to protect their well-being (Mahapatra and Mishra, 2022; Batat and Tanner, 2021). In particular, this research classifies corrective actions and groups them into three broad strategies that managers should follow: educate and inform the customer, guarantee technological support and improve privacy policies. These are the three avenues' companies should take to alleviate or eliminate consumer vulnerability. First of all, the company must engage in educating and informing consumers, to prevent them from becoming victims of deception and manipulation. It is essential to ensure transparency and clarity in the information on the products/services on sale to allow the consumer to make the right decisions (Batat and Tanner, 2021; Pallant et al., 2022). Furthermore, the consumer must be educated on how to improve their online shopping experience, on the security risks (Steinmetz, 2021; Kursan Milaković, 2021) and on how to improve digital literacy in general (Batat and Tanner, 2021). The second way to alleviate digital consumer vulnerability is obviously to offer technological support to consumers; please note that the use of technology is one of the main triggering factors in digital consumer vulnerability. First of all, they need to invest in cybersecurity to strengthen digital security (Mani and Chouk, 2018) and introduce new consumer protection mechanisms (Liyanaarachchi et al., 2020). The company could also create online chat rooms and forums to connect all consumers, so they can support each other and exchange information. Furthermore, they must inform the consumer, for example through advertising campaigns, about the addiction that technology could generate (Del Bucchia et al., 2021) and reassure users about the use of new technology (Mani and Chouk, 2018). Finally, the company should improve and strengthen its privacy policies so that consumer concerns would be alleviated (Liyanaarachchi et al., 2020). The company could activate periodic monitoring of the privacy problems of its customers (Guo et al., 2022) and ensure a personalized privacy policy (Guo et al., 2022) so as to offer fair treatment and contribute to inclusion (Mogaji et al., 2021).

Below is a summary table of the research results.

Tab. 9: Corrective actions for responsible companies

Strategies	Corrective actions	Important authors
Educate and inform the consumer	<ul style="list-style-type: none"> - Staff training on safeguarding the consumer - Show users personal statistics on the use of social media - Greater transparency and control - Make educational videos available - Educate the consumer on how to improve his online shopping experience and on the security risks - Improve digital literacy 	Walker (2016), Glavas et al. (2020), Steinmetz (2021), Muñoz-Mazón et al. (2021), Kursan Milaković (2021), Batat and Tanner (2021), de la Cuesta et al. (2022), Zahrai et al. (2022), Pallant et al. (2022),
Technological support	<ul style="list-style-type: none"> - Online chat rooms and forums between consumers - Virtual tours of the products - Traceability of the orders - Platforms dedicated to the management of complaints - Map of the site - Inclusive technology - Inform consumers on the dependency that technology can generate - Invest in and reinforce cybersecurity - Communication strategies that reassure users on the use of IoT - Design assistance software 	Walker (2016), Mani and Chouk (2018), Liyanaarachchi et al. Privacy policies	<ul style="list-style-type: none"> - Periodic monitoring of privacy problems with the clients - Personalised privacy policies - Ethical adoption of AI in the collection of data - Differentiated approach in the use of data - Strengthening of privacy policies for equal rights and to contribute to inclusion - Reduce privacy concerns 	Liyanaarachchi et al. (2020), Mogaji, Soetan and Kieu (2021), Guo et al. (2022), Pallant et al. (2022), Gao et al. (2022)

Source: our elaboration

Public policies should also implement corrective actions to safeguard the consumer and alleviate his vulnerability. Policy makers should ensure ethical business conduct and customer welfare (Mogaji et al., 2021). With the introduction

of new technology, consumer sharing of information is a long-term ethical issue for individuals and society as a whole, but it can be mediated if marketing and public policy managers implement an authentic education policy and effective regulation to increase awareness and reduce uncertainty (Walker, 2016). It is precisely on these two fronts that policy makers should act: regulatory support and consumer education. Global and national regulators have attempted to introduce strategies to reduce digital consumer vulnerability but they have not always worked (Zahrai et al., 2022). For this reason, new national and international regulatory responses are needed (Muñoz-Mazón et al., 2021; Nadler and McGuigan, 2018). Both regulatory and self-regulatory actions are needed that are however easy to use and implement for the business (Walker, 2016). Regulations should have the aim of safeguarding the consumer in the digital context, therefore it would be useful to regulate the digital choice architectures where the consumer navigates and where power imbalances are generated daily (Helberger et al., 2022). It is also necessary to impose consolidated standards on public and private companies to ensure safe and inclusive accessibility of the websites; to this end, funds and deductions could be granted to companies that incur costs for these purposes (Kaufman-Scarborough and Childers, 2009). Finally, there is a need to improve the privacy regulations (Guo et al., 2022; Mogaji et al., 2021) and strengthen consumer rights in the EU (Strycharz and Duivenvoorde, 2021).

The other road to take regards consumer education; to prevent them from being manipulated in the digital environment it is essential to educate users about online risks (Batat and Tanner, 2021), cyber security (Morrison et al., 2020), the influence of online marketing (Kennedy et al., 2019) and on data sharing (Walker, 2016). Education on this subject must be made compulsory first at school through specific programmes (Kennedy et al. 2019) and then continue at university level (Robson et al., 2017).

Below is a summary table of the research results

Tab. 10: Corrective actions for institutions

Strategies	Corrective actions	Important authors
Regulatory support	<ul style="list-style-type: none"> - National and international normative solutions - Business-friendly self-regulatory and regulatory dispatches - Strengthen UE consumer rights - Regulations for digital choice architecture to avoid power imbalance - Privacy policies that guarantee transparency, control and protection - Compulsory standards for web site accessibility - Guarantee funds or deductions for companies that sustain costs associated with online accessibility 	Kaufman-Scarborough and Childers (2009), Walker (2016), Nadler and McGuigan (2018), Muñoz-Mazón et al. Education	<ul style="list-style-type: none"> - Educate consumers to keep back personal information - Support and money management sessions organized by the universities - Greater knowledge and understanding of the risk of fraud (e.g. through the use of educational games) - Compulsory school programmes dealing in the influence of online marketing - Support forum - Cyber security formation schemes - Programmes and education policies to promote digital well-being and the awareness of the risks to be found online 	Walker (2016), Robson et al. (2017), Fenge and Lee (2018), Kennedy et al. (2019), Morrison et al. (2020), Batat and Tanner (2021)

Source: our elaboration

In the light of what has been said so far, it is now possible to consider digital consumer vulnerability as a multi-stakeholder phenomenon, which involves not only the consumer, but also company managers and policy makers. According to Helberger et al. (2022), digital consumer vulnerability is relational, in that the consumer is not vulnerable alone, but is often vulnerable in relation to others. Therefore, it is the consumer’s relationships with all the stakeholders involved in the process that make him vulnerable. Obviously, corporate managers have an enormous responsibility towards consumers, because vulnerability arises precisely from an imbalance of power between the seller and the consumer (Helberger et al., 2022); if company managers limited this imbalance, through the corrective actions seen above and a more ethical and responsible behaviour, the consumer could be fully or partially safeguarded. Politicians and institutions have the same responsibility as business managers. Therefore, they could on the one hand support companies in the adoption of digital protection systems and on the other hand support the consumer by strengthening his rights and educating him on the risks he runs in the digital world.

Research limitations. The first limitation of the research consists in having examined only scientific, English-language articles, excluding volume contributions and other scientific material, with the risk of having left out information useful for achieving the research objective. The second limitation is the impossibility of generalizing the research results. Consumers’ behaviour and ability to defend themselves may vary due to individual and contextual

differences. In addition, the general results do not highlight the possible differences that may emerge in consumer vulnerability depending on the digital platform being used. These differences may push companies to manage vulnerability differently.

Managerial implications. The results of this paper show what coping strategies and corrective actions, identified in the literature, can be developed by the various stakeholders involved in the phenomenon to alleviate or avoid vulnerability. Understanding how to manage and cope with vulnerability in digital contexts is crucial both for consumers, who are victims of this phenomenon, and for companies and public institutions, which are often responsible for consumer vulnerability. Therefore, this paper aims to frame digital consumer vulnerability as a multi-stakeholder phenomenon so that it can be carefully managed by companies and public managers. The research aims to bring attention to the issue to spur companies to manage the phenomenon more responsibly, suggesting corrective actions for decision makers to implement to alleviate or avoid consumer vulnerability in digital contexts.

Originality of the paper. The review contributes to studies on digital consumer vulnerability and marketing responsibility in the digital age. The research also allows vulnerability to be seen as a multistakeholder phenomenon, as it involves the consumer, the company, institutions, and the entire community. Therefore, the responsibility for such digital vulnerability falls not only on marketing, but also on institutions and civil society. In addition, the paper makes it possible to integrate findings from previous research and identify coping strategies that consumers can develop to defend themselves and react in the face of deceptive business practices that could make them vulnerable. In addition, for the first time, all the remedial actions, identified in the literature, that can be implemented by companies and public decision makers to alleviate or avoid consumer vulnerability in the digital context have been compiled. Beyond the many theoretical contributions that make the paper original, the real originality of the paper lies precisely in the great topicality of the topic. The increasing use of digital platforms and new technologies, including the metaverse, creates the need to address the topic, thus opening the door for future research as well.

The Benefit Factor: Understanding the Role of Benefits in In-Game Advertising Consumers' Responses

LUCA MATTEO ZAGNI* CRISTIAN RIZZO*

Framing of the research. *Within a context in which digital games an increasingly important role, gaming is benefiting by spreading into popular culture (Hamari and Sjoblom 2017), also becoming a platform that pave the way for new opportunities for brands. Obviously, this has led to an increasing interest among brands in exploiting the popularity of video games to promote their products or services. By integrating branded content within video games, brands can reach their target audience in a more engaging and interactive way, resulting in higher brand recall and recognition (Besharat et al., 2013; Chaney et al., 2018).*

Moreover, if we also consider the fact that consumers spend around 13 hours per week on social media and 12 hours per week on video game platforms, it's clear that active engagement with entertainment is on the rise (Newzoo,2022). Gen Z consumers, in particular, spend more time engaging with games and virtual worlds than on TV, indicating that younger generations are seeking more creative styles of engagement. In fact, nearly three-quarters of Gen Z consumers actively create digital content. As a result, brands are seeking to forge impactful partnerships within the gaming industry, such as HBO's adaptation of The Last of Us and live events hosted by Fortnite and Roblox (Newzoo,2022). Through the embedment of a branded content in a digital game, advertisers expect to have an impact on cognitive, affective and conative consumers' responses (Martí-Parreño et al., 2017). Furthermore, with the rise of the metaverse and the expansion of video games toward virtual reality (VR), we can expect even richer engagement opportunities for consumers and brands alike (Dwivedi et al., 2022).

Although the coupling between product placement and video game is not a whole new topic, it is also true that video games have changed their role. Thus, in-game advertising (IGA) may represent a revolutionary concept that has the potential to change the way we think about advertising. IGA has grown in popularity in recent years as these platforms have become even more popular and immersive, such as metaverse, unveiling a great potential (Chaney et al., 2018; De Pelsmacker et al., 2019).

Imagine being fully immersed in a virtual world in which you are completing quests, and exploring new lands, when suddenly a virtual billboard appears on the side of the road promoting the latest energy drink that maybe purchased in-game and help your character in recovering stamina. This type of advertising is not only more engaging and memorable, but it also allows for a more targeted audience (Tran and Strutton 2013).

IGA can assume different formats, from product placement within the virtual game environment, to banner or video advertisements that may appear during loading screens or as pop-up notifications.

With marketers and game players acting as the actors and the game serving as the mediator, IGA provides a different type of two-sided market (Herrewijn and Poels 2013). Traditional IGA such as static virtual billboards (as in FIFA 23) or in-game product placements, is static and akin to product placement in television shows or motion pictures (e.g., the Monster energy drink placed in Death Stranding). Instead, a dynamic in-game advertising allows marketers to modify adverts via the Internet to fit geographical areas, time points, or players' in-game behavior, allowing them to run time-critical and cost-effective campaigns (Yoon, 2019; van Berlo et al., 2022)

In recent years, several studies have been conducted to understand the role of IGA in shaping consumer responses and purchasing behavior (Herrewijn and Poels, 2015; Verberckmoes et al., 2016; Dardis et al., 2018; Wang and Chou, 2019). The effectiveness of in-game advertising may depend on the characteristics of the game (Dardis et al., 2018) and the advertisement, as well as the players (van Berlo et al., 2022). Moreover, congruity and intrusiveness have a significant impact on consumer attitude towards IGA: advertisements that are congruent with the game environment are likely to be more effective as they are perceived less intrusive, favoring brand attitude and purchase decision (Verberckmoes et al., 2016; Hussain et al., 2022).

Although research contributions have increased in recent years to expand knowledge on the topic, there are also several challenges and considerations to be aware of in placing branded content in a video game, as the overall effect of IGA on consumer responses is small and varies substantially between studies (Ingendahl et al., 2023).

As motivations for playing video games involve escapism, social interaction, gratification, etc. (Cheah et al., 2022), elements that intercede with the gaming activity may result in negative effects on the motivation itself dropping them. In

e-mail: cristian.rizzo@unito.it

this vein, an advertised content incorporated into the game environment may be potentially more subtle and less intrusive to the viewer. If it were not so, then it would result in a psychological reactance (PR) that come out as a result of invasiveness perception of an advertisement by consumer (Brehm and Brehm, 1981; Brehm, 1966). Non-skippable online ads are an example, as consumers may perceive them a kind of forced intrusions or a threat to their freedom (Amarnath & Jaidev, 2021). Thus, an individual that perceives a branded element as an obstacle to their ability to enjoy the game, is likely to reject the advertising content as well may have negative attitudes towards brands that are perceived as too controlling or manipulative (Brehm and Brehm, 1981; Tran and Strutton, 2013).

According to the PR theory, previous research have shown that in-game advertisements (IGA) that are perceived as intrusive or disruptive to the gameplay experience may also trigger psychological reactance in players, leading to negative attitudes towards the game itself and the advertised brand (Malhotra et al., 2021). This because, interruption by an advertisement can be associated with invasiveness and feelings of annoyance, leading players to try and bypass such advertisements.

Conversely, if an IGA is perceived as entertaining, congruent with the game, or providing a benefit to the player's performance, it may attract their attention and create a positive response (Vashisht and Chauhan 2017). Although there is rapid spread of video games and an increasing interest towards this topic, the research is still at a preliminary stage as the technological advancement of games has become very rapid in recent years, opening up various opportunities for brands.

In addition, research contributions focused on consumer responses have mostly investigated the effects that in-game advertising content generates on individuals' memory and recall abilities toward brands, as well as their perceived intrusiveness and attitude (Herrewijn and Poels 2015; Chaney et al., 2018; Hussain et al., 2022; Ingendahl et al., 2023). However, they have not considered the benefits that consumers may derive from in-game sponsored branded content, as discussed by Rialti et al., (2022) in-app purchases. This makes IGAs an area of research yet to be explored.

In order to study the video game players' behavior, most research has relied on the Uses and Gratification Theory (U>) (Kaimann et al., 2018). U> (Uses and Gratifications Theory) suggests that consumers engage in media activities to satisfy a range of socio-psychological needs, which can be classified into five main categories: cognitive, personal integrative, social integrative, and hedonic (Nambisan and Baron 2009; Verhagen et al., 2015). These needs involve using media for acquiring relevant information, fulfilling personal goals such as reputation or self-confidence, building relationships and interacting with others, and finding pleasure and entertainment (Rialti et al., 2022).

Initially developed to study consumer motivation and usage of traditional mass media, such as television, U> has also been adopted to explain the motivation and benefits derived from various digital media, including user-generated content (Shao, 2009). This theory has been widely applied to investigate diverse consumer behaviors, such as participation in online communities, adoption of food delivery apps, co-creation of value in innovation-based brand communities, motivation for browsing social media pages, and luxury brand social media pages (Nambisan and Baron 2009; Verhagen et al., 2015; Ray et al., 2019; Zollo et al., 2020). By identifying and addressing the socio-psychological needs of their target audiences, companies can create more engaging and relevant media content appealing to their consumers.

Furthermore, the U&G theory has been applied in mobile gamified ads by Rialti et al., (2022), which investigate their impact on consumer's benefits and in-app purchase intention. In examining the role of benefit they found that a gamification experience of an advertised content in mobile app may favor in-app purchases but this relationship is mediated by several variables as perceived consumer-benefits, their attitude toward advertising, and the perceived advertising effectiveness. Thus, to create an effective advertising, it should be able to elicit a set of benefits dimensions which refer to social, personal, hedonic and cognitive, as well as be congruent with the context in which the branded content is embedded.

However, they investigate the role of benefit only in relation to purchase while not considering its role in consumers' perception of intrusiveness and attitude to be exposed to in-game advertisements, thereby providing opportunities to study possible different outcomes (Rialti et al., 2022). In addition, since greater entertainment and interactivity may positively foster brand perceptions (Terlutter and Capella 2013), an extension of the research context towards game environments connoted with different characteristics that may affect the entertainment is worthy (Rialti et al., 2022).

Purpose of the paper. The purpose of this research is to investigate the responses of consumers who are exposed to different types of advertising elements and how IGA may be embedded in a beneficial and non-intrusive way to avoid reactance.

In this perspective, building on Use and Gratification Theory (UGT) and Psychological Reactance Theory (PR), the research wishes to explore how consumers' experience deriving from the exposition to a variety of IGA could contribute to the consumers' benefits perception and to the perception of intrusiveness. Moreover, their attitude in being exposed to advertising content during the gameplay is also investigated. In specific, we develop three interwoven research questions:

- RQ1. Does IGA congruity and interactivity influence consumers' perceived benefit of an IGA?
- RQ2. What is the role of consumers' perceived benefits in affecting IGA attitude?
- RQ3. Does the perceived benefit influence the perceived intrusiveness of an IGA?

By answering the question this ongoing research project aims to investigate the complex relationships between congruity and interactivity, benefit, reactance, and attitude in the context of digital advertising in videogames. These variables have been studied in previous research, but little attention has been given to the benefit that a videogame player may perceived during the game experience.

Perceived benefit refers to the positive outcomes or rewards that users expect to receive from interacting with a particular advertisement. These benefits can take many forms, such as increased knowledge, entertainment, or even monetary rewards or receive personalized offers and promotions based on their interests and preferences. Previous studies have suggested that the perceived benefit of mobile advertisement can influence a user's attitude towards the advertisement, which in turn can affect their purchase intentions and actual behavior (Ham and Nelson 2016; Kurtz et al., 2021).

Thus, we aim to investigate the mediating role of perceived benefit in the relationship between congruity and interactivity, reactance, and attitude. Congruity refers to the degree of fit between the advertisement and the context in which it is presented, while interactivity refers to a behavioral element of a users' actions, as they can interact with the surrounding environment in which they are located (Flavián et al., 2019). Reactance refers to the negative reactions that users may have when they feel that their freedom or autonomy is being threatened.

By investigating the mediating role of perceived benefit, we intend to gain a deeper understanding of how these variables interact with each other in the context of digital advertising within a video game. Specifically, we expect that the perceived benefit of interacting with an advertisement will play a key role in determining users' attitudes towards the advertisement and their subsequent behavior. Ultimately, this research may have important implications for advertisers and marketers who are looking to create more effective digital advertising campaigns.

Methodology. The research adopts a 2 (IGA Congruity: high vs low) x 2 (IGA Interactivity: high vs low) between-subject experimental design in which congruity and interactivity are manipulated.

The main dependent variables that will be studied include the perceived benefit, perceived intrusiveness, and the attitude towards IGA. To study these relationships, respondents are exposed to different visual stimuli representing different types of advertisements within the game *Grand Theft Auto V* (GTA). We selected GTA as represents a realistic scenario that can be compared to real-life situations, which can help to better understand the impact of branded content on players. Additionally, the open-world gameplay mechanics of GTA make it an ideal candidate for studying how players interact with branded content in immersive, nonlinear game environments.

The study is carrying out thought the administration of a questionnaire composed by six parts, each aimed at studying each variable mentioned above.

In the first part of the questionnaire, respondents will be asked to answer a couple of question about their knowledge about the video game selected and their level of expertise. Furthermore, they will be randomly assigned respondents to one of four scenarios characterized by different condition of congruity and interactivity (high - low).

For each of the four scenarios, respondents will be exposed to visual stimuli in which different types of in-game advertising are depicted, which include both product placement and billboard advertising as a component of the game context. In each of the subsequent sections of the questionnaire, where the effects of the variables are investigated, assessments of each are made on a Likert scale of 1 to 7 (1= "Not at all agree"; 7= "Completely agree").

In the second part of the questionnaire, respondents will be asked to give their opinion on the perceived level of congruity between the advertised content of the scenario and the game theme. The congruity is studied based on the scale adopted previously by Speed and Thomson (2000) and Verberckmoes et al., (2016).

In the third part, we asked respondents to state their degree of interactivity based on four items adapted from Lee et al., (2014) (e.g. "I can interact with the advertised product in the game). In the fourth part, we investigate the benefit perceived based on items adapted from Nambisan and Baron (2009), which consider different dimension of benefit: cognitive, social, personal, and hedonic.

Furthermore, the fifth part is dedicated to the perception of intrusiveness of in IGA that may lead to a psychological reactance (Malhotra et al., 2021) relying on Li et al., (2002) scale, which include items as "The advertisement is intrusive" or "The advertisement invades the game experience". Lastly, based on Fortin and Dholakia (2005), respondents are assessed on their attitude towards IGA.

Results. The research is still in its early stages since data have to be gathered. Yet, we may discuss about our expected outcome.

First of all, we expect that an IGA with high congruity may be perceived as helpful for the game's advancement and are considered more beneficial, as fulfilling the cognitive and hedonic needs of players. In fact previous research demonstrated that having ads which is congruent with the videogame context has significant effects on how successful they are at generating positive consumer outcomes (Wang and Chou 2019). Conversely, when an IGA is perceived as incongruent with the game, it may be seen as disruptive to the gameplay experience and therefore not fulfilling any needs. This can lead to negative attitudes towards IGA itself.

Moreover, previous contributions have shown that interactivity positively promotes the purchase of virtual items and usage patterns (Wang et al., 2019) has a benefic effect on consumers, favoring the perception of informativeness (Ott et al., 2016) and attitude towards IGA (Vashisht and Chauhan 2017). Consequently, it is plausible to assume that interactive advertising content has a positive impact on consumers' perceived benefit and attitude towards IGA. Within this relationship we expected that the benefit perceived by consumers play a mediator role as when consumers have a higher interaction with products their attitude positively benefits (van Berlo et al, 2021). Ultimately, when a user perceives a positive benefit, we expect that they will perceive the advertising content as less intrusive and thus

psychological reactance will not be generated. Based on previous research, we expect this effect to be stronger for scenarios in which users are exposed to advertisements congruent with the game theme (Verberckmoes et al., 2016; Pelsmacker et al., 2019).

Research limitations. This research has some limitations which could be used as hints for future studies. A first limitation is the game context, which limits its generalizability, as game characteristics influence consumers' responses to IGA. Therefore, it would be interesting to evaluate other types of games as well, including assessing different levels of interactivity, such as virtual reality, which could change the effect of other variables.

Subsequently, future research could delve into consumers' responses to IGA through a qualitative methodological approach, as the large body of studies has been predominantly quantitative (van Berlo et al., 2022).

Managerial implications. For advertiser, to consider these characteristics of an IGA is important to cope with players acceptance, as they may resent being interrupted by ads during their gameplay perceiving ads as intrusive (Tran and Strutton 2013; Verberckmoes et al., 2016). This, results in a psychological reactance as the interactive nature of digital advertisements might be irritating and provide an overwhelming volume of information (Stewart and Pavlou, 2002). Thus, it becomes important to be able to understand how branded content can be placed within video games. Therefore, investigating consumer responses to certain advertising stimuli within a game becomes strategic for practitioners to collimate the need of brands to use new communication channels to engage consumers, with that of users to avoid invasive content.

Originality of the paper. Given that the existing literature has only partially examined the role of perceived benefit in in-game advertising through this work we intend to make step forward providing empirical evidence of the role of the benefit perceived in affecting the perceived intrusiveness and the attitude, in a different context in which characteristics may affect the involvement as suggested by Rialti et al., (2022). Furthermore, the potential for GTA's open-world gameplay mechanics to be transposed into the metaverse makes it an even more relevant example to study. As the concept of the metaverse continues to gain traction and become more mainstream, understanding how branded content can be integrated into immersive virtual environments will be increasingly important for marketers and game developers alike (Dwivedi et al., 2022).

Keywords: in-game advertising, product placement, psychological reactance, brand attitude

The rise of Virtual Influencers: Bizarrely realistic or scarily uncanny?

RADA GUTULEAC* GABRIELE BAIMA* CRISTIAN RIZZO[♠]

Framing of the research. *The emergence of Web 3.0 has triggered a paradigm transformation in endorser marketing. The convergence of social media and artificial intelligence (AI) technologies is reshaping the way brands and consumers engage with endorsers.*

Traditionally, endorsement marketing is the practice of acquiring experts or individuals with a high reputation, namely “celebrities”, to promote brands’ products or services to others (Liu et al., 2020). Their effectiveness has consistently contributed to positive outcomes in terms of customer attitudes, intentions, and behaviour (Arora et al., 2021). However, the rise of social media represented the first disruptive shift in how marketers engage celebrities. In the last decade, a new phenomenon of so-known “influencers” has begun to outclass traditional celebrities and dominate branding and marketing communication (Feng et al., 2021). According to Ki and Kim (2019), an influencer is an independent, third-party endorser who built a vast social network by publicly expressing opinions. More specifically, an influencer is a specialist in using online presence to promote products or services to the audience, in exchange for compensation from brands or companies (Campbell et al., 2022).

Although traditional influencers are widely recognized, the newest wave in brand communication is to leverage “nonhuman alternatives to traditional celebrity endorsers” (Thomas and Fowler 2021: 11). Prada, Calvin Klein, and Hugo Boss are just some of the most fervent adopters of virtual influencers, who have successfully engaged social media to promote their products and brand reputation (Sands et al., 2022). According to Thomas and Fowler (2021), AI or digital influencers - well known as virtual influencer - are computer-created characters or personas with human features, traits, and personalities that are designed to look and behave like real-life human influencers for the sake of influence. While Arsenyan and Mirowska (2021: 2) refer to virtual influencers as “agents augmented with digital avatars, designed to look human”.

In this regard, Choudhry et al. (2020) acknowledge that virtual influencers are not just restricted to highly human-like representations, but they may differ depending on the extent to which they resemble humans. Therefore, Choudhry et al. (2020) have classified virtual influencers by encompassing those with both human and non-human appearances into these distinct categories: (i) Non-Human, designed without a human identity, instead frequently that of an animal; (ii) Animated Human, designed in the likeness of a human being but as an animated, anime, or cartoon character; (iii) Mimic-Real Human, visually indistinguishable from a human.

The purpose of virtual influencers is akin to traditional influencers, especially in terms of advantages, popularity, status, personality and interactions (Arsenyan and Mirowska, 2021). In this sense, influencers exert their influence via content they create for their followers, while acting as opinion leaders capable of shaping consumers’ decisions (Shan et al., 2019). They have typically a large audience (Taillon et al., 2020), are specialized in a particular niche or product category (Campbell et al., 2022), tie a trustworthy and two-way communication with followers (Boerman and Van Reijmersdal, 2020), and share self-generated content (Karagür et al., 2022). Thus, they balance their advertising content with realism and expression of ordinary routine to enthrall their followers by turning them into narrative advertising, sponsored entertainment and credible EWOM (Breves et al., 2019; Ye et al., 2021).

Although virtual influencers share the same attributes as traditional ones, they present a unique array of advantages.

When it comes to benefits, they provide a balance of flexibility, exclusivity, innovation, and safety, which traditional influencers may struggle to achieve due to the limitations of physical presence (Conti et al., 2022). In terms of flexibility, they are leveraged for promotional purposes in a wide range of settings and times. Due to their adaptability, virtual influencers are unconstrained and able to continue creating innovative content even during times of confinement, as is also demonstrated by the Covid-19 pandemic (Conti et al., 2022).

Furthermore, brands may create or commission virtual influencers to promote their products, which enhances the credibility and authority of their endorsement (Yan et al., 2022). In some cases, virtual influencers are tailored to mirror the brand’s image and values (Sands et al., 2022), serving as organizational stakeholders that perform specific

functions such as advertising campaigns and strategic communication. By collaborating with virtual influencers, companies avoid the unpredictability often associated with traditional influencers' behaviour (Conti et al., 2022). In addition, virtual influencers lend the company a greater brand reputation, as their implementation establishes the company as forward-thinking and technologically advanced in the eyes of users (Conti et al., 2022). Among other advantages, Thomas and Fowler (2021) highlighted that virtual influencers leverage artificial intelligence technology to maintain uninterrupted interaction with their audience (Thomas and Fowler, 2021).

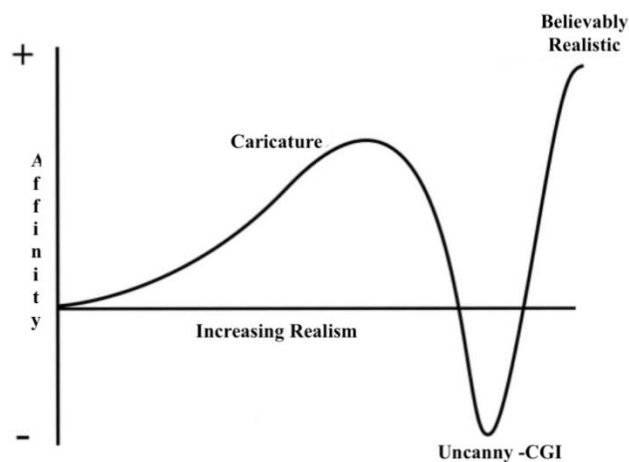

Despite virtual influencers offering an innovative approach to endorsement, they may still receive negative perceptions from certain segments of their audience (Arsenyan and Mirowska, 2021; Lou et al., 2022). This aspect was further highlighted in a recent study on virtual influencers, where a participant's comment "Bizarrely realistic. This online person looks so real... If you think about that... It's kind of scary" (Wortelboer, 2022: 28), supported the notion that the high degree of similarity to human evoke uncanniness.

While virtual influencers may strongly resemble human traits, they are not representative of any real-world human being (Moustakas et al., 2020), leading to confusion among users who may mistake them for traditional influencers (Franke et al., 2023). According to a recent report, 42% of Generation Z and Millennials follow an influencer without recognizing that the profile is virtual (Kim and Park, 2023; Chowdhary, 2019). This is likely due to the remarkably high level of humanization that virtual influencers exhibit, rendering them indistinguishable from human beings (Kim et al., 2023).

In this vein, anthropomorphism is the practice of imbuing non-human beings with human characteristics, desires, and ambitions in order to present them as more sentient (Zhu and Chang, 2020). In fact, this process exceeds merely adopting physical features, assigning human qualities such as consciousness, intentionality, cognitive processing, emotional experiences, and behavioral traits to nonhuman entities (Blut et al., 2021). However, the degree to which virtual influencers exhibit these human features may impact how they are perceived by audiences. Wiese and Weis (2020) suggested that Mimic-Real Humans, or High-humanized virtual influencers, are frequently perceived more negatively compared to Animated Humans, or Low-humanized virtual influencers, and Non-human or Non-humanized virtual influencers.

To well express this concept, we introduce the Uncanny Valley Theory which posits that individuals experience a negative emotional response when faced with an object or entity that resembles a human being (Mende et al., 2019; Mori, 1970). While entities and objects that bear a resemblance to humans can be tolerated up to a certain point, if the degree of similarity exceeds what is considered acceptable due to inconsistent realism or atypical features in the stimuli, they become "uncanny." This sense of uncanniness can unsettle observers and impact their sense of well-being (Lou et al., 2022; Mori, 1970) (Figure 1).

Fig. 1: Mori's graph of the Uncanny Valley Theory (Seymour et al., 2017). The graph shows the Uncanny Valley and the non-linear relationship between increasing realism and the affinity to an entity.

Recent studies have investigated followers' relation to virtual influencers relying on the Uncanny Valley Theory as a framework (Arsenyan and Mirowska, 2021; Block and Lovegrove, 2021; Lou et al., 2022; Yang et al., 2022). According to Arsenyan and Mirowska's study (2021), which examined user comments and reactions to virtual influencer posting, followers had more negative reactions to virtual influencers that appeared too human-like, as opposed to those that resembled more like anime characters or human influencers. Instead, Lou et al.'s (2022) study occupies a middle ground between providing evidence for the Uncanny Valley Theory and challenging its validity. In fact, the study reported that the majority of respondents described virtual influencers as "authentically fake" and perceived them as uncanny when they simultaneously appeared human-like and artificial. However, some respondents were conscious that human-like virtual influencers are artificially created, and consequently continued to engage with their content.

Although scholars have confirmed the virtual influencers' uncanniness, a few studies have suggested that the level of uncanniness exhibited by virtual influencers contributes to their appeal, rather than creepiness (Block and

Lovegrove, 2021; Yang et al. 2022). In light of this, Block and Lovegrove (2021) state that virtual influencers' transparent characteristics and ability to display human-like traits ultimately increased their marketing effectiveness in persuading followers. Furthermore, Yang et al. (2022), comparing two types of virtual influencers, one humanlike and one cartoonlike, even further disproved Mori's theory. The authors refuted their hypothesis by acknowledging that virtual influencers with high humanness elicited higher attractiveness, reliability, and expertise to followers.

Drawing on this reasoning, the following hypotheses are proposed:

H1: A High-humanized virtual influencer generates a greater uncanniness that negatively impacts past behaviour

H2: A Non-humanized virtual influencer generates a lesser uncanniness that positively impacts past behaviour

Fig. 2: Conceptual framework

Purpose of the paper. Grounded on the Uncanny Valley Theory (Mende et al., 2019; Mori, 1970), we aim to investigate the degree to which the humanization of virtual influencers may impact customers' past behaviour, i.e., intention to follow and intention to purchase. Specifically, we intend to explore if two different virtual influencers, one non-humanized and one high-humanized, induce a sensation of uncanniness and, as a result, diminish past behaviour.

We intend to clarify the potential (dis)advantages of humanizing virtual influencers and the implications for influencer marketing strategies. First, we provide theoretical implications to guide academics in further studies on this under-explored topic. Second, we provide concrete implications to influencer marketing stakeholders in understanding the degree of which anthropomorphism elicits positive emotions in consumers, thereby facilitating the development of effective product and service promotion campaigns via virtual influencers. Overall, the findings will inform the development of guidelines for humanizing virtual influencers in order to enhance positive consumer reactions and promotes effective marketing strategies.

Methodology. The objective of the paper is to examine the role of anthropomorphization on positive behavioral intentions. In doing so, we considered two different virtual influencers with varying degree of humanization and examined how feelings of uncanniness shape different consumers' intentions to follow the VI, and to buy a product sponsored by a virtual influencer. Adapted from Choudhry's categorization (2022), we redefined the Mimic-Real Human as a high-humanized virtual influencer (HHVI) - Imma Gram - and the Non-Human as a non-humanized virtual influencer (NHVI) - Nobody Sausage. Imma Gram is a model, brand ambassador and virtual influencer, whose bubble gum pink bob and Asian features has already gained 2,8 million followers to 2023. Indeed, she earned more than 300k followers just after appearing on the cover of CGWorld magazine (Conti et al., 2022). Nobody Sausage is a food shaped virtual influencer, which rose to prominence on Instagram thanks to his bright, hilarious, and funky dancing videos. Indeed, this dancing sausage gained the fastest social growth on Instagram in 2021 (Awdziej et al., 2022). While HHVIs are among others followed for applying humanlike characteristics to the brands due to anthropomorphization, whilst NHVI like Nobody Sausage is followed due to the comical and cartoonish looks and contents (Choudhry et al., 2022).

To compare the two virtual influencers, we used a within-subject experiment on a sample of 254 respondents. The study has been conducted on an online sample of US respondents.

The questionnaire was initially aimed to assess respondents' familiarity with virtual influencers. To this end, we asked them to report: (i) subjective knowledge through a single item (i.e., "I know what VIs are") on a Likert scale where 1 = "Not at all agree" and 7 = "Totally agree"; (ii) past behavior, here intended as they proclivity to follow ("I follow virtual influencers on social media"); (iii) country-of-origin effect (e.g., "I prefer influencers of my own country") on a 7-point Likert scale (1 = "Not at all agree"; 7 = "Completely agree") to control for possible cultural effects, especially because of the presence of virtual influencers with Asiatic traits.

In the second part of the questionnaire, we also considered some constructs that according to extant literature may influence consumers' perceptions. First, we asked respondents to state their degree of conformism based on five items

extracted by Schwartz et al. (2012) (e.g., “Obeying all the laws is important to him”; “It is important to him to avoid upsetting other people”).

In the third part of the questionnaire, we investigated: (i) uncanniness (e.g., “I feel uneasy”) and (ii) socio-psychological distance. To control for the social psychological distance, we used three items by Sands et al. (2022) (e.g., “The influencer Imma Gram/Nobody Sausage is far - near”).

Sample

The sample consisted of a total amount of 254 UK respondents. Regarding age, more than half were Millennials (61%), and the remaining were mainly belonging to Generation Z (15.4%) and X (16.5%). Most of the respondents have an income lower than 60.000 \$ (76,8%).

Results. Dimensionality and reliability checks

To obtain a single measure for the variable assessed through multiple items we calculated the average. For each construct, we conducted a factorial and reliability analysis. The analysis showed that all the involved constructs were unidimensional and Cronbach alpha’s were above the threshold recommended by Nunnally (1978).

To estimate the impact of uncanniness on the intention to follow and buy the sponsored product, we conducted an OLS (Ordinary Least Square) regression for each dependent variable. The results are reported in Table 1.

Tab. 1: Regression analysis

	HHVI		NHVI	
	Beta	p-value	Beta	p-value
Uncanniness	-0.07	0.02	0.05	0.11
Conformism	0.07	0.02	0.08	0.01
SPD	0.81	0.00	0.73	0.00
COE	-0.04	0.31	0.00	0.94
Past behaviour	0.03	0.47	0.02	0.60
Age	-0.07	0.02	0.06	0.07
Sex	0.02	0.49	0.03	0.40
Income	0.00	0.99	0.08	0.01

Notes: COE = Country-of-Origin-effect; SPD = Social Psychological Distance; R-Squared_(HHVI) = 0.81; Adjusted R-Squared_(HHVI) = 0.80; R-Squared_(NHVI) = 0.80; Adjusted R-Squared_(NHVI) = 0.79.

Findings underline that for HHVI the impact of uncanniness was negative and significant on the intention to purchase and follow Imma Gram, while for NHVI the impact of uncanniness was not significant. These results provide useful support for our research hypothesis.

We also found a positive effect of conformism for both virtual influencers, whereas a negative effect of age for the high-humanized virtual influencer. The other variables do not have a significant impact on past behaviour.

Research limitations. The current study is not without its limitations. First, we acknowledge that we investigated only two virtual influencers, categorized into two degrees of humanization - high-humanized and non-humanized. Future research could broaden the sample size by including virtual influencers with varying degrees of humanization to further validate our results. Second, our respondents were selected on the basis of their interaction with the virtual influencer exclusively on Instagram. Future studies may consider video-based social media platforms such as TikTok, which is gaining popularity among new generations (Araujo et al., 2022). Indeed, the peculiar characteristics of platforms may influence consumers differently in terms of uncanniness. Third, our research focused on the follower perspective. Future studies may explore the manager perspective if not even the virtual influencer themselves or their creators to gain more insights.

Furthermore, future lines of research could also investigate how virtual influencers facilitate company entry into appealing domains such as virtual communities or metaverse marketing.

Although our results suggest that a high degree of humanization elicits a sense of uncanniness in the follower, more investigation into whether this impact may be moderated by other stimuli, in line with Lou et al., (2022), would provide a more detailed knowledge of the psychological mechanisms underpinning these cognitive responses.

Managerial implications. Companies have increasingly begun to leverage virtual influencers as advertising tools. They can tailor their social media presence via virtual influencers to reflect the brand’s image and values and control the content (Conti et al., 2022). On the other hand, companies are concerned about facing different challenges, among which the humanlike appearance of virtual influencers is outstanding (Sands et al., 2022).

From a managerial perspective, brands that leverage virtual influencers for marketing purposes should evaluate the degree of humanization when designing and implementing their campaigns, as a highly humanized virtual influencer may decrease the consumer’s intention to purchase the sponsored products and follow them. Therefore, managers should carefully consider the level of humanization and test it with focus groups to ensure it is well-perceived. Additionally, since a highly humanized influencer induces a sense of uncanniness, they could monitor customers’ emotional reactions, possibly signs of discomfort and negative emotions, to adjust campaigns accordingly.

Furthermore, managers should be transparent about their virtual influencers being non-human entities, as this can impact the credibility and trustworthiness of the brand. Thus, they can implement a campaign of transparency about the operation of the virtual influencers and their control by human beings, to allow greater recognition by their consumers of their fictitious entity.

Moreover, companies should also consider the message they want to convey as well as the product they are promoting to ensure that the virtual influencer's level of humanization matches the brand's image and purpose. Virtual influencers can be an effective tool in a company's marketing campaign. However, companies cannot only rely on them, but should integrate other endorsers to create a comprehensive, omnichannel, and integrated campaign.

Originality of the paper. This study advances the literature on virtual influencers, a still under-explored area. Specifically, our research focuses on testing the impact of the degree of humanization of virtual influencers on customers' behavior grounded on the Uncanny Valley Theory. Moreover, our research approach differs from previous studies (Franke et al., 2023; Yang et al., 2022; Lou et al., 2022; Arsenyan and Mirowska, 2021; Block and Lovegrove, 2021) by focusing on the comparison of two distinct virtual influencers with varying degrees of humanization. Our study allows for a more in-depth investigation of the impact of humanization on customers' emotional reactions and past behaviour, particularly intention to follow and intention to buy.

Finally, our findings contribute to assisting marketers and managers who are keen to leverage the power of virtual influencers and AI technology in their marketing efforts, while also ensuring that their campaigns elicit positive behavioural intentions.

Keywords: virtual influencers; consumer behaviour; uncanniness; influencer marketing; uncanny valley; endorser

Something red, something blue. A psychomarketing approach to political branding.

ANDREA BAZZANI* GIOVANNI GASPARINI* UGO FARAGUNA* GIUSEPPE TURCHETTI**

Abstract

While the relevance of colours in shaping individual perception is widely accepted, it has received limited attention in the political realm. Political marketing literature suggest that a political offer is formed by three elements: party, policies, and leader(s). Each of these yields several association links and nodes, that overall contribute to build the political brand image in voters' minds. Colour is one of the most evident nodes, as it appears in the media, campaign materials, ballot papers, and even in leaders' clothing.

This work-in-progress study aims to investigate the role of colours in political branding, and their effect on voters' ability to associate specific colours to political affiliations.

To quantify the impact of colours on voters' implicit attitudes, we conducted an experiment with 103 participants who underwent an Implicit Association Task (IAT) measuring the ease of association (*d*-score) between colours (red and blue) and words related to Italian political parties or politicians (Left-wing and Right-wing), along with neutral words as a control condition. Participants' individual differences were evaluated through a profiling questionnaire assessing socio-demographic characteristics, political literacy, and cognitive style (as measured by the Autistic Quotient).

Findings show that participants more easily associated red with Left-wing words and blue to Right-wing words rather than the opposite. Also, we observed a positive and significant correlation between the participants' level of political literacy and their ease of association between a colour and a political side: higher levels in political literacy positively correlated to an easier association of red to Left-wing words and blue to Right-wing ones. Finally, a positive significant correlation emerged between *d*-score and Autistic Quotient.

We discuss how voters' decision-making might reflect the influence of colours on their perception, and how unconventional profiling variables, such as autism traits, can help revealing how strong such impact is.

Framing of the research. The concept of branding can be applied to politics, specifically the different elements that make up a political offer. The triple components model by Butler and Collins (1994) provides a framework to identify the key elements of political marketing, which include ideology/policy, party/organization, and person/leader. Within the party element, the party logo is a crucial visual identifier that voters can easily recognize. The logo is a significant part of a party's public image, seen on campaign materials, media appearances, on the ballot papers, and even on leaders' clothing. Colours are a vital component of party logos and are used to create distinctive brand images and group allegiances. Colours can also evoke cultural associations with political ideologies, hence influencing voter perception and behaviour (Elliot and Maier, 2014). For instance, the colour red is often associated with dominance and aggression: in agonistic situations it is perceived as threatening, and may even provide a competitive advantage to individuals or teams that wear red (Hill and Barton, 2005). Companies use colours to consciously capture customers' attention towards products design, packaging, advertisements, in-store environments, and corporate logos. Colour blue, for example, is a popular choice for party logos due to its association with competence (Labrecque, Patrick et al., 2013).

Despite the recognized importance of colours in shaping individual perceptions, their central role in the political arena, the use of colours in the political realm has surprisingly received limited attention so far.

Marini (2017) conducted a study on political logo colours of major European political parties, showing that political parties belonging to the same "party family" use similar colours. Moreover, the author observed that new parties tend to adopt new colours, as a distinctive element from existing competitors. Finally, this study reports that

colours hue and position on a spatial policy dimension are correlated: the more parties are on the right wing, the more they resort to lower wavelength (away from red) colours. A robust connection between ideology and specific colours hues has been recently pointed out by Casiraghi et al. (2022). The authors observed that logos of left-wing parties predominantly use hues on the red side of the colour spectrum. On the contrary, blue hues are mainly used by in right-wing logos.

The role of voters' cognitive style in political decision-making - *Implicit attitudes are receiving an increasing interest in marketing research (Maison et al., 2001). Unlike explicit actions, implicit attitudes cannot be faked. In politics, the research focus on implicit attitude, as measured by the Implicit Association Test (IAT), has been mostly directed to predicting voting behavior (Gawronski et al., 2015). Friese et al. (2007) conducted an experiment to determine whether the IAT measures for the top five political parties in Germany could improve the prediction of voting behaviour over explicit self-report measures. Their findings supported their hypothesis. Roccoato and Zogmaister (2010) using the IAT showed that implicit attitudes were slightly more effective than explicit attitudes in forecasting the results of the Italian elections.*

In addition to the study of implicit attitudes in political decision-making, recent works have also explored the relationship between political preferences and physiological parameters and cognitive style. Among these, chronotype has been studied in relation to leadership (Guarana et al., 2021). Chronotype, or circadian typology, is the individual preference for sleep and daytime activities timings (Adan et al., 2012): e.g., morning chronotypes tend to wake up early and go to bed early, concentrating their activities in the first part of the day, while evening types prefer to do the opposite.

Guarana et al. (2021) investigated how a leader's chronotype affects charisma and expression, and observed that the synchrony between a leader's chronotype and time of day can impact perceptions of charismatic leadership among followers. Ksiazkiewicz (2019) found that morning types tend to be more conservative and evening types tend to be more liberal, which may be also related to age and habits: young people tend to be more liberal compared to elder people.

In a similar vein, individual differences in autistic traits might influence the ease of association between colours and political affiliations. Pellicano and Burr (2012) proposed that individuals with autism, and to a lesser extent those with high AQ scores, tend to process sensorial information that directly driven by a current sensory input, while less influenced by background expectations, as compared to individuals with lower AQ scores. Given that, for example, the colour red is traditionally associated with the political left for historical reasons, it is possible that individuals with high autistic traits may not be sensitive to the effect of colours in political decision-making.

Purpose of the paper. *This work-in-progress study aims to investigate the role of colours in political branding, and their effect on voters' ability to associate specific colours to political affiliations. We intend to study the easiness of association between colours, i.e., red and blue, with words related to the Italian left-wing and right-wing parties respectively. Individual differences in political literacy levels, as well as in chronotype and autistic traits are considered as possible variables correlated to the ease of association between colours and political affiliations. The overall purpose of this research work is to shed light on the relevance of assessing voters' perceptual and cognitive attitudes towards political branding.*

Methodology. *138 participants were recruited for our experiment. 35 participants were discarded because they did not complete the experiment, so that 103 participants (average age = 38 ± 16.05 years old; 53% males and 47% females) were considered for statistical analysis. All participants were fluent in Italian language and over 18 years old. The study was approved by the Bioethical Committee, and participants signed an informed consent before joining the study. The experiment was entirely conducted online. The experiment consisted of four parts:*

- (i) *The Implicit Association Test (IAT), run on a free-to-use toolkit for cognitive and psychological experiments;*
- (ii) *A self-evaluation of the environmental conditions in which the IAT was taken (i.e., assessing participant's concentration during the task), in order to provide a measure of the quality of the data collected;*
- (iii) *A questionnaire exploring participants' political literacy and other socio-demographic characteristics;*
- (iv) *Two questionnaires measuring the Autistic Quotient (AQ test) and chronotype (the reduced version of the Morningness-Eveningness Questionnaire, rMEQ) of participants respectively.*

Implicit Association Test (IAT) - *the Implicit Association Test (IAT) is based on the assumption that if two concepts are strongly associated in people's minds, it should be easier and quicker to categorize them together when the same response is used. Conversely, if two concepts are not strongly associated, it should be more difficult and slower to categorize them together when the same response is used. The IAT uses this principle by asking participants to categorize stimuli into four categories, with the aim of measuring the implicit attitudes or associations between two target categories based on the differences in response times (latencies) when paired with different attribute categories.*

The IAT design used in this study was based on a model developed by Roccoato and Zogmaister (2010) to predict voting behaviour using implicit measures. This IAT design has two key features: first, the target categories, "Left" and "Right", are always fixed on the corresponding left and right of the screen to eliminate potential bias that could arise from having to press the left key to select the political right (and vice versa). Secondly, they provided a benchmark for the order of blocks, number of trials, and type of stimuli. In this study, the IAT structure was adapted to use the attribute categories of "red" and "blue" instead of "pleasant" and "unpleasant", and these attributes were represented by colored rectangles instead of words. The target categories were "Left" and "Right" ("sinistra" and "destra" in

Italian, respectively, since the experiment was administered to Italian speakers). The colours red for the left and blue for the right were chosen based on previous research on the principal colour displayed in the party logos of European parties and the colours currently used in the logos of major Italian parties at the time of the experiment. The stimuli chosen for the target categories were 24 names of principal parties and well-known politicians at the time of the experiment, with 12 stimuli selected for each category to ensure the stimuli had the same or quasi-same number of syllables to prevent that the participants' reading velocity with could affect their response latency and the validity of the results. The 24 stimuli for the attribute categories "red" and "blue" were chosen among well-known red/blue common items (e.g., sky).

The IAT used in this study was designed as follows: the first and fourth blocks are training blocks that present two rectangles, one blue and one red, as categories. The red rectangle is on the left side of the screen in the first block, and the blue rectangle is on the right. In the fourth block, the position of the rectangles is reversed. The stimuli for these blocks are names of objects that are easily identifiable as either blue or red. The second block is another training block that presents the categories "sinistra" (Left) and "destra" (Right) on the left and right sides of the screen, respectively.

The stimuli for this block are well-known names of political parties and politicians from the left or right wing. The third and fifth blocks are target blocks where participants must categorize both the colours and political labels. In the third block, the red rectangle is on the left alongside the "sinistra" category, and the blue rectangle is on the right alongside "destra". In the fifth block, the position of the rectangles is inverted. To avoid an order bias, there were two versions of the IAT: one with the blocks presented in the order just described, and one with the third and fifth blocks reversed. The version administered to each participant was randomly chosen by the toolkit used to run the test.

The main output of the IAT is the "d-score," a variable that represents the difference in average response time between the compatible blocks (where the colour and political category are both on the same side of the screen) and incompatible blocks (where they are on opposite sides). The d-score is adjusted for errors and very fast or slow responses. In this study, the d-score was calculated by subtracting the adjusted average response time of incompatible blocks from the adjusted average response time of compatible blocks. The attribute categories used in the study ("red" and "blue") were chosen from well-known red or blue common items.

Political literacy - To address the lack of a standardized scale for measuring political literacy in the Italian population at the time of our experiment (to the best of our knowledge), we developed a survey based on the method outlined by Carpini and Keeter (1993), which has also been used by other authors (e.g., Ferrín and Fraile, 2014; Gil de Zúñiga et al., 2017). In their seminal paper, Carpini and Keeter identified three key areas for exploring political knowledge: government, parties, and political history and economy. As their questions were designed for the US context, we adapted them to fit the Italian context, resulting in a pool of 30 questions: 12 about state, institutions, and laws; 12 about parties, people, and current political alignment; and 6 about political history and economy. Each question offered 5 alternative answers, including a DK ("Non saprei" in Italian) option. For each correct answer, participants scored 1 point, and for each wrong/DK answer, they scored 0 points. In the end, we had a 30-point scale of political knowledge for each participant.

Political profiling - Participants were asked to state their interest in politics on a 10-point Likert scale from "no interest" (= 1) to "strong passion" (= 10). Their political orientation was also assessed on a 10-point "left (= 0) - right (= 1)" Likert scale, according to Kroh (2007).

Reduced Morningness-Eveningness Questionnaire (rMEQ) - Participants' circadian typology (i.e., chronotype) was assessed through the reduced Morningness-Eveningness Questionnaire (rMEQ). Based on the final score of this 5-item self-report scale, we can distinguish three main chronotypes: evening types (ET, with a score < 11), neither or intermediate types (NT, with a score between 11 and 18); and morning types (MT, with a score > 18). In this study we used the validated Italian version of the rMEQ (Natale et al., 2006).

Autistic Quotient (AQ) - Autistic traits were assessed through a 50-item scale. Participants could answer to each item on a 4-point Likert scale. Half of the items (1, 2, 4, 5, 6, 7, 9, 12, 13, 16, 18, 19, 20, 21, 22, 23, 26, 33, 35, 39, 41, 42, 43, 45, 46) scored 1 point for the responses "Definitely agree" or "slightly agree". The other half of the items (3, 8, 10, 11, 14, 15, 17, 24, 25, 27, 28, 29, 30, 31, 32, 34, 36, 37, 38, 40, 44, 47, 48, 49, 50) scored 1 point for the answers "Definitely disagree" or "slightly disagree" instead. The final score of the questionnaire was given by summing each item. In this study, we used the Italian validated version of the AQ (Ruta et al., 2012).

Results. In terms of profiling variables, our sample showed an average political literacy score of 19.88 ± 5.18 , with an average AQ score of 16.95 ± 5.89 , and an average rMEQ score of 17.13 ± 3.4 .

To test the first research hypothesis, i.e., whether participants would have found it easier to categorize stimuli when the colour red was associated to the Left-wing and the colour blue was associated with the Right-wing rather than the opposite, we calculated the d-score from the IAT. The d-score in our sample was on average 0.27 ± 0.44 , indicating that participants on average found more difficult to categorize stimuli when the colour red was associated with Right-wing and colour blue with Left-wing as compared to when red was associated to "Left" and blue to "Right".

Moreover, the d-score was positively and significantly correlated to participants' political literacy (Spearman correlation test, $r = 0.37$, $p = 0.001$), so that participants with higher political literacy reported a higher ability in associating a colour to a political side (red to "Left" and blue to "Right").

We also observed a positive significant correlation between the *d*-score and the political orientation of participants (Spearman correlation test, $r = 0.3593$; $p = 0.0002$). This result suggests that the more Right-oriented participants are, the more they tend to associate the colour red with political Left, and the colour blue with political Right, and they find more difficult the opposite associations. In parallel, participants with higher autistic traits showed a higher *d*-score (Spearman correlation test, $r = 0.2521$; $p = 0.0102$).

Finally, we showed that participants' response time for establishing an association "colour-political side" was on average 30.7 ms lower for stimuli representing Right-wing parties/politicians compared to those showing Left-wing parties/politicians (1092.1 ± 231.3 ms vs 1122.8 ± 254.2 ms).

Research limitations. We are fully aware of the limitations of this ongoing research study. First, our IAT experimental design is not standardized, although moving from the well-established version of 5 blocks IAT (Greenwald et al., 1998). Indeed, due to the lack of literature applying the IAT to test voters' ease of association between colours and political sides, this is the first case - to the best of our knowledge - in which coloured rectangles are used as target categories instead of words. This could stimulate new research activities in this direction.

Secondly, despite our sample size is in line with the literature applying IAT (Lane et al., 2007), we may need a larger number of participants to replicate a representative sample of the Italian voting population in order to further explore the role of individual differences based on psychometric measures (namely, autistic traits and chronotype).

A third possible limitation is related to the choice of the stimuli displayed during the IAT. As a selection criterium, we opted for the most voted parties and most known politicians of Left and Right wings at the time of the experiment, but we excluded a well-represented political movement due to the difficulty of positioning it in one of the two wings at the time of the experiment.

Finally, a future study could be conducted to test the same experimental design in a lab setting under controlled conditions. Running this kind of experiments online allows to reach a larger audience. Nevertheless, the quality of data collected might be lower (e.g., due to the limited attention paid in an familiar environment during a remote testing) as compared to experiments conducted in a lab setting.

Managerial implications. Political marketers can benefit from our study on several levels. We here outline a threefold possible practical contribution of this ongoing research for political marketing. First, we highlight that the visual elements selected to build the brand image of a political party might be differently perceived by the voters according to their cognitive style. Second, we provide political marketers with unconventional tools (e.g., psychoprofiling variables) able to differentiate voters' reactions to strategical marketing actions (e.g., the choice of a colour). Finally, we offer a concrete approach to quantify the effect of a political marketing action on voters' perception (as measured through the IAT).

Originality of the paper. The main conceptual contribution of this paper is offering a new perspective on the application of empirical knowledge derived from cognitive neuroscience and neurophysiology into political marketing research. This could provide scholars and practitioners with a promising approach to test the effectiveness of crucial marketing actions in the political realm, such as the choice of the colour for a political party, which should be congruent and easy to associate with the political idea they want to convey. Our study might represent a starting point for a future research agenda directed to uncover the neurophysiological mechanisms underpinning political decision-making, opening new plausible scenarios for the application of neuroscientific tools into political campaigning.

Keywords: Political branding; consumer neuroscience; implicit association; political literacy; autism.

Food labels in a consumer behavior perspective: a bibliometric analysis[♦]

GUIDO CRISTINI^{*} ANNA BONCOMPAGNI^{*} CRISTINA ZERBINI[♦]

Framing of the research. *Consumer lifestyle and purchasing decisions have a significant impact on people health. Despite numerous efforts by different institutions and organizations, obesity has approximately doubled worldwide since the 1980s and has become one of the major societal problems (Chooi et al., 2019). Ultra-processed packaged foods, which are sources of energy, fat, saturated fat, sodium and added sugars, have contributed to the increased risk of chronic diseases (WHO, 2002; WHO, 2017). Furthermore, the obesity pandemic is also an economical burden for society: a high body mass index is estimated to cost USD 990 billion per year globally for healthcare services (World Obesity, 2020).*

There is, therefore, a growing public interest in the long-term link between diet, lifestyle and health. Many actors in the market, including consumer groups, public authorities, retailers and product manufacturers, have all focused on giving more and better nutritional information to consumers. In particular, food labels are considered to be an integral strategy to improve diet by providing consumers with nutrition information at the point of purchase and to promote healthier purchases and choices (Cowburn and Stockley, 2005; WHO, 2004; 2011).

The information conveyed by labels has evolved over time, and they have become more numerous and more complex depending on different goals. For many years the only nutritional labels in use were BOP (back-of-package) labels. They were in form of a small chart with numeric information, but evidence indicates that most consumers are not able to accurately interpret them (Cowburn and Stockley, 2005).

Consumer understanding of food labelling. Even if the self-reported use of nutrition labels in previous research was found to be prevalent (Cowburn and Stockley, 2005), consumers often report difficulty in interpreting quantitative information (Drichoutis, 2006) and in understanding the role of different nutrients in their diet. In fact, the number of ingredients can be high enough to generate an information overload situation that limits the ability of the consumer to process information and to decode the message of the label (Hall and Osses, 2013). Some consumers find different nutrition label formats confusing (Grunert, 2007) and generally prefer graphical information to the traditional label: previous studies have demonstrated that the message in pictorial form is more effective than one in textual form (Jae et al., 2008). Moreover, the greater effectiveness of the combination of textual-pictorial elements in food advertising on the attitude towards the brand and the intention to buy emerged (Luceri et al., 2016). Compared with nutrition labels with quantitative information on nutrient content, several studies have reported greater effectiveness for labels using graphics and symbols, adjective labels and labels with minimal numerical content (Zerbini et al., 2019; Lee et al., 2009; Lieberman et al., 2002). The use of well-recognized health logos and ‘traffic lights’ may be particularly effective (Marette et al., 2019).

Consumer use of food labelling. The use of labels is prevalent among the female population and could be predicted by health awareness, income and education level (Drichoutis, 2006). From the literature emerged that individuals with healthier eating habits report a greater use of nutrition label due to their personal preference or because of requirements of a health-related diet (Satia et al., 2005; Canadian Council of Food and Nutrition, 2006). Consumers read labels more accurately if they (a) are familiar with the label format, (b) are interested in health and nutrition, (c) have a high level of education (Cowborn and Stockley, 2005). Moreover, consumers who spend more time to shop for

groceries are more likely to use label (Drichoutis et al., 200); in fact, one reason for non-use is often the lack of time (Rasberry et al., 2007), together with size of print on packages, lack of understanding of terms and concerns about the accuracy of the information (Cowborn and Stockley, 2004).

Some efforts have been made to develop designs for labels that are more user friendly (Temple and Fraser, 2014) and by the end of the 20th century, both governments and non-governmental organizations began to implement different front-of-package (FOP) nutrition labelling system:

- nutrient-specific and display information on individual substances (saturated fat, sugar and sodium or salt);
- warning labels on a food package if it has relatively high content of an undesirable substance such as salt or sugar;
- summary labels in which the healthiness of the food is indicated by a single value expressed in a very simple manner such as stars or a thick;
- traffic light labels which typically display green, amber or red labels to indicate whether foods contain low, medium or high amounts of contents such as fat, saturated fat, sugars;
- health Star Rating expressing the healthiness of the product by the number of the stars in the label.

Other elements such as health claims have been increasingly displayed on packages. One goal of nutrient content claims is to communicate the value or relative amount of a specific nutrient within a food product (e.g., good source of fiber, fat free, low calorie). Claims have been shown to impact how other food label information is processed and to influence other dietary behaviors (Mathios and Ippolito, 1999; Williams, 2005). On the other hand, claims sometimes have little impact on product evaluations (Garretson and Burton, 2000) and may even be misleading and confusing (Hasler, 2008). Overall, claim comprehension is higher among those with greater experience and education (Dean et al., 2011; Verbeke et al., 2009).

Manufacturers and retailers in food labelling. In the complexity of this context, many actors in the market are involved with contrasting interests. Policy makers together with companies (manufacturers and distributors) and organizations can have a significant role in helping consumers to behave healthier and food labels can represent an important tool to achieve the purpose.

The impact of any label can be determined by how and to what extent the information can change consumer behaviors and food manufacturers to introduce healthier products (Van Camp et al., 2012). Comparing with the number of studies investigating consumer responses to nutrition labels, literature on industry and distributors in food labelling is evidently poor.

Few studies have examined manufacturers reformulation of food products following the implementation of FOP labelling systems. The most remarkable example is the reduction of the amounts of trans fats in many products after the FDA (US Food and Drug Administration) mandate (Unhevehr and Jagmainate, 2008). In the 1980s, food companies were using both nutrition and health claims such as the 'light' and 'low fat' products, even if in some cases they were misleading and confusing (Petruccielli, 1996; Silverglade, 1996). In 2010 Tesco introduces the FOP nutrition labels and other retailers and producers followed this direction with their own FOP schemes.

From the distribution perspective, in the UK, simplified FOP nutrition labels were initially introduced by retailers. In 2005 Tesco introduced a Guideline Daily Amounts (GDA)-based FOP label and by 2010 all of their private label products has this type of nutrition information (Tesco, 2010).

Purpose of the paper. Different issues and fields of knowledge are related with the world of food labels and a huge amount of literature has been produced on this topic. The aim of this paper is to understand how the food labels topic have evolved over time in order to face the huge problem of obesity and chronic diseases. The research has the purpose of providing a preliminary knowledge map by a Keyword Cooccurrence Analysis on food labels and consumer behavior as well as identifying future trends. The study proposes the following research questions:

RQ1. What is the evolution of the literature on food labels and consumer behavior?

RQ2. Which are the most influential journals, countries, and institutions that have published content on this research topic?

RQ3. What are future research agendas and patterns related to food labels that can be deepen?

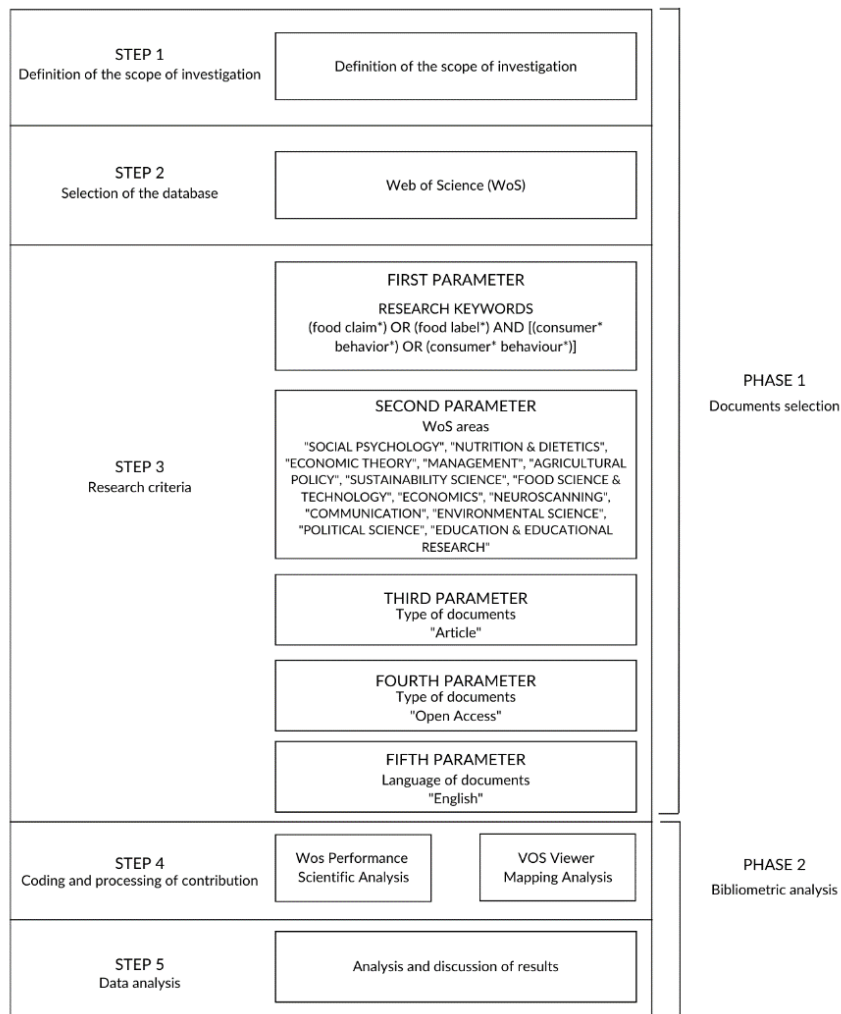

Methodology. In order to analyze the literature on the topic of food labels from the consumer behavior perspective and to answer to three research questions, a quantitative approach based on bibliometric analysis was adopted. Bibliometric analysis allows a systematic and orderly review of the available literature on a specific subject. This methodology was founded in the 1920s and it has recently developed due to the greater availability of online databases and the large number of available publications (Gutiérrez-Salcedo et al., 2018). For this research, the analysis was carried out using the online database Web of Science (WoS) since it represents one of the largest and most structured databases, while the software VOS Viewer was used to develop and provide scientific mapping based on co-word analysis. The present work has been structured in three phases consisting of:

- the identification of the scientific contribution of interest through the WOS database
- the bibliometric analysis through VOS Viewer
- the bibliometric analysis through Scimat (work in progress)

According to the well-respected evidence-based approach widely used in the literature (Castillo-Vergara et al., 2018; Capobianco-Uriarte et al., 2019), the research has followed different steps. The first step concerned the definition

of the scope of investigation: food labels in a consumer behavior perspective. The second step was the selection of the database, Web of Science (WOS). The third step included the definition of (1) Research keywords, with the combination of the terms “(food claim*)” OR “(food label*)” AND “(consumer* behavior*) OR (consumer* behaviour*)”; (2) WOS areas, selecting “Social Psychology”, “Nutrition & Dietetics”, “Economic Theory”, “Management”, “Agricultural Policy”, “Sustainability Science”, “Food Science & Technology”, “Economics”, “Neuroscanning”, “Communication”, “Environmental Sciences”, “Political Science”, “Education & Educational Research” as areas of interest; (3) Type of documents, selecting “Article”; (4) Type of documents, selecting “Open Access”; (5) Language of publication, selecting “English”. In the document selection phase, only “open access” publications have been considered. In the fourth step concerning the bibliometric analysis, a performance scientific analysis in WOS was developed and a mapping analysis in VOS Viewer was implemented. The final sample comprises 487 papers. In the last step, the preliminary results have been discussed. The third phase of the bibliometric analysis using the software Scimat is in progress.

Fig. 1: Bibliometric analysis process

(Source: authors' elaboration)

Results. The first set of findings of the review are related to descriptive analysis of 478 selected papers, related to the year of publication, journal, country or region and institution that have published content, in order to answer to the second research question and identifying the numeric evolution of the literature over time.

Year of publication: the academic production related to food labels in a consumer behavior perspective was almost absent until the 2007 (Figure 2). Since 2007 there has been a general steady increase in the number of publications until 2015. A significant growth of literature on this topic is remarkable between 2015 and 2021. There is a reduction in 2022. The limited number of publications in 2023 is attributable to the fact that the analysis is limited to the articles published in the first two months of the year. In 2022 the publications were 65 and in the first two months they were 11, 8 in January and 5 in February, while in 2023, the publications until the end of February are 8 (7 in January and only 1 in February). In view of this, the number of documents published seems to be slightly lower than the previous same period and the trend of publications seems to be declining.

Fig. 1: Year of publication

(Source: authors' elaboration - Web of Science)

Most influential journals: the Table 1 (below) shows the top ten most influential journals on the topic of the analysis. The table presents the journal, the publisher, the number of documents published on the topic, the SJR (SCImago Journal Rank) and the H-index. The "Sustainability" is at the top of the ranking with 81 documents, the "Nutrients" is at the second position with 29 documents, while the "Foods" ranked third position with 23 documents. The journal "Sustainability" represents alone more than 16 % of the total documents analyzed. It means that it is the most influential journal on the topic of food labels in a consumer behavior perspective.

Tab. 1: Most influential journals

Journal	Publisher	Documents	% of total documents	SJR	H-Index
<i>Sustainability</i>	MDPI	81	16,63	0,664	109
<i>Nutrients</i>	MDPI	28	5,75	1,287	143
<i>Foods</i>	MDPI	23	4,72	0,726	53
<i>Food Quality and Preference</i>	Elsevier	21	4,31	1,146	129
<i>International Journal of Environmental Research and Public Health</i>	Frontiers Media	17	3,49	0,814	138
<i>Bmc Public Health</i>	BioMed Central	14	2,88	1,156	159
<i>Public Health Nutrition</i>	Cambridge University Press	14	2,88	0,904	146
<i>Appetite</i>	Academic Press	13	2,67	0,986	156
<i>British Food Journal</i>	Emerald	10	2,05	0,609	86
<i>International Journal of Behavioral Nutrition and Physical Activity</i>	BioMed Central	10	2,05	2,028	129

(Source: authors' elaboration - Web of Science)

Most influential countries: one interesting aspect of the analysis concerned the geographic division of the published documents. From the Table 2 emerged that the most influential country is USA, with 133 documents published, that represents more than 27% of the total number of publications on the topic. England is at the second place (61 documents) and Italy at the third (48 documents). The analysis output shows that the topic of food labels and consumer behavior is mostly discussed in USA and in EU countries: in the ranking of the top ten influential countries only the most developed regions appear, while developing countries are absent.

Tab. 2: Most influential countries

Countries/Regions	Documents	% of the total documents
<i>Usa</i>	133	27,31
<i>England</i>	61	12,53
<i>Italy</i>	48	9,86
<i>Australia</i>	33	6,78
<i>Germany</i>	33	6,78
<i>France</i>	28	5,75
<i>Netherlands</i>	26	5,34
<i>China</i>	26	5,34
<i>Spain</i>	25	5,13
<i>Belgium</i>	23	4,72

(Source: authors' elaboration - Web of Science)

Most influential institutions: in the Table 3 the top ten influential institutions for the papers' publication on the research topic are displayed. The analysis outlines that the two most influential institutions are based in the USA, with a total of 57 financed documents (more than 11% of the total number of published documents). At the third position, there is the European Commission with 15 financed documents. These results are in line with the most influential countries showed in Table 2, outlining that in USA and in Europe the topic of food labels is part of the institutions' interest. In addition, in the following table, public or private institutions based in developing countries are not present, confirming that the topic is less discussed in these countries and less financed by the governments/organizations.

Tab. 3: Most influential institutions

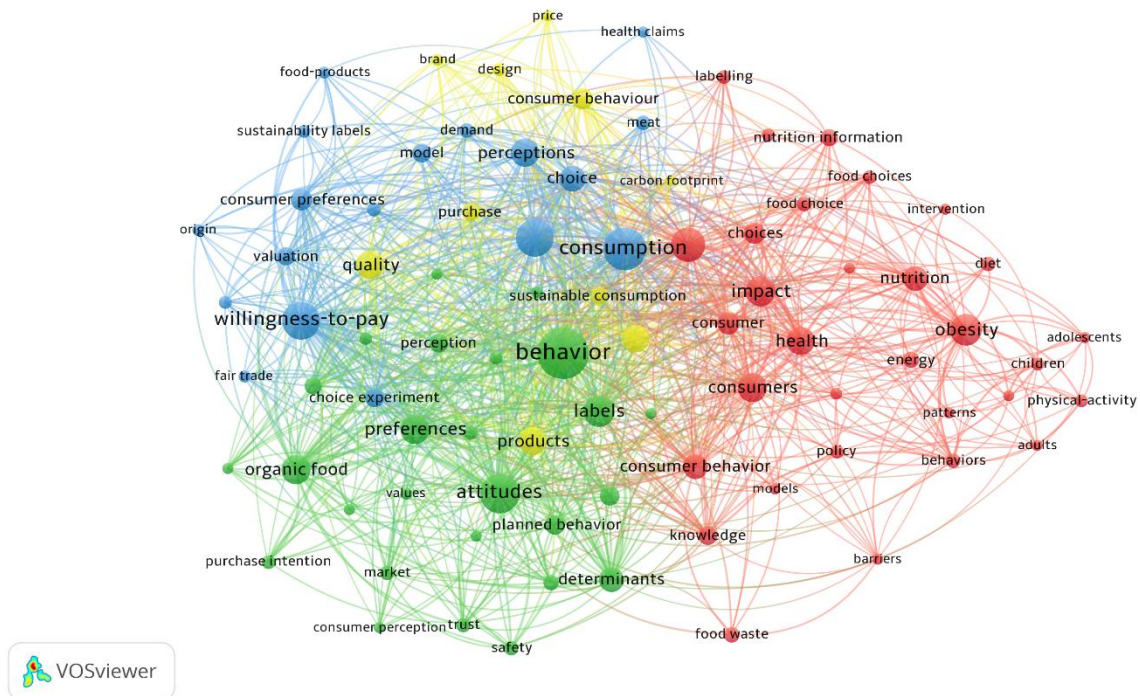

Institutions	Documents	% the total documents
United States Department of Health Human Services	29	5,96
National Institutes of Health Nih Usa	28	5,75

(Source: authors' elaboration - Web of Science)

In order to answer to understand the evolution of the literature on food labels and consumer behavior, the possible future research directions and emerging fields of study that can be deepen (first and third research questions), a bibliometric mapping analysis using VOS Viewer software has been developed.

Network visualization map: The network visualization map provides an overview of the items, that are shown as colorful circles of different dimensions. The size of the circle represents the frequency of the topic presence in the documents and the largest the circle, the most frequent the item is. The color of the circle represents the cluster (that is related to a specific thematic) to which the item belongs. Furthermore, the colorful threads in the map are the most frequent co-occurrence of keywords. In the Figure 3 the co-occurrence relationships of the keywords are displayed.

Fig. 2: Network visualization map

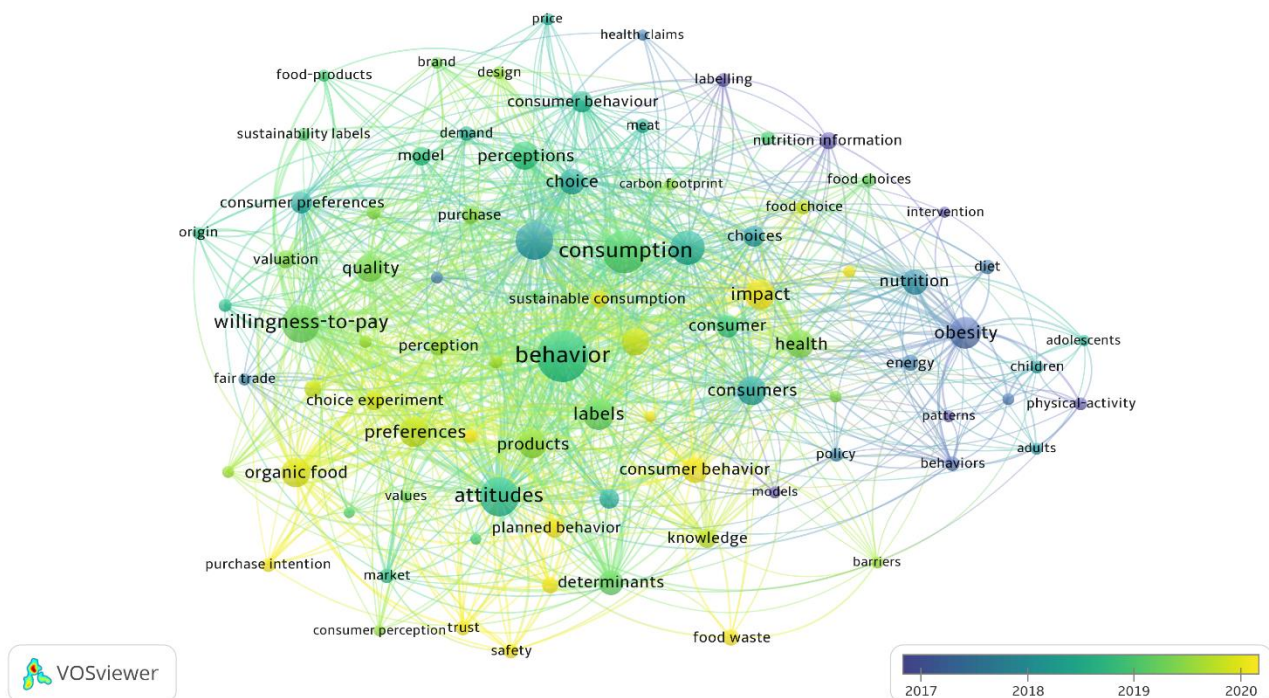

(Source: VOS Viewer)

The map returns four different clusters. The color is given by default by VOS Viewer, but in order to give a clearer overview, a name to each cluster is assigned.

- **Red cluster: nutrition and health.** This cluster is the largest and includes many items. Those that are characterized by a larger size are “obesity”, “health”, “impact”, “nutrition” and “consumer behavior”. The thematic is the problem of the obesity and the impact of consumers’ food choice and nutrition on their health. Given the larger size of the keywords cited, they are more discussed in literature compared to the other items of the cluster. The topic of obesity and nutrition is correlated with the interventions (of different actors in the market) aiming to contrast the problem (Wyse et al., 2019; Gamburzew et al., 2016).
- **Green cluster: attitudes and behavior.** In this cluster, the most discussed keywords in the literature are “behavior”, “attitudes”, “labels”, “preferences” and “determinants”. Since their circle’s size is larger than the others, they represent frequent topics in the documents analyzed and correlated each other. This cluster describes the most relevant determinants of the attitude and of the behavior towards food labels, including the consumers’ preferences, the values, and the purchase intention (Lamonaca et al., 2022; Lorenz et al., 2015).
- **Blue cluster: willingness-to-pay and consumption.** The keywords emerging in this cluster are “consumption”, “willingness to pay”, “information” and “perceptions”. They are the most frequent items of the cluster appearing in the literature analyzed. The term “willingness to pay” is near “choice experiment” and “valuation”, while the item “consumption” is near to “information” and “perceptions”. The cluster describes the finding of several studies focused on consumers’ food consumption and on their willingness to pay. (Hempel and Hamm, 2016; Poelmans and Rousseau, 2017). The cluster includes also less discussed terms correlated with the two topics of consumption and willingness to pay: origin of the product, sustainability labels, health claims and fair trade.
- **Yellow cluster: characteristics of products.** The most relevant keywords are “products”, “quality” and “sustainability”. The cluster includes different characteristics of the products which can influence the purchase by consumers, such as the quality, the brand, the design, the price, the carbon footprint. (Boehm et al., 2019; Margariti, 2021). The topic of sustainability emerges in the literature together with “sustainable consumption”.

Overlay visualization map: the map (Figure 4) is very similar to the network visualization map, but not in colors. In fact the overlay visualization map indicates the thematic development over time. The map returns the evolvement of a specific topic during the years and it can be useful in order to study the evolutionary trend, trajectory and research front of a given topic. The color of a term indicates the average year of publication of the documents in which the term is included. In particular, the closer the color of a term is to blue, the older are the publications in which the term appears, and the closer the color of a term is to yellow or red, the more recent are the publications in which the term appears.

Fig. 3: Overlay visualization map

(Source: VOS Viewer)

According to the analysis, the topic of food label and consumer behavior have been discussed especially between 2017 and 2020. In 2017 the theme of obesity and nutrition has started to become popular in literature. In this period also the keywords “policy” and “intervention” have been discussed, probably from the point of view of the governments intervention on food labels. Later, from 2018 to 2019, the attention has been focused on the consumer, his attitudes, and his behavior towards food. More recently, from 2019 to 2020 new thematic have been studied and developed: the topic of food label referring to the health emerged together with the consumers’ preferences for some characteristics of food products (organic, health, perceptions). The most recent keywords appeared in literature are “impact” of food labels, “sustainable consumption” and “safety”, following the increasing attention of consumers in these two emerging topics, especially after the Covid-19 pandemic.

Density visualization map: the density visualization map (Figure 5) returns a clear overview of the amount of literature about a topic exists. Every area in the map has a color that identify de density of that specific area. The color range is from blue to green, until the yellow. The greater the number of items in a specific zone of the map, the greater the weight of the neighboring items (yellow). Conversely, the smaller the number of items in the zone of the map, the smaller the weight of the neighboring items (blue).

The most relevant keywords in this perspective are “behavior” and “consumption” (in deeply yellow). The topic of consumer’s behavior has been deeply discussed in the literature when considering food labels. Moreover, the consumer’s food consumption seems to be another highly discussed topic together with the “food choice” and “attitudes”. Somewhat less discussed, are the issues related to nutrition and obesity, health, consumer’s perceptions, and preferences. Other important topics have a lower weight in the existing literature, and should be examined more, the health claims of food products and the intervention of different actors in the market and policy of governments in food labels are only some of those. The map does not include the role of retailers and industry in food labelling. The documents focused on these two topics are rare and can be a future research direction.

(Source: VOS Viewer)

Research limitations. The study presents some limitations that can be considered a good starting point for future research. Since the research is still ongoing, the findings can be considered as preliminary and not final. In order to have a more detailed evolution of the thematic analyzed an additional bibliometric analysis through the use of a specific software is in progress thanks to the software Scimat. The findings should be compared and integrated with the one discussed in this paper.

Managerial implications. The paper offers theoretical and practical implications. At theoretical level, the bibliometric analysis suggests the need for additional research on food labelling also in the online context (rarely discussed) and the need of more field experiments in both offline and online context focused on food choice related to labels (Ljusic et al., 2022; Temple, 2020). At practical level it gives useful insights to all the actors and policy makers in the role of food labelling in consumer’s behavior and suggest the importance of the way to convey nutrition information to consumers in order to enhance their healthy consumption (Latino et al., 2020; Mhurchu et al., 2018).

Originality of the paper. *Although other recent literature review on food labels and their efficacy exists, they are narrative (not bibliometric) and more focused on the FOP labels (Penzavecchia et al., 2022; Temple, 2020; Shangguan et al., 2019). Moreover, no bibliometric analysis of the existing literature on this topic have been made through the use of VOS Viewer software. The study wants to provide an overall, comprehensive, and integrated approach towards the investigation of food labels in the consumer behavior perspective using a reliable tool for bibliometric analysis.*

The relevance of local business ecosystem in sustainable business model

ROSARIA FERLITO* ROSARIO FARACI*

Framing of the research. *Over the last few years, the market turbulence and increasing levels of competition motivate firms to engage in collaborative processes as a way to gain agility and resilience. This context has created a great interest in the topic of business ecosystems as a new way to represent the competitive environment.*

The first definition of the business ecosystem has been borrowed from biology and provided by Moore that defined it as an intentional economic community made up of “organisms of the business world” (Moore, 1993, p. 26) where a focal firm could play a pivotal role in forming and supporting the business ecosystem (Fielt, 2014). For Teece (2007), it is the environment that the firm must monitor and react to. Business ecosystem includes both formal and informal relationships and transactions between businesses and individuals that contribute to the economic and social vitality of the community. In detail, Moore refers to an extension of stakeholders from suppliers and customers to the broader business ecosystem composed of organizations that influence the context such as competitors, government agencies, regulatory authorities, and investors (D’Souza et al, 2015).

In managerial literature ecosystem perspective has emerged because the value chain theories presented limitations in explaining how the entities interact with, depend on and share their experience with other actors. With the notion of the business ecosystem, it has become easy to explain the phenomena of cooperation, collaboration, co-creation, network value, and co-production among economic entities (Kim et al, 2018). For this reason, this topic has become pervasive in discussions about strategy, entrepreneurship, business model, multi-sided markets, alliances, technology innovation, and supply chains. About the business model researches, business ecosystem has raised awareness of the existence of new ways of value creation and capture (Adner, 2017) based on the interdependencies between different organizations and new value co-creation mechanisms (D’Souza et al, 2015). In particular, the role of the business ecosystem becomes even more important in sustainable business models (SBMs) where the aim of firms is to generate positive impact or/and reduce negative consequences for the environment and society “through changes in the way the organisation and its value-network create, deliver value and capture value” (Bocken et al, 2014, p.44). So the perspective behind a SBM is extended from a single business to an ecosystem perspective, and from a purely organisational to an embedded systems view (Breuer et al, 2018).

Ecosystem perspective requires a long-term vision and an open mindset. Furthermore, it requires firms to have good listening and communication skills, to involve the various stakeholders. Some authors provide the definition of regional business ecosystem to underline the network of local businesses, customers, suppliers, service providers, and other stakeholders that interact with each other within a specific geographic area (Kim et al, 2018). The local business ecosystem is characterized by its interdependence, as businesses rely on each other for resources, support, and referrals. By leveraging the strengths of the local business ecosystem, sustainable businesses can create long-term value for themselves, their communities, and the environment.

Purpose of the paper. *Most of the current research has focused only on the economic value created by the business ecosystem (Clarysse et al, 2014), the measurement of its performance (Graça, & Camarinha-Matos, 2017), and technology that enables it (Li, 2009). Moreover, if we consider specifically the context of SBMs, the ecosystem perspective has been considered mainly to analyse the circular business models (i.e. Kanda et al, 2021; Geissdoerfer et al, 2020) or the community platform business model (i.e. Zhao et al, 2020; Velu, 2015).*

There are no studies that provide a vision of the role of the business ecosystem in all typologies of business models that present a sustainable design (Geissdoerfer et al, 2020; Haigh and Hoffman, 2012; Tabares, 2021).

To address this gap, our study aims to improve the comprehension of the activities that involve the business ecosystem carried out by firms with a SBM. In particular, the research question that we address is:

“how could a focal entrepreneur leverage its local business ecosystem to adopt a SBM?”

Methodology. *This study adopted a multiple-case study methodology that required a comparative analysis of individual case studies and provided in-depth knowledge of complex social phenomena (Eisenhardt, 1989; Yin, 2013).*

The cases selected were Italian benefit corporations. These for-profit firms have, by definition, a sustainability-driven hybrid business model that combine both market and mission-oriented practices, facing the tension of balancing social, environmental, and economic logic (Hestad et al, 2021; Reuter, 2022; Tykkylainen and Ritala, 2021). The

e-mail: faraci@unict.it

business model of benefit corporations is based on the integration of traditional business aims with social and environmental needs, as well as between profit and purpose value creation goals (Reuter, 2022).

Data were collected between July 2022 and January 2023. Firms were first identified by the AIDA database (AIDA Bureau Van Dick, 2022). We adopted the firm’s name as the search criterion, where one of the following abbreviations must be present: “sb”, “s.b.”, “società benefit”. We then selected only SMEs (defined as organisations with an annual income less than 50.000.000 Euros, and with less than 249 employees). Once the selection was completed, we sent e-mails to obtain an interview with either the founder and/or chief of sustainability from each benefit corporation. Seven firms agreed to participate in the research. The industries involved are: beverage, manufacturing and consulting. Due to the exploratory nature of the research, semi-structured interviews were chosen. A defined protocol was used to ensure that the same topics were treated in all interviews. The protocol was based on a business modelling perspective in terms of mission, value proposition, customers dimension, key resources, key activities, partnership, costs and benefits. Interviews were performed remotely using Zoom and were recorded with consent. They lasted between 30 and 60 minutes. To ensure the reliability and validity of data collection we asked the interviewees to provide us with additional documents, such as company presentations, company reports, balance sheet, and other documents, with the aim of triangulating the data acquired through the interviews and secondary information (online company information, including the company website and social media) (Yin, 2013).

The collected data were analysed using the methodology developed by Gioia et al. (2013). Data analysis was performed manually. The coding process is divided into three steps: open coding, axial coding, and theoretical coding.

Initially, we used open coding, to create the “first order codes”. As the research progressed, we attempted to find similarities among categories and moved from open to axial coding. We clustered the open codes into theoretical categories, leading to “second order codes”. We then grouped second-order codes under “aggregate dimensions” (Table 1).

Tab. 1: Data structure

<i>1st Order Concepts</i>	<i>2nd Order Themes</i>	Aggregate Dimensions
-Continuous dialogue with trade associations to dissemination of know-how about sustainable practices. -Promotion of events (e.g. conventions, workshops, study days) with Public Institutions to raise sustainability awareness.	RAISING-SUSTAINABILITY AWARENESS ACTIVITIES	NON-PROFIT ORGANIZATIONS AND INSTITUTIONAL AGENCY
-A continuous dialogue with patent’s Agencies. -Dialogue with trade associations driven by Innovability principles.	OPEN INNOVATION	
-Dialogue with trade associations and Public Institutions to obtain greater legislative clarity on managers' liability, controls, and punishment. -Reporting activity: definition of KPI/Involvement of trade associations in the materiality analysis. -Agreement with non-profit organizations to include socially vulnerable groups in business processes and projects.	GOVERNANCE MECHANISMS	
-Support and aid to the voluntary association to promote the sport culture. -Collaboration with museums to promote culture and arts. -Collaboration with trade associations to improve the quality of life of employees.	COMMUNITY CULTURAL DEVELOPMENT	
-Continuous relationship to customize the product. -Partnership with B2B customers to realize co-production and obtain the Cradle to cradle certification. -Reporting activity: definition of KPI/Involvement of customers in the materiality analysis. -Tools to obtain feedback from customers and know the need of customers. -Implementation of plans to listen to and hold discussions with all the stakeholders.	OPEN INNOVATION	
-Company visits to receive customers.	RAISING-SUSTAINABILITY AWARENESS ACTIVITIES	
-The part of the investments is about the education provided to distributors, in terms of product, the value of firm, and sustainable approach. -Training to raise awareness on sustainable issues.	RAISING-SUSTAINABILITY AWARENESS ACTIVITIES	SUPPLIERS
-Mutual aid to implement business sustainable practices. -Suppliers' aid to define KPI (materiality assessment). -Partnership based on multi-years agreements .	MUTUAL SUPPORT	
-Monitoring of the sustainable approach of suppliers. -Certified and ethical supply chain. -Periodic audits for controlled supply chain. -Assessment tools (i.e. survey) to check the sustainable business model of suppliers. -Selection of suppliers based on proximity to the community also to reduce the negative impact of logistics.	QUALITY AND ETHICS OF SUPPLY CHAIN	
-R&D carried out with suppliers to share experiences, skills, knowledge, and technologies. Co-production. -Collaboration with suppliers to provide a quality products and services to the customers.	OPEN INNOVATION	

-Firm's push on University to create a course about Sustainability to train Chief of Sustainability. -Firms are looking for talented and specialized figures. -Partnership with private organizations to train managers. -Firms' support to research projects about business sustainability approach.	TRAINING & RESEARCH	UNIVERSITY, TRAINING INSTITUTIONS, RESEARCH CENTERS
-Participation in events and workshops organized by Universities to build relationships with other ecosystem actors and disseminate the sustainable approach. -To be member of advisory board of university courses and master's. -Company visits to receive students.	RAISING-SUSTAINABILITY AWARENESS ACTIVITIES	
-R&D with University and research centres.	OPEN INNOVATION	
-Firms' push toward a more sustainable investor business model. -Investors' push toward more sustainable investment.	RAISING-SUSTAINABILITY AWARENESS ACTIVITIES	INVESTORS
-Partnership with investors to the production and the presentation of innovative solutions.	OPEN INNOVATION	
-Investors' push toward the implementation of a sustainable business model. -Investors' push toward the implementation of more transparent business practices.	GOVERNANCE	
-Collaboration with competitors to promote sustainable business practices.	RAISING-SUSTAINABILITY AWARENESS ACTIVITIES	COMPETITORS
-Knowledge sharing to realize innovative solutions. -Co-Branding with competitors.	OPEN INNOVATION	
-Support of certification agencies in implementing environmental and sustainable development politics.	GOVERNANCE	CERTIFICATION AGENCY
-Use of protocols and standards of certification agencies to improve the production process. -Continuous dialogue with certification agencies to improve the business model.	PRODUCTION	
-Collaboration with certification agencies to obtain LCA certification.		

Results. *In this study, we focused on the relation between a focal firm that adopt a SBM and its local business ecosystem. After analysing the selected case studies thought business model lens, we identified (1) the main actors of local business ecosystem; (2) the activities that a focal firm carried out with these actors; (3) the purposes of the relationships with the local business ecosystem.*

The main actors of the local business ecosystem involved by the seven benefit corporations are: the non-profit organizations and institutional agencies (i.e. trade associations, patent agencies, public authorities, cultural organizations), the suppliers, the customers, the University and the other public or private training institutions, the research centres, the investors, the competitors, and the certification's organizations. The focal company carries out a series of activities involving these ecosystem actors.

This activity-system includes (1) partnership with the local ecosystem actors to develop products or services to benefit from complementary skills and shared idea, infrastructure, resources and technologies; (2) exchange of the knowledge and skills with other ecosystem actors through shared training programs; (3) organization and participation in events and initiatives such as fairs and conferences to build relationships with other ecosystem actors; (4) participations in workshops, training activities and recurring meetings with the customer to raise awareness on sustainability issues; (5) continuous dialogue to disseminate sustainable business practices, improve sustainable business model and production processes, and obtain greater law protection in terms of liability, control and punishes; (6) implementation of plans to listen to and hold discussions with all the stakeholders; (7) inclusion socially vulnerable groups in business processes and projects; (8) philanthropic activities, such as donations to voluntary association or cultural organizations to promote culture, arts, sport and so on; (9) adoption of common standards and protocols to guarantee interoperability between the various actors of the business ecosystem to encourage collaboration and information sharing; (10) sustainable investing; (11) actions to guarantee a controlled supply-chain, which is inspected at every stage and certified by an independent entity.

The role of business ecosystem emerged by this study can be summarized as follows: raising awareness toward sustainable business approach; (2) open innovation; (3) ethical governance mechanisms; (4) improvement of internal infrastructure in terms, for example, of human resources and production process, (5) cultural development of the community; (6) mutual support with customers, suppliers, non-profit entities (7) implementation of ethical supply-chain thanks to a sustainable supply chain management; (8) training and research about SBM.

In conclusion, the local business ecosystem is relevant for a SBM in several ways: firm can use resources more efficiently and with less negative environmental impact by sourcing materials and services locally; focal firms are more accountable to their local communities, and they are more likely to adopt socially responsible practices such as fair labour standards, environmental stewardship, and ethical and certified local supply chain; focal firms collaborate with local actors to share resources, reduce costs, and pursue common goals, local business ecosystem perspective can foster innovation by creating a supportive environment for entrepreneurs and start-ups, facilitating knowledge sharing and collaboration, and developing new products and services that meet local needs; focal firm are more resilient in the face of economic, environmental, and social challenges because they have strong relationships with their communities, can adapt quickly to changing circumstances, and are more likely to receive support from local organizations and governments.

Research limitations. *Our research presents some limitations, particularly deriving from methodology used. First, with seven cases, our sample size could be considered too narrow to generalise the results. However, according to Eisenhardt four to ten cases are fine (Eisenhardt, 1989). Second, our study addresses only firms operating in Italy. Consequently, we were not able to determine whether country-specific factors affected business ecosystem relationship. Third, the most relevant data were collected through interviews. The respondents were owners and founders of the firms. Thus, the answers might emphasize positive aspects of the phenomenon. These limitations may represent opportunities for future research on this topic.*

Managerial implications. *The findings will provide important implications also for managers and entrepreneurs that want to adopt a SBM based on local business perspective. In particular, the results highlight a way to involve many actors of local business ecosystems with successful results in terms of value creation.*

Originality of the paper. *This study aimed to increase knowledge about the role of local business ecosystem actors within a SBM. Previous research has often considered business ecosystem to analyse circular business models (i.e. Kanda et al, 2021; Geissdoerfer et al, 2020) or the community platform business model (i.e. Zhao et al, 2020; Velu, 2015). Therefore, despite this topic representing a rich research stream, it required more insight into the role of the local business ecosystem in all typologies of business models that present a sustainability-driven design. To address this gap, we undertook a multiple case study of seven Italian SMEs with benefit corporation qualification. The findings presented, contribute to research in the sustainable business model field by shedding light on how a focal entrepreneur could leverage its business ecosystem to adopt a SBM. In doing so, we provided some theoretical contributions.*

First, our findings highlight the shift away from an activity-based view of SBM to an actor-based view (Hou et al, 2020): the first order codes are made up of activities carried out by focal firms, while, in the end, the aggregate dimensions of collected data are composed by all actors of the business ecosystem.

Second, like Jacobides et al (2018), our study considered the firms that adopt a SBM as the fulcrum of an ecosystem, in the sense of a network. Indeed, in our findings we underlined the links that the focal firm has with the actors who influence or are influenced by its activities.

Considering the classification provided by Adner (2017), our results provide insight into both the ecosystem-as-affiliation which sees ecosystems are a community of actors, and the ecosystem-as structure which views the ecosystem as a set of activities defined by a unique value proposition. Moreover, our findings complement those of Walker, Di Sisto, and McBain (2008), who emphasized collaborative innovation as a key characteristic of SBM. Our study also confirms that SHBM instigates or stimulates business ecosystem innovation in terms of business model innovation of ecosystem participants other than the focal firm (Snihur and Bocken, 2022). The key aspect of successful collaboration is a good climate in terms of trust, mutual value, and credibility in relationships (Danese et al, 2019). Consequently, the governance of a business ecosystem should be based on a collaborative approach. Indeed, as in any complex system, there is a risk of conflict within business ecosystems derived from different motivations, such as competition for funding, resources or talent, different opinions on business models, divergent views on strategic priorities, etc. To prevent conflicts, it is important to develop a culture of dialogue.

Keywords: *ecosystem; local business ecosystem; business model; sustainable business models; value creation mechanisms; benefit corporations.*

The interplay between humanistic management and regenerative development: renewal of community-based destinations in the hinterland

STEFAN LAZIC* MARIA DELLA LUCIA*

Framing of the research. *The impact that the exponential growth of our economic systems has had in the last five decades has sparked debates about the foundations of this progress and its future trajectories (Kallis et al., 2015; Meadows et al. 1972; Meadows et al. 2004). The Covid19 pandemic exacerbated further this debate (ATLAS, 2020; Brouder, 2020; Gössling et al., 2020) and prompted the search for approaches to address circumstances of injustice, unfairness, and inequality in uneven systems (Healey and Barish, 2019). Sustainability and sustainable development have become the prominent alternative paradigm and a key priority to tackle this urgent need for change, but their promises have been widely disregarded yet (Hall, 2019; 2022; Hopwood et al., 2005).*

New calls ask for a transformational paradigm that leads our societies into a more prosperous future (Du Plessis and Brandon, 2015) by revising radically the currently present neoliberal models (Gosling and Hall, 2017; Kallis et al., 2015). Values-based paradigms emphasizing equality and ecology concerns (Della Lucia et al., 2021; Niewiadomski, 2020) are gaining credit for tackling the current need for radical changes (Hopwood et al., 2005; Pirson and Lawrence, 2009). While the former prioritises human well-being, the latter gives priority to environmental health and eco-centred concepts. The intensity of the shift in social equality and environmental justice that these approaches advocate respectively, qualifies the transformative approaches and marks their distinction from reformist ones. While reformist approaches look to solve the problems within existing systems or structures, transformative approaches identify the roots of the existing problems in the current neoliberal forms of capitalism and the prevailing relationships existing among humans and with the environment. The fundamental changes in how society functions require a shift in values, mindset and worldview, and may be prompted by decentralized decision-making governance forms and empowerment of marginalized social groups instead of top-down solutions driven by reformist approaches.

Humanistic management and Regenerative development are showing an increasing presence in the debate about alternative development models and may be framed within the transformational approaches valuing respectively social equality and environmental justice to change the current socio-economic paradigm. The former is a novel area of research, practice, policy, teaching, and education (Pirson and Lawrence, 2009; Pirson et al., 2018) that puts human beings at the centre and leverages dignity, ethics and legitimacy to humanize businesses, economies, and societies (Melé, 2016). This humanism and values-based perspective is still largely unexplored and seems particularly relevant to address the challenges of improving societal development from both a theoretical and a managerial perspective. Multidisciplinary in its nature, Regenerative Development is another transformational approach that is gaining credit lately for novel actions for human and nature flourishing (Ateljevic, 2020; Bellato et al., 2022; Cave and Dredge, 2022; Dredge, 2022; Higgins-Desbiolles, 2020; Pollock, 2015, 2019) but was originally introduced by works in the fields of architecture, built sciences and design (Cole, 2012; Du Plessis, 2012; Reed, 2007). This approach is established on the premises of the ecological worldview (Du Plessis and Brendon, 2014) and mutually beneficial relationships between humans and nature. The final outcome is a net-positive result that restores and enhances the overall livelihood of the community and society (Dredge, 2022; Mand and Reed, 2011).

The above-mentioned values-based transformational approaches offer significant opportunities for paradigmatic change within tourism management. Despite tourism has been widely recognized as a driver of development worldwide and peace (WTTC, 2016), it also reveals well-documented (old and new) inherent paradoxes, vulnerabilities, and crises (Fletcher, 2011). The benefits that tourism can bring to the host destinations and countries concern socio-economic development supported through job creation, infrastructure, business and service development; the latter has a positive spillover effect on other industries that already exist or are born thanks to the impact of tourism (Dwyer, 2016). The tourism economy may also support conservation activities by funding these efforts and raising awareness about the importance of nature for the travel sector (Buckley, 1994).

Tourism is also a social force enabling sustainable transformation by empowering active community participation in decision-making (including minorities and marginal social groups) and building capacity through innovation, education, and social relationships (Higgins-Desbiolles, 2006).

However, tourism also causes social, environmental, and economic problems (Gössling and Hall, 2017) as a consequence of imbalanced tourism growth that does not include all countries equally and neither all social groups. These vulnerabilities and problems reflect the role of tourism as a fuel of neoliberal pro-growth trajectories (Fletcher, 2011) reflected in economic gaps, social inequalities and environmental injustice (Higgins-Desbiolles et al., 2019). For example, over-dependence on uncontrolled tourism development, i.e. overtourism, leads to a decrease in the quality of local livelihood, gentrification, and potential tension between the visitors and hosts. It also damages protected natural areas, landscapes, biodiversity and animal life that cannot be easily repaired (Pollock, 2015).

Values-based transformational approaches have already tried to answer the calls to revise tourism development models for a truly sustainable sector by introducing the notions of Humanistic Tourism and Regenerative Tourism. Humanistic Tourism emphasises the humanistic differences and advantages (Della Lucia et al., 2021c) generated by the application of humanistic management principles to tourism management. It allows the transformation of uneven systems and fosters collective value-creation relationships on different scales (Della Lucia & Giudici, 2021a) by valuing humanistic management dimensions (dignity, ethics and legitimacy) in different human interactions (human-to-human, human-to-nature, human-to-technology and human-to-economy). Instead, Regenerative Tourism echoes equitable co-creation and harmony of tourism development with the socio-ecological context that tourism contributes to transform and improve (Ateljevic, 2020; Bellato et al., 2022). Tourism operators become stewards of regenerative tourism and bridge host communities and visitors (Pollock, 2015).

Among the others, small-scale and remote community-based destinations may benefit from the application of these values-based transformative approaches to address their depopulation and marginalization and value their meaningful social capital and natural and cultural resources.

Purpose of the paper. The aim of this short paper is twofold. First, exploring the interplay between equality and ecology-concerned transformational approaches - i.e. humanistic management and regenerative development - to try to build a blended theoretical framework that sets a paradigmatic change. Bridging these approaches may foster values-based radical changes reflected in a shift in the way people perceive places, communities, nature, and economic activities (including tourism) and outcomes measured not only in economic terms but also assessed through qualitative changes in well-being, community livelihood, and welfare.

Second, as tourism and destination management and development have an urgent need for this type of change, we aim to test the interpretative capacity of this framework through its application to a hinterland community featuring a small community-based rural destination. Smaller scales and hinterland enable better than others to capture patterns among actors and local practices embedding social equality and environmental justice.

Methodology. The research design is based on a systematic literature review carried out through the PRISMA approach (Moher et al., 2009). The sample accounts for 175 articles covering the topics of humanistic management (87 articles) and regenerative development (88). Key concepts provided by this literature were identified through qualitative content analysis (Abbott and Monsen, 1979) and combined to create a novel values-based framework. This framework was then applied to a field-based case study analysis (Eisenhardt, 1989) featuring a rural-specific context, i.e. a hinterland community. The intention was to assess the capacity of the framework to help understand if and how local development was transformed on values that echo humanistic management and regenerative development. The case selected - the local development network of San Rafael (Colombia) and "Zafra", a private nature reserve leading this process - is an exemplary manifestation of a hinterland community that has radically transformed its livelihood and regenerated its community.

Fieldwork was implemented in 2018 through participatory action research (PAR) involving one of the co-authors (Chiu, 2003; Mackenzie et al., 2012). This three-stage process is based on actively guiding and involving community members in the search and implementation of solutions for the problems identified as relevant by the community (Cornwall and Jewkes, 1995). Problem identification, solution generation and implementation enable a joint effort between researchers, community members and local practitioners to foster a radical change (Chiu, 2003). Interactions and dialogues with San Rafael community members and communal leaders were used as preferred methods of analysis to recognize the presence of the main pillars of the designed framework while going through the steps of the participatory action research.

Results. Preliminary results concern the drawing of the novel theoretical framework blending the main pillars of humanistic management and regenerative development. In addition, the identification of the principles and values driving the community transformation in the examined case results from the in-field application of this framework. The main concepts of the integrated framework correspond to the topics characterizing both approaches - holistic view, values of the ecosystem, collective effort, and shared governance models.

A holistic view towards the world, communities, and organizations, is at the core of the framework and feeds practitioners' work in the field. It suggests understanding the interconnectedness between social, economic, and environmental processes in an ecosystem, and recognizing the reciprocal influence that exists between them and the related actors (Dredge, 2022). Individual and group actors do not function isolated one from another, but they are rather involved in mutually influential relationships within a larger system that must be considered on the whole. Human-to-human, human-to-nature, human-to-economy, and nature-to-economy links strive for reciprocity and synergy (Cole, 2012; Della Lucia and Giudici, 2021a; Du Plessis and Brandon, 2015). Thus, interconnectedness recalls mutual respect, responsibility, and ethics.

Interconnectedness among the actors echoes the main values of the ecosystem, blending dignity, ethics and legitimacy brought by humanistic management with environmental justice brought by regenerative development. The

recognition of the dignity and legitimacy of all beings and their needs (Melé, 2009) as an integrated part of the whole aligns with social equality and environmental justice, individual, collective and institutional ethics, and moral and financial logic (Spitzek, 2011).

The holistic approach imbued with ecosystem values implies a responsible collective effort of all stakeholders for the functioning of an ecosystem - multiplying its positive impacts and reducing its negative effects. This joint effort develops throughout the shared value generation process, from value proposition co-design to collective value creation for achieving a common good (Mehmood et al., 2019).

The collective effort also reflects shared governance models of organizations and businesses operating in the ecosystem. They empower values-based leadership, stakeholder engagement, a sense of responsibility, and value diversity and inclusion to serve human ends and human well-being along with respect for the dignity of humans and the environment while generating profit through their activities (Dredge, 2022; Pirson and Turnbull, 2011).

Preliminary insights derived from the application of this exploratory framework to the “Zafra” case are promising. They show that values-based actions (the responsible collective effort rooted in the values of the community) promoted by community-based decision-making (shared governance models manifested in communal leaders identified by the community as agents of change) contribute to designing more livable communities (the renewed ecosystem of San Rafael) in which humans and the natural environment co-exist and flourish (the holistic view of the regeneration process of the community shared by community members).

The area of San Rafael suffered from the deterioration of “social capital and the environment along with poor livelihood” as a consequence of a civil armed conflict that lasted for several decades. A decade ago, at the end of this conflict, the remaining population first acknowledged the existence of this problem and then addressed it by engaging the whole community to find shared solutions and take collective action. The vision inspiring solutions and actions was not economic. It was not just a matter of creating jobs and developing new infrastructures, businesses, and services to improve livelihood and standard of living. Instead, it was a matter of undertaking these processes collectively and responsibly for having a positive impact on the well-being of community members and the environment. In other words, solutions and actions for “giving the community new life” were equality and ecology-driven.

Tourism was one of the solutions identified to catalyze this change. In the past, tourism was not one of the leading activities in the area and only a few accommodation providers were operating. However, the local network created to find solutions recognized it as a possibility to link various actors and activities in collective action towards the renewal of the local livelihood and well-being. Tourism management was based on humanistic premises and was meant to consolidate other sectors into a joint meaningful experience that could deliver the wholeness, purpose, and unity of the complete community. Through open discussions among the members, the network identified nature-based tourism as the main activity they were interested in and capable to provide and that could communicate successfully the local identity and sense of place to the visitors. The network also recognized other activities that could be developed in the area by the local population and that are aligned with the area’s environmental and cultural characteristics, thus creating more opportunities for the multi-scale restoration of local livelihood. The new activities were determined according to one’s skills and knowledge that could express the local population at its best and showcase community members’ intentions and capabilities.

While problem identification and generation of solutions included a variety of stakeholders to capture collective perspectives, actions were carried out by communal leaders, i.e. representatives from several stakeholder groups recognized by the community as the drivers of a collective change inspired by social equality and environmental justice. Their actions included the creation of several accommodations and tourist services reflecting San Rafael’s cultural heritage and natural context. Tourism was complemented by agricultural activities that helped avoid tourism monoculture and single-sector dependence. Cultivation of coffee, honey production, fishery, agroforestry, and organic agriculture were all initiated at different moments of local development, diversifying the local economy and providing possibilities for job creation. These activities enriched the tourist offer to showcase to the visitors the outcomes of joint work and local skills. Community members’ capacity building, social improvement and empowerment were fed through the creation of educational opportunities for youth and formational activities for the community members thus creating a virtuous cycle between the strengthening of social capital and local development. The environmental concern and care were expressed through the implementation of sustainable practices in design and construction, the establishment of protected areas and reforestation strategies, contributing to protecting the environmental context of San Rafael. As a result of all previous actions, depopulating trends in the area slowed down and the gradual rebuilding of the local society was stabilized.

Research limitations. This exploratory work shows several limitations. First, humanistic management and regenerative development are still niche research fields compared to mainstream research. As they advocate disruptive changes compared to mainstream lines, they could be labelled as unrealistic and critical with restricted acceptance and use. Second, compared to regenerative development, the majority of published works so far on humanistic management/tourism are theoretical. The exploratory integrated framework we drew, thus suffers from the exploratory characteristics of the handful of cases that connect humanistic management theory and practice and do not allow the generalization of conclusions. Third, while showcasing an exemplary real case that can serve for future work in this domain, this single case analyzed in this paper is context-based. Its contribution to interpreting values-based transformation in a hinterland community driven by tourism remains limited and the generalization of the findings could be questionable. Therefore, more practical cases including, large-scale destinations, are needed to provide

significant insight to build an integrated transformational framework and assess its interpretative and managerial capacity.

Managerial implications. This novel research contributes to the understanding of the significance and relevance of values-based approaches that are intended to reply to the calls for radical changes in the economy, particularly tourism and destination management, but are still niche research fields. This contribution has both theoretical and managerial value.

The cross-fertilization between equality and environmentally-concerned approaches enables the creation of an integrated framework that grounds a radical values-based transformation of the economy, and tourism and destination management. The key concepts of humanistic management and regenerative development that this framework combines embed the advantages brought by each approach and are catalysed by their in-field implementation.

From a managerial viewpoint, this framework could potentially be transformed into a dashboard used to investigate, guide and monitor the values-based transformation of projects developed by different proponents, in diverse contexts and focusing on different drivers of development (i.e. tourism, agriculture, culture etc.). Thus, tourism and destination management may be considered an exemplary domain to experiment with the integrated framework and evaluate its difference and advantages when applied to case study analysis. Initial results in San Rafael and “Zafra” have shown that humanism-regeneration hybridization provides benefits and opens spaces for pathways to revitalize community-based rural areas through values-based forms of tourism focused on social and environmental justice, heritage valorization, equality, and empowerment. This preliminary insight may be used to create guidelines to feed the application of the aforementioned principles in other contexts. One of these fundamental principles relies on participatory governance models that decrease authority levels and increase value co-creation. The real-life case-study showed the advantages that these models bring to empower community members and generate a collective effort benefiting all.

Originality of the paper. An interlink and blending between two transformative approaches have not been investigated so far, especially one equality-centered and one ecology-centered. Thus, the hybridization between humanistic management and regenerative development is a novel perspective on values-based transformative approaches that are suggested as an alternative to neoliberal economies in tourism and destination management models. The present contribution is part of a broader PhD research that deals with the interplay between humanistic management and regenerative development. This work is based on several simultaneous activities that feed the overall outcome of the PhD research. As such, it has not been published so far in any other outlet.

Keywords: transformative approaches; humanistic management; regenerative development; values-based theoretical framework; community-based tourism; hinterland

Co-producing chronic care services: two discrete choice experiments, in rural and urban scenarios

VERONICA SPATARO* SABINA DE ROSIS* MILENA VAINIERI[♠]

Framing of the research

Introduction

Current turbulent times are forcing policymakers and managers to rethink the relationship between strategies and locations, also in the healthcare sector (Bathelt and Li, 2022). The global crisis produced by the pandemic has produced several important changes and challenges in rural development, population and economies (OECD, 2020). OECD governments showed interest in a more place-based approach to public policy, investments, and expenditure in rural areas, before the pandemic too (OECD Publishing, 2006).

Usually, “knowledge-poor regions, especially smaller and rural cities (...) are excluded from state-of-the-art innovation networks lack upgrading opportunities” (Bathelt and Li, 2022, p. 461). In fact, the locational strategy of organizations aims to get the best access to talent, knowledge, and customers (Florida and Adler, 2022). The availability of infrastructure and facilities, as well as of digital connections and quality of broadband, is also an issue in remote areas (Khan, 2023), which can affect the possibility of people to access to resources and services. In fact, distance and transportation produce logistical difficulties and limit access to basic services, such as education, healthcare and welfare services, employment and workplace (Crandall and Weber, 2005; Khan et al., 2020).

In the healthcare sector, public organizations do not decide where and how to locate and deploy resources: their mission is to provide high-quality services assuring equity and sustainability. Over the last 20 years, the centralization of procedures in several healthcare systems, for reaching a minimum threshold of volumes and assuring more effective services, has localized highly specialized services in organizations of excellent, mainly in urban areas, and produced equity implications in terms of access to optimal care in rural areas (Birkmeyer et al., 2002; Dimick et al., 2004; Liu et al., 2006; Stitzenberg et al., 2009; Ward et al., 2004).

According to a very recent literature review (Gashi Nulleshi and Tillmar, 2022), remoteness, accessibility and the sense of place (the rural locale and sense of place dimension) are crucial topics in rural studies. These aspects are strictly linked to each other, since the human capital of people in rural areas is among the framework conditions for the development, together with access to capital, markets, and public services (OECD, 2020). Human capital in remote areas has been recognized as a key asset by researchers and scholars in the management field, since cultures, social norms, symbols, values, knowledge, and practices compared are different in local and non-local areas, and this can affect perspectives, interactions and networks in local or remote areas (Petheram and Campbell, 2010).

We already know that different prosocial attitudes of citizens can produce different practices of people engagement by organizations: size and characteristics of the organization’s geography play a determinant role in this regard (Attig and Brockman, 2017). What about the determinants of people’s willingness to be engaged? Our aim is to investigate whether living in a rural area can affect the preferences of people to be engaged by organizations that mandatorily provide services in the outskirts of the system, such as public healthcare services.

Theoretical framework. The literature emphasises the significance of recognising users’ roles as more than just passive. Users today take an active part in the creation of value for the services that are offered to them, and they are seen as co-creators (Grönroos and Voima, 2013; Vargo and Lusch, 2014, 2016). The customer-centric logic has emerged as an important concept, with users serving as both a vital source of unique information and active contributors in the development of new value (Prahalad and Ramaswamy, 2004).

From the perspective of the service dominant logic (SDL), services are considered as always co-produced (Vargo & Lusch, 2016). This perspective was also applied to public services, with some adjustments to reflect the characteristics of the public context, which can be considered as a more complex service ecosystem (De Rosis et al., 2019; Osborne et al., 2013, 2016). Osborne and colleagues highlighted the existence of different ways of involving users in the co-

production of public services. Indeed, along with this more intrinsic co-production process, there are also more explicit ways of involving users in the co-production process, at both individual and systemic levels (Osborne et al., 2016). In particular, voluntary and conscious involvement of service users is needed to improve already existing services or innovate them with the contribution of users themselves (Osborne et al., 2016). In particular, people can be engaged by organizations in the following phases of the public service cycle: co-commissioning, co-designing, co-delivering, and co-evaluating (Nabatchi et al., 2017). Co-commissioning refers to activities aimed at identifying “what needs to be delivered, to whom, and to achieve what outcomes” (Bovaird and Loeffler 2013, 6). It is about strategically identifying and prioritizing needed public services, outcomes, and targets of users, and it is usually prospective. It is also similar to “co-prioritization” and “co-financing” (Nabatchi et al., 2017). Co-design includes users' activities aimed at defining a user-oriented creation, planning or arrangement of services (Bovaird and Loeffler, 2013). In this sense, applying the user perspective can be helpful in better understanding how public services could be designed to be of greater utility and benefit to individuals and communities. It may be future-oriented or concerned with what presently exists or is occurring (Nabatchi et al., 2017). In co-delivery activities, users and providers collaborate to directly provide public services and/or improve public service provision. Co-delivery is typically targeted at currently offered services (Nabatchi et al., 2017). Co-assessment focuses on monitoring and evaluating services. In this sense, users and providers work together to assess service quality, and identify problems, areas for improvement and/or good practices (Bovaird & Loeffler, 2013; Nabatchi et al., 2017). Co-assessment generally has a retrospective nature, which means it concerns services already provided by the organization and experienced by the user. However, the results of co-assessment activities can be used prospectively to improve services.

Our interest is to study the determinants of people's engagement into different kinds of value co-creation processes in the public domain, considering the role that the living context can have on their preferences (Virlée et al., 2020). In particular, in healthcare, some activities can be more complicated for patients who live far away from hospitals and/or in a region where the hospital's service offerings are limited (Virlée et al., 2020). Indeed, geo-physical proximity, which refers to “the connections between geographic locations and their inhabitants by physical contact and the exchange of goods and services” (Kolb, 2008, p. 132) can have an influence on patient co-creation activities at the systemic level (Virlée et al., 2020). More specifically, the authors highlighted that geo-physical proximity has an impact on the compliance of patients with the basics in the context of chronic diseases (Virlée et al., 2020). This can be related to difficulties in engaging in follow ups pre- and post- surgery, or in the revalidation of physical therapy, which leads patients to search for an independent physical therapist. Sometimes the patient finds a revalidation centre close to home; however, if it doesn't happen, the patient is in a difficult situation (Virlée et al., 2020).

Previous studies on the antecedents of co-production provided mixed results and, more important, may vary according to the type of service and activity (Cepiku et al., 2022). Different types of co-production activities may be facilitated by different determinants (Steen, 2021). Steen (2021) categorized co-production antecedents found in literature into citizens' (i) abilities, (ii) opportunities and (iii) motivation. Moreover, other factors such as trust, satisfaction, self-confidence, and context can have an influence (Cepiku et al., 2022; Fusco et al., 2023; Palma et al., 2019).

Purpose of the paper. Given these premises, the present study aims at investigating the patients' preferences for co-producing in healthcare by (i) focusing on the patients, as “experts by experience” (McLaughlin, 2009), and (ii) identifying what moves the preferences with respect to: the type of co-production, opportunities, abilities and motivations, by applying an experimental methodology. In particular, special attention has been placed on the factors above-mentioned, such as trust, satisfaction, self-confidence, and, in particular, the living context. Patients' preferences were detected considering people living in two different settings, namely in an urban or rural area, in order to investigate what moves people with different senses of place, remoteness and accessibility in participating in the value co-creation in the public sector, and, consequently, provide insights on the more proper co-production practices, and relative levers and process to be implemented by organizations to assure a successful engagement of people.

Methodology. This work uses data from a cross-sectional study carried out between September and December 2021, on 7266 patients. The study was based on a web survey including an observational section and an experimental one. The observational section consists of socio-demographic questions and reporting questions with single answers regarding the experience with healthcare services. Namely, we used for this study, variables collected with questions on: socio-economic characteristics, being a chronic patient as a proxy of being a stronger “expert by experience” for repeated use of healthcare services; the reasons for the hospital choice as a proxy of trust; the satisfaction with the last used healthcare service as a proxy of salience.

The experimental part of the survey was represented by two Discrete Choice Experiments (DCEs), administered on the Qualtrics Platform. The two DCEs aimed at analyzing the same attributes (see Table I) with two different scenarios: patients living in an urban area and patients living in a rural area. Patients were randomly assigned to one of the two experiments. Patients were asked to identify themselves with a chronic patient in an urban or in rural area before indicating their preferences. The scenario was introduced by the following sentence: “Imagine that you have a moderate chronic disease that requires regular check-ups”. The first experiment's scenario continued with the following sentence: “and that you live alone in a city with many services.”; the second scenario, instead, continued with: “and you live alone in a rural area.” Both scenarios were closed by: “Which of the two alternatives would you prefer?”. Data collection took place completely digitally. Patients were enrolled after hospitalization in two Italian regions, Tuscany (in both private and public healthcare organizations) and Veneto (in public organizations). For an in-depth description of the process of patients' involvement in the survey, please read De Rosis and colleagues (De Rosis

et al., 2020). The participants could access the study via smartphone, tablet or computer using a link. We administered the observational section of the survey using LimeSurvey and the experimental section through Qualtrics. The study was conducted in Italian.

Tab. I: Attributes and levels

Attributes	Levels
Type or phase of co-creation activities	1. To choose the modality of service provision 2. To do some activities independently 3. Co-evaluation of services 4. Use services as they are
Supportive network	1. Service providers 2. Group (of people with similar needs) 3. Community 4. Alone
Motivation - level of the return	1. Individual 2. Group 3. Collective/social

We carried out:

- 1) a descriptive analysis of the sample;
- 2) a dummy coding of respondents' preferences, by equaling 1 for each selected choice set and 0 for the not selected choice sets;
- 3) an analysis of DCE data through conditional logit modelling using STATA 17 software (Hauber et al., 2016).

Our dependent variable was respondents' preference in terms of co-production activity in the analyzed context.

We analyzed data by reporting the attribute importance and the preference share. The first one is a measure of the influence an attribute has when the respondent is choosing their preferred alternative. The higher the score, the more weight it carries in the decision-making process. Scores add up to 100. The second one measures the preference that respondents have for each level within a feature. The higher the score, the greater its weight in the decision-making process. In performing conditional logit models, we analyzed both main and interaction effects. The latter investigates the interaction between the choice and the variables collected in the observational section of the study. Namely, we used:

- Socio-economic characteristics: age class; sex; educational level
- Being a high-level user / Previous experiences: chronicity
- Trust in the service, measured as the choice of hospital based on the belief that the hospital is the best for the health condition of the respondent
- Salience of the service evaluated, linked to the demand-drive engagement, measured as the overall satisfaction of the hospitalization service and willingness to recommend.

Throughout the analysis, the p -value cut-off considered for statistical significance was $p < 0.05$.

Results. The main characteristics of respondents randomly assigned to the experiments are summarized in Table II. There are no statistical significance differences in the samples of the two experiments.

Tab. II: characteristics of patients in the two experiments.

Variables	Categories	Experiment 1	Experiment 2
Sex	Female	59%	57%
	Male	41%	43%
Age	<18	6%	6%
	18-44	31%	30%
	45-64	34%	35%
	>64	29%	28%
Highest education qualification	No educational qualification / elementary education	13%	14%
	Middle school	27%	27%
	High school	37%	38%
	Graduate or postgraduate	22%	21%
Citizenship	Italian	85%	85%
	Not Italian	15%	15%
Chronicity	Not chronic	60%	63%
	One chronicity	21%	20%
	More than one chronicity	13%	13%
	I don't know	6%	4%
Hospital-Region	Public- Tuscany	50%	49%
	Public- Veneto	36%	37%
	Private- Tuscany	13%	14%

Overall, the most selected reason for choosing the hospital is because the patients' doctor works there (32%), the second one is the proximity of the facility (23%), and the third is the positive reputation of the hospital (16%). The 11% arrived at the hospital with an ambulance and did not choose the hospital. 69% of respondents are very satisfied with the last service used (hospital stay), and around 90% of them will recommend the hospital.

Experiments' analysis

Results of the conditional logit models indicate that the most important lever is related to the support of the co-production activity proposed to the patients, in both experiments (Figure 1 and 2). On a scale from 0 to 100, the relative importance of each of the three attributes, affecting the respondent's choice of the alternative, is reported in Table III.

Tab. II: Attribute importance and preference share for the urban and rural scenarios

Attribute	Attribute Importance		Levels	Preference shares of the levels	
	Urban	Rural		Urban	Rural
Type of co-production activity	37.8	39	Use of healthcare services as they are	16.7%	15.3%
			To choose the modality of service provision	17.9%	15.1%
			To do some activities independently (i.e., measuring some health parameters)	16.5%	15.2%
			To have a direct channel with the company to evaluate the service provided (i.e., what worked and what didn't work)	48.8%	54.4%
Support	43.5	43.6	with the support of the healthcare staff	50.7%	57.6%
			with the support of people with similar healthcare needs	20.3%	17.3%
			with the support of the community (i.e., associations, neighbors, friends)	21.3%	19.5%
			alone	7.7%	5.6%
Motivation- level of the return	18.8	17.4	for a personal benefit	19.5%	17.8%
			whether it benefits patients in similar health conditions to mine	41.2%	42.5%
			if it contributes to the sustainability of the national health system	39.3%	39.7%

Fig. 1: Main effect of the logistic results in the urban scenario

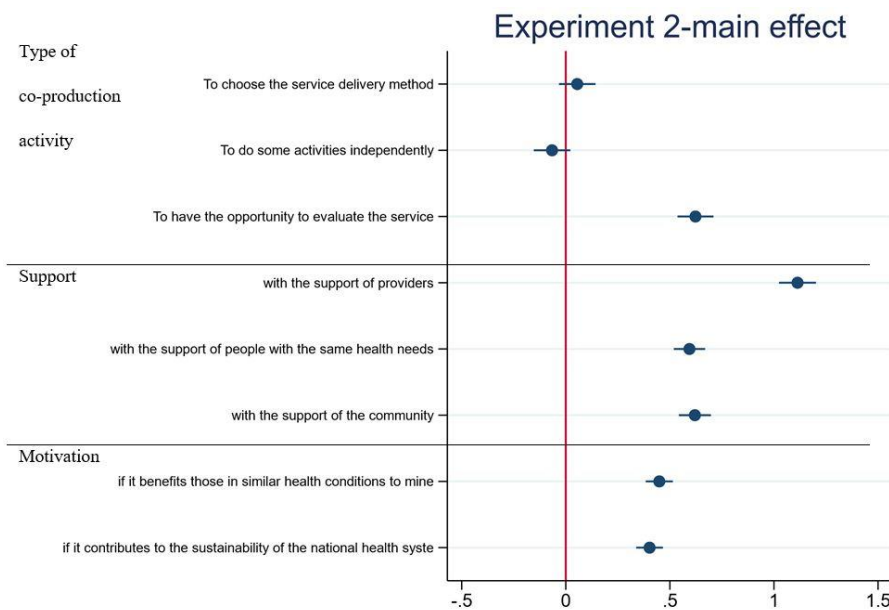

Fig. 2: Main effect of the logistic results in the rural scenario

Overall, our study shows that the preferences of patients, in terms of main effects, are not determined by the different living contexts. The differences we found do not regard the direction of the preferences, but the intensity, if any, and are described in the following lines.

In terms of co-production activity, along a continuum from co-commissioning to co-evaluate the services, the preferred option from patients is the latter (co-evaluation), which moves the choice of patients in both scenarios, with a higher preference share in the rural area. Considering the supportive network, co-production should preferably happen with the providers of the healthcare services, both in rural and urban areas. Also, in this case, the rural scenario counts as a higher preference. Finally, in terms of motivation linked to the return of the co-production activity, patients prefer to co-produce for the benefit of patients in similar health conditions, with a slightly higher preference share in rural areas.

The analysis of the interaction effects driving participants' preferences confirms the results. The direction of the preferences has just some exceptions, and very few variations were observed in the probability of choosing a specific configuration of participation activities for different co-production processes. In the following lines, we list only the statistically significant differences between rural and urban scenarios considering the interaction effects.

Co-assessment is the preferred option. However, we found a higher preference for co-design of services for more educated and younger participants (under 45 years old in the urban scenario, and between 18 and 45 years in the rural scenario). For co-delivery, we registered a change in the direction of the effect (from negative to positive) and a statistically significant difference between patients with the highest level of education and i) the lowest one, in the urban scenario; or ii) with a medium and low level of education in the rural scenario. In the rural scenario, being a chronic patient increases the preferences for the evaluation activity.

For the attribute of motivation, we registered a higher preference for benefits for the community rather than for the group for mild chronic patients (i.e., with one chronicity) in the rural scenario ($p < 0.001$), and for severe chronic patients (i.e., with more than one chronicity) in the rural scenario ($p < 0.001$).

In the following lines, we list the interaction effects we found in both urban and rural contexts, without differences.

In general, in both scenarios, we registered a higher preference for the co-assessment for patients with no trust in the service provider, who have not declared an excellent overall evaluation, and with a minor willingness to recommend. We registered positive preferences for patients with no choice based on trust ($p < 0.005$ in the urban scenario, and $p < 0.05$ in the rural one), and negative preferences for co-design for satisfied patients (who declared an excellent overall evaluation) ($p < 0.001$ in the urban scenario, and $p < 0.001$ in the rural one).

We registered a higher positive preference for co-design for patients with a minor willingness to recommend the hospital (who declared to not be willing to recommend the hospital for sure) ($p < 0.001$).

In terms of support in doing co-production activities: we found a lower preference for the support of providers, the support of patients' groups and the support of the community for older participants. The support of providers and of the group are more preferred by women, particularly in the urban area. The preferences for the support of providers, groups of similar patients and communities are lower for people affected by at least one chronic disease. Also, the preferences for the support of the providers in the co-production activities are higher for patients with trust, while the preferences for the support of the group and the community are higher for patients who have not declared that the choice of the hospital was based on trust.

Research limitations. Our research is not free from limitations, which offers avenues for future research. Although we applied a robust methodology based on an experimental survey, preferences are self-reported by respondents. Also, patients could be supported by caregivers in completing the questionnaire and the experimental part. As a result, they can only be observed as proxies of the actual behaviours of engagement in co-assessment processes. Future experiments are needed for testing the generalizability of our findings on the field. Another potential threat to the external validity of our inference lies in the generalizability of results to other sectors. The healthcare services are per se salient, in an internal as well as external or social perspective.

Discussion and Managerial implications. Our findings provide insights into what moves the engagement of patients in co-production initiatives in healthcare provided in a rural versus urban context.

One of our findings is that the area in which patients live, urban vs rural, does not change patients' preferences about co-production activities. All the variables related to the patient's ability to participate, opportunities, but also trust, satisfaction, self-confidence, as the living context, resulted overall not relevant with respect to the main effects that describe the people's preferences about co-production.

Co-producing with the support of healthcare providers is the strongest determinant of participation in co-production processes, for patients. In the rural scenario, compared to the urban one, results show lower preferences for patients in doing activities alone (the "zero alternative"), and a higher need for support from healthcare providers. This can be explained by the perception of higher need that people in rural areas can have, since their living context can be a poorer region by definition (Bathelt and Li, 2022), and in the healthcare sector in particular (Virleé et al., 2020). In fact, the literature underline how patients may experience greater difficulties in their care when living away from healthcare facilities (Virleé et al., 2020). Moreover, some scholars underline that rural individuals may define 'health' differently from their urban peers on the basis of their personal health-related beliefs, attitudes values and knowledge (Gessert et al., 2015). Thus, healthcare organizations should value the local perspective, listen to the local expectations, values, practices and perspective, in order to better understand and satisfy needs in remote contexts, as well as in non-local areas.

The phase or type of co-production is the second strongest determinant of participation for patients, with a higher preference for the co-assessment. In the rural scenario if compared with the urban one, we registered a higher preference for co-assessment, and less preferences for the other types of co-production activities, where the intensity of citizen contributions is typically higher (Loeffler and Timm-Arnold, 2021). Our results seem to indicate that patients prefer to be engaged in less intensive, more affordable, maybe perceived as an easier co-production activities: when tasks can be easily performed, users are more willing to co-produce (Nabatchi et al., 2017). This is in line with the evidence of the people ability (real and perceived) as an antecedent of participation (Steen, 2021).

In our study, patients' preferences are not directed towards co-delivery of the services, expressed in our study as contributing to the self-management of their care by doing some activities independently. Thus, it is important to understand what would move patients in participating in more intensive activities of co-production, by creating the right "conditions to make individuals, patients and communities able to improve their health and well-being and increase both individual and social value", such as applying person-centred and person-driven models (Leggett, 2014; Oliver, 2015) based on collaborative processes of education, activation, engagement and empowerment of people paying a greater attention to cultural and social contexts (Pennucci et al., 2022).

The motivation that mostly moves patients is the benefits of patients in similar conditions, strictly followed by the benefit for the community, both highly preferred to the personal return. Our findings confirm the importance of intangible rewards in stimulating people's participation in co-production activities (Cepiku et al. 2022). The solidarity-related motivation that move the preference for participation are higher in the rural scenario. Organizations should consider "the sense of belonging attached to rural space" (Gashi Nulleshi and Tillmar, 2022). This can imply the need to link both the co-production initiatives and its results in terms of activities of services' monitoring, re-design and innovation based on patients' co-production practices, with the local conditions, as well as with the local groups of interests and people-in-need.

This result can be also related to the salience of and the trust towards the healthcare services for patients. Unsatisfaction and less trust in the providers affects the preferences of patients to be engaged in the co-production processes. The implications of these results are crucial considering the centralization of high specialized and innovative services, which can regard both surgical procedures and chronic care services. People in rural areas perceive their living place as remote also in terms of opportunity of access to basic community services (Fahmy et al., 2004), and this is another key aspect to consider by organizations that want to engage with their patients.

Originality of the paper. This study applies an experimental methodology to provide insights into what moves the engagement of patients in co-production initiatives in healthcare. It takes a systemic perspective, considering i) different types of activities in which patients can be engaged, from the design of services to their evaluation; ii) two different contexts of living: urban vs rural; and iii) the important role of patients' informal networks.

Preferences for monetary and non-monetary rewards in loyalty programs: the effect of gender and generation

GIADA SALVIETTI* MARCO IEVA* CRISTINA ZILIANI[▲]

Abstract

When designing a loyalty program, a major decision for retailers concerns choosing which rewards and of which nature (monetary vs. non-monetary) to offer. Customers do not evenly react to the same rewards, urging retailers to maximize efficiency by identifying segments that share a common preference and design programs to target them. Traditionally, such segmentation is based on behavioural variables, such as expenditure or purchase frequency. Our study adopts a different perspective, based on customers' generation and gender, to investigate preference for monetary and non-monetary rewards as well as for loyalty programs overall. Data were collected through a panel survey on 2,009 Italian customers. Significant differences are found with reference to enrollment in a loyalty program and reasons not to enroll, and to preference for rewards.

Framing of the research. Loyalty programs are widespread across many retail sectors, as a way to keep profitable customers close and engaged. Research has shown that retailers may obtain a variety of benefits from loyalty programs, in terms of sales and gross profit growth (Chaudhuri et al., 2019). Moreover, loyalty programs have helped many companies enduring and recovering from the impact of the Covid-19 pandemic (Pascual and Cain, 2022).

Designing a loyalty scheme, however, is a complex task. Retailers designing a loyalty program must take into account multiple characteristics that all contribute to the program's effectiveness in terms of increased attitudinal or behavioural loyalty (Belli et al., 2022). Among these characteristics (e.g. enrollment type, fees, tiers, etc.), the types of rewards offered are key to the program's success. The type of reward, in fact, has a direct effect on store loyalty (Meyer-Waarden, 2015) as well as on retailer profitability (Bombaji and Dekimpe, 2020).

Rewards can be categorized with a variety of criteria: exclusivity, timing (i.e. whether the redemption is immediate or delayed), delivery (i.e. whether the rewards are direct, related to the retailer's core business, or indirect) (Kim et al., 2021). A major distinction is that referring to their nature, that differentiates between monetary (or "hard") and non-monetary (or "soft") rewards. Monetary rewards include all kinds of tangible and financial benefits (e.g. discounts, savings, coupons, and free products or samples). Non-monetary rewards are more difficult to frame, as they can be either tangible or intangible; their main feature is "providing psychological, relational, emotional, and functional benefits" (Meyer-Waarden, 2015, p. 23). Both monetary and non-monetary rewards have been shown to have a positive influence on customer satisfaction towards the loyalty program and the retailer (Bridson et al., 2008); also, non-monetary rewards seem to enhance a customers' sense of belonging towards the retailer, with positive relational outcomes (Lacey et al., 2007). Moreover, from a strategic point-of-view, it is best to offer non-monetary rewards alongside monetary ones as they are unique and not easily replicable by competitors (Chaabane and Volle, 2010).

Customers may react differently to the same rewards offered, for many reasons. For example, personality traits have been found to influence choice of rewards to redeem (Daryanto et al., 2010) as well as likelihood to join the loyalty program (Gómez et al., 2016). Haverila et al. (2022) point out that retailers should work towards identifying customer segments and understand whether and how they value different rewards, in order to improve their program effectiveness. Traditionally, customer segments in loyalty programs have been based on behavioural variables such as expenditure or purchase frequency (Dorotic et al., 2012). To our knowledge, no significant attempt at generalizing generation-related or gender-related differences in attitude towards loyalty program as well towards monetary vs. non-monetary rewards has been made so far.

Purpose of the paper. The present study investigates preferences for different types of rewards, as well as for loyalty programs overall, based on customers' generation and gender.

The Generational Cohort Theory (Inglehart, 1977) states that it is possible to identify distinguished groups of people that are born in the same time period, living similar experiences during their formative years (Meriac et al.,

2010). These experiences contributed to form similar values, attitudes and beliefs shared by members of the same group, leading in turn to equally similar behaviors (Soares et al., 2017). So far, literature identified five generational cohorts: Silent Generation, Baby Boomers, Generation X, Generation Y or Millennials, and Generation Z, the latest. In marketing, the study of generations has extensively investigated how potential targets belonging to each group react to stimuli of different nature (Schewe and Meredith, 2004), such as social media advertising (Kamal et al., 2013) or price promotions (Eastman et al. 2021). Nevertheless, only a few studies have addressed the context of loyalty programs and generations, and typically with a focus on one generation only (e.g. Tahal, 2014, on Millennials); moreover, the majority of these studies attain to the hospitality and tourism sector. Extant studies depict the younger generations as hyper-connected, due to their early exposure to technology, and very receptive about social benefits (Agrawal, 2022). Generation X has been depicted as heavy spenders compared to Baby Boomers and Silent Generation, who are, in turn, more price-sensitive (Gauzente and Roy, 2012). We expect, therefore, that these characteristics will have an impact on rewards preference in loyalty programs too.

As what regards gender, studies in marketing suggest that men have preference for utilitarian benefits whereas women do value hedonic benefits more (Wolin, 2003). Such gender-specific preference has been investigated with reference to utilitarian and hedonic products (Wang et al., 2021) and sales promotions (monetary and non-monetary, Carpenter and Moore, 2008). Loyalty research on gender has been scant so far. Vilches-Montero et al. (2018) show that women and men differ in the information cues used to evaluate loyalty programs (respectively, innovativeness and perceived benefits of the program), which in turn affects store loyalty. Hu and Zhang (2021) study the effect of gender on utilitarian vs. hedonic rewards in the context of customer referral programs and identify significant gender differences on reward-product congruency. When the referral decision concerns utilitarian products, utilitarian rewards are more effective for men than hedonic rewards; similarly, hedonic rewards work better than utilitarian rewards for women making decisions about hedonic products. The opposite is not true for either men or women. Another study exploring gender-specific rewards preference is that of Melnyk and van Osselaer (2012). The authors address personalized attention and high statuses, that are related to the loyalty program's tier structure rather than the nature of rewards offered. Based on the aforementioned studies, we expect women to show a higher preference for non-monetary rewards, as the benefits offered are of hedonic nature, and men to favor monetary rewards, as utilitarian benefits.

In the present study, we therefore aim to shed light on personal characteristics influencing program and rewards preferences, and specifically we formulate the following research questions:

- RQ1: to find out whether gender and generational cohorts have a role in determining enrollment or non-enrollment in loyalty programs;
- RQ2: to identify generation-specific differences as far as reward preference. We expect that Millennials and Generation X will express a higher preference for non-monetary rewards than monetary rewards, and Baby Boomers and Silent Generation consumers will express a higher preference for monetary rewards than non-monetary rewards;
- RQ3: to identify gender-specific differences as far as reward preference. We expect that women will express a higher preference for non-monetary rewards than monetary rewards, and the opposite for men.

Methodology. The above research questions were investigated through an online survey conducted on a representative panel of Italian consumers by a leading consumer panel research company. A structured questionnaire was designed as follows. Participants were instructed to answer about their purchase behaviors as far as supermarket purchases and electronics purchases were concerned. Moreover, in order to ensure that they could offer reliable behavioral data, they were asked to refer to the retailer they had bought more frequently from in the past 6 months. To facilitate this task, they were provided with a list of all major Italian retailers operating in the supermarket and electronics sectors.

The questionnaire was composed by three sections. The first section investigated consumers' preference for retailers' channels, specifically the frequency of use of online vs. offline channels. The second section focused on loyalty programs: participants were asked questions about the length of relationship with their preferred retailer and its loyalty program, if they were enrolled, as well as engagement with the loyalty program. To measure the latter construct, the scale by Bruneau et al. (2018) was adopted; its internal consistency was verified through the Cronbach's α (Nunnally, 1994) and each item's factor loadings (Gerbing and Anderson, 1988). Those who, in turn, were not enrolled in their preferred retailer's loyalty program, were asked to disclose main reasons for non-enrollment. Finally, in the third section of the questionnaire, participants were asked to express their preferences for monetary vs. non-monetary rewards. Participants were first provided with examples of monetary and non-monetary rewards and asked to indicate their agreement with two items on a 7-points Likert scale (from "completely disagree" to "completely agree"). Also, participants were asked to rank their top three preferences from a list of 18 rewards of either monetary or non-monetary nature. The list was generated by drawing from industry practices.

Generational differences were investigated using the one-way Analysis of Variance (ANOVA), and post-hoc (Tukey's HSD and Tamhane's T2) evaluation of specific group differences. Following Levene's Test for homogeneity of variance, the Welch modification was adopted when needed (Gastwirth et al., 2009). Conversely, differences by gender were investigated through the T-Test for independent samples. Further differences among percentages, for categorical variables, were assessed using the Chi-Square test.

Results. Data were collected in September 2022 on a sample that was purposefully built to be representative of the Italian population. Table 1 summarizes the sample's demographic characteristics that were retrieved from the panel at the end of the survey. 2,009 valid responses were obtained (1,162 answered questions on supermarket retailing and 847 on electronics retailing).

Tab. 1: Sample demographics

Measure	Category	Frequency	Percentage
Gender	Male	1.023	50.9
	Female	986	49.1
Generation	Millennials	455	22.6
	Generation X	645	32.1
	Baby Boomers	739	36.8
	Silent Generation	170	8.5
Education	Middle-school degree	272	13.5
	High-school degree	1.045	52.1
	University degree	692	34.4
Income / Affluency	Low	318	15.8
	Below average	583	29.0
	Above average	630	31.4
	High	478	23.8

Starting with preferences for retail channels, we find that Italian customers are extensively using the offline channel for their purchases. 69.9% of participants in the sample shop exclusively offline, and 15.8% shop mostly offline. Conversely, only 1.1% are buying exclusively online and 3.8% mostly online. Finally, 9.5% of participants state they use offline and online channels without distinctions. Nevertheless, Millennials are more likely to purchase using online channels than Generation X (0.237, SE = 0.061, sign. 0.001), Baby Boomers (0.370, SE = 0.059, sign. 0.000), and Silent Generation consumers (0.394, SE = 0.086, sign. 0.000). In turn, Generation X use online channels more than Baby Boomers do (0.133, SE = 0.051, sign. 0.04). Significant differences are also found for gender, with men using online channels more than women ($t = 4.084$, sign. 0.000).

When it comes to the loyalty program, with reference to generations, Millennials and Generation X consumers show a significantly higher enrollment rate in their preferred retailer's program than Baby Boomers and Silent Generation. Women have a higher enrollment rate than men, too (Chi-square test = 18.263; $df = 3$). This is also shown by enrollment rate in other loyalty programs from the same sector. For example, 12.7% of Millennials and 8.7% of Generation X consumers are enrolled in more than six loyalty programs, against 3.7% of Baby Boomers and 2.9% of Silent Generation consumers. Similarly, 10.1% of women are enrolled in more than six loyalty programs, against 4.5% of men.

We asked the respondents who were not enrolled in their preferred retailer's loyalty program to express main reasons for non-enrollment, so as to obtain some insight about the eventual role played by rewards on this respect. Significant differences are identified for both generations and gender. Silent Generation consumers and men are, respectively, those more aware of the loyalty program's existence, but consciously choose not to enroll. Among identified reasons, issues related to the program design and reward system are prevalent: excessive effort in terms of time and additional payments requested to redeem rewards, rewards are not interesting or not valuable, redeeming rewards after enrollment is too difficult - 67.1%). Issues related to the enrollment procedure follow (privacy concerns, too many communications from the retailer, procedure too complicated or lengthy, lack of clarity about the program - 24.7%). Finally, 8.2% states they won't enroll because another family member is already enrolled in that loyalty program.

We also found that Baby Boomers and Silent Generation consumers, as well as men, are less sure about the retailer having a loyalty program or not than their counterparts. Finally, 23.7% of Millennials as well as substantial percentages for other generations state that their preferred retailer does not have a loyalty program; this issue is also shared by equal percentages of men and women.

Results for enrollment rates and statuses are displayed in Table 2 and Table 3.

Tab. 2: Enrollment status in loyalty programs

	Enrolled in LP	Not enrolled in LP	Not know if ret. has a LP	Ret. does not have a LP
Millennials	54.7	5.9	15.6	23.7
Generation X	52.1	6.4	19.7	21.9
Baby Boomers	48.0	8.3	27.5	16.2
Silent Generation	41.2	10.0	34.7	14.1
	Enrolled in LP	Not enrolled in LP	Not know if ret. has a LP	Ret. does not have a LP
Men	46.3	8.6	25.6	19.5
Women	54.4	5.9	20.1	19.7

Tab. 3: Enrollment in other loyalty programs

	<i>0 - Not enrolled</i>	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6 or more</i>
Millennials	23.7	16.3	20.0	13.2	10.3	3.7	12.7
Generation X	27.0	24.2	18.4	12.2	6.7	2.8	8.7
Baby Boomers	36.3	24.8	22.1	9.3	2.4	1.5	3.7
Silent Generation	48.4	25.9	12.4	7.1	2.9	0.0	2.9
	<i>0 - Not enrolled</i>	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6 or more</i>
Men	35.6	23.1	18.9	10.9	4.8	2.3	4.5
Women	27.3	22.4	20.4	11.1	6.5	2.2	10.1

Questions focusing on reward preferences, as well as the length of relationship with loyalty program and loyalty program enjoyment were addressed only to those participants who were enrolled in their preferred retailer's loyalty program. The following results, therefore, refer to 1,010 individuals out of the 2,009 sample (of which, 707 for the grocery sector and 303 for the electronics sector).

As for generations, it is shown 19.8% of Millennials have been purchasing from the same retailer for 1 to 3 years, 19.1% of them for 3 to 5 years, and 29.2% of them for 5 to 10 years, significantly more than other generations. However, only 20.7% of Millennials have been purchasing from the same retailer for more than 10 years, as opposed to 36.6% of Generation X, 36.9% of Baby Boomers and 35.9% of Silent Generation consumers. Measuring the length of relationship with the retailer's loyalty program yields similar results. Millennials, in fact, display the higher percentages for all time ranges but "more than 10 years". Such progression suggests that Millennials are a relevant target for retailers (Table 4). As for gender, women do display the highest percentage in the "more than 10 years" time range, whereas men display the highest percentage for the other time ranges, for both length of relationship measures. Differences are statistically significant (respectively, Chi-square test = 10.073; $df = 4$, and Chi-square test = 8.702; $df = 6$ - see Table 5).

When testing the loyalty program engagement, differences based on generations are not significant (ANOVA, $p = 0.58$), whereas differences based on gender are significant; women display higher engagement than men ($t = -2.241$, sign. 0.02).

Tab. 4: Generations, LoR retailer and LoR Loyalty Program

<i>LoR retailer</i>	<i>< 1 year</i>	<i>1 to 3 years</i>	<i>3 to 5 years</i>	<i>5 to 10 years</i>	<i>> 10 years</i>
Millennials	11.2	19.8	19.1	29.2	20.7
Generation X	11.0	14.3	16.6	21.6	36.6
Baby Boomers	11.4	13.4	17.1	21.2	36.9
Silent Generation	11.8	18.8	13.5	20.0	35.9
<i>LoR LP</i>	<i>< 1 year</i>	<i>1 to 3 years</i>	<i>3 to 5 years</i>	<i>5 to 10 years</i>	<i>> 10 years</i>
Millennials	12.0	28.5	20.9	24.9	13.7
Generation X	11.9	17.6	16.1	18.5	36.0
Baby Boomers	9.6	18.3	16.1	22.8	33.2
Silent Generation	8.6	22.9	20.0	17.1	31.4

Tab. 5: Gender, LoR retailer and LoR Loyalty Program

<i>LoR retailer</i>	<i>< 1 year</i>	<i>1 to 3 years</i>	<i>3 to 5 years</i>	<i>5 to 10 years</i>	<i>> 10 years</i>
Men	11.5	14.6	18.2	25.0	30.7
Women	11.0	16.6	15.9	21.0	35.5
<i>LoR LP</i>	<i>< 1 year</i>	<i>1 to 3 years</i>	<i>3 to 5 years</i>	<i>5 to 10 years</i>	<i>> 10 years</i>
Men	11.6	19.4	19.8	21.3	27.8
Women	10.3	22.2	15.5	21.6	30.4

When it comes to rewards preferences, the scores obtained for monetary and non-monetary rewards, expressed on a scale from 1 to 7, are shown in Table 6. An overall preference for monetary rewards over non-monetary rewards is shown. Nevertheless, Millennials and Generation X's mean scores for non-monetary rewards are higher than average. The Welch test ($p = 0.002$) identifies significant differences among generations for monetary rewards. As emerging from Tamhane's T2 post-hoc, Silent Generation consumers display higher preference for monetary rewards than Millennials (0.446), Generation X (0.547) and Baby Boomers (0.553). No significant differences were identified for non-monetary rewards (ANOVA, $p = 0.66$). As for gender, no significant differences were found with reference to rewards preference. We can, however, appreciate that men and women display equal scores for monetary rewards, whereas women's preference for non-monetary rewards is above the average.

Tab. 6: Preference for rewards' nature

	Monetary rewards	Non-monetary rewards	Diff.
Millennials	5.94	4.62	1.32
Generation X	5.84	4.62	1.22
Baby Boomers	5.83	4.43	1.4
Silent Generation	6.39	4.37	2.02
Mean	5.90	4.53	
	Monetary rewards	Non-monetary rewards	Diff.
Men	5.90	4.47	1.43
Women	5.90	4.59	1.31
Mean	5.90	4.53	

Finally, consumers expressed preference for a variety of rewards, through ranking. Out of 18 alternatives, drawn from industry practices, significant differences were identified with respect to generations and four rewards: free products/services, birthday gifts, gift upon reaching tier, and special deals only for members (Table 7). According to Tamhane's T2 post-hocs:

- Baby Boomers display higher preference for free products/services than Silent Generation consumers;
- Millennials and Generation X display higher preference for birthday gifts than Silent Generation;
- Silent Generation display higher preference for gift upon reaching tier than Baby Boomers;
- Silent Generation show higher preference for special deals only for members than Millennials, Generation X and Baby Boomers.

Tab. 7: Generations and rewards preference

	Sum of square	Df	Mean squares	F	Sign.
Free products	7.494	3	2.498	2.570	0.04
Birthday gifts	7.827	3	2.609	2.573	0.05
Gift upon tier	10.270	3	3.423	2.959	0.03
Special deals	16.375	3	5.458	5.894	0.01

	(I)	(J)	(I-J)	SE	Sign.
Free products	Baby Boomers	Silent Gen.	0.342	.106	0.01
Free shipping	Millennials	Silent Gen.	0.317	.112	0.03
	Gen. X	Silent Gen.	0.292	.106	0.04
Gift upon tier	Silent Gen.	Baby Boomers	0.389	.141	0.03
Special deals	Silent Gen.	Millennials	0.534	.159	0.01
		Gen X	0.443	.157	0.01
		Baby Boomers	0.485	.156	0.01

As regards gender, differences have been found with reference to: free samples, prizes catalog, birthday gifts, special deals only for members, and the possibility to try (not purchase) new products. As follows:

- Women display higher preference for free samples ($t = -3.227, p = 0.001$), birthday gifts ($t = -2.903, p = 0.004$), and trying new products ($t = -2.228, p = 0.02$).
- Men display higher preferences for prizes catalog ($t = 3.430, p = 0.001$), and special deals only for members ($t = 3.105, p = 0.002$).

Research limitations. The study presents a few limitations, that might also represent cues for future research.

The main limitation concerns the setting in which the study has been developed. Customer preferences towards rewards of a monetary or non-monetary nature might be affected by their culture as well as industry practices in that country. It might therefore be interesting to extend and replicate the study to other countries, where offering non-monetary rewards in loyalty programs is more or less common among retailers than in Italy. On the other hand, data were collected in a period of economic and financial uncertainty for the country, when consumers were deeply concerned about high inflation rates and high energy prices. These factors might have had an impact on the overall predominant preference for monetary rewards expressed by Italian consumers.

Managerial implications. The paper offers insights for retailers as concern the design and redesign of loyalty programs. As regards generations, it has been shown that Millennials and Generation X show the highest percentage of enrollment in loyalty programs, compared to Baby Boomers and Silent Generation. As such, it makes sense for retailers to focus on their retention, and also consider working towards integrating the loyalty program with their online channels - given that Millennials are those more prone towards online adoption for purchases. Differences about channels used and length of relationship are less marked when it comes to gender; men, however, are found as more open towards online channels than women.

No significant differences have been found for monetary and non-monetary rewards, neither across generations nor across gender identities; nevertheless, Millennials, Generation X and women expressed above-the-average evaluations

for non-monetary rewards. Also, preferences towards specific rewards have been identified. Retailers interested in targeting these consumers might consider offering non-monetary alternatives in their programs, and eventually later in the relationship with the customers.

Originality of the paper. The study provides evidence about differences occurring between generational cohorts and gender identities about rewards preferences and enrollment in loyalty programs, thus integrating extant literature. On the one hand, a generational perspective on rewards preferences is offered, opening the discussion about how a generation's shared values and beliefs may affect individual choices in loyalty programs. On the other, data about how genders differ in loyalty are provided.

Keywords: Retailing; loyalty program; generational cohort theory; gender; reward nature

The gap between real and perceived sustainability inside grocery stores

MARIA GRAZIA CARDINALI* BENEDETTA GRANDI* SUSANNA GRAZIANO[▲]

Framing of the research. Nowadays sustainability is an important aspect that a retailer must include in its strategy in order to be competitive on the market (Elg and Welinder, 2022). In fact, consumers look for sustainable stores and have an higher opinion of those retailers who act as good citizens (Luo and Bhattacharya, 2006; Kim et al., 2014). Typically, the main motivations for retailers to embark on sustainable strategies are, in addition to economic profitability, environmental regulations and consumer pressure (Saber and Weber, 2019). Bekele, Bosona, Nordmark, Gebresenbet and Ljungberg (2012) highlight the importance for the company to pursue sustainable actions, especially in the food sector, in terms of social, economic and environmental sustainability (Bhattacharyya, Dash, Hewege, Balaji and Lim, 2021). In fact sustainability must be pursued by companies which have the possibility to encourage sustainable behaviours in their customers. Furthermore, sustainability can support brand trust and credibility of retailers (Elg and Welinder, 2022). In fact, it is important to involve sustainable strategies in corporate agendas and guidelines. Luo and Bhattacharya (2006) found that retailers need to implement CSR if they want to build a satisfied customer base. Corporate social responsibility (CSR) can be defined “as an organization’s ethical behavior and social obligation beyond their own financial profits” (McWilliams et al., 2006). CSR can help retailers build their reputation by giving consumers a positive image (Singh, 2016). However, CSR positively influences the performance of companies, such as sales, market share and return on investment (Margolis and Walsh, 2003; Surroca et al., 2010; Abu Bakar and Ameer, 2011; Ko et al., 2013 Saeidi et al., 2015; Chaudary et al., 2016) and enables retailers to build and maintain long-term customers relationships (Hultman and Elg, 2018; Walker et al., 2019). Yazdanifard and Mercy in 2011 conducted a research that highlighted the fact that consumer decide to visit and shop in those store that embody sustainable values, sell sustainable products and develop sustainable initiatives. The literature states that consumers are willing to pay a premium price for green and sustainable products (Yazdanifard and Mercy, 2011). Indeed, Haanpää (2007) said that the consumer’s way of life in terms of environmental attitude greatly affects consumer behaviour and, consequently, consumption and purchasing choices. However consumers give different levels of importance to CRS strategies. Mohr and colleagues (2001) identified four types of consumers. The first group comprises the pre-contemplators, who do not base their choices on CSR; the second group comprises contemplators who take into account CSR, but they don’t take action. The third group is made of action-oriented consumers, who sometimes use CSR as a purchasing criterion. Finally, we have maintainers, who always use CSR as a driver. No matter which is the level of sustainable involvement, according to a study by Su, Duong, Dinh, Nguyen-Phuoc, and Johnson (2021), if consumers recognize the retailer’s commitment to responsible strategies, there is a greater probability that they will select those store and carry out their shopping expedition. What plays a key role in the success of a retailers’ sustainable strategy is the consumer perception. The perceptions of consumers are “shaped from various sources when they obtain information about retailers’ environmental activities, including from print and social media advertisements, word-of-mouth from existing customers, or personal visits to the store” (Kumar and Polonsky, 2019). The link between what the retailer does and communicates and what the consumer perceives is mediated by two fundamental concepts: credibility and trust in the retailer. Communicating a sustainable image creates expectations in the mind of the consumers (Soppe et al., 2011) and what consumers perceive shapes their evaluation of services and offer (Kumar. and Polonsky, 2019) and, as a result, impact trust (Walker and Kent, 2013). Trust can be defined as “the willingness of a party to be vulnerable to the actions of another party based on the expectation that the other will perform a particular action important to the trustor, irrespective of the ability to monitor or control that other party” (Mayer et al., 1995, p. 712). Previous research (Luo and Bhattacharya, 2006; Cacho-Elizondo and Loussaief, 2010; Perrini et al., 2010) stated that retailer’s social responsibility efforts have a positive influence on consumer attitudes and trust. Building consumer trust is not an easy task. Moreover, consumers’ trust can be affected by several factors, like services, salesperson, product etc. (Komiak and Benbasat, 2004). In turn, trust affects consumer perceptions (Nguyen and Pervan, 2020). Indeed, not only credibility and trust influence consumer decision-making (Dawar and Parker, 1994;

DeWitt et al., 2008; Guenzi et al., 2009 Nilsson et al., 2012;), but the perception consumers have of the information they collect encourages consumers to trust the retailers' product-related information (Kumar and Polonsky, 2019). It is important to stress that not all levers of in-store marketing equally perform in terms of sustainable strategies. According to the Cue Utilization Theory, the cues and information considered are those who are readily available, easily processed and salient (that are relevant for the consumers and have a higher probability to be noticed). Since it is a matter of perceptions, consumers may not be able to correctly select the appropriate cues and perceive certain features (Gaiser, 2020). A previous research conducted by Mauri, Pacicco, Petruzzellis and Pichierri (2022) reported that the elements that consumers consider in the evaluation of the sustainable image of a retailer are low-plastic packaging, reduced plastic waste, local products and finally, because still not properly implemented in Italian retailers, the bulk products. Their research was based on levers of services, social campaign and product range. What is missing in the literature so far is an analysis that takes into account all the levers of in-store marketing.

Purpose of the paper. Given the importance of sustainable strategies, able to influence brand identity and loyalty (Anselmsson and Johansson, 2007; Park and Kim, 2016; Simões and Sebastiani, 2017) and given that customers' perceptions have a high degree of importance in assessing the retailer's sustainable behavior (Grewal and Levy, 2007; Gupta and Pirsch, 2008), it is paramount to understand which levers managed in store contribute better to the image of sustainability of retailers. Our research intends to investigate consumers' perception of sustainable strategies developed by grocery retailers in order to understand in which ways they are involved in the decision making process. The present work aims to enrich the results of previous research by considering not only assortment's strategies but also space management and green instore communication. Specifically, our work intends to answer the following research questions:

Q1 - Which is the main definition of sustainability given by consumers?

Q2 - Which strategies are developed and communicated by grocery retailers and which levers are managed inside the stores?

Q3 - Which are the levers perceived by the customers and which variables do they use to develop their own sustainable image of a store?

Q4 - Is there a gap between real and perceived sustainability?

Methodology. In order to pursue these research aims, we used qualitative methods based on focus group and store checks. Focus group discussion took place between February and March 2022 and involved 40 participants. The sample consisted of 69% women and 31% men. 38.5% were under 25, 36% were aged between 26-40 and 25.5% were aged between 41-61. A screening questionnaire was used in the recruitment process to be sure that all the participants were responsible for buying food products for themselves or their families. Participants who took part in the first phase of the study (Focus Group 1) were asked then to take part in a second step (Focus Group 2) so that we interviewed each participant twice. In the first phase we asked participants to discuss the main concepts of sustainability and sustainable strategies developed by retailers in order to understand their importance in the decision making process. At the end of the first focus group they were asked to indicate their habitual store and were invited, during their next shopping expedition in those stores, to take pictures of everything that seemed sustainable to them. Then during the second focus group they were asked to comment the pictures and to motivate them. Each discussion lasted for about one hour and a half and was sound and video recorded. Sessions have been videotaped and verbatim transcribed for the purposes of thematic analysis. Secondly, store checks were conducted. Researchers from the University of Parma of the marketing area went to the same stores visited by the participants to observe analytically all the strategies implemented. They used a systematic and structured approach for collecting and analysing data in order to compare the results with the levers perceived by shoppers and measure the gap. Our research focused the analysis on physical stores since they represent the most powerful touchpoint. As Lehner (2015) stated, the retail store is an important player in the promotion of sustainable consumption.

Results. In order to answer the first research question, focus groups participants were asked to discuss the concept of "sustainability" and the main meanings associated to it. Then, participants were invited to indicate and comment the "sustainable strategies" developed by grocery retailers they were used to visit. This second section allowed the researchers to answer the second research question. In order to analyze the data, the 'word association' tool of T-Lab has been used. Specifically the software helps identifying the words that were associated most with 'sustainability' and 'sustainable strategies', selected on the basis of their meaning and number of times they occurred (Papaleo et al., 2013). The software presents these correlations as radial diagrams with the word(s) selected at the center and all the others distributed around it at distances proportionate to their degree of association. The outputs are presented in Figure 1 and Figure 2.

Fig. 1: Sustainability's associations

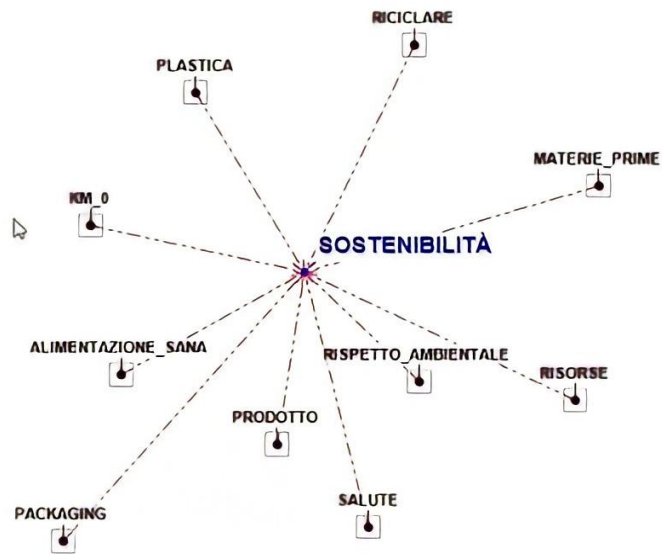

Fig. 2: Sustainable strategies' associations

The results show that the concept of sustainability has an environmental dimension since it is mainly associated with environmental respect and efficient management of the resources, but also a consumption dimension, associated with sustainable products, local products and the quality of raw materials. Furthermore, sustainability goes along with the concept of health and healthy products and the packaging (recyclable and plastic free).

Considering the sustainable strategies, it is possible to find overlap of results, given the already mentioned important role of grocery stores in shaping consumers' behaviors and choices. Thus, sustainable strategies are plastic reduction and sustainable packaging, price reduction of sustainable products, energy saving, sustainable communication, promotion and visibility of fruits and vegetables, control of the supply chain and quality of the raw materials.

The second part of the analysis tried to compare the strategy implemented in store (considering the retail mix) and the levers perceived by shoppers during their shopping. Thus, the researchers took note of all the strategies implemented in store by 10 retailers present in the Italian market and divided them into assortment strategies, communication strategies and space management strategies, considering a total of 18 levers (4 for the price and assortment, 7 for the space and 7 for the communication). The pictures provided by the participants during the second focus groups, were used to identify, among all the levers that a retailer can manage in store, those that were actually perceived by shoppers. Table 1 shows for each retailer (identified with a letter) the percentage of levers not mentioned by shoppers in the three strategic dimensions (assortment, communication and space).

Tab. 1: Strategies implemented vs strategies perceived by shoppers

RETAILER	ASSORTMENT	SPACE	COMMUNICATION
A	0,0%	0,0%	16,7%
B	16,7%	33,3%	50,0%
C	42,9%	33,3%	60,0%
D	33,3%	83,3%	28,6%
E	16,7%	50,0%	75,0%
F	16,7%	42,9%	40,0%
G	42,9%	60,0%	20,0%
H	0,0%	33,3%	83,3%
I	16,7%	0,0%	0,0%
L	16,7%	0,0%	66,7%
average	20,2%	33,6%	44,0%

The table tells us the on average, the communication strategies implemented was not fully considered and seen by shoppers to create their own sustainable image of the retailers they are used to visit. Probably, this is not because its an ineffective levers itself, but because it is not yet exploited adequately by retailers. Communication is a very powerful lever, which could serve as a real guide for shoppers in purchasing sustainable products.

On the contrary, products and assortments, in line with the results of the focus groups, are the strategies mostly mentioned and seen by shoppers. When we talk about the product, we talk about a tangible element, that is not only easier to perceive since it is consumed, but also more credible for the consumer (Elg and Welinder, 2022).

Research limitations. This research is an initial step to better understand the gap between real and perceived sustainability. However, this study has some limitation. In fact, the results are to be considered in specific urban areas, with a sample that does not allow generalization. Secondly, this research only focused on the Italian market, in particular the Northern part, which limits generalizability to other countries and sectors. Further research should focus on quantitative analysis that can statistically measure the data.

Managerial implications. In the grocery sector, being able to communicate to customers the sustainable activities developed by retailers becomes a central element of marketing strategies to positively impact brand image, brand value and store awareness (Marín-García et al., 2021). A sustainable strategy well perceived by the consumers, can give the retailers economic advantages in terms of improvements in the store image and consumer loyalty to stores (Wiese et al., 2015). The retail store has a key role in the promotion of sustainable consumption. However, retailers do not sufficiently recognize this potential (Lehner, 2015). For the retailer it is essential not only to understand how much to invest on sustainability, but also and above all on which levers to invest.. Understanding which strategies can be most effective in relation to the retailer's target must become a priority (Marín-García et al., 2022). Measuring the effectiveness of the different strategies developed and the levers managed could became a systematic practice to better allocate resources and obtain an increase in the performance.

Originality of the paper. For the purpose of the study we analyzed how shopper perceive and use not only assortment's strategies but also space management and green instore communication, in order to enrich the results of previous research. Moreover, we tried to measure the gap between strategies implemented by retailers and strategies perceived by shoppers in the food context, providing useful insight for companies that have to decide on which strategies invest in order to communicate a sustainable image on the market.

Keywords: perceived sustainability; consumer perception; CSR; grocery shopping

Grocery shopping: just a matter of time?

CHIARA MAURI* FAUSTO PACICCO* GRETA SIRACUSA[▲] LUIGI VENA** ANDREA VENEGONI**

Framing of the research. *Pandemic, war, inflation (+8% in 2022), rising costs and restrictive monetary policies: it is a combination of negative factors that puts retailers under stress. On top of this, the Italian retail market is facing several challenges, including a saturated market, a decline in population growth, an increasingly discerning and less brand loyal consumers. Furthermore, challenges include the intensification of market competition, the emergence of alternative distribution channels, the blurring of boundaries between suppliers and retailers, and the elevated bargaining power of prominent retailers.*

Focusing on physical stores, these changes has led to a progressive abandonment of large surfaces in favor of smaller sizes, with a more capillary presence throughout the territory. The new kind of stores are usually very innovative small sales outlets, which make extensive use of technology, also in support of the sales outlet staff. In detail, stores with large sales surfaces (between 1,500 and 5,000 m²) decreased by -12% in 2021 compared to the previous year (Osservatorio eCommerce B2C, Politecnico di Milano). Accordingly, some retailers such as Pam Panorama Spa and Esselunga have recently opened new outlets in strategic locations in Milan to cater to their customers' daily shopping requirements while providing a wide range of products through e-commerce (EuroMonitor, 2022a).

In this context, traditional grocery retailers offering omnichannel opportunities are expected to perform well in the near future. These retailers are also set to invest in improving their services, such as providing sustainable and healthy products and prioritizing health and safety measures, which have gained popularity during the pandemic (EuroMonitor, 2022b).

In short, the grocery retail sector, as the whole retail industry, is experiencing an important evolutionary phase in which the paradigms of competition, costumers management and location choices is rapidly changing following new rationales.

Utilitarian and hedonic shopping orientations

Numerous studies have been conducted to investigate the factors influencing consumer channel choice (Konus et al., 2014; Montoya-Weiss et al., 2003) and their multichannel behavior (Gensler et al., 2012; Konuş et al., 2008; Neslin et al., 2006). Additionally, researchers have explored the utilitarian and hedonic values that drive consumers' shopping behavior (Anderson et al., 2014). This distinction has been extended in the retail context to portray shopping as either work or a pleasurable activity (Fischer and Arnold, 1990; Bloch and Bruce, 1984). These two overarching areas represent the fundamental motivations for understanding consumer shopping orientations, as they serve as the foundation for all consumption phenomena (Babin et al., 1994).

The utilitarian shopping motives refer to the functional attributes of shopping, such as saving time and effort (Babin et al., 1994). Utilitarian and hedonic shopping motives have distinct emotional effects, depending on the consumer's consumption motivations. For instance, Anderson et al. (2014) found that the utilitarian shopping motive has a positive emotional impact in the case of time savings and ease of access to information, as it is viewed as more efficient and rational. Consumers who have utilitarian motives aim to purchase products quickly and efficiently to achieve their goals with minimal effort and avoid any stimuli that may cause irritation.

Furthermore, grocery shopping is mainly an instrumental behavior and is not intrinsically enjoyable. As such, beliefs about specific goal-oriented features of the online shopping environment have a stronger influence on attitudes and intentions to use such an environment. For example, big-box discount stores and warehouse grocery stores are designed to facilitate efficient shopping rather than to entertain and amuse shoppers as for online shopping (Childers et al., 2001).

Utilitarian factors: time-saving and location (proximity)

Regarding channel choices, consumers employ multiple channels for pragmatic reasons, such as saving time, money, and effort (Hsiao et al., 2012). Utilitarian perceived value explains usage and eventual purchases on the internet or in brick-and-mortar stores. Consumers consider brick-and-mortar stores to have the highest immediate possession value, while the internet has the best price comparison value (Noble et al., 2005). In a multichannel environment, stores are positioned on service, while the internet is positioned on search convenience, ease of information comparison, and, to a lesser extent, money savings (Verhoef et al., 2007).

Apart from saving money, the objective of saving valuable time has been consistently emphasized as significant for pragmatic shoppers who strive to maximize the efficiency of their shopping trip (Kim et al., 2014). Although consumers who favor proximity stores, such as city stores, tend to be more influenced by non-utilitarian factors, they are nevertheless attentive to the time-saving benefits of shopping in their neighborhood (Cervellon et al., 2015).

Proximity, defined as the physical distance between the consumer's home and the convenience store, has a strong influence on channel choice (Gahinet and Cliquet, 2018). Consumers are more likely to patronize convenience stores that are closer to their homes. The study suggests that the closer the convenience store is to the consumer, the more likely they are to choose it as a shopping channel. Consumers' channel choice is predominantly determined by functional proximity, however, it is also favored by consumers as they enable them to save time and organize their visits more optimally (Gahinet and Cliquet, 2018).

Consumers choose stores based on a tradeoff between time-saving, shopping convenience, and price. One-stop shopping has become prevalent due to the increasing demand for time-saving convenience, indicating that consumers value their time more.

The model suggested by Messinger and Narasimhan (1997) indicates that consumers' choice of retail format is influenced by the perceived efficiency of the format in terms of saving time during the shopping experience. They find that consumers are motivated to economize on shopping time due to their busy lifestyles and the value they place on time.

The authors recommend that retailers should adopt more efficient retail formats to reduce shopping time and they identify three retail formats: convenience stores for easy access and quick service, supermarkets and hypermarkets for a wide range of products and lower prices. In a multichannel environment, retailers could also enhance the efficiency of their retail formats by offering services such as home delivery, self-checkout, and online shopping (Messinger and Narasimhan, 1997).

Competition

There are two schools of thought regarding competitive interaction and retail structure: the first is referred to as "symbiosis", the second school of thought, instead, is named "Darwinism". The former suggest that retailers have mutually beneficial effects on one another while the latter wants that retailers fiercely compete for limited consumer dollars in a survival-of-the-fittest type of challenge. Theories supporting symbiotic relationships among retailers include multipurpose shopping (Ghosh 1986), minimum differentiation (see Brown 1989), symbiosis (cfr. Hirschman 1978 and 1979), resource partitioning (Carroll 1985), localized competition (Baum and Singh 1994; McPherson 1983), and social mutualism (Leifer 1985; White 1981; White and Eccles 1987).

Darwinists take the position that competition is a zero-sum game. Generally, it is an accepted tenet of competition that lower differentiation among businesses leads to lower prices, profits, and sales (Aaker 1992; Czepiel 1992; Kerin et al., 1990). Ingene and Lusch (1981) examine intratype competition between mom-and-pop grocery stores and full-line grocery stores. They predict that crowding out occurs because these stores offer similar product lines. Conditionally, multipurpose shopping (Ghosh 1986), resource partitioning (Carroll 1985) and localized competition (Baum and Singh 1994), reach the same conclusion.

The current scenario closely fits this second description. The proliferation of additional shopping channels presents new challenges for retailers, who have to compete in a complex environment in order to avoid the issue of consumer crosschannel free riding (Pantano and Viassone, 2015). Hence, retailers face new challenges to successfully compete in the emergent scenario (Neslin et al., 2006).

Ellickson et al. (2020) argue that competition between retailers is due to consumer preferences and trade-offs between store features (such as assortment, amenities, and prices) and travel distance. The authors suggest that measuring competition requires identifying the relevant consumer choice set, accounting for overlap in ownership across products, and estimating the degree of substitution between the relevant options.

Purpose of the paper. This paper tries to shed light on all these features by providing a comprehensive assessment of the structure, competitiveness and consumer behavior of the Lombardy region's grocery retail sector.

Indeed, The choice of physical retail channel is influenced by a multitude of factors, including product quality and ethical values, as well as utilitarian motivations (e.g., time-saving, location, proximity to the retailer). Understanding the impact of these motivations on consumer choices is crucial for retailers aiming to attract and retain customers.

According to EuroMonitor, the opening and relocation of retail stores to city centers are driven by the increasing demand for convenience and proximity to consumers. However, declining demographics in Italy set a challenge for retailers, as they have to compete for the same marketplaces and consumers. This has resulted in increased competition among retailers, who are striving to differentiate themselves from their competitors and offer unique value propositions to their customers.

In this context, the dynamics of competition among retailers are changing and retailers need to understand the interplay between utilitarian and hedonic shopping motivations to ensure customer satisfaction.

Based on these insights, the following research questions may be relevant for an academic retail marketing paper:

- (1) How do utilitarian (such as time-saving, location, and proximity) and hedonic shopping orientations (such as emotional connections and brand values) impact consumer choices in the context of physical retail channels?
- (2) How are retailers adapting their strategies to the changing dynamics of competition?
- (3) Can we still talk about retail loyalty?

Methodology. Given that the aim of this paper is to answer a threefold research question we have to apply a diversified empirical strategy able to tackle all the different issues we want to address.

As first, in order to investigate which shopping orientation impact the most on consumer choices in the context of physical grocery retail stores, we have resorted to a survey approach which consists of a questionnaire submitted both physically and online to a sample of over 2.000 retail consumers to explore their purchasing patterns, their expenditure, their consuming behavior and their shopping orientations.

Then, to assess how retailers are changing their location strategies and how competition is evolving in the grocery retail industry we provide a measure of the overlap rate of retailers in the major cities in Lombardy and investigate the possible substitution patterns between different physical stores by the same consumer. To do this we resort to a model of spatial demand, that can provide measures of both substitution patterns and competitive pressures (cfr. Ellickson et al., 2020 and Cervellon et al., 2015).

This model allow to estimate the complex spatial interrelations within and/or between stores of the same and/or different group, therefore depicting a more interesting and relevant picture of the contemporary competitive scenario.

Results.

Fig. 1: Relevance of shopping orientation factors obtained from survey answers.
Likert scale from 1 (not important) to 7 (very important)

As can be noticed from Figure 1, distance and accessibility are the predominant elements in determining the choice of stores to go to. On this basis, consumer loyalty tends to fade and to leave space to proximity, accessibility and time-to-shop, which become the key drivers of consumers' choices about the stores in which to shop.

These is reflected in the competitive dynamics traceable for grocery retail stores in the main Lombardy region cities. As it is described by Table 1, there is a high concentration of grocery stores in urban areas, with the closes grocery store that is, on average within 2 minutes and a half by foot and 1 minute and a half by car from consumer's home, leading to

Tab. 1: Average times (in seconds) to reach the nearest point of sale by car or on foot, by province and by type of sales point and in general (Total). SUP stands for supermarkets, IPR for Ipermarkets, LIS for sales area and DIS for discount

Municipality	By Foot					By Car				
	SUP	IPR	LIS	DIS	TOT	SUP	IPR	LIS	DIS	TOT
Bergamo	127	127	102	175	139	42	34	80	50	52
Brescia	159	171	236	164	171	80	71	78	48	67
Como	150	257	181	192	186	37	94	50	104	63
Cremona	211	102	122	200	176	100	52	17	48	60
Lecco	313	84	75	246	225	61	177	25	118	100
Lodi	102	1224	201	101	243	126	191	72	37	89
Mantova	90	157	-	449	219	16	52	-	119	55
Milano	93	189	74	117	94	66	74	73	69	70
Monza	139	200	138	344	184	42	128	40	201	84
Pavia	411	227	132	161	234	110	74	35	31	61
Sondrio	217	-	123	135	158	42	-	62	32	52
Varese	110	100	90	90	101	42	72	133	17	51
Average	126	206	89	160	129	65	81	70	66	68

To further confirm the concentration phenomenon, Table 2 shows that within a “radius” of 10 minutes on foot, the number of points of sale is on average 4 with a peak of 6 in the city of Milan. Moving by car, these figures increase to 62 (within 10 minutes) and 216 (within 20 minutes) with a peak of almost 400 in the city of Milan.

Tab. 2: Average number of points of sale in the three isochrones equal to 10 minutes on foot, 10 minutes by car and 20 minutes by car

Municipality	By foot	By car	
	10 minutes	10 minutes	20 minutes
Bergamo	2	43	143
Brescia	2	39	117
Como	1	21	72
Cremona	2	26	35
Lecco	1	17	40
Lodi	2	24	46
Mantova	1	19	38
Milano	6	105	384
Monza	2	64	324
Pavia	2	26	51
Sondrio	4	17	30
Varese	1	24	74
Average	4	62	216

Research limitations. The results obtained from the paper analysis represents a “screenshot” of single moment in time (albeit an actual one) within a single region. Therefore, it could be interesting to test how these results compare to other analysis in different moments and/or different regions/country.

Managerial implications. The study presents an overview of the current Italian grocery retail market, where people are facing time constraints and have limited time to spend on grocery shopping. To address this issue, large-scale retailers are opening more stores in city centers, providing consumers with easier access to quality products, and catering to their need for time-saving. In addition to offering complete product assortments, retailers are increasingly investing in e-commerce and multichannel retailing, which enable them to bring the store to the customers, delivering products right to their doorstep, thus fulfilling the need for convenience.

This trend is causing a shift in the competition among retailers, as they are cannibalizing each other by opening stores in the same areas, and customers are becoming less loyal to a particular retail store. To measure this competition, the authors developed a retail competitiveness index that helps to identify substitution patterns and assess the level of competitive retail pressure.

The convenience factor has become an essential component of modern retail, and retailers are leveraging technological advancements to cater to the ever-changing consumer preferences. The availability of online and mobile channels is allowing retailers to interact with customers on a 24/7 basis, offering them greater flexibility in terms of product availability and purchase options, but also increasing competition in the retail industry.

This new competition dynamic among retailers is characterized by a focus on proximity to customers and a need to provide greater convenience, as consumers have less time to spend on grocery shopping.

Retailers’ efforts to be closer to their customers, both physically and virtually, are key to their success in the current competitive landscape.

Originality of the paper. This paper represents one of the first attempt to investigate how the retailers’ landscape in a highly competitive region has been shaped by the concurrent shopping practices, by using a two-fold approach that combines a survey and a desk-analysis of geo-referenced data.

Therefore, it allows to take into account how such a complex phenomenon of contemporary shopping orientations are influenced by multiple perspectives.

This is a very relevant point of view for managers as well, as it allows to navigate between within a highly “dense” scenario, focusing their efforts toward what consumers perceive as important within their choices, and not only the mere “physical” presence of stores.

Keywords: Grocery retailer; Lombardy; Shopping orientation; Utilitarian and Edonistic orientations

The Metaverse phenomenon: a first approach based on bibliometric analysis

SIMONE AIOLFI* BEATRICE LUCERI• MARTA BARATTIN^ SABRINA LATUSI**

Abstract

The metaverse is a very recent and still developing technology, and despite the skepticism of many, an increasing number of companies are investing in it; it is estimated that profits from the Metaverse market will grow exponentially in the years to come. However, as often happens in the face of phenomena still in the phase of innovation or early adoption, the increase in interest in the issue hardly corresponds to a real clarity of vision on the direction, timing and fate of the phenomenon itself. The metaverse could be the next flop or the next technological revolution. The outlines of the great project are still poorly defined, and it remains to be understood how it will be welcomed by those who in theory should populate it. Therefore, we need to look more closely at the direction and evolution of the phenomenon as well as to the interest of businesses and consumer perceptions. What we present is the first step of an ongoing research on businesses and consumer perceptions and interests in the adoption of this new technology. In order to analyze the literature produced so far on the topic of the metaverse, a quantitative approach based on bibliometric analysis has been adopted. 484 contributions from Web of Science were selected for the systematic review of the existing literature on the metaverse and analyzed with the open source bibliometric software VOSviewer in terms of performance analysis, clustering, evolution of the topic, focus of the contributions. The results suggest that despite being relatively new, the metaverse has been fairly discussed under different perspectives in the literature. Regardless of the coverage the topic has received in the last few years, though, it is important to stress that the metaverse is constantly changing and evolving and that the opportunities it creates are still to be classified. Thus, it is possible to expect an increasing number of studies on the topic and so several future research directions, both toward the theoretical development of the phenomenon and the practical use of it.

Framing of the research. *From artificial intelligence to augmented reality, from virtual reality to mixed reality, from cryptocurrencies to the Non Fungible Tokens (NFT), the virtual world is experiencing a period of extraordinary excitement and change. If it is true that changes in marketing go together with technological changes, then it becomes necessary to focus on one of the current technological innovations, the further development of which will surely have a growing impact on the world of digital marketing: the metaverse.*

The word 'metaverse' was coined in 1922 by Neal Stephenson in a science fiction book (Snow Crash), where the metaverse is described as a sort of virtual reality shared through the Internet where users, through their avatar, can move on an immense black sphere on which they can realize in 3D what they want.

What was just an abstract concept was first developed with video games and then by firms in several sectors (Kim, 2021). As technology evolved, several definitions emerged in the literature. Thus, more recently, Ball (2022) defined the metaverse as "a massively scaled and interoperable network of real-time 3D virtual worlds in which users can experience synchronously and persistently with unlimited numbers of other users, and with continuity of data such as identity, entitlements, objects, communications and payments".

The common idea is that the metaverse is a 3D digital virtual world that goes beyond the real universe (META= beyond; VERSE= universe) inhabited by digital human replicas (avatars). Thanks to the avatars, users can move and interact in three-dimensional spaces with a psychological and emotional involvement resulting from the use of sight, hearing and touch (Dionisio et al., 2013). In this new world people will be able to carry out multiple activities: meeting with friends, working, shopping, building social and emotional relationships, attending concerts, meetings and events, and much more.

Although the metaverse is still an ongoing project, its first features begin to emerge (Bratu and Sabău, 2022; Hwang and Chien, 2022; Ng, 2022; Reyes, 2020): a) digital nature: it includes any digital experience on the Internet that is persistent, immersive, three-dimensional (3D) and virtual resulting in a digital world that everyone can access, using virtual reality, augmented reality or video game platforms; b) global and decentralized: its matter is composed of data and information, it does not bear geographical or jurisdictional boundaries and its structure is space-time; c) high degree of immersion and interactivity: the interaction between physical reality and virtual reality allows users to interact and communicate with others thanks to the developed technologies that facilitate a dynamic learning scenario of autonomous and collaborative learning; d) corporeity: users, using avatars, move freely in three-dimensional spaces and can live virtual experiences; e) continuous connection and interoperability: the metaverse is a virtual world that mimics real-world settings where digital content can be saved and retrieved even when reconnected to the virtual world thanks to artificial intelligence and machine learning technologies that can manage and regulate the use of metaverse; f) the metaverse is a shared technical structure, not owned by companies, where virtual spaces can be created by the users themselves who make them available to other users g) in the metaverse users can use Non-Fungible Tokens (NFTs) – digital property certificates that documented the unique ownership by the user of a digital product not fungible, such as images, videos, music and other objects (Nadini et al., 2021). NFTs are stored on the Blockchain, a decentralized digital registry, through which users validate transactions made (Bodkhe et al., 2020)

To sum up, we are only at the beginning of a phenomenon that will impact the digital transformation proposing new economic, cultural, managerial, social and organizational models. To date, it is difficult to predict its development and to understand how the possible preference of people for physical reality over virtual reality will affect its concrete applications. What is certain is that the metaverse concerns and will affect different aspects of our way of living and working: thanks to it, for the first time, technology offers everyone the opportunity to create their own three-dimensional virtual worlds, populate them with creativity and explore a reality open to art, services, collaboration and communication, generating increasing investments by companies in the digital future (Dwivedi et al., 2022).

Purpose of the paper. The metaverse is a very recent and still developing technology, and despite the skepticism of many, an increasing number of companies are investing in it; it is estimated that profits from the Metaverse market will grow exponentially in the years to come. According to Statista (2022a), the global metaverse market size is expected to rise to 678.8 billion U.S. dollars by 2030. Although these technologies have not yet reached their full potential, the first changes in the way companies communicate with target users have already begun to occur, and it is therefore necessary to follow the further development of this area.

However, as often happens in the face of phenomena still in the phase of innovation or early adoption, the increase in interest in the issue hardly corresponds to a real clarity of vision on the direction, timing and fate of the phenomenon itself. The metaverse could be the next flop (what we can call 'metacrash') or the next technological revolution. The outlines of the great project are still poorly defined, and it remains to be understood how it will be welcomed by those who in theory should populate it. Therefore, we need to look more closely at the direction and evolution of the phenomenon as well as businesses and consumer perceptions and interests in the adoption of this new technology.

From a managerial point of view, 67% of companies believe that the Metaverse will enter the phase of full success within the next 5 years thus representing the future for their company, a new field full of opportunities or a new way of doing business and interacting with the market (Statista, 2022b). According to a recent research (Osservatori.Net, 2023), the majority of investments in metaverse concern Retail (30%) and Entertainment (30%) followed by IT (17%), Finance and Insurtech (9%) and Food & Beverage (5%). In the retail sector the big brands of fashion and luxury lead the metaverse, opening their stores in the metaverse virtual worlds. The Osservatori.Net (2023) identified 141 existing virtual worlds, populated by the avatars of hundreds of millions of people, with different rules, features and business models. Among these, only the 44% (62 platforms) is already 'metaverse ready': freely accessible by anyone, persistent, economically active, equipped with 3D graphics, with interoperability components that would allow to use digital assets in a cross-platform way. It should be noted that 84% of the projects were developed on the most famous platforms of 'The Sandbox' (43%), 'Decentraland' (23%) and 'Roblox' (15%), demonstrating that companies prefer to launch initiatives within the more known and mature worlds (Osservatori.Net, 2023). However, not all the companies are in favor of this new technology. According to a recent study by Statista (2022c), more than 38 percent of companies that have already invested in the metaverse were most concerned about cyber security in the new digital environment and a further quarter of respondents were doubtful of the metaverse being a long-lasting trend. The Covid-19 pandemic has led many skeptics to test, out of curiosity and entertainment, some virtual worlds, such as 'Fortnite' or 'Roblox'. However, it remains to be seen whether this trend will continue in the near future. Currently, it is still difficult to predict whether we are facing a revolution like the advent of the Internet or at least the spread of social media, or whether it is a bubble ('metacrash'): as always, it is the rate of acceptance that determines the success or failure of any innovation.

From a consumer perspective, the latest surveys by Statista (2022d) show that 74% of respondents in the United States have a desire to participate personally in the Metaverse in the next future. Specifically, the main reason to join the metaverse was to experience things they couldn't do in physical reality (44%), followed by the opinion that the metaverse could be a positive way to unite people (38%) and the desire to become a different person other than their real self (23%) (Statista, 2022d). Despite these positive numbers, many people point to potential ethical problems; according to a research by PCMag UK (2012), almost 77% of individuals believe that the metaverse can cause serious harm to modern society: respondents perceive addiction to a simulated reality (47%), privacy issues (41%), and mental health issues (41%) as the biggest perils of the metaverse. According to some, the Metaverse would drastically reduce physical interactions and daily activities, thus causing potential negative psychological effects (Dwivedi et al., 2021). In

addition, a large part of the world's population highlights dangers related to the violation of privacy, wondering how many and what data will be required by users to ensure access to the Metaverse (Dwivedi et al., 2021).

From the academic point of view, metaverse is already a fast-growing area of research that has attracted interest from several different disciplines. Scholars have started to conceptualize and define the metaverse and its attributes in order to understand how it can transform marketing and business activities. Recently, several top journals (i.e., *Journal of Retailing, Psychology & Marketing*) have proposed calls for papers in the marketing, retailing, brand areas. Specifically, several special issues aim at stimulating further interdisciplinary research and development in order to explore a new phenomenon that can contribute to the further development of the literature in several disciplines. Recent works that offer valuable theoretical and practical insights into business and social opportunities and challenges have emerged in academic literature (Dwivedi et al., 2021).

However, since new exciting metaverse implementations are expected soon and the use of metaverse is expected to disrupt the way people interact in the virtual world, it is crucial to understand prior research in academic literature: theory and theoretical developments are essential for understanding how research progresses, knowledge accumulates and research fields evolve over time. Considering the above, the research we present in this paper is proposed as the first investigation of a wider ongoing research on the phenomenon of the adoption of the metaverse among firms and users. Specifically, we aim to develop a synthesis of both theoretical and early empirical research on the topic and to conduct a mapping of the scientific knowledge on the metaverse that will then offer practical value and trigger new research questions concerning novel opportunities and challenges the virtual worlds can present.

Methodology. In order to analyze the literature produced so far on the topic of the metaverse, an approach based on bibliometric analysis has been adopted. This methodology of analysis allows a systematic and orderly review of the existing literature on the topic analyzed and can be divided into two macro-areas: performance analysis and scientific mapping analysis (SMA) (Noyons et al., 1999; Gutiérrez-Salcedo et al., 2018).

The performance analysis was carried out using the online database Web of Science (WOS) which allowed, through the use of bibliometric indexes based on citations and publication data, to evaluate from a descriptive point of view the characteristics of the contributions (e.g. types, journals, citations, country) (Narin and Hamilton, 1996); the scientific mapping was realized, in a first phase, only with the open source bibliometric software VOSviewer version 1.6.19. VOSviewer is a software tool for constructing and visualizing bibliometric networks (Van Eck and Waltman, 2010). Using this software, it is possible to identify, through a content analysis, the structural and evolutionary aspect of the metaverse (Van Eck and Waltman, 2010). Specifically, the VOS mapping technique aims to define clusters to be further analyzed: each term is assigned to a cluster in a two-dimensional space where terms that do not have a strong relation further away from each other, while terms that are assigned to the same cluster often co-occur in publications and tend to be strongly related to each other.

Before proceeding with the bibliometric analysis, we first identified relevant publications in the Web of Science (WoS) bibliographic database. To identify publications related to metaverse, we selected all publications in the WoS database in the period 1985-2022 and the data collection stopped at 31 December 2022. In particular, the research of scientific contributions was carried out using a precise query that also included the type of contribution requested and the research areas within which to search for compatible documents. The final query was as follows: (metavers*) (Topic) and English (Language) and Articles or Proceedings Papers or Book Chapters or Early Access (Document Types). Contributions were also requested in multidisciplinary databases such as Social Science Citation Index (SSCI), Science Citation Index Expanded (SCI-Expanded), Emerging Sources Citation Index (ESCI) and A&HCI, CPCI-S and CPCI-SSH. From the identification of 576 total publications, following further skimming based on the topic treated, 484 contributions were selected for the bibliometric analysis.

Results. The study results unfold in the description of the systematic bibliometric analysis on the topic of the metaverse. This systematic bibliometric analysis structure expands in the following dimensions: performance analysis, clustering, evolution of the topic, focus of the contributions.

Performance Analysis

Starting the descriptive analysis from scientific productivity, Figure 1 shows that there has been a significant increase in academic interest in metaverse issues since 2012, with a first peak in 2017 until further growth in the following years that sees a sudden increase in the number of publications between 2021 and 2022 with 319 contributions, equal to 66% of the total. Concerning scientific productivity among countries, China is on the lead with 102 publications (equal to 21.1% of the total), followed by the United States with 86 publications (equal to 17.8% of the total). Taken together, the productions of the two nations account for more than a third of the total contributions published in the period under review. In third place we find South Korea (64 publications), followed by England (43 publications), Germany (23 publications). Italy accounts for 22 publications, the same for Brazil.

Fig. 1: Times cited and publications over time

Source: our elaboration from WOS

Table 1 shows the top ten most cited articles published in the period 1985-2022. This is a particularly useful analysis as it allows us to understand the influence of publications in the scientific community.

Oliver et al. (2012) are the most cited authors, both on the total of the period (since it is among the contributions published for the longest time) and as an annual average of citations. In this work, the authors study how virtual worlds can be used to support experiential learning and to promote cultural heritage.

Following, albeit with a significantly large gap in the number of citations, the study by Davis et al. (2009) that develops a model of an in-depth characterization of metaverse technology capabilities from a socio-technical view that recognizes the potential for variation in emergent interaction and in outcomes, and the study by Dionisio et al. (2013) in which the authors analyzed the metaverse progress in four areas: immersive realism, ubiquity of access and identity, interoperability, and scalability.

Tab. 1: Citation analysis

Title	Authors	Year of publication	N° citations 1985-2022	Average annual citations
Mongoose: Throughput Redistributing Virtual World	Oliver I.; Miller A. and Allison C.	2012	1,333	111.08
Avatars, People, and Virtual Worlds: Foundations for Research in Metaverses	Davis A.; Khazanchi D.; (...); Owens D.	2009	141	9.4
3D Virtual Worlds and the Metaverse: Current Status and Future Possibilities	Dionisio J.D.N.; Burns W.G. and Gilbert R.	2013	125	11.36
A Metaverse: Taxonomy, Components, Applications, and Open Challenges	Park SM and Kim YG	2022	89	44.5
Making real money in virtual worlds: MMORPGs and emerging business opportunities, challenges and ethical implications in metaverses	Papagiannidis S.; Bourlakis M. and Li F.	2008	76	4.75
Second Life and the new generation of virtual worlds	Kumar S.; Chhugani J.; (...); Kim Y.M.	2008	66	4.13
Introduction: Virtual, Augmented, and Mixed Realities in Education	Dede C.J.; Jacobson J. and Richards J.	2017	52	7.43
Educational applications of metaverse: possibilities and limitations	Kye B.; Han N.; (...); Jo S.	2021	51	17
Metaverse beyond the hype: Multidisciplinary perspectives on emerging challenges, opportunities, and agenda for research, practice and policy	Dwivedi Y.K.; Hughes L.; (...); Wamba S.F.	2022	46	23
Retail spatial evolution: paving the way from traditional to metaverse retailing	Bourlakis M.; Papagiannidis S. and Li F.	2009	46	3.07

Source: our elaboration from WOS

Table 2 shows the top ten of the research areas to which contributions pertain. Specifically, the majority of the publications pertain to computer science (195 contributions, equal to 40,3% of the total), followed by engineering (126 contributions, equal to 26.1% of the total) and, with a large gap, business economics (47 contributions, equal to 9.8% of the total).

Tab. 2: Citation analysis

Research Area	N° contributions	% of 483
Computer Science	195	40.373
Engineering	126	26.087
Business Economics	47	9.731
Telecommunications	41	8.489
Psychology	33	6.832
Science Technology Other Topics	32	6.625
Education Educational Research	30	6.211
Materials Science	23	4.762
Chemistry	22	4.555
Communication	19	3.934

Clustering

In order to understand the connections between different topics, the first step to be developed using VOSviewer is the network visualization map. Thanks to the network visualization, the items are depicted as colorful dots of different dimensions: while the size of the dot represents the frequency of the topic's appearance in the documents – the larger the dot, the more frequent the item –, the color of the dot represents the belonging of the item to a certain thematic or social cluster. Moreover, the colorful threads in the network visualization represent the most frequent co-occurrence of terms.

As noted in Figure 2, our analysis reveals that the most frequent items are: metaverse, virtual reality, virtual words, blockchain.

The analysis also reveals seven main clusters referred to the hard and soft dimensions of the metaverse. The hard dimension refers to the technological side and pertains to three clusters: (a) the blue one, that covers the topic of designing the metaverse and addresses the elements needed to develop it (such as environment design, deep learning, framework); (b) the orange one, focused on the connection between metaverse and virtual reality: it covers topics such as virtual reality and extended reality; (c) the red one, focused on the connection between metaverse and technology, covers topics such as blockchain, avatars, artificial intelligence, cryptocurrency; this cluster is rich in the technological elements that make the metaverse possible and the experience richer. The soft dimension refers to the applications of the metaverse and includes four clusters: (d) the light blue one concerning the connection between metaverse and Meta (formerly the Facebook company): as Meta declared the company commitment to developing a metaverse, this cluster focuses on the main topics it had to address and the technology it'll use (ex. privacy, VR); (e) the purple one covers the relationship between metaverse and experience: it covers topics such as mixed reality, telepresence, environments, and is focused on the mixed experience that one can have in the metaverse, living its environments and interacting with them; (f) the yellow cluster focuses on the relationship between metaverse and education: in the cluster, the focal points addressed are the educational opportunities the metaverse offers in different areas; (g) the green one is specific to the link between metaverse and virtual world: in this cluster the focus is on the performance one can have in the metaverse (diving in the simulation with his/her digital twin).

Fig. 2: Network visualization map

Source: VOSviewer

As noted in Figure 5, according to the cluster density map: a) in the Metaverse and technology (red) cluster, the focus is mainly on blockchain and artificial intelligence topics rather than NFT and gamification; b) in the Metaverse and virtual reality (orange) cluster, the focus is mainly on virtual reality topics rather than emotions; c) in the Metaverse and Meta (light blue) cluster, the focus is equally distributed around the topics; d) in the Metaverse and experience (purple) cluster, the focus is mainly on experience rather than e-commerce; e) in the Metaverse and education (yellow) cluster, the focus is mainly on education and avatars rather than acceptance; f) in the Metaverse and virtual world (green) cluster, the focus is mainly on virtual world and second life topics rather than the self and e-learning; g) in the Metaverse and design (blue) cluster, the focus is equally distributed around the issues. As the overlay visualization map reveals how frequent an item is in the literature, it is fairly possible to say that areas that are less dense represent topics that should be further explored by researchers.

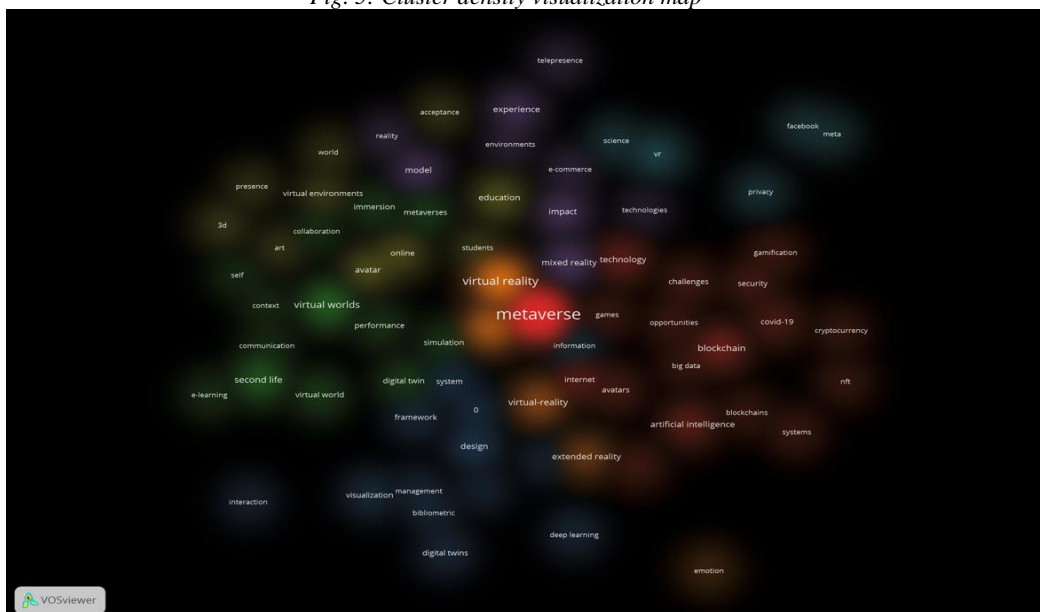

The results of the bibliometric analysis suggest that despite being relatively new, the metaverse theme has been fairly discussed under different perspectives in the literature. Regardless of the coverage the topic has received in the last few years, though, it is important to stress that the metaverse is constantly changing and evolving and that the opportunities it creates are still to be classified. Thus, it is possible to expect an increasing number of studies on the topic, both toward the theoretical development of the phenomenon and the empirical use of it.

Research limitations. *The study is not without limitations. First of all, the paper focuses on the bibliometric data, not gathering inputs from companies nor including their perspectives to develop theoretical and managerial implications. Then, even though Web of Science is considered one of the most reliable publications databases for most researchers, some relevant papers might not be included and/or might be overlooked. Moreover, VosViewer does not allow an analysis of the emerging topics or the evolution of the themes. Other software – such as SciMAT – should be used for these. For further research we aim to integrate the present analysis with the scientific mapping analysis through SciMAT.*

Managerial implications. *The present paper offers several theoretical and practical implications. At a theoretical level, the bibliometric analysis suggests the need for additional research on the metaverse and on other relatively new and complex topics such as the technological features that characterize it. Literature has focused on both the description of the technology used by and in the metaverse (hard dimension of the metaverse) and its applications (soft dimension of the metaverse). Seemingly disruptive, metaverse is based on long-standing technologies that are nowadays enriched with innovative tools coming from the recent innovation on AI-based technologies. Therefore, there is the need to update the knowledge on the topic in order to develop an organic vision on this new world and understand its potential applications in several industries.*

At practical level the paper gives useful insights to all the actors, such as companies from different industries, that are currently interested in entering the metaverse in order to increment their profits and create new and stronger relationships with their consumers. Showcasing the absence of the marketing applications, this paper proves that the metaverse implications for business are still to be clarified, if they really exist. There is a significant need to understand if and how the metaverse could be included in the value chains of manufacturers and retailers and if and how it can create real value.

According to our research, it is currently necessary to focus on the opportunities and threats that are metaverse related and to understand if metaverse could be a disruptive phenomenon able to impact on business activities, or whether companies are just managing a new phenomenon that we can call ‘meta-washing’ (which recalls the concept of ‘greenwashing’), a form of communication strategy aimed at building a misleadingly positive image of the firm as metaverse-ready company although the firm actually does not effectively and completely implement the metaverse technologies in his business strategies.

Originality of the paper. *The paper gives an overview of the contents the literature has produced over the topic of the metaverse. To the best of our knowledge, the present study is the first to produce a bibliometric analysis on such topic using the VOSviewer software. Moreover, the utility of the paper lays on the fact that this bibliometric analysis allows to early organize the literature on the topic and to ease the future research directions. As previously stated, the literature analysis highlights the current gap in marketing impact and strategies of the metaverse, that demands a further investigation. What we have presented is only the first step of an ongoing research on businesses and consumer perceptions and interests in the adoption of this new technology. The topic needs to be deepened in order to define the rate of acceptance among companies and consumers that predict its development and let scholars understand how the possible preference of people for virtual reality over physical reality (or viceversa) will affect its concrete applications.*

Artificial Intelligence robots in social groups: an extension of the AIDUA model

GIOVANNA DEL GAUDIO[•] VALENTINA DELLA CORTE^{*}
 FABIANA SEPE[▲] SIMONE LUONGO^{**} ENRICO DI TARANTO^{***}

Framing of the research. *The ageing population has grown significantly over the last thirty years. In 2019, the number of individuals who are 65 years old or older has surpassed 700 million and it is expected to double by 2050 (United Nations, 2019). The quantitative growth of ageing population also corresponds to changes in the needs of elderly, in demographic and economic profiles determining different behavioral patterns (Guido et al., 2020). This is what Barusch (2013) defines as “grey tsunami” indicating, with this metaphor, the dispute with the classic stereotypes that conceive the elderly as static, sick and unwilling to spend instead of people asking for wider life expectancy and wellbeing. These requests constitute the practical needs to satisfy. In this context, senior living facilities offering health, clinical, social, daily routines services (Figure 1) should be able to differentiate themselves from competitors enabling end users to live a real and positive experience (Johs-Artisensi et al., 2021).*

Fig. 1: Senior living facilities services

Services	Author/s
Clinical services	Clinical screening (Gnanasambantham et al, 2020) Fall risk screen (Norman et al, 2020) Infection prevention (Shaban et al, 2020) Management of agitation (Watson and Hatcher, 2020)
Daily routines support services	Eating (Maluf et al, 2020) Medication support (Sluggett et al, 2020) Sit-to-stand activity (Kagwa et al, 2020) Oral Hygiene support (Steinmassl et al. 2020)
Healthcare services	Rehabilitation (Mitchell et al, 2020; Simonov and Delconte, 2015; Muhm et al, 2016) Treatment management (Kurch-Bek et al, 2018) End-of-life care (Kong et al, 2017) Avoidance hospital (Shepperd et al, 2016) Mental illness support (Bousa et al, 2016) Disease prevention (MacIntyre et al, 2016)
Social services	Spiritual services (Suchomelova, 2018) Social Vulnerability (Khaksar et al, 2016) Loneliness and Life Satisfaction (Bergefurt et al, 2019; Gmage et al, 2018) Social interaction and relationships (Thomas et al, 2013; Yu et al, 2019)

Purpose of the paper. *The aim of this paper is to investigate the potentiality of the use of Artificial Intelligence (AI) robots in social groups and specifically the antecedents that impact on either senior citizens' willingness or objection to use Artificial Intelligence robots. Knowledge about elderly needs may help to find solutions satisfying the most disparate requests in healthcare. These solutions have to be affordable for everyone. Indeed, accessibility in terms of price, availability and easy-to-use is of fundamental importance to offer equal opportunity (Wang et al., 2010). However, due to the presence of some barriers, healthcare services and products have represented and, in some cases, still represent a mismatch between supply and demand. This is a significant challenge for managers of senior living facilities. Managers are facing problems like labor shortages and increasing cost of labor in healthcare. Firstly, labor shortage of doctors and nurses is a global issue. High turnover level (Tao and McRoy, 2015), constant retirement of*

medical staff and fewer entrance (Omachonu, and Einspruch, 2010) lower availability of skilled workers in specialized fields of healthcare (Scheffler et al., 2009) represent the main critical points of labor shortage. Secondly, there is the payroll growth of high labor cost of human resources (Cooke and Bartram, 2015), whose work is high knowledge and experience-based and whose outcomes are measured through the performance of care as well as the satisfaction of the elderly patients and the staff members. Thirdly, what appears to be common across countries are the strategies of restraint in the field of public healthcare. This has led to alternative models that marked the transition from a more state-sponsored to a customer satisfaction-oriented model where orientation is towards market (Cooke and Bartram, 2015). They represent the real challenges in this sector and at the same time the impetus for innovation. The approach on satisfaction-oriented model puts the elderly in a central position and the patient experience assumes a key role. The terms hospitality and experience (Johs-Artisensi et al., 2021) constitute an axiom in the actual context of senior living facilities. Managers today have to solve dilemmas about cost of labor while focusing on the elderly satisfaction. Consistent with the expansion of ageing population and the high costs in healthcare, growing attention has been paid to AI in the last two decades (Yang et al., 2020), due to the awareness of healthy lives and well-being at all ages (United Nations, 2019) and to the digital transformation in this field. AI in healthcare has found its attention by the researchers of medical community in order to find real-life implementation and consequent benefits for older population. For example, the humanoid robot NAO (58 cm tall) interacts with seniors, speaking, singing, and dancing since it recognizes subjects and shapes (Pino et al., 2020). Zora, another humanoid robot, has two speakers, several microphones, and a camera to scan and identify shapes and it is able of many things, from demonstrating gymnastic exercises to sing elderly's favorite songs (Melkas et al., 2020). They are supportive for memory-training programs (Pino et al., 2020), for rehabilitation (Melkas et al., 2020). Nowadays, the use of AI in the field of healthcare covers different domains, such as daily physical, cognitive, psychological, and social activities that are expressions of specific elderly's needs from eating and medicine administration to cognitive exercises and mood (Vercelli et al., 2018). Existing literature on the topic of AI in healthcare for aging people (Pino et al., 2020) has been explored according to different perspectives. Given the variety not only of the actors (doctors, caregivers, nurses, family members, elderly, etc.) but also of the scenarios (hospitals, nursing homes, specialized centers, residential aged, etc.), this paper focuses on senior living facilities and retirement communities. Within these contexts, literature has paid the attention on the role of nursing in supporting elderly in using smart technologies (Fritz and Dermody, 2019), on the importance of the phase of diagnosis and treatment making (Graham et al., 2020). Another important focus is on the phase of monitoring since AI tools allow to observe if there are changes in physical or cognitive state and, consequently, to directly act according to the status of health. Indeed, literature covers the union between AI technologies and different actors of the process right from the beginning (i.e., analysis, diagnosis making, etc.) till the end when the older person uses the AI robots. It is at this step and, precisely, in what precedes the use or rejection that our paper focuses on. This clear cornerstone relates to the belief that there is room for improvements linked not so much to the willingness to use but rather to the antecedents that lead to rejection. Paradoxically it is all this focus on the technological component, either conceived as barrier or competence, that represents the real gap in literature. Indeed, the premises at the base of AI are of easy-to-use and versatility (Hansen et al., 2020) and smart features, such as hands free, mark these robots (McLean and Osei-Frimpon, 2019). This means that although these works explore user acceptance within AI context, the used variables relate to older technologies. To fill this research gap, we aim to investigate what can be the antecedents that can have impact on either willingness or objection to use of AI robots. Starting from the above-mentioned assumptions, the following research questions come out:

- 1) What are the antecedents of elderly acceptance of AI robots in the context of senior living facilities?
- 2) What are the antecedents that inhibit the use and, therefore, act on the rejection of AI robots in the context of senior living facilities?
- 3) What role does each antecedent play in accepting or rejecting AI robots in the context of senior living facilities?

Methodology. The topic of willingness to accept the use of AI has been analyzed in literature using different theoretical models, such as norm activation model, planned behavior theory model, innovation diffusion theory model, technology acceptance model, reasoned action theory model, and Unified Theory of Acceptance and Use of Technology Model (Cimperman et al., 2018). Among these, technology acceptance model (TAM) and its expanded versions are the most used in literature. Although they have been used in healthcare studies, these models show several limits. Firstly, they have been originated and implemented in the context of self-service technologies rather than of smart technologies (Gursoy et al., 2019). Hence, they are difficult to apply because they do not capture a series of aspects concerning both the technology per se and the physical, cognitive, and emotional world of the person who will use the technology. Secondly, these models assume that human behaviors are rational without considering any kind of irrational (Zhou et al., 2020) and emotional choices as well as non-utilitarian aims in the decision-making process. Thirdly, the succession of models and related variables has not given sufficient stability to these models (Zhou et al., 2020). In the context of AI and, especially, in healthcare for elderly, a first evaluation concerns the necessity to satisfy a certain need and the following analysis concerning a comparison between human resources and AI devices in terms of who and how it provides the better service (Lu et al., 2019). To date, some studies (Lu et al., 2019) starting from the debate that exists in literature, have developed the model of AI Device Use Acceptance (AIDUA) - (Gursoy et al., 2019), encompassing six predictors (performance efficacy, hedonic motivation, anthropomorphism, social influence, facilitating condition, and emotion) of behavioral intention that can take to two dichotomous ways: willingness to accept the use or rejection to the use of AI technology. This paper also adds social gratification belonging to Uses and Gratification theory. This model has been applied to the hospitality industry (McLean and Osei-Frimpon, 2019; Gursoy et al., 2019), overlapping

both *Cognitive Appraisal Theory (CAT)* - (Lazarus, 1991) and the *Cognitive Dissonance Theory (Festinger, 1962)* and explains the process from which comes the willingness to accept or not the use of AI. Conceived in the psychological field, CAT has been applied in different service settings (Liu et al., 2019). This theory explains the antecedents of consumption emotions since it offers a series of evaluation criteria that require the involvement of cognitive functions. According to this theory (Lazarus, 1991) there is a clear relationship between cognitive appraisal and the associated emotion. The *Cognitive Dissonance Theory (Festinger, 1962)* has been conceived in the social psychological field and it explains the existence of discordant thoughts (Harmon-Jones and Mills, 2019). In addition, this paper adopts the *Uses and Gratification theory (U&G)* - (Severin and Tankard, 1997), initially belonging to mass communication literature, since it links the satisfaction of needs with the willingness to use a specific medium. The topic of gratification is particularly important in elderly healthcare. Actually, according to some authors (Gursoy et al., 2019) the acceptance is part of the decision-making process shaped by three stages: primary appraisal, secondary appraisal, and outcome stage.

Based on the literature review, 21 research hypotheses have been formulated:

Hp1: Social influence positively influences the performance expectancy of AI robots in the context of senior living facilities.

Hp2: Social influence positively influences elderly effort expectancy of AI robots in the context of senior living facilities.

Hp3: Social influence positively influences trust in AI robots in the context of senior living facilities.

Hp4: The hedonic motivations have a positive influence on performance expectancy of AI robots in the context of senior living facilities.

Hp5: The hedonic motivations have a positive influence on effort expectancy of AI robots.

Hp6: The hedonic motivations have a positive influence on positive emotions towards AI robots.

Hp7: The hedonic motivations have a positive influence on trust towards AI robots.

Hp8: Social gratification has a positive impact on performance expectancy of AI robots.

Hp9: Social gratification has a positive impact on social gratification has a positive impact on effort expectancy of AI robots.

Hp10: Social gratification has a positive impact on trust in AI robots.

Hp11: Anthropomorphism is positively related to performance expectancy of AI robots in the context of senior living facilities.

Hp12: Anthropomorphism is positively related to effort expectancy of AI robots in the context of senior living facilities.

Hp13: Anthropomorphism has a positive impact on trust AI robots in the context of senior living facilities.

Hp14: Symbolic gratification is positively related to performance expectancy of AI robots.

Hp15: Symbolic gratification is positively related to effort expectancy of AI robots.

Hp16: Anthropomorphism has a positive impact on trust AI robots.

Hp17: Performance expectancy positively influences the generation of positive emotions toward the use of AI robots.

Hp18: Effort expectancy negatively influence the generation of positive emotions toward the use of AI devices.

Hp19: Trust positively influences the generation of positive emotions toward the use of AI robots.

Hp20: Elderly emotions have a negative impact on willingness to use AI robots.

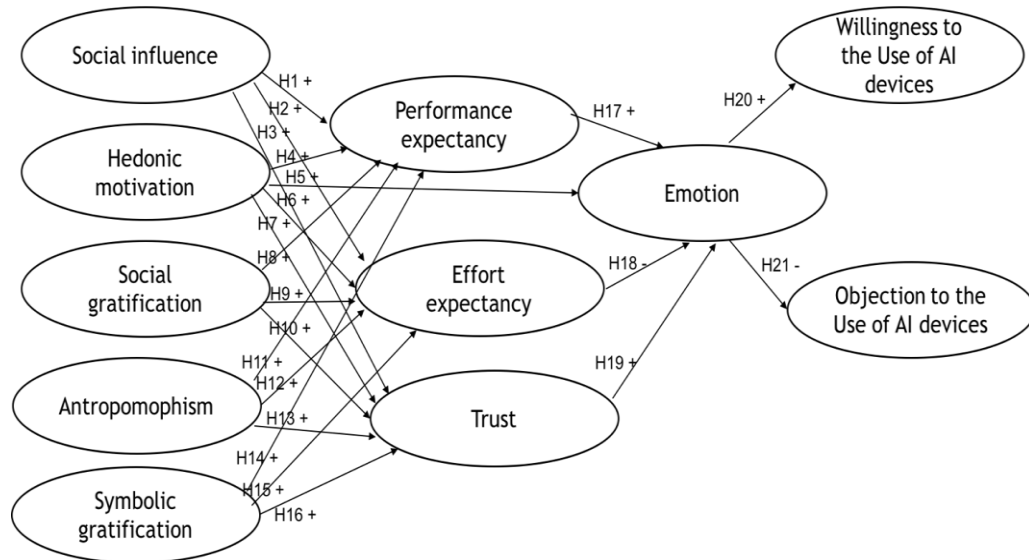

Hp21: Elderly emotions positively influence the objection to use AI robots.

Results. The quality of the model (Table I) is evaluated by considering: the coefficient of determination (R^2) and the goodness of fit (GoF) statistics. R^2 values indicate how much of the variance in the endogenous latent variables is accounted for by their independent latent variables. More specifically, the model explained 54% of the variance in Performance expectancy, 20% of the variance in Effort expectancy 46% of the variance in Trust, 42% of the variance in Emotion, and 41% of variance in Willingness to accept the use of AI devices; and 21% of the variance in Objective the use of AI devices (Table I). A GoF index has also been proposed as a solution for the global fit of the PLS-SEM. It is an index of prediction power for the entire model (Tenenhaus et al., 2004; 2005) and it is 0.47 for the whole model. The bootstrap results are useful for assessing the significance of the parameters of the inner and outer model and it is essential to check whether the constructed interval with the percentile bootstrap contains or not zero. As regards the significance of the path coefficients, Table 2 shows that all the links are significant, except for the impact of Social influence on trust; Symbolic gratification on Effort expectancy; Trust on Emotion. In this case, the path coefficients have an interval with negative and positive values. This study found that social influence was positively related to performance expectancy, Effort ($\beta = .12$, $\beta = .25$), respectively. Hedonic motivation was positively related to performance expectancy and trust ($\beta = .36$; $\beta = .30$) and negatively related to effort expectancy ($\beta = -.17$). Social gratification was positively related to performance expectancy and trust ($\beta = .14$; $\beta = .18$) and negatively related to effort expectancy ($\beta = -.14$). Anthropomorphism was positively related to effort expectancy, Effort and trust ($\beta = .075$, $\beta = .33$, $\beta = .082$).

Performance expectancy was negatively related to emotion ($\beta = -.43$) and the effort expectancy was positively related to emotion ($\beta = -.18$, $p < .001$). In addition, emotion was negatively associated with willingness to accept the use of AI devices ($\beta = -.63$) and positively associated with objection to using AI devices ($\beta = 0.46$). However, findings indicated a non-significant positive relationship between social influence and Trust ($\beta = .10$); Symbolic gratification on

Effort expectancy ($\beta = .08$); and a non-significant negative relationship between Trust on Emotion ($\beta = -.17$). The results show important implications. From a theoretical point of view, the proposed model overcomes the current gaps of existing acceptance models and takes into consideration new items that are strictly related to the specific target of senior citizens and the related needs. From a managerial point of view, the paper deepens possible solutions as a response to the lack of available human resources, as well as how and to what extent robots can be exploited; also, the trade-off costs-benefits in adopting AI technologies and the possible options of usage for the customers are investigated. Moreover, it is important for senior living facilities' managers to look at AI as an opportunity or a threat, depending on users' willingness or objection to the use of AI technologies. It is useful for companies to look at AI through the lens of business capabilities, considering that AI technologies can support three important business needs: automating business processes, gaining insight through data analysis and engaging with customers and employees (Davenport and Ronanki, 2018).

Specifically, AI can support the understanding of end-users' choices, by obtaining descriptive models to be used in optimization scheme (Laínez et al., 2009). The greater proximity to consumers enabled by new technologies makes the relationship between a business and its consumer deeper and more robust. In addition, data play a key role in offering personalized services by means of AI-based interface of their level of propensity in supporting strategies that entail extra-sensory experiences and automation.

Research limitations. The study is not exempt from some limitations. In particular, the analysis has been conducted only within the Italian context. Further research should perform a cross country comparative analysis. Furthermore, the second limitation concerns the sample. Too small samples reduce the power of the study and increase the margin of error. Thus, authors suggest to perform the analysis using a large sample.

Managerial implications. The paper shows important theoretical implications as well as for the decision makers of elderly care and for the whole society. From a theoretical point of view the AIDUA model overcome the classical limits of TAM models considering the smart component of these technologies. As regards the managerial implications, this paper suggests how and to what extent elderly would use or not AI devices.

Originality of the paper. To explore what are the antecedents of senior citizens' acceptance or rejection towards the use of AI robots in the context of senior living facilities, this paper proposes a revisited Technology Acceptance Model. The model is analyzed using SEM to test the hypotheses and to check the loading of each factor.

What Open Innovation practices enhance SMEs' adoption of Big Data?

GIULIO FERRIGNO* SAVERIO BARABUFFI ENRICO MARCAZZAN ANDREA PICCALUGA**

Framing of the research. Nowadays, the world is overwhelmed by Big Data generated every second, with the growth rate increasing approximately 10 times every five years (Del Vecchio et al., 2018; Hendrickson, 2010; Hilbert and López, 2011). Big Data refers to any set of data that, with traditional systems, would require large capabilities in terms of storage space and time to be analysed (Kaisler et al., 2013; Ward and Barker, 2013). The ability to aggregate, elaborate and analyse Big Data is becoming a key competitive advantage and resource, especially for small- and medium-sized enterprises (SMEs) (Del Vecchio et al., 2018). However, SMEs struggle with the liability of smallness, facing resource constraints and scale limitations and having fewer technological assets to bargain with (Chesbrough 2011; Dahlander and Gann 2010; Narula 2004). Therefore, they have to open up more than their larger counterparts to access external knowledge and technology for innovative purposes (Mesquita and Lazzarini 2008).

In order to adopt Big Data technologies, SMEs can leverage their external networks (Mittal et al., 2018; Spithoven et al., 2013). In fact, external partners can increase SMEs' awareness of the benefits and challenges of Big Data technologies and provide useful knowledge and support for their adoption, thereby reducing their reluctance to invest in them (Bourke and Roper, 2019). More specifically, Open Innovation (OI) practices (Chesbrough, 2003; Spithoven et al., 2013) can support the transformation of SMEs' processes and products provoked by the adoption of Big Data technologies, because the required resources can be made available through the cooperation with other organizations (Terjesen and Patel, 2017). Accordingly, SMEs become able to strategically adopt new technological solutions (Lichtenthaler, 2008). Although OI is commonly included in maturity models to assess a firm's readiness to Big Data technologies (e.g. Prause, 2015; Schumacher et al., 2016), its effect on the adoption of Big Data technologies has not been deeply analysed. Indeed, extant studies tend to focus on the obstacles that hamper their adoption without focusing on the strategy that they can adopt to overcome their problems (Horváth and Szabó, 2019). Actually, some scholars have recently investigated how OI can support SMEs in the adoption of I4.0 technologies (Messeni Petruzzelli et al., 2022). However, their analysis is not focused on Big Data and is limited by the regional context (Campania) used to test their hypotheses.

Purpose of the paper. Our paper aims at covering this gap by investigating how SMEs can adopt a larger number of Big Data technologies by leveraging OI practices. To analyse OI practices, we consider the four dimensions proposed by Spithoven et al. (2013), namely (1) search for external sources of innovation, (2) the acquisition of external R&D, (3) the use of collaborative innovation partners and (4) the exploitation of available IP protection mechanisms. We discuss the relevance of the four OI practices for SMEs below.

Albeit OI is a broad and multifaceted concept that involves a variety of innovation-related practices and processes in companies, the four dimensions highlight the main practices that can be articulated in the well-known categorization of inbound, outbound, and coupled OI processes (Gassmann et al., 2010). First, in OI literature it is acknowledged that firms heavily rely on external sources of information, subsequently combining these external sources with internal sources of innovation (Dahlander et al., 2021). Search strategies have thus been recognized as exerting an impact on the innovation activities of firms (Katila and Ahuja 2002; Laursen and Salter 2006). This OI practice is highly relevant for SMEs since they struggle with the liability of smallness, facing resource constraints such as fewer human resources to screen the external environment, scale limitations and having fewer technological assets to bargain with (Chesbrough 2011; Dahlander and Gann 2010; Narula 2004).

Second, previous research on OI has also emphasized that firms are no longer in a position to perform all R&D internally (Gassmann, 2006). Firms have to acquire-through licensing, venturing or buying-external knowledge. In this regard, SMEs not only lack financial resources but also the required number of skilled workers to perform R&D internally.

Third, extant studies have also documented that firms can make use of a variety of collaborative innovation partners such as customers, suppliers, competitors, universities, public research organisations, consultants, professional and industrial associations, among others (Leiponen and Helfat 2010). Since the process of developing and introducing big data technologies is more complex for SMEs than before, the use of collaborative innovation partners to innovate can be important to improve or speed up innovation (Laurson and Salter 2006; Messeni Petruzzelli et al., 2022).

Fourth, existing OI studies pointed out that IP protection mechanisms are indispensable to stimulate the firm's propensity to engage in risky and uncertain R&D investments and innovation projects such as big data technologies. In this context, Lee et al. (2010) argue that exploitation of IP protection mechanisms is particularly important for SMEs.

In line with this theoretical approach, we will develop some hypotheses to analyse the effects of these OI dimensions on SMEs adoption of Big Data technologies. Exactly, we will hypothesize that some OI practices may provide a large variety of, potentially complementary, resources that may support SMEs in dealing with the uncertain and complex implementation of Big Data technologies (Messeni Petruzzelli et al., 2022). Conversely, we will assume that other OI practices may support the absorption of some resources, like tacit knowledge, that may improve the implementation of Big Data technologies (Terjesen and Patel, 2017).

Methodology. To test our hypotheses, we will collect evidence on the adoption of Big Data from SMEs' perspective, at the individual firm level. To ensure internal validity, we will select the Italian context to control for normative environment, contextual munificence, and entrepreneurial opportunities (Beckman and Burton, 2008). Italy is characterized by a large prevalence of SMEs, since they employ more than 90% of the national workforce (ISTAT, 2022). In accordance with a study of the Italian Ministry of the Economic Development (MISE, 2020), Italy presents a high percentage of firms that are moving toward I4.0. As a matter of fact, in the last decade, the Italian Government has launched a number of plans and ad-hoc interventions to stimulate firms' digitalization and the adoption of I4.0 technologies, including Big Data. Consequently, considering the peculiar structure of the Italian economy mainly based on SMEs and the recent national policies aiming at accelerating digitalisation, Italy represents an interesting country to catch the complexity of SMEs behaviors toward the adoption of Big Data (Martinelli et al., 2021).

To build our sample, we will access the Italian website "registroimprese" and search for the companies that develop Big Data technologies. A preliminary search on this website produced an initial sample of 3891 companies. Since we are mainly interested to analyze SMEs' adoption of Big Data technologies, we will restrict the sample by selecting those companies that employed less than 250 people and had a turnover lower than 50 millions of euros (Messeni Petruzzelli et al., 2022). After, we will use Orbis database to access the mail and main contacts of the companies. Moreover, we will manually search on companies' websites for data that we will not be able to download. We will contact the selected Italian SMEs and send them an online structured questionnaire to be addressed by their CEOs or founders. We aim to collect more than 150 responses in order to perform a quantitative analysis of what OI practices enabled Italian SMEs' to adopt Big Data technologies.

As regards the operationalization of the variables, we will follow the measures used by previous studies on OI practices in SMEs (Spithoven et al., 2013), especially with regards to Big Data technologies (Messeni Petruzzelli et al., 2022). The explanatory variables of OI practices (namely (1) search for external sources of innovation, (2) the acquisition of external R&D, (3) the use of collaborative innovation partners and (4) the exploitation of available IP protection mechanisms) will be scaled between a minimum value of 0, implying that no use is made of them, and a maximum value of 10, implying that they are all used. Then, we will use composite indicators to examine the effects of OI practices by applying Factor Analysis to resume and to reduce the complexity of the questionnaire answers into the four dimensions proposed by Spithoven et al. (2013) since we cannot measure them directly. Factor Analysis models the observed variables (i.e., questionnaire's answers) as a linear function of a smaller number of underlying unobservable factors (i.e., dimensions of OI practices) as proposed by previous studies (Bigliardi and Galati, 2016), Sun et al., 2020). Each factor will capture a certain amount of the overall variance in the observed variables, and the factors will be listed according to how much variation they explain (Fabrigar and Wegener, 2011).

Moreover, in line with previous studies, our model will include the following control variables: (1) whether the SME operates in a high-tech industry or not (Messeni Petruzzelli et al., 2022), (2) the SME's age (Kelly and Amburgey, 1991), (3) the SME's size (Arbore and Ordanini, 2006; Horváth and Szabó, 2019), (4-5) the SME's potential and realised absorptive capacity (i.e., the R&D expenses on total revenue and the number of patents in the last 10 years; see Cassetta et al., 2020, Zahra and George, 2002), (6) the digital skills of the SME's human resources (measured as the percentage of employees with a STEM degree; see Agostini and Filippelli, 2019, Eller et al., 2020, Giotopoulos et al., 2017, Horváth and Szabó, 2019), and (7-8-9) the CEO's education, age and tenure (Datta et al., 2003; Li et al., 2018; Wiersema and Bantel, 1992).

We will test the hypotheses by running several probit regressions to estimate the effect of OI practices on the probability of adopting Big Data technologies. Probit models have been widely used to quantitatively assess the role of open innovation in firms (Spithoven et al., 2013; Triguero and Fernandez, 2016) and the link between Big Data and innovation (Niebel et al., 2018).

Results. In general, we expect that OI practices will lead to an increased propension of adopting Big Data technologies in SMEs. However, taking into account the different OI practices, we also expect that the magnitude and the path that leads to this enhancing adoption could be different. In particular, we anticipate that the degree of breadth of the OI is more important than the degree of depth in SMEs' Big Data technologies adoption.

Research limitations. Although this extended abstract may contribute to our understanding of OI practices affecting SMEs' propension to adopt Big Data technologies, several limitations must be taken into account. First, the

OI practices on which we base our study were identified through the work written by Spithoven et al. (2013). However, we are aware that other studies recognize other OI practices that we do not consider in our questionnaire. For instance, Gassmann et al. (2010) take a 'process perspective' by discussing these practices in terms of inbound, outbound and coupled OI processes. Future studies may replicate our approach by also considering alternative OI practices.

Second, we have examined the effects of OI practices on the adoption of Big Data technologies in a very specific context: Italian SMEs that are registered at the Italian website "registroimprese". We recognize that the generalizability of our results is limited to this type of organization operating in this specific country. Future studies could investigate what are the effects of OI practices in SMEs operating in other countries. Likewise, this study focuses on SMEs. Future research may examine the impact of OI practices in other types of firms, such as older firms, large firms, or start-ups.

Third, in this study we do not analyze the characteristics of the potential partners and collaboration in the OI practices. Future studies may investigate if these characteristics moderate the effects of OI practices on SMEs' adoption of Big Data technologies.

Fourth, OI practices may affect every type of I4.0 technology (Messeni Petruzzelli et al., 2022). In this study, we have focused our attention on Big Data. It might be interesting to study whether the impact of OI practices on Industry 4.0 technologies differ by considering the technological features that epitomize a specific technology. For instance, future studies may explore whether OI practices impact differently on Industry 4.0 base technologies and front-end technologies (Frank et al. 2019).

Last but not least, in this study we will analyze what OI practices affect SMEs' propensity to adopt Big Data technologies. However, we will not investigate whether the adoption of these technologies can be reflected in SME's innovation performance. Future studies may conduct econometric analysis that can assess the mediation effects of OI practices on the relationship between the adoption of Big Data technologies and SMEs' innovation performance.

Managerial implications. *Our research has implications for practitioners such as SMEs owners-managers. More specifically, we emphasize that a more cooperative and collaborative relationship between SMEs and other organizations may facilitate their propensity to adopt Big Data technologies, which is fundamental for those companies that are facing organizational and business challenges that contain their future growth. In general, we expect that OI practices may allow SMEs towards an increased propensity of adopting Big Data technologies. More specifically, we highlight that the magnitude and the path that leads to this enhancing adoption could be different, depending on the type of OI practices. As a matter of fact, this study suggests that the degree of breadth of the OI is more important than the degree of depth in SMEs' Big Data technologies adoption.*

Moreover, our expected findings may point out that OI practices may allow SMEs' managers to make up for the lack of financial resources and knowledge that can be accessed by forming open and collaborative relationships with external partners. On this basis, SMEs' CEOs must overcome the well-known "not invented here" syndrome and dedicate their resources to the relationship with external partners in order to develop big data technologies.

Our study may also be considered useful for policy makers. More specifically, in this study we will show that policy makers should support interactions between firms to facilitate the exchange of knowledge that is necessary to develop breakthrough technologies such as Big Data technologies.

Originality of the paper. *The main originality of the paper relies on its focus on the underestimated relationship between the setting (i.e., SMEs) and the particular Industry 4.0 technology (i.e., Big Data) analysed, covering a research gap in the literature that should be studied for both theoretical and practical reasons. Theoretically speaking, moving away from the view that considers (only) the SMEs' limitations in adopting I4.0 technologies, our study could suggest important and peculiar factors that SMEs could implement for the adoption of Big Data technologies (compared to their larger counterpart). Practically speaking, our study can be used not only by SMEs' owner-managers, but also by policymakers in order to promote policies in favor of more cooperative and collaborative behavior in the SMEs' ecosystem.*

Innovative SMEs, Board Gender Diversity and Firm Performance: An empirical analysis in Italy

VALERIA SCHIFILLITI* ELVIRA TIZIANA LA ROCCA**

Framing of the research. *With the aim of supporting technological progress and economic growth, the Italian government introduced in 2015 (DL 3/2015, article 4) the Innovative Small and Medium Businesses (SMEs) commercial category, representing an essential nucleus of enterprises that contribute to the development of the country. The legislation was proposed in the aftermath of the regulation pertaining to innovative startups since Innovative SMEs constitute the subsequent evolving stage meaning that the startup is mature and prepared for the phase of consolidated growth stages. Hence, the difference with the startup definition is that Innovative SMEs can operate for longer than five years along with additional distinctions concerning law and legal activities. In particular, according to the legislation, the legal form of corporation is demanded and some requirements (i.e., being based in Italy, have completed the certification of the financial statements, not traded on a regulated exchange, not listed in the innovative startup area) should be satisfied in order to gain access to this business classification. Furthermore, in order to be considered an Innovative SMEs, the company should meet at least two of the following three criteria: (i) investing in R&D and innovation at least the 3% of the greater value between turnover and production cost; (ii) employing skilled individuals with high level of education (at least one fifth with a doctorate, a doctoral student or researcher, and one third with master's degrees); (iii) having at least one patent or registered software, either as the owner, custodian, or licensee (MISE, 2015).*

In the Italian context, small enterprises (those with ten to forty-nine employees) are quite numerous (200.000), with 3.6 million employees constituting a large portion of the country production system (ISTAT, 2021). Among them, 12.2% are innovative enterprises with a percentage of 22% operating in the high and medium high-tech manufacturing sectors (Chemicals, pharmaceuticals, electronics, machinery, electrical appliances, transportation) and in ICT services (ISTAT, 2021). The presence of innovative enterprises is higher in the Centre-North (12.7%) than in the South (10.3%), probably because are considerably more likely to operate on the national or worldwide market. On the other hand, a substantially larger incidence of small innovative firms is noted in the South, despite the region's overall lower rates, when considering just enterprises with a focus on the regional market (ISTAT, 2021).

As reported by MISE (2022), the total number of Italian innovative startups and SMEs stands at 14.621 companies in the second quarter of 2022 increased by 1,8% compared to the previous quarter with free and simplified access to the Italian Guarantee Fund for SMEs, involving 1,424 businesses that received 5.542 granting of credit, approximately 350 more than the first quarter of 2022.

Purpose of the paper. *In the past decade, government legislations, media and stakeholder influence have encouraged corporations to support more diverse boards. Accordingly, a number of initiatives have been implemented to promote gender diversity on the board of directors including the adoption of the European Commission Directive (2016) with the goal of increasing the number of women who participate in the company boardrooms (European Commission, 2016). Therefore, gender equality and diversity in the workplace have recently been recognized as crucial aspects of corporate governance, as well as sustainability and growth (Farag and Mallin, 2016). According to the findings of the most recent research on women's entrepreneurship published by the Global Entrepreneurship Monitor (GEM), at international level, women constitute almost one third of high growth enterprises and one third of innovators who target both local and overseas markets. In terms of global market, women in countries with upper-middle incomes are on par with men in terms of the most innovative and rapidly expanding business owners in the world. Over the two-year pandemic period, women's overall company exit rates increased from 2.9% to 3.6%, however men's rates rose from 3.5% to 4.4%. In comparison to men (34%), women in upper-middle-income nations experienced a 74% growth in business exits between 2019 and 2021. More than half of the women entrepreneurs globally are employed in the wholesale and retail industry, but the government and social services sector employs one out of every five (18.5% women compared to 10.1% males). Nevertheless, 2.7% of female entrepreneurs found their businesses in the information, computers, and technology (ICT) industry that attracts the preponderance of venture capital funding, whereas 4.7% of male entrepreneurs do so. The GEM report also analysed the contribution of women to the growth and*

development of the regions. Compared to other part of the world, results demonstrated that Europe has the lowest rates of entrepreneurial ambitions and participation for women, but greater rates of gender parity overall. Women in the high-income nations that are prominently represented in Europe and North America are highly engaged in startup activities with great potential. Nonetheless, these regions have some of the most substantial gender variations in entrepreneurial perceptions. Despite the fact that women in these locations are among the most influential and privileged female entrepreneurs in the world, they continue to face major obstacles to success in the perspective of gender equality.

Previous literature has investigated the relationship between female board composition and the companies' financial performance, however the findings appear to be unclear. Numerous studies contend that gender diversity positively affects both the performance and competitive advantage of a company (Cox and Blake, 1991; Elsbach, 2003; Smith, Smith, and Verner, 2006; Campbell and Minguez-Vera, 2008; Adams and Ferreira, 2009; Westphal and Zajac, 2013). Likewise, previous works showed that the presence of women on boards of directors (BoD) has been associated with increased asset returns and improved financial advantages (Singh, Vinnicombe, and Johnson, 2001; Campbell and Minguez-Vera, 2008). According to Arvanitis et al. (2022), the favorable relationship between gender diversity on boards and the performance of companies is in line with agency theory and resource dependence theory and this positive influence on board operations (i.e., enhanced legitimacy, monitoring and evaluation, improved evaluation, and greater accessibility to scarce external resources), can lead to higher financial performance. In addition, they demonstrated that in Greek listed firms, once the percentage of female directors reaches the key point of 33% percent, the positive effect on performance of the agency and resource dependence theories, changes into a negative effect, in line with the social identity theory. Some research, however, reveals that the presence of more women on a board has no meaningful impact on a company's profitability, as seen by declining accounting returns (Adams and Ferreira, 2009; Darmadi, 2011; Minguez-Vera and Martin, 2011; Fernández-Temprano and Tejerina-Gaite, 2020). In the study on the relationship of board members and financial outcomes of Indonesian firms, Darmadi (2011) considered three demographic features of board members: gender, ethnicity, and age founding that financial performance and market success are negatively associated with gender diversity.

In the Italian context, Bacchin and D'Agostino (2022) using a sample of 3,257 innovative start-ups found that gender-related factors have a positive correlation with performance levels. In particular, the presence of a diverse gender in the boardroom is associated with higher return on assets (ROA), whilst the percentage of women is associated with higher return on equity (ROE). Accordingly, Mari and Poggesi (2020) in their research on the effect of gender on the performance of Italian Innovative SMEs, by using as performance measures "Growth in Revenues" and "Growth in number of Employees", found that female-owned businesses are more likely to be successful, in contrast to their male counterparts.

In light of this studies, our goal is to explore whether gender diversity in the boardrooms of Italian innovative SMEs has a measurable impact on firms' performance. This work-in-progress intends to contribute with new evidences to the ongoing discussion on the topic. First, Italian Innovative SMEs were identified based on data collected from the AIDA dataset; second, gender comparison evaluations were performed in terms of financial outcomes.

Methodology. Our study develops a quantitative analysis based on data collated through the AIDA database of Bureau van Dijk. The analysis focuses on Italian Innovative Small and Medium firms (SMEs).

The sample includes 3.264 Italian Innovative SMEs, operating in non-financial sectors, with a total of 12.188 observations. An unbalanced panel covering a period from 2016 to 2021. We perform the firm-fixed effects analysis to eliminate unobservable heterogeneity with robust standard errors.

The dependent variable is Return on Asset (ROA), a well-established firm performance measure (Adams and Ferreira, 2009; Easterwood et al., 2012; Zona et al., 2015) calculated as the ratio between EBIT and total assets, that allows to obtain information on the operating profitability in the core business. Our main explanatory variable is Female Board, considering the percentage of women in the board (ratio of female in the board scaled by the total number of board components). We provide as control measures of Board characteristics as Age Board, calculated as the natural logarithm of the age of the board components.

As control we also added in the model some measures related the degree of R&D effort to appreciate the companies' ability to invest in innovation; in particular, the variables R&D expenses, Patent expenses and Licensing expenses are included.

Traditional control variables are included in the model. Tangibility is measured by the ratio of tangible assets to total assets, and it represents the firm tangible assets. It may increase firms' financial capacity since they are used as collateral. Cash Holding, amount of liquidity held by the company, and the Long-Term Debt of a business are included in our analysis as financial capital variables (Campbell and Minguez-Vera, 2008). This group of financial variables can give a general idea of the firm's financial resources that could be invested in strategic projects, such as those related to innovation. We control, also, for firm Size (natural logarithm of total assets) and firm Age (natural logarithm of number of years since the firm foundation plus one), as proxy for the reputation and track record a company gains over the years (Campbell and Minguez-Vera, 2008; Low et al., 2015). Dummy Listing is a dummy equal to 1 if the company is listed in a stock exchange, 0 otherwise. Dummy DeListing is a dummy equal to 1 in case of delisting, and 0 otherwise. Dummy South is a dummy that is equals 1 if the firm is located in the southern of Italy and 0 otherwise, for considering differences between the northern and southern of our country. Year dummies and industry dummies are included in our model.

Results. First of all, some descriptives are reported to provide a general overview of the sample. Tables 1 and 2 show the composition of the sample of Italian Innovative SMEs according to the presence of women in the board.

Tab. 1: Female and male presence in the board

Female presence	Freq.	%	Cum.	Male presence	Freq.	%	Cum.
0	7,261	59.57	59.57	0	626	5.14	5.14

As shown in Table 1, in 40.43% of Italian innovative SMEs sample there is at least one woman present in the board. Table 2 suggests that the highest percentages of female presence in the board are recorded in the Northern Italian regions (more than 10%).

The descriptive statistics of the sample analyzed are shown in Table 3. The values relating to the mean, median, standard deviation, quartiles, minimum and maximum values of the variables considered in the analysis are shown in the following table.

Tab. 3: Descriptive statistics of the full sample

	Mean	Median	SD	Min	1° quartile	3° quartile	Max

Table 4 reports the correlation matrix of the variables. Additionally, we tested possible multicollinearity among the independent variables by using variance inflation factors (VIFs). The maximum VIF in the model is 1.56 (mean of 1.13), which is far below the generally accepted cut-off of 10 (or, more prudently, 5) for regression models (Kutner et al., 2004), suggesting that multicollinearity is not a problem in this study.

Source: our elaboration from AIDA data

In column 1, the negative and statistically significant coefficient of the variable *Female Board* reveals that the presence of women on board decreases SMEs performance (ROA). Thus, board gender diversity has a relevant negative impact on firm performance. This result is in contrast with many previous studies (Brahma et al., 2020; Arvanitis et al., 2022), while it is in line with some other empirical studies (Adams and Ferreira, 2009; Fernández-Temprano and Tejerina-Gaite, 2020). The other columns show a similar negative effect considering cross-sectional regressions in each of the year included in the analysis.

Research limitations. This work-in-progress regards a sample of Italian innovative SMEs operating in non-financial sectors. In our future research we want to complete this analysis examining how the impact of gender diversity on firms' performance differs by sector and also considering the role of moderating variables on the relationship studied. In this regard, more advanced econometric techniques could be useful to better understand the impact of board gender diversity on corporate performance. A limitation is that the analysis involves just the Italian context, considered a civil-law country, thus the results could be unique to this environment and could not be generalized to different institutional context (common law countries).

Managerial implications. Our preliminary findings suggest that the costs of board gender diversity could outweigh its potential benefits. Thus, it seems that board gender diversity could harm decision-making process and firms' performance. Greater monitoring related to the presence of women on board, different viewpoints, and opinions, could lead to concerns about miscommunication, conflicts, and disagreements. The present results raise questions about the reasons of this negative effect of female presence in the board of innovative SMEs.

From a managerial point of view, this research underlines the need to investigate the causes of the conflicts within the board. Perhaps, the lower risk propensity of women could represent a "constraint" for innovative SMEs considering their specific characteristics of innovation. Thus, trying to trigger actions for improving decision-making processes and results, by developing synergies, leveraging the positives aspects related to board gender diversity, and strengthening them.

Originality of the paper. Our paper adds new insights to the literature by presenting a broader understanding on Innovative Italian SMEs. We extend previous works through a focus on board gender diversity of Innovative Italian SMEs investigating specifically the presence of women in their boardroom and exploring their impact on firm performance. The analysis is developed using variables and performance measure in line with the literature of the board gender diversity which represent a novelty for the research stream on Innovative SMEs.

Keywords: Italian innovative SMEs; board gender diversity; firms' performance.

A Four Steps Approach to Achieve Digital Innovation in Family Enterprises: Evidence from Multigenerational Italian Firms

MARCO MISMETTI* SAMUEL WAYNE APPLETON*
EMANUELA RONDI* ALFREDO DE MASSIS**

Abstract

Research in family businesses digital and technological innovation is developing significantly and is growing in new directions. Previous research has pointed their attention in identifying drivers and outcomes of family firm innovation and differences between family and non-family counterparts. However, we lack an understanding on the innovation process and how family firms innovate. Our study is intended to cover this gap by unpacking the innovation process of multigenerational family firms. By using an abductive approach, we theoretically, empirically and practically contribute to the digital innovation literature in family firms. In addition, we contribute by advancing knowledge on how family firms leverage the unique characteristics and resources to innovate. In so doing, based on a qualitative analysis of 12 family businesses, we combine primary and secondary data sources to identify four interconnected steps - perception step, assessment step, application step and evaluation step - that family firms follow to achieve digital innovation. Then, we offer avenues for future research.

Framing of the research. Digital technologies are every day increasing their presence in organizations and are unsurprisingly affecting every firm in their activities (Nambisan et al., 2019), including family firms. Research interest in family businesses digital and technological innovation has grown considerably in the last decade (Calabrò et al., 2019; De Massis et al., 2013), focusing on drivers and outcomes of family firm innovation and their differences with non-family counterparts. In the debate, a recent stream of research has emerged, focusing on the interplay of digitalization and family business. In the new context of digital transformation and fourth industrial revolution, prior studies point the attention on the impact that technologies have in shaping family firm's behavior (Soluk et al., 2021), while providing evidence that family firms can successfully innovate even in conditions of limited resources (De Massis et al., 2018). However, there is an existing gap in explaining the processes of family firm innovation. A finer grained comprehension of the family business innovation and digitalization process could advance both family business and innovation literature in regards to the resources leveraged in innovation processes.

Purpose of the paper. We aim to unpack the digital innovation process in multigenerational family firms. To answer our research question and achieve the objective of the study, we are following an abductive approach and we are investigating 12 manufacturing Italian family firms who have implemented digitalization and Industry 4.0 technologies, such as artificial intelligence, cloud computing, cloud manufacturing, internet of things and big data analytics (Culot et al., 2020). In our study we combine interview data with field observations and secondary data sources. We relate to the resource-based theory (Barney, 1991) to empirically unpack the digital innovation process in multigenerational family firms, identifying innovation process' interactive steps and mechanisms, to empirically and theoretically explain how family firms innovate while leveraging on their unique characteristics to their advantage (Habbershon and Williams, 1999; Rondi et al., 2019). We aim to contribute to the family business literature by showing how family firms can engage in innovation activities, providing evidence of the whole process and steps that family business owners and members could follow to achieve digital innovation. Second, we aim to contribute to the innovation literature, providing empirical detailed evidence, along with theoretical and managerial implications on the process of innovation.

Methodology. To understand how the innovation process unfolds in family firms, we are conducting an analysis of large Italian manufacturing firms who have engaged in innovation activities and are actively using innovative

technologies in their business processes. We are adopting an abductive qualitative research philosophy (Timmermans and Tavory, 2012), which is useful to generate new knowledge and understand phenomena (Behfar and Okhuysen, 2018; Folger and Stein, 2017). We purposefully selected the companies from the Orbis database based on two main criteria. The first criterion regards the type of firm investigated. The companies had to be family-owned companies. We investigated whether they were family firms in two steps. First, we observed through secondary data (e.g., website, social media accounts, newspaper articles) whether they presented themselves as family businesses and/or whether we could find evidence that they were family businesses. Second, we further validated the information that we gathered through secondary data, by asking directly to family business members through email exchange, telephone and during interviews whether the company is a family business. We follow the main family business definition according to Chua et al. (1999): “The family business is a business governed and/or managed with the intention to shape and pursue the vision of the business held by a dominant coalition controlled by members of the same family or a small number of families in a manner that is potentially sustainable across generations of the family or families” (Chua et al., 1999, p. 25). The second criterion to select the cases regards digital innovation. Family firms had to show a digital innovation attitude, with a clear strategy in progress. We were able to identify these criteria either through a public list of firms that were known to engage in innovative activities, or through secondary data (the family firms’ website and media outlets). As per the first criterion, we also validated the second criterion with family members and non-family managers of the sampled firms through email exchanges, telephone and interviews that the family businesses were engaging in digital activities and were pursuing an innovation strategy. Hence, the final sample consists of 12 family firms which account for 30 interviews with family members and non-family members conducted in 2022. In addition, we did 12 field observations and analyzed a vast variety of secondary data, such as books, videos, websites, newspaper/press articles, company available database information and documents, to triangulate with primary data (Butcher, 2021). We aimed to capture distinctive inter-generational family dynamics, therefore, we made sure to include in our sample companies representing multigenerational family enterprises. This means that the sampled firms had to be in line with the criteria and scope of our research. To include multigenerational family enterprises, firms needed to have multiple generations simultaneously involved in the ownership and/or management, and in their day to day activities. This differentiates from family firms that are owned and managed by the founder, wherein intergenerational dynamics and the inheritance of values, traditions, and distinctive family features are less evident or non-existing at all. According to our sample, the family business generational number varies from second generation to the fifteenth generation, which ensure aspects of family firm heterogeneity (Daspit et al., 2021; Daspit et al., 2018) to capture their relation with digital innovation (Li and Daspit, 2016).

Data analysis follows the general grounded theory approach (Glaser and Strauss, 1967), comparing emerging pattern in the multiple cases (Yin, 2013). Each case was summarized and quotes from the interviews are used as first-order concepts through an open coding process. Cases are compared and first-orders are aggregated into theoretical second-order categories and overarching dimensions (Gioia et al., 2013). The interpretative process allows us to develop and make sense of qualitative data (Suddaby, 2006), and to identify overarching mechanisms of multigenerational family firms’ digital innovation processes. In analyzing the data, we go back and forth from our primary and secondary data, the emerging codes and theory (Eisenhardt, 1989).

Results. We build our findings by relating first order codes - exemplary quotes coming from the participants- to second order themes and overarching mechanisms, which serve to evidence the steps followed by multigenerational family enterprises to achieve digital innovation. Our findings identify four steps of digital innovation: perception step, assessment step, application step and evaluation step. In the perception step, the opportunity is identified, where a digital innovative solution is discovered and screened. The input can come from diverse sources. It can be individual, derived from the entrepreneurial attitude and vision, wherein the family business actor, in this first step, recognizes that there is an opportunity; familial, wherein innovative attitudes may be inherited by previous family generations that faced prior industrial revolutions or brought by the next generation who is daily in touch with digital technologies; team-oriented, from the R&D department and/or specific teams who come up with innovative solutions; organizational, stemming from cluster and other activities of the entrepreneurial family or driven by employees and business members; external, wherein ideas and suggestions come from competitors, suppliers, customers and partners. Once the opportunity to innovate is identified, the owning family, sometimes along with the support of designated teams, compare the opportunity with the status quo in order to understand whether the opportunity is needed and worth pursuing for the family business.

In case the opportunity is deemed to be followed, the focus shifts to the second step: the assessment step. In this step, the decision makers assess what they require and how they can get what they need. Partnerships and tight relationships with the local community, suppliers and customers help family businesses to achieve human (e.g., specific team creation) and financial (e.g., monetary incentives) resources. Once the resources are identified and actions that need to be taken are clear, it is crucial to actuate division of roles and responsibilities among family and non-family business members, with the aim to keep up with the fast-changing environment and technologies, to be pioneers and to stay at the top front of the market. Family firms have a competitive advantage of quick decisions-making given that oftentimes they discuss within the family in informal environments rather than in formal board meetings.

The third step is the application step. Once the family business has established what they require and what they have to do, they take action and implement the changes shaping the business. While some elements of the organizations, such as old employees, are resistant to change, to integrate innovation in the business and make it the backbone of the organization help to overcome the challenges of making everyone understand the need to change. Digital innovation

requires technologies and people to work together. As mentioned by one of the family business CEOs interviewed: “Digital innovation changes the business, but not the family”. This allows to change the business culture step by step and with the help of the family, to make the digital technologies the backbone of the company, as done with past innovations, while working with people leveraging on the trust that employees have in the family. This is a crucial step. Indeed, the firm should motivate and engage with old employees favoring training courses and hiring younger employees who have the knowledge and are prone to engage with advanced technologies.

The fourth step is the evaluation step. After the new digital technologies are applied, family members and technicians start to analyze data to assess whether they actually gained benefits by introducing the technology. At the same time, new digital technologies allow family business members to appraise big data from their production processes and customers services, to evaluate new valuable solutions for their clients. In a recursive cycle, this rises new opportunities that can be recognized and/or taken by actors involved in the business, which make the digital innovation process to the first step. In this way, family businesses can continuously improve their technological systems and processes, providing constant benefits to their organization and their customers.

Our study reveals the processes and steps of digital innovation in family enterprises. We identify four different yet interconnected steps for family firms to acquire digital innovation. An important discovery is the importance of leveraging both human and financial resources at different levels to achieve digital transformation. A second discovery is that the processes of digital innovation follow clear interrelated steps. In addition, our findings highlight that the digital innovation process, for multigenerational family businesses keen to engage in innovation activities, follows recursive cycles that allow technicians and decision makers to continuously improve their choices and change the business step-by-step. The optimal situation in the first step is the combination of external pulls (e.g., customer driven) and internal pushes (family entrepreneurial vision). If the customers are looking for something new in their product that requires digital innovation or other stakeholders propose innovative technologies to advance the production processes, but the business members do not see the opportunity or necessity, the chance is not pursued and the opportunity is lost. Family firms have the competitive advantage to generationally transfer the entrepreneurial mindset of previous generations to younger generations throughout the years, wherein next generation members can learn from senior generations, which keeps the family business at the forefront of future technological revolutions. These provide evidence of individual and familial capabilities as key resources that can be inherited and strategically orchestrated in achieving innovation in an entrepreneurial setting (Alvarez and Busenitz, 2001). In the second step, family firms can clearly divide roles among family members or reliable people that are within the company for years and have the expertise, knowledge and trust of the family. Also, in time of digital innovation, being fast is crucial. Indeed, family firms have the advantage to take quickly decisions and invest in innovation without going through formal meetings. In the third step, old employees may be resistant to change. Family businesses can change the business backbone into the digital technology, while leveraging the trust that employees have toward to family to make them understand the need to achieve digital transformation while recognizing their key role in the process. Furthermore, family businesses do need people that know the latest technology. Specialized training programs and planning a generational change also within employees, i.e., they can balance and combine old employees that knows the company and newly hired employees with technological skills. In the fourth step, family business members evaluate the technologies and their processes which can highlight the efficiency of the new technology and/or can rise new opportunities to engage in new innovations, which brings back the cycle to step one of the digital innovation processes for further development.

Research limitations. The study is not without limitations. First, we are focusing on family owned and run businesses. Additional studies on other types of businesses and ownership may lead to contrasting results and different processes. Second, despite providing evidence of heterogenous aspects within our family business sample, we purposefully focus only on multigenerational family firms, to investigate how history, family values and traditions interplay with digital innovation and to comprehend the intra- and inter-generational dynamics in relation to digital innovation and resources allocation (of family and non-family members). Studies that investigate digital innovation that are family businesses at the first generation, or where there is only one generation of the family involved (Li and Daspit, 2016), may discover different findings than ours. We also encourage future studies to investigate the digital innovation processes in other types of firms. The third limitation regards innovation. We decided to focus our effort to comprehend family business innovation processes in the digital context, to understand how family businesses characteristics affects the innovation processes. Moreover, we are trying to identify how the digital innovation process unfolds, which includes interconnectivity between departments and exchange between human capital (old and new employees, non-family managers and technicians, senior generations, and new generations) and technologies. Future studies could point their attention to unpack other types of innovation processes that are not strictly related to digital technologies. Fourth, our sample comprehend only Italian family firms. Cultural and contextual aspects may play a role in interpersonal and family dynamics as well as in digital innovation activities (Fletcher et al., 2012). Future studies could replicate our study focusing on family businesses from other regions (Aguinis et al., 2020; Samara, 2021), such as North and Latin America, Africa and Asia, wherein family relations, values, intergenerational power dynamics and organizational environments may differ. Simultaneously, different environmental contexts such as incentives from the government and the possibility to acquire (human and financial) resources may play a role and would be worth investigating (Guan and Yam, 2015).

Managerial implications. By using an abductive approach to in-depth study twelve Italian family firms, we develop theory on the digital innovation processes in multigenerational family businesses. In so doing, we identify four distinct, yet interconnected steps that family firms pursue to achieve digital transformation and incorporate modern

technologies in their processes and products. The study practically contributes by advancing the understanding of how family firms innovate, while leveraging on their unique characteristics, such as family history, inherited entrepreneurial mindset and attitude, and organizational members' trust.

Innovation is required to remain competitive in the market, but many companies fail to do so. We analyze cases of multinational family enterprises that were able to achieve digital innovation. Our empirical findings highlight key steps and processes that can be used by family owners, family managers, non-family managers, technicians, advisors and mediators to handle and manage digital innovation within the family business context. Through our findings and the identified steps, family and non-family managers can follow the steps to achieve digital innovation and successfully implement the newest technologies in their businesses.

Originality of the paper. Despite a lot of interest has been given to innovation and digitalization in family firms, we lack an understanding of the process of digital innovation. Therefore, we contribute to the family business and innovation fields by unpacking the digital innovation process. We follow the perspective of Alvarez and Busenitz (2001) and we contribute to the theory of resource-based view by showing how individual, family and firm resources, along with acquired and inherited capabilities can be leveraged on the firm's advantage. The identified steps to attain digital innovation and the analytical themes offer theoretical and managerial implications.

Keywords: Family business; process; innovation; digitalization; qualitative methodology

Organizational adaptability and digital innovation in the agri-food start-ups: An emerging perspective on the mediating role of digital learning orientation

EDMUND IMBRAH* ILARIA MASTROROCO* FEDERICA STELLA BLASI[▲]

Framing of the research.

Introduction

After 50 years from Moore's law, we are living in the "golden age of digital innovation" (Zheng and Finchman, 2014). The phenomenon has obtained an increasing interest in the academic and in the enterprises' field, and it is possible to define it as a "product, method, or business model that is regarded as new, needs some important changes by adopters, and is incorporated in, or aided by, IT" (p. 330). A significant disruption to global business has resulted from the formerly distinct functions of various digital technologies merging and integrating as a result of this digital convergence (Giudice and Scuotto, 2022). People's way of living, thinking, working and learning is changing as a result of digital transformation (Lanzolla, Pesce, and Tucci, 2020; Correani, and Natalicchio, 2020; Frew, 2017). This has taken advantage of novel economic prospects and newly developed digital business models, which depend on the adaptability, ambidexterity, and agility of organizations (Grass, Backmann, and Hoegl, 2020).

In this evolving scenario, enterprises are scouting Industry 4.0 enablers - such as smart sensors, the Internet of Things, cyber-physical systems, Big Data, automation, robotics, and artificial intelligence - to retain and improve their strategic and organizational capabilities (Bogoviz, 2020; Popkova and Sergi, 2020). Particularly, enterprises in the agricultural sector, like those in other sectors, have recognized the possibility to be productive, sustainable (Secundo et al. 2022), and market competitive through the integration of digital technologies into the supply chains, systems, and production processes, while meeting what Shepherd et al. defined as "the megatrends that challenge the status quo: a hungrier world, a bumpier ride, a wealthier world, choosier customers, and transformative technologies" (Shepherd et al., 2018).

Some scholars have introduced the "self-tuning model" into the innovation management literature. This model consists of three main organizations features: Organizational agility, organizational adaptability, and organizational ambidexterity (Reeves, Zeng, and Venjara, 2015, Russo and Vurro, 2010). According to Pisano and Borioli (2017), this model allows organizations to quickly cope and acclimatise to customer needs through systems, and large tech corporations like Alibaba, Google, and Amazon, have incorporated it since the commencement of their business journeys. SMEs have adopted this strategy somewhat later than the aforementioned businesses as a result of resource shortages (Scuotto and Mueller, 2017). To deal with lack of resources and adapt their strategies and operations to market developments, SMEs must, according to Papa and Tarba (2021), exploit and explore new information and technologies. With the current 4.0 economy, adopting new technologies could be vital but this greatly relies on the orientation of the enterprises (Giudice and Scuotto, 2022). Digital learning orientation (DLO) within SMEs emerges as a key factor (Benzidia et al., 2021).

The concept of learning orientation regards the entire organization, because it is related to the collection and adoption of data and information about customers' needs, market features, and competitors' strategies (Hurley and Hult, 1998). In this manner it is possible to create new products or services and obtain a competitive advantage (Zhao and Calantone, 2002). According to Wang (2008), learning orientation is an organizational value that is linked to the tendency of the organization to use knowledge. It focuses on gaining an understanding that is likely to be helpful to the organization through the provision and dissemination of information as a mechanism for learning (Wang, 2008). Moreover, learning orientation is a corporate orientation that incorporates the ideas of looking for and trying to use learning (Fernandez-Mesa and Alegre, 2015).

e-mail: blasi@lum.it

Organizational learning and innovation are typically combined concepts. Innovation is a wide concept, defined in different ways depending on schools of thought: According to Thompson (1965), it is the creation, acceptance, and application of novel concepts, procedures, ideas, goods, or services. Citing Amabile et al. (1996), Hurley and Hult (1998), innovation is the successful application of original ideas within a company. The innovation process encompasses the collection, diffusion, and utilization of new knowledge (Damanpour, 1991). Deepening research, organizational learning is linked to the creation of new knowledge, which is essential for business performance and innovation capabilities (Hurley and Hult, 1998). An organization committed to learning is likely to possess state-of-the-art technology (Gatignon and Xuereb, 1997), which leads to greater innovation capability in both products and processes.

According to Freeman and Engel (2007), one explanation for why a window of opportunity arises and grants innovators like start-ups a transitory advantage is the conflict among large corporations. Consequently, Herterich and Mikusz (2016) emphasize that digital innovation extends beyond traditional product functioning of the physical artifact and traditional methods in the literature of innovation. Therefore, start-ups going after digital innovation in contrast with other categories of innovation constitute a crucial analytical component that serves as the focus of this study.

From the above discussions, it is evident that there is a relationship between organizational adaptability, digital learning orientation, and digital innovation that has not been studied in the literature. Accordingly, in order to contribute to filling this gap, we aim to investigate how organizational adaptability could influence digital innovation through the digital learning orientation of start-ups in the agri-food sector, by providing empirical evidence.

The remaining sections of this ongoing research are as follows: Section two focuses on the theoretical framework and hypotheses development. Section three explains the research methodology that we will adopt for this study. In the fourth section, the results of the study are presented. The fifth section focuses on research limitations, managerial implications, and the originality of the paper.

The digital transformation of the Italian agri-food sector and the rise of start-ups

Entrepreneurship has gained notable interest in recent years in both the policy-making and scientific spheres, since it can help job creation and economic development (Di Paola et al. 2018; Audretsch 2002; Clarysse and Heirman 2004). In line with this point of view, national and/or regional policies have been implemented on a global scale to assist the development of new businesses (Rocha, Mamédo, and Quandt 2019; Matricano 2020).

Regarding Italy, the national government took action by providing the Decreto Crescita 2.0 (Law Decree N. 179/2012), in order to support the development and expansion of innovative start-ups. Innovative start-ups are defined by Italian law as new enterprises, or recently formed, having a high-tech value. Three requirements highlight the innovative nature that these start-ups must possess; a specific percentage of investments in R&D assets, a specific number of highly skilled people (e.g., Ph.D.s, researchers, or collaborators hired as research staff), and a patent. Innovative start-ups in Italy are required by the legislator to meet at least one of the requirements listed above.

Food has played a significant role in this context, with the agri-food sector setting the pace for national innovation. Universities, research institutes, and start-up businesses have all engaged in technical innovation and research with the aim of enhancing existing processes and products or creating new ones (Sartoni and Guidi, 2020). Results from "Osservatori.net digital innovation" show that the Italian "Agriculture 4.0" (a term that refers to the impact of sensors, satellites, digital technology, and robotics on management tasks on farms and off-farms; Rose and Chilvers, 2018) accounted for 540 million euro in 2020 (4% of the global market), a 20% increase from the previous year. Additionally, in 2021, with 60% of the Italian farmers converting to Agriculture 4.0, the total revenues of these production models were 1.6 billion euros (+23% from 2020), notwithstanding the undesirable effects of the Covid-19 pandemic. Blockchain is the most widely deployed technology, especially for marketing and communication activities (54% of respondents), supply chain management (47%), and raising the level of production chain sustainability (27%) (osservatorio.net). Data analytics and the Internet of Things are further technology that farmers might use; the findings reveal.

Indeed, the openness of the Italian agri-food sector to innovation is all but uniform. The Italian agri-food SMEs have generally shown to be resilient to changes in the external environment and have demonstrated a high level of adaptation to new challenges (either the "megatrends" or the effects of climate change), despite the high level of fragmentation and the small size of the enterprises (Del Baldo, 2022). However, new technologies are challenging to integrate into established agribusinesses, due to innovation knowledge and competence gap (techeconomy2030). Instead, forward-thinking start-ups are promising to bring the tech industry's renowned disruptive innovation, gaining ground. In recent years, industries and organizations already well placed on the market have thus intensified exchanges with start-ups looking for fresh concepts and innovations. As seen by the founding of two significant international accelerators, Start-upBootCamp FoodTech in Rome and the FoodTech Acceleration Platform by Deloitte in Milan, this has led to increased awareness and growth potential for Italian start-ups (Sartoni and Guidi, 2020). They are the subject of the analysis in this study as a result.

Theoretical framework

The determinants of innovation can be evaluated using the framework provided by Crossan and Apaydin (2010). They divide these determinants into three macro-categories: environment, organization, and individuals and groups. At the environmental level, one main factor is industry, its main features, and the level of competition among enterprises (Cohen and Levin, 1989). At the organizational level, the driving factors of innovations are conversely related to size (Damanpour, 1991, 1996), resources, and learning capability of managers and the workforce. These factors can influence the ability of enterprises to react to the external environment's stimulus.

The learning curve of an enterprise affects organizational adaptability, as a result of changes in the enterprise model which arises as the result the convey of high-tech capabilities (Lall, 1992; Bell and Pavitt, 1995). Organizational adaptability results in growing requirement for IT capacities and investments (Fjermestad, Kudyba, and Davenport., 2020).

Neirotti and Paolucci (2011) claim that researchers have concentrated on opening the black box, which is motivated by worries about how IT adoption affects SMEs' innovative performance. Additionally, SMEs are acknowledged as being extremely innovative and having agile, flexible structures (Gopalakrishnan, Pérez-Luo, Saporito, 2016; Laforet, 2013), despite appearing to be both independent (Hayek, 1945) and synergetic (Barnard, 1938) in the utilization of external events. They also tend to adapt more to the current knowledge-intensive economy (Kock and Gemünden, 2016; Hessels and Parker, 2013).

Utilizing a collaborative strategy, organizational adaptability aids businesses in enhancing their innovation learning curve over time (Kelly, 2009). According to organizational learning theory, the ability of an individuals to exploit innovations and to build novel knowledge is reliant on their cognizance of the situation, the capacity to explore, and the aim to exploit (Nambisan, Agarwal, & Tanniru, 1999). Kohli and Melville (2018) describes learning a key organizational lens through which the internal organizational environment of digital innovation has been studied. For instance, learning can be seen as a link between innovation and routine work, which is stagnant and resistant to change (disruptive but usually important; Huang, Makoju, Newell, & Galliers, 2003). In accordance with Chan et al. (2019), adaptability fosters disruptive digital innovation in SMEs by reducing any rigidity in their business models, maintaining their innovative capacities, and achieving organizational ambidexterity while balancing the tension. Organizational adaptability, according to Grover, Sambamurthy, and Bharadwaj (2003), can also be viewed as a co-evolutionary adaptation. They defined it as an organization's capacity to "learn over time and through experience as they develop digital options and agility and launch a variety of competitive actions" (p. 253).

Therefore, we propose that there is a link between digital learning orientation, organizational adaptability, and digital innovation through a conceptual framework depicted in Figure 1. Furthermore, we propose that the positive influence of organizational adaptability on digital innovation is enhanced through the mediating role of digital learning orientation. The work by Scuotto and Tarba (2021) confirmed that organizational adaptability and ambidexterity of smart manufacturing SMEs have a positive influence on digital learning but the influence of digital learning orientation on digital innovation is under-studied.

Purpose of the paper. *Following the findings from the literature, we seek to effectively determine the effect of organizational adaptability on digital learning orientation and digital innovation among start-ups in the agri-food sector. Additionally, we want to assess the effect of digital learning orientation on digital innovation, and particularly, we want to investigate the influence of digital learning orientation on the relationship between organizational adaptability and digital innovation among start-ups in the agri-food sector.*

Accordingly, we formulate the following hypotheses:

H1: Digital learning orientation of agri-food start-ups has a positive effect on the digital innovation

H2: Organizational adaptability of agri-food start-ups has a positive effect on digital innovation.

H3: Organizational adaptability of agri-food start-ups has a positive effect on the digital learning orientation.

H4: Digital learning orientation mediates the relationship between organizational adaptability and digital innovation.

At the same time, we aim to add to the body of research on digital innovation in agri-food start-ups, by arguing that digital learning orientation has a beneficial impact on digital innovation, based on empirical data. We will in fact evaluate digital innovation from a digital learning orientation standpoint, in contrast to the majority of past studies.

Methodology.

Sampling strategy

We will collect data adopting a purposive sampling strategy from the data source Bureau van Dijk database AIDA (Mara Del Baldo, Onest et al., 2022), which describes the economic and financial situation of Italian enterprises. We will use the following criteria to define the final sample:

- 1. Industry, according to the ATECO code: enterprises that belong to "agricultural cultivation and production of animal products, hunting, and connected services"; "forestry and use of forest areas"; "fishing and aquaculture", "food industry" and "beverage industry".*
- 2. Type of enterprises: innovative start-ups.*
- 3. Time period: last year available, 2021.*

According to AIDA, the number of innovative start-ups in 2021 in the agri-food sector was 223. The leading region is Lombardia (23%), followed by Emilia-Romagna (12%), Lazio (11%), Campania (8%), and Puglia (7%). In most cases, they are micro companies, with less than nine employees (97%), while only seven enterprises are small (more than nine employees), and 79% of them have total revenues under the average.

Research design

The nature of the research objective is quantitatively inclined, hence the adoption of a quantitative research approach with a descriptive survey design. The research methodology will make use of a questionnaire to be sent, by email, to start-uppers in the agri-food sector in the Italian context (database obtained from AIDA). Questionnaires will

be used to obtain information about the three main constructs under analysis, according to the research design: organizational adaptability, digital learning orientation, and finally digital innovation.

To avoid errors and bias in the questionnaire completion, and to verify the clarity of the items, we will subject the survey to a review by three to five experts, belonging to the academic world and to the start-up entrepreneurial environment. Moreover, we will perform a pilot test with the assistance of ten or twenty entrepreneurs from local start-ups.

The survey will be first designed in the Italian Language (Brislin, 1970 and Del Giudice et al., 2021), and sent by email; then it will be translated into the English Language by a bilingual professional (Keskin, 2006).

The primary data will be merged with secondary data sourced by AIDA, to prepare the dataset to perform the analysis and test the hypotheses.

Variables and measures

The survey will be divided into four parts: the first one will consist of three items to evaluate organizational adaptability (adaptation from Del Giudice, 2021), using a seven-point Likert scale. This is an attitude that needs to pervade the organization, starting from the leader (Boylan and Turner, 2017), and regards the readiness of an organization to react to planned or unplanned changes (Del Giudice et al., 2021, Birkinshaw and Gibson, 2004). It is also defined as a multidimensional construct that includes several cognitive skills and behaviors, and it is necessary to include new ideas in the organization routine and transform the culture (Boylan and Turner, 2017). It permits the creation of innovative digital instruments or outcomes, increases the level of agility to market changesets, and provides new market opportunities (Davenport, 2000; Hayek, 1945).

The second part of the survey will be dedicated to the evaluation of digital learning orientation, and it will consist of seventeen items, four to measure commitment to learning, four to evaluate the shared vision and four to measure open-mindedness, and five to measure intra-organizational knowledge sharing (Sinkula, 1997, Calantone et al, 2002). All these items will present a five-point Likert scale, from “strongly disagree” to “strongly agree”. This variable is usually tested at the educational level (the unit of analysis being students) (Bullen, Morgan, and Qayyum, 2011, Aboobaker and Zakkariya, 2021), while only a few researchers analyze this concept at the organizational level. One of the most appreciated solutions is the adoption of a three measures evaluation (Sinkula, 1997, Calantone et al. 2002). According to this view, the organizational learning of a company depends on the organization’s commitment to learning, shared vision, and open-mindedness, as well as intra-organizational knowledge. These measures are adapted considering the digital inclusion in the learning process of a firm in recent years.

The third part will comprise three items, with a seven-point Likert scale, to assess the adoption of digital innovation technologies (Del Giudice et al, 2021). It is a widely analyzed concept, which can be assessed using several measures. According to Ciriello et al. (2018), innovation in the digital context includes the creation of products, processes, or business models with the contribution of digital technology platforms as means or final output. The main features of digital innovation are convergence (union of separate components using technology), and generativity (digital technologies are “dynamic, extensible and malleable”) (Yoo et al. 2012). We associate this concept with the introduction of Agriculture 4.0 technologies such as Big Data, the Internet of Things, and automation (Damanpour and Arandiv, 2012) by the interviewees.

The last part of the questionnaire will be composed of demographic measures, used to obtain information about control variables:

- A. Number of employees: it is an indicator of an enterprise’s size (Rothaermel and Deeds, 2004; Wei, Yi and Guo, 2014).
- B. Region dummies: a variable equal to one if the enterprise belongs to a specific Italian region and zero otherwise (Minus one to avoid the dummy variable trap) (Onesti, Monaco and Palumbo, 2022).
- C. Sub-sector: it is useful to evaluate the competition level of each sub-sector in the agri-food industry. (Thomas et al., 2017).
- D. Total Revenues: it is an indicator of performance of an enterprise. (Onesti, Monaco and Palumbo, 2022, Calantone et al., 2002).
- E. Age: natural logarithm of the difference between the current year and the year of foundation (Wei, Yum and Guo, 2014; Sinkula, 1997 and Calantone et al. 2002).

Data analysis

We will test the relationships defined by the model representation (Figure 1 in the Appendix) using structural equation modeling (SEM) (Rhee et al. 2010; Del Giudice et al., 2021; Calantone et al., 2002). This model enables the distinction between observed variables and latent variables (also known as factors), with two or more indicators. Factors are commonly represented in the graphical analysis using circles while indicators are represented by rectangles (Ullman and Bentler, 2013). Factors are divided into exogenous variables (independent) and one endogenous variable (dependent variable).

In this case, all the three variables will be factors, because they cannot be directly measured but require measures to define them.

This technique allows several advantages in contrast with other methods (multiple linear regression), since it eliminates the effect of measurement errors and further, offers the possibility to test complex and multidimensional relationships. Finally, this type of model permits to verify the “construct-level hypotheses at a construct level” (Ullman and Bentler, 2013).

The data in structural equation modeling are the variance and covariance in the sample covariance matrix. For this reason, descriptive statistics would be provided to obtain preliminary information about the main characteristics of the data sample, and to evaluate the correlation between the variables and the values of variance and covariance. To test the predictive power of the model, it would be necessary the analysis of R^2 and t -test.

Results. Provided the main features of innovative start-ups (Unioncamere, Del Baldo, 2022), we expect to obtain the confirmation of all the hypotheses described above.

Indeed, these enterprises are very small (according to the number of employees and revenues), the average age of entrepreneurs and employees is not quite high, people have a good educational background, and they are flexible but at the same time resilient to external changes.

In particular, we expect to obtain a positive relationship between digital learning orientation and digital innovation (Keskin, 2006; Lestari et al., 2018; Rhee, 2010; Aboobaker and Zakkaryia, 2021; Calantone et al., 2002), because the higher propensity to increase the level of digital knowledge, added to the shared vision through the organization, the open-mindedness and the sharing of knowledge in the organization, are all factors which should create the ideal background for the implementation and the satisfactory adoption of digital innovation in this context.

The second group of results should confirm the positive relationship between organizational adaptability and digital innovation (Del Giudice et al., 2020) for the reasons explained above, especially because of the good level of flexibility of the realities analyzed.

The third group of results should verify the positive and significant relationship between digital learning orientation (Sinkula, 1997; Liu, 2002) and organizational adaptability (Del Giudice et al., 2022), although this has not been tested in literature before. In this manner, it should be possible to understand if and to what extent the ability of an enterprise to adapt in a fast way to planned and unplanned changes is an accepted base to improve the orientation of managers and employees to digital learning.

Finally, the last part of the results should test the mediation role of digital learning orientation (Meekaewkunchorn et al., 2021; Rhee, 2010) between organizational adaptability and digital innovation adoption. We suggest that, without a solid learning orientation, it is difficult or likely impossible to guarantee the right level of innovativeness in relation to the digital changes in the external environment.

In conclusion, these expected results should confirm the relevant role of the determinant aspects of digital innovation (Crossan and Marina Apaydin, 2010; Rhee et al., 2010) in this specific context of small and innovative enterprises (innovative start-ups) in the agri-food industry, as one of the main drivers of the Italian tech economy.

Research limitations. Similar to other studies, there are some limitations to ours, and some recommendations for further research might be made.

For instance, it would be interesting to replicate the study to check the generalizability of our findings, and there are numerous ways to do it.

First, our analysis will investigate how organizational adaptability could influence digital innovation through the digital learning orientation of Italian start-ups in the agri-food sector. Exploring the same relationship, and particularly the mediating effect of digital learning orientation, in other countries where the agri-food industry has been experimenting with the same transition towards Agriculture 4.0, driven by innovative start-ups, would thus be interesting.

Further, instead of focusing simply on innovative start-ups, agri-food SMEs might be the unit of analysis in the following studies, which would allow us to evaluate the potential range of effects of the control variables.

Finally, we may expand this study to other sectors (such as manufacturing, energy, or healthcare) where digital transformation has had significant or comparable effects. This would allow us to assess whether and how much the model we suggest might alter as a result of industry effects.

Managerial implications. We expect that the findings of our analysis could contribute to the evolution of innovative start-ups in the Italian agri-food industry into established and more competitive enterprises. Indeed, the outcomes should attest to the beneficial influence of digital learning orientation and organizational adaptability on digital innovation, confirming the significance of workforce and organizational characteristics in developing the ideal responses to external changes. This suggests that it is possible to be competitive in this complex industry without sacrificing the economic purpose of the enterprise, leveraging on the human resources function of these enterprises. Accordingly, the selection of employees must be focused on the educational background and behavioral characteristics to provide a satisfactory and innovative development, because digital learning orientation is a multifaceted notion influenced by various factors, such as open-mindedness and commitment to learning.

A second implication is related to the value of investing in digital learning to establish the ideal environment for the adoption of digital innovation. Although the government has designated funds and incentives for these businesses, innovative start-ups are typically micro-firms with a small number of employees. As a result, it is crucial to make the best use of the resources available to raise the level of digital education and increase the likelihood that the introduction of digital technologies will be successful.

The third implication is broader and refers to the need for the organization to keep a good level of adaptability. The level of competition among enterprises in the agri-food sectors is currently quite high, and the contribution of digital innovation is a potential source of competitive advantage. For this reason, it is essential to choose and train employees to be responsive and adaptive to all changes that occur in the market and possibly anticipate these changes.

Originality of the paper. Our study aims to develop a conceptual framework linking digital learning orientation, organizational adaptability, and digital innovation. The role of digital learning orientation in this relationship is novel,

especially in the emerging digital innovation market. We contribute to the digital innovation literature by proposing a positive effect of digital learning orientation on digital innovation. Unlike most earlier studies, this study assesses digital innovation from a digital learning orientation perspective. Additionally, this study proposes a positive effect of organizational adaptability on digital learning orientation which has not been tested in the literature.

Accordingly, it is expected that start-up businesses with a high level of learning orientation will help them to accept developing know-hows and advance novel skills and design state-of-the-art products.

Our study is very relevant at this time when innovative start-ups have gained prominence in the agri-food sector as major drivers behind innovation, sustainability, and a focus on food safety orientation.

Finally, we will contribute to empirical evidence on digital innovation in the context of start-ups in the agri-food sector.

Keywords: digital innovation; organizational adaptability; digital learning orientation; agri-food start-ups; Agriculture 4.0

Fig. 1: Framework of the study

Exploring the interplay between digital implementation and SMEs' performance: an empirical study

LUDOVICA ANTENZIO* DANIELA DI BERARDINO*

Framing of the research. *Smart technologies implementation has gained a key role within companies, influencing both strategic and organizational levels (Isensee et al., 2020), especially by revolutionizing internal organization through operational processes, communication and corporate governance (Matarazzo et al., 2021), as well as external relationship with customer, suppliers and industrial partners (Matarazzo et al., 2021).*

Digitalization is changing small and medium enterprises' business model and customers' value creation process (Matarazzo et al., 2021) with the aim to gain competitive advantages in intense and dynamic market competition (Ghosh et al., 2022) and to improve their business performance (Roffia, 2020). Digitalization, digital transformation and digital innovation have been central issues in economic and academic debates, assuming a key role in the development of small and medium enterprises (SMEs) (Eller et al., 2020; X. Zhang et al., 2022). Defining digital implementation (DI) as the integration of digital technology into all areas of business, fundamentally changing how you operate and deliver value to customers (Kraus et al., 2022; Verhoef et al., 2021). DI contributes as an input and as an outcome, while also affecting the performance and efficiency of companies (Corvello et al., 2023; Gaglio et al., 2022; Verhoef et al., 2021). The prominent impacts of smart technologies in society, such as Artificial Intelligence, Big Data, Internet of Things, and cloud computing, have revolutionized internal operational process (Isensee et al., 2020), innovation strategies (Ghasemaghaei and Calic, 2019), and decision-making (Goes, 2014; Merendino et al., 2018), as well as the environment or context in which these process are conducted (Corvello et al., 2023), leading firms to adopt malleable organizational design that digitally transform their business models (X. Zhang et al., 2022).

Purpose of the paper. *This study aims to contribute to strategic management studies by examining the existent relationship between the DI of SMEs and their performance.*

Researches have paid many attention to the pervasive adoption of digital innovations in big companies by focusing on new products or services as an outcomes and how their new products and services are commercialized (Ancillai et al., 2023; Sabatini et al., 2020). SMEs have an important position within the economy of the European Union as they make up 99% of EU businesses in 27 countries and they cannot avoid being influenced by the environment's changing¹. Due to the importance of SMEs, they cannot be excluded and must adapt to the changes that are taking place over the years.

Digital innovation and implementation assume a crucial role in the development of SMEs, because they influence not only internal strategies linked thus to operational development but also external relationships and thus user choices (Eller et al., 2020; Kotarba, 2018; Skare et al., 2023). Specifically, digital innovation is presented as a key factor in improving the efficiency and effectiveness of business operations, developing new products and services, reaching new markets and improving customer relations. Thus, digital technologies (DT) are the stars of this transformation, which become a priceless source of future competitiveness for contemporary SMEs (Ancillai et al., 2023).

The rising of DTs are reaching across SMEs innovative industries as well as traditional industries, which are typically not characterized by high levels of technological investment (Teece, 2010). DTs have been significantly adopted by companies, shaping industrial systems, operations, business processes, and the way companies create and capture value across a broad range of fields (Ancillai et al., 2023; Müller et al., 2018).

DI significantly impacts SMEs' business activities (Matarazzo et al., 2021; Skare et al., 2023) and improves their competitiveness (Matarazzo et al., 2021; Skare et al., 2023) and radically altered organizations (Ardito et al., 2021) and environmental conditions (Corvello et al., 2023; Ghosh et al., 2022; Isensee et al., 2020). In this view, new DTs enables SMEs to pursue new opportunities and supply value when companies unfreeze their full business potential (Ancillai et al., 2023) and, therefore, are empowered to exploit these technologies (Verhoef et al., 2021).

DI goes over the business changes of individual processes, products, or repeated tasks performed by employees that impact entire business (Verhoef et al., 2021). Kotarba highlighted that DI leverages technologies to have an important impact on three levels: external by driving to increase the customer experience and thus boosting the value proposition; internal by moving to shift organizational structures and processes (Kotarba, 2018). The last level is more holistic by

¹ https://single-market-economy.ec.europa.eu/smes_en

going to completely disrupt the entire business model leading it to become innovative as well (Verhoef et al., 2021). However, the three levels do not operate individually but are all focused on improving and enhancing the performance of small and medium-sized companies (Eller et al., 2020; Gaglio et al., 2022).

Internally, DI can offer several benefits, such as improving operational efficiency by automating some business processes (Ghosh et al., 2022), enhancing information and data management, reducing turnaround time as well as improving management of inventory and supply chain (Ardito et al., 2021; Cassetta et al., 2020). In the same way, there are some productivity benefits through the adoption of several and specific technological tools such as IoT, Artificial Intelligence, etc., which enable small and medium-sized businesses to work efficiently, reduce some costs and minimize human effort (Hansen & Bøgh, 2021). The deployment of selected digital tools also enables rapid adaptation to changes within the external environment thereby increasing the competitiveness of small and medium-sized enterprises that can branch out into new and international markets through the use of e-commerce and online payments, as well as by scaling up their value proposition with new products and services (Li et al., 2023). SMEs' own use of a website and social media can also generate increased performance and consumer interest, which in turn helps increase a company's return (Gaglio et al., 2022). As a result, SMEs in almost all industries have undergone or are currently undergoing DI (X. Zhang et al., 2022; Z. Zhang et al., 2023).

However, due to the limited funds, resources and capabilities (X. Zhang et al., 2022; Z. Zhang et al., 2023), SMEs are lagging when it comes to digitalization (Eller et al., 2020) which has a negative impact on performance. SMEs face high barriers, and it is more difficult to successfully implement digitalization (X. Zhang et al., 2022). Not always they are able to deploy in their business the technology drivers most fitting to their requirements. In some cases, when they switch to new technology, the expected results are not always achieved and consequently, small and medium-sized enterprises fight to attain the projected outcomes driven by the fact that the empowered transformations currently fail to generate benefits that leaders have been expecting by lagging behind (despite having introduced a DI) in major decision-making that then leads to business differentiation and ultimate goal achievement (Kohtamäki et al., 2020; Tortora et al., 2021).

A large stream of literature has focused on the interaction between DI and SMEs. Maroufkhani (2022) focuses on success factors and the influencing mechanism of DI in SMEs, showing the technological and environmental factors positively impact organization capabilities and promote the success of DI in SMEs (Maroufkhani et al., 2022). The existent literature has been large explored the implementation of DI in large firms (X. Zhang et al., 2022) or in innovative firms such as start-up, spin-off or high technology firms (Ghezzi and Cavallo, 2020) by analyzed individual case studies. However, specific studies on SMEs that operate in both traditional and innovative sector are relatively scarce. While recent studies have focused on the integration of new technologies in the internal process, especially in Industry 4.0 (Ancillai et al., 2023; Müller et al., 2018). They studied how this incorporation change business model (Gaglio et al., 2022) or change value creation (Matarazzo et al., 2021). Due to the lack of defined index to evaluate DI within the SMEs, scholars have focused on how adopting individual technologies can offer a positive impact on business performance (Ardito et al., 2021; Skare et al., 2023).

These studies neglect the different impacts played by the implementation of different digital technologies. The extent to which SMEs need to undergo DI and the impact of different technologies on performance remain unclear. While studies have provided valuable insights, there is also a high degree of fragmentation on the topic that inhibits a comprehensive understanding of the issue and represents an obstacle to the advancement of academic research.

Building this state of art and in line with the academic debate, this research aims to explore the relationship between different digital technologies and SME's performance.

The study focuses on the Italian context and SMEs. The Italian context is a relevant test case with strong evidence of SMEs as these companies are an important and representative component of the country's business structure (Cassetta et al., 2020) and are located throughout the country. According to the European Commission, small and medium-sized enterprises in Italy represent the basis of the economic territory and are key to economic and territorial development.

Italy's SMEs-based entrepreneurial fabric makes digitalization critical for its economy. However, implementing DTs in SMEs is complex due to territorial, sectoral, cultural, and organizational factors. Italian firms have comparatively slower adoption rates of DTs rather than European countries, attributed to limited knowledge, financial resources, cultural challenges, and regional differences (Ancillai et al., 2023; Matarazzo et al., 2021; Roffia, 2020). Northern SMEs are more innovative and export-oriented, showing greater openness towards DTs. SME digitalization studies in Italy should consider these unique features to maximize opportunities and overcome challenges (Maroufkhani et al., 2022).

Methodology. To evaluate the relationship between SME's performance and DI, we use the generalized methods of moments (GMM), considering the DI and SMEs' performance estimate based on a pool of indicators. We consider a sample of 500 SMEs, innovative and non-innovative, over an 8-year period to emphasize the actual relationship between the adoption of DI and the increasing of the performance. This research is based on a combination of methods and empirical models that permit us to explore the existent relationship between the adoption of different digital innovations tools and the impact of the SMEs' performance.

In developing this research, we constructed and considered several variables to investigate the adoption of DI, combining a series of databases and sources.

Data for selected variables related to SMEs' performance were collected using AIDA Bureau van Dijk's database, which is a comprehensive platform used to research, analyze and process economic, financial, and commercial

information of all public limited companies operating in Italy. This database is increasingly validated and widely used in the literature (Civera and Meoli, 2023; Roffia, 2020).

Data used to construct variable *DI* come up from different database and sources including Digital Economy and Society Index (DESI, 2022), firm's website, and variables widely used by academic researchers (Skare et al., 2023). To structure the variables regarding *DI*, an index is proposed based on a set of indicators, which includes variables such as the use of e-commerce, social media, big data, cloud, Artificial Intelligence, e-commerce turnover, SMEs selling online, selling online cross-border, ICT specialists, number of international clients.

Firm's website information is collected by "Wayback Machine of the Internet Archive", which captures and stores website daily and track their history and their evolution over time. To measure the SMEs' performance, we propose using a series of accounting indicators recognized by academic community and comparable like ROI, ROE, ROA, ROS, return R&D investment, number of registered patents (Liu et al., 2022). A series of control variables are included in this research like firms' size, measured as the total number of employees, firms' age measured as the total number of years since a firm's establishment and firm ownership (Liu et al., 2022).

Our sample comprises 500 innovative and non-innovative Italian SMEs, collected over an 8-year period (2013-2021) from AIDA and the Italian register of start-up and innovative SMEs. The reason why to choose this sample is prompted by a several reasons. The first concerns the heterogeneity of the sample, which well represents the reference context characterized by small and medium-sized companies distributed throughout Italy with small and large regions, more and less developed according to territorial identity in Italian NUTS 2 and European Cohesion Policy. Secondly, the Italian context is a relevant test case being SMEs the main industrial system of the country. Thirdly, the sample of 500 SMEs turns out to be very significant in terms of its contribution to the academic debate in which recent studies offered insight into a smaller number of companies in developed countries.

SMEs were identified following the definition established by the European Commission (2003) and in compliance with European Union guidelines. Due to configuration and as also reflected in many academic studies, the Italian territory has a clear division at the level of enterprises in the various sectors that populate the nation. Data provided by the European Commission in the plan for the "Cohesion Policy 2021-2027" project evaluating European structural and investment funds for regional and urban development in the EU, also assessing the digital transition in companies, shows that Italy is divided into less developed regions, transition regions and more developed regions. As Italy is the EU's third-largest economy, its progress in *DI* over the next few years will be crucial for the entire EU to meet the Digital Decade 2030 goals.

The 500 firms from the Italian SMEs were selected on an equal basis within the territory concerned so that the sample could be considered highly heterogeneous. First, the homogeneity of the variables used to construct our model has been considered uniform to ensure the model approach. Second, the heterogeneity of the sample, representing the reference context, is characterized by enterprises located in medium-sized and large regions and less and well-developed according to the territorial identity considered in NUTS 2 of European Union policies (EU) and localized in different region with differences in terms of population, GDP. To make our re-partition consistent with the real information we take into consideration data regarding innovation, R&D investment, and ICT development analyzed by ISTAT. Finally, we applied probability-proportional-to-size-sampling in each stratum of less and well-development to ensure the robustness of our sample (Levy and Lemeshow, 2008). Firms located in an area with a larger number of total firms, population, GDP and R&D investment, with higher innovation and ICT development in each stratum are more likely to be selected (Levy and Lemeshow, 2008). This means that this subdivision is distributed proportionally throughout the country according to the parameters taken into consideration.

The sample of 500 small and medium-sized enterprises is highly significant in terms of contributing to the academic debate (Ardito et al., 2021; Müller et al., 2018; Zoppelletto et al., 2023).

Due to the characteristics of the data, we use GMM method with a wide cross-section and a relatively short time period (8-Years), it is a suitable for estimation in dynamic panel data models and allow us to reduce the effect of possible unobserved heterogeneity and endogeneity issues into the model (Lee and Yu, 2014). The adoption of the GMM method allows us to predict the extent of the strength of the effects of the independent variables on the dependent variable over the years.

Results. This research examines the links between digitalization and SMEs performance. Specifically, these findings support the current academic debate on SMEs, which emphasized the importance of implementing managerial software, supply chain management systems, and administrative automation tools that can improve SMEs efficiency by reducing costs, time, and required resources. While this relationship is evident, we are going to investigate the role that digitization plays in increasing the competitiveness of small and medium-sized enterprises and how digitization affects the performance levels of SMEs.

Preliminary results show that SMEs performance have a direct relationship with *DI*, with a distinction made between innovative and non-innovative SMEs. The analysis revealed that innovative SMEs showed a higher level of digitalization compared to non-innovative SMEs. In detail, innovative SMEs were more likely to have a greater *DI* using tools such as artificial intelligence, big data, and cloud computing. Moreover, the adoption of these technologies positively affected the financial and innovative performance of innovative SMEs. On the other hand, non-innovative SMEs showed a lower level of digitalization, with the adoption of cloud computing that limits their capacity of collect and organizing a large quantitative of data, IoT that if unused leads to have a higher operative costs and lower operational efficiency. This had a limited impact on their performance. These findings suggest that specific digital technologies may improve the SMEs' performance more than others.

Research limitations. Due to the quantitative nature of the analysis, and the complexity of the phenomenon of DI this research presents intrinsic limitation related to the sample and variables used in the analysis, which open up opportunities for future investigations. The first limitation in conducting the research is the sample for analysis. Although it represents the development in the Italian and European contexts in terms of characteristics and structure, we focus on a single country.

Future research could extend this sample to other countries with different policies, development plans, and social cultures to evaluate the impact of these results in various directions.

Another possible limitation arises from the potential weaknesses in using the performance measures linked to accounting ratios. These ratios suffer the earnings manipulation risk and don't evaluate innovation or the strategic efficacy. Similarly, we measure digital innovation using the macro-variable of DI: this choice is driven by the need to capture the evolution of these practices in SMEs over the years. Although SMEs differ by sector, this approach enables us to capture the development of digitalization and the relationship between the SMEs' internal development DI practices.

Managerial implications. This study holds significant and important managerial implications for SMEs. The study provides useful insights to guide SMEs to carefully plan their digitalization strategy, especially since not all digital tools adopted by SMEs necessarily lead to performance improvement. Thus, it emphasizes the importance of developing a comprehensive digitalization strategy to guide the implementation of digital practices. SMEs need to carefully evaluate the appropriateness of DTs before implementing them and ensure that they align with their overall business strategy. Therefore, it is crucial to implement the digitalization of operational processes and internal management systems to increase efficiency and productivity. Furthermore, caution is necessary when implementing external digital practices, such as customer-facing activities, as results may not always meet expectations.

Research findings provide useful insights that may contribute to future public funding decision, for digitalization, providing a comprehensive picture of Italian SMEs.

Originality of the paper. The originality of this paper lies in its investigation of the relationship between DI practices and the development of SMEs. While previous research has explored the adoption of digitalization on SMEs, this study adopts a comprehensive approach to digitalization by examining the impact of different digital technologies on SME performance. This study provides insights into the complexities of digitalization in SMEs and highlights the need for SMEs to adopt a strategic approach to digitalization in order to fully leverage its potential benefits. Furthermore, the study's approach constructing variable of DI provides a novel way to measure the DI achieved by SMEs and its relationship to performance. Finally, the study's focus on a specific country provides valuable insights into the development of SMEs in that context and highlights the potential for further research in other countries with different policies, plans, and cultures.

The internationalization of luxury SMEs: untangling the liability of localness

ANDREA RUNFOLA* MATILDE MILANESI* SIMONE GUERCINI[▲]

Framing of the research. *This paper investigates luxury SMEs and the features of their internationalization process, focusing on the liabilities that may emerge in the process. The luxury industry has always attracted scholars' attention, dealing with several topics (Kapferer, 2014; Cristini et al., 2017; Ko et al., 2019). Among these topics is the interplay between internationalization and luxury companies. Thinking of luxury companies as international companies may seem almost obvious to many. Several luxury fashion brands perfectly represent the globalization that has characterized the past decades. These brands are often the expression of large companies and part of global groups, and they have been the object of international business and international marketing studies (Moore et al., 2010, Armitage and Roberts, 2021). There is a strong bond between luxury and internationalization. It is possible to outline some of the main motives that lead luxury companies to face internationalization processes, often since their establishment (Runfola et al., 2022). The size of the demand is a first motive: luxury fashion companies may find insufficient demand in the country of origin to guarantee their development, especially for niche or elitist products, and this can push luxury fashion companies to turn to foreign markets to find broader demand. Additionally, a global image and, therefore, a global reputation of luxury brands are essential for obtaining legitimacy and orienting customers' preferences (Philippe et al., 2022). This aspect relates even more to global recognition, which has long been indicated among the elements that characterize the brand strategy of companies in the luxury industry. Another factor that pushes the internationalization of luxury fashion companies is represented by the characteristics of the customers of luxury products, namely their cosmopolitan character, attention to the international scenario, and frequent trips to various destinations for business and leisure reasons. Lastly, the evolution and management of distribution and communication channels, including the physical and the digital ones, have pushed luxury companies to open retail stores in areas such as large metropolises and the main cities or shopping centers in many foreign countries (Guercini and Runfola, 2016; Guercini and Milanese, 2017). The management of distribution and communication channels is related to different types of advantages: the economy of scope (distribution formats and merchandising models can be replicated on a large scale and for different brands), the economy of scale in the purchase or rental of physical spaces and advertising spaces (both in the traditional and digital media).*

Thus, luxury and internationalization seem to be two faces of the same coin. However, research on the internationalization of luxury companies has not yet reached a level of maturity and depth. Most contributions have focused on some relevant aspects, such as the internationalization of management of know-how (Moore and Burt, 2007), the sourcing of products from foreign markets and supply chain management (Caniato et al., 2011), the operation of retail stores by fashion retailers within foreign markets, and the use of e-commerce (Guercini et al., 2020). Many contributions have focused on large luxury companies. This focus is because large companies tend to have the necessary resources to establish themselves on an international scale. However, this also happens frequently for smaller companies, making the topic worthy of further attention. On this point, the international business and entrepreneurship literature offers instead a contribution, which has been growing since at least the nineties, as evidenced by the emphasis on born global companies (Knight and Cavusgil, 2004; Coviello, 2015) and international entrepreneurship (McDougall and Oviatt, 2003). Thus, we argue that there is a need to consider the internationalization of luxury companies from the perspective of small and medium-sized enterprises (SMEs). These companies are as international as large multinationals and often have roots in manufacturing. Moreover, internationalization frequently occurs since the foundation of the company. Despite this, both the theoretical debate and the world of practitioners seem to have paid much attention to the internationalization of large luxury companies, leaving luxury SMEs out of the debate. Moreover, the international business literature underlines that internationalizing companies may suffer from liabilities (Ong et al., 2022), especially the liability of foreignness and the liability of outsidership (Johansson and Vahlne, 2009), namely difficulties faced by companies in their internationalization process, and only in part concern the digital context but, above all, they manifest in the

internationalization of companies both through the opening of subsidiaries and in the opening of stores in foreign markets. The liabilities faced by luxury SMEs and how these can be overcome represent fertile ground for in-depth investigation.

Purpose of the paper. Some research gaps seem to emerge. The first concerns the internationalization of luxury companies that is taken for granted in the literature, or it seems to be understood that operating in the luxury industry implies being international. However, this can not be taken for granted, and further research seems necessary to analyze the features of the internationalization of luxury companies. A second gap concerns the study of SMEs. In fact, a large part of the literature on the internationalization of luxury companies takes into consideration the global brands of large companies. At the same time, the Italian panorama - and not only - sees SMEs operating steadily in the global luxury industry. Finally, research on liabilities in internationalization focuses on categories such as foreignness and outsidership. However, the peculiarities of SMEs and the luxury industry that could bring out new liabilities are worthy of attention.

Starting from this background, this study addresses the internationalization of luxury SMEs, intending to outline its features and the liabilities that may emerge during the internationalization process. Thus, the research questions addressed by this study are the following:

- How do luxury fashion SMEs set the internationalization process?
- How do liabilities in internationalization intervene in this process?

To this end, the paper examines four cases of Italian companies operating in the luxury fashion sector. In fact, Italy is not only a context rich in SMEs but is also at the forefront of the global luxury fashion industry, presenting a context in which both large global companies and manufacturing SMEs coexist, with the latter well-positioned in global luxury niches.

Methodology. To address the research gap, we adopted a qualitative research methodology. In particular, we present the results of a multiple-case study (Eisenhardt, 1989; Eisenhardt and Graebner, 2007) of four Italian luxury SMEs in the fashion industry. The companies were purposively selected as cases of international luxury SMEs. Moreover, the authors of this paper had the possibility to follow the companies or get in touch with entrepreneurs of the companies in previous research. The primary sources of information were in-depth interviews with entrepreneurs and managers of the companies conducted within three years (2019-2022). Interviews were supplemented with findings from secondary materials (such as balance sheets, company documents, and news in magazines). Moreover, it was possible for some of the companies to organize company visits. The empirical material collected was then analyzed through a within-case and cross-case analysis. We first developed single case studies and then confronted the results through cross-case analysis. We identified some common themes that characterize the international development of luxury SMEs in the fashion industry. The company selected for the research were the following. Alpha is a family business that produces luxury leather items, in particular bags, and is also a supplier of major luxury fashion brands. For Alpha, foreign markets account for roughly 90% of the turnover. Beta is an artisan luxury company that produces handmade men's shoes. The company personalizes luxury shoes in its laboratory according to customer requirements. International markets quite exclusively generate company turnover. Delta is a women's clothing and accessories brand in the luxury segment, focusing on cashmere knitwear. 80% of its turnover is from foreign sales. Gamma operates in women's clothing, offering a total look proposal in the accessible luxury segment. Foreign markets account for around 70% of turnover.

Results. Findings from the cross-case analysis highlight some features of the internationalization of SMEs in the luxury fashion industry. In particular, we found a strong international orientation of each entrepreneur in any company. The internationalization of each company starts from the foundation and the brand's launch. The international mindset of entrepreneurs is then crucial. Beta, for example, launched a brand of men's shoes to target international markets directly. Delta entrepreneurs explained how internationalization has been within the company's DNA since its foundation. Moreover, to feed the international expansion, the four SMEs investigated propose a concept of luxury quality that relies on local craftsmanship but is not ostentatious. It means that the value proposition is strictly connected to the quality of the product that stresses the root with some specializations of each specific localization. In the case of Delta, for example, this means relying on quality, craftsmanship, and sustainable issues connected to the legacy of the region where it is located. This issue emphasizes how manufacturing competencies are crucial for international expansion in the four cases investigated. Similarly, in the case of Alpha, the territory's heritage lets the company produce luxury items and partner with important luxury players. Similarly, Delta and Gamma rely on the competencies of local suppliers. Interestingly, the fact that the SMEs investigated are run by families or single entrepreneurs points out another feature. Customer relationships are primarily managed at a personal level, with the direct involvement of the entrepreneurs. Beta is an emblematic case in this perspective, as entrepreneurs always travel to meet its customer directly. While this aspect is peculiar, the companies investigated adopted some of the most common strategies in retailing, with the management of retail stores abroad and online channels, with e-commerce through their own website. Delta is interesting as the company has invested significantly in retail stores supplemented by an e-commerce presence. However, the wholesale channel remains the main channel in most cases analyzed. For example, Beta directly manages the relationships with wholesalers. Additionally, Alpha and Gamma have significant relationships with a network of agents that let them export abroad. It is interesting to point out that foreign expansion is always a process that relies on careful consideration of costs in any company. In other words, entrepreneurs clearly understand the economic and financial implications of any strategy implemented due to the small size dimension. Gamma is emblematic in this respect. Gamma, for example, paid extreme attention to this aspect when it started a retail

project. To summarize, the empirical investigation shows how luxury SMEs in fashion present a genetic internationalization. We define international genetics as a characteristic of luxury SMEs that lies in considering the global market as the target market since the company's foundation. National and international markets are not separate but a sort of a whole. In this sense, as in the case of large fashion companies, SMEs in luxury fashion aim at obtaining global notoriety and prestige, although on a smaller scale. However, we found that each SME has global recognition. In foreign development, luxury SMEs found difficulties and suffered from liabilities related to their small dimension. Moreover, they encountered challenges competing with large dominant players in the global luxury markets. However, our cross-case analysis shows how luxury SMEs do not abandon international expansion; instead, they realize that only through being international they can be successful. Hence, we may argue that for luxury SMEs, not being international can be a liability. Results from our empirical investigation can let us advance the concept of liability of localness. Localness involves a lack of international genetics. In other words, if the SME does not have an international dimension, it can not be competitive in the luxury market. In our interpretation, the liability of localness implies low performance if luxury SMEs are not international. Each company in our empirical investigation clearly shows how the international character supports the competitive advantage in the luxury market.

Research limitations. The first limitation of the study concerns the focus on the fashion industry. Although the fashion industry is full of cases of luxury companies that represent leading global players, this prevents us from generalizing our results to luxury in the broad sense, although we believe that what emerges can be extended to more areas of luxury. A study beyond the fashion industry considering more areas of luxury, such as yachting, wine, or supercars, could help obtain transversal and more generalizable results. Furthermore, this study focuses on the Italian context, which undoubtedly represents a peculiarity, especially as regards SMEs. A cross-country analysis could bring out new insights, for example, by comparing Italy with other countries of origin of many luxury brands, such as France or the United States. Moreover, the attention on SMEs is justified by underdeveloped literature concerning the study of these companies in the luxury sector and by empirical evidence that places luxury SMEs as relevant players at a global level. However, comparing SMEs and large companies could widen the discussion on internationalization liabilities, allowing to unpack the liability of localness further. The latter represents a new concept that undoubtedly requires further empirical study.

Managerial implications. It is clear from our study that luxury calls for internationalization. Luxury SMEs should leverage a global demand and image, target defined profiles of consumers of luxury goods in international markets, and benefit from supranational management of distribution and communication channels. To do this, entrepreneurs and managers should immediately consider internationalization not as an option or a strategy to be pursued later but as a part of the DNA of the company's essence. In other words, they should remember that internationalization is more a must than a choice, although it can be pursued differently. Instead, staying in the domestic market means running into difficulties that can undermine the company's performance, including suffering from the liability of localness. However, this must not make entrepreneurs and managers eager to go abroad at all costs or make risky investments. Especially for SMEs, the focus must be on the solidity, also on an economic and financial level, of the company. The approach to internationalization must always be careful, reasoned, and calculated to balance growth in foreign markets with the company's economic and financial sustainability. In other words, entrepreneurs and managers must consider an "incremental" approach to internationalization. The incremental nature of internationalization is not so much about the choice of markets, which can also be very distant geographically and/or culturally, nor does it concern the entry mode, which can also be complex and require investments, such as the opening of stores. The incremental approach must concern constant attention to the company's economic and financial solidity to pursue balanced dimensional and qualitative growth. In this regard, international development may not always be linked to the dimensional growth of companies, which may remain small in size but still be relevant players in global luxury markets. The growth to be pursued can also be qualitative, related to relationships and capabilities. Therefore, the action of the liability of localness leads to a lower performance for luxury SMEs that are not international compared to those that are. The theoretical debate has highlighted a series of liabilities for SMEs, including smallness, foreignness, and outsidership, linked explicitly to internationalization processes. This study adds another, the liability of localness, which requires the company to design its business components considering the international dimension. In other words, the company was born with international characteristics to avoid difficulties due to the liability of localness.

Originality of the paper. The paper addresses the internationalization of luxury SMEs, a category of companies at the forefront of the global luxury industry, but it is under-investigated in the international business and international marketing literature. The fact that when we think of luxury, we usually remember large companies with globally known brands does not mean that luxury cannot offer other players. The foregoing analysis has highlighted the existence of a variety of companies and has proposed themes with both theoretical and managerial implications, which may be the subject of further academic and empirical research. Moreover, this study highlighted the genetic internationalization of luxury SMEs that can be considered "born global ante litteram" companies. In our interpretation, genetic internationalization is a different concept concerning that of born global. Our findings show how SMEs are born international. They do not become international within a time period or because they reach a threshold level of turnover abroad. Instead, they started by considering the international markets as a whole, and since the company started, they wanted to propose a brand with a global appeal to international clients. Hence, the national market cannot be a specific target, as found in our empirical investigation. Luxury SMEs, of course, develop in foreign markets incrementally. So, we do not want to affirm that SMEs have operated in any international market. Nevertheless, we want to stress that international genetics means that companies already consider the global market as their target at the

time of their foundation and the launch of their brand. This perspective is novel compared to existing literature, taking into consideration the internationalization of SMEs and luxury firms. Finally, the paper has introduced and discussed the concept of liability of localness. The understanding of what liabilities companies may suffer from when internationalizing has received attention. We propose an original contribution in this sense. Hence we believe that not being international in luxury represents a source of liability. Luxury is characterized by a series of features linked to the consumer profile, the need for a global image, the dimension of demand, and the management of communication and distribution channels. The two concepts of genetic internationalization and liability of localness are interconnected. Localness involves a lack of international genetics and, therefore, the failure to achieve an international dimension that allows effective and efficient competition in the luxury market. Although internationalization is challenging, not taking this path from the start puts luxury SMEs in an unfavorable competitive position. Our study emphasizing how SMEs in luxury have an international dimension is original because we believe that internationalization for these types of SMEs is not a strategy to implement. Instead, it is a feature to have to compete. To conclude, this paper has the merit of untangling the liability of localness as a novel liability from an international standpoint.

Keywords: SMEs; internationalization; luxury; liability of localness; case study; fashion.

Digital Platforms Business Models. A Systematic Literature Review[♦]

DANIELE BINCI^{*} GIORGIA MASILI[♦] CORRADO CERRUTI[♦] ANDREA APPOLLONI^{**}

Objectives. Research on digital platforms has increasingly grown over recent years (McIntyre et al., 2021) due to the pervasiveness of digital transformation, becoming relevant for scholars and managers (Abbate et al., 2022). Platforms are marketplaces, technology-mediated, that radically change how digital business ecosystems (Baumann, 2022) create, deliver, and appropriate value (Hein et al., 2019), by matching the supply side of the complementors, third-party collaborations and applications developers with the demand side of the end-users and customer groups contributions.

Literature has analyzed platforms in a quite fragmented way as separated research fields (Bonina et al., 2021) that consider different perspectives, mainly, the digital-technical view (Tiwana et al., 2010) and the economic-managerial ones.

While the technical perspective focuses on the digital technological components (Chae, 2019; den Hartigh et al., 2016), that enables platform transaction (Parker et al., 2016) for the matchmaking process, the economic-managerial view examines platforms regarding the interactions with users that disrupts traditional economic markets with a focus on the business model that enables new interactions (de Reuver et al., 2020) that lead to costs reduction for platform' offerings (Deilen & Wiesche, 2021) in the ecosystems (Halckenhäusser et al., 2020)

This fragmentation poses risks for misunderstanding the complex interactions and interdependencies that determine the platform dynamics performance with relevant limitations. Moreover, literature fragmentation calls for a more focused research effort to better understand a comprehensive view of the digital platforms' business model.

By systematically analyzing the previous literature, our paper aims at providing a more comprehensive understanding of the digital platform phenomenon by collecting evidence from the literature, which is sparse in the various related research fields. Based on a systematic literature review, the paper aims to systematize the scientific knowledge of the phenomenon and set directions for research. Our approach differs from previous conducted literature reviews which focus solely on one topic at the interface between digitalization and business model platforms. Our research questions are the following:

RQ1. To what extent do digital platforms business models find consideration in current literature and how is it characterized?

RQ2. What are the main research directions suggested by the analysis of the literature?

Methodology. We approach our research through the systematic literature review method. We apply our research under the PRISMA approach (Moher et al., 2015), an evidence-based checklist composed of the four following steps: Identification, Screening, Eligibility and, Inclusion. (Fig. 1).

Fig. 1: PRISMA Steps for literature review

Identification

The first step of data search is literature identification to locate the relevant topics by targeting prominent literature. The Scopus search engine which is widely acknowledged as a world-leading source in the research field (Paschou et al., 2020) was chosen to identify papers from relevant journals according to our purpose. We use two sets of keywords related to the concepts of the digital aspects of the platform and platform business model. The first set of keywords was related to the digital platforms: (“Digital Platform*” or “open platform” or “Multi-side Platform*” or “Transaction Platform*” or “Innovation platform*”). The second set of keywords was based on the business model perspective by using the general keywords “Business models” or “Business Model”. The dataset was enriched also by grey literature. Initially, a total of 757 studies were identified from the database.

Screening

Next, we used the screening criteria by including in the sample the most appropriate journals for the topic by selecting only published papers in the area of business and social sciences, written in the English language only. At this stage we selected 193 records. Not all the papers were available as full text. 115 papers were selected for the next steps (78) as not all the papers were available. The review covered studies conducted from 2017 to 2023 (Fig. 2).

Fig. 2: Time distribution of the selected papers

Eligibility and Inclusion

The abstracts of the articles were checked deeply to ensure quality and only digital platforms relevant publications were included in the review process. In this process, we excluded 31 papers as they were irrelevant. After removing the publications that did not meet the inclusion-exclusion criteria and quality assessment, a total of 84 remained for the “digital platform” business model literature review analysis. The data was then exported to an Excel sheet to perform the qualitative review analysis.

Findings. In this stage, a careful evaluation of each full journal article was carried out for the 84 finalized articles to ensure we captured only the digital platform. All 84 journal articles were identified as relevant to analyze, synthesize and present the interpretations on the paper topic. The papers selected are descriptively analyzed in this section concerning the year of publication, journal, and impact factor according to the Scopus database.

Figure 2 depicts the time distribution of the papers analyzed, all published between 2017 and 2023. More specifically, 60 articles (i.e., 71% of the 84 scrutinized papers) were published between 2020 and 2023, pointing to an increased scholarly interest in the digital platforms’ business model analysis. The growing interest in the digital platform business model phenomenon has been testified by recent literature reviews on the subject (Mishra, S. &

Tripathi, A. R., 2020; Mukhopadhyay, S. & Bouwman, H.; 2019; Trabucchi, D. & Buganza, T.; 2021). The journals were also classified according to the Scopus database subject area (Table 1).

Eight papers focus on the ICT sector, while fourteen are on strategy and management. It is worth mentioning that a journal may belong to more than one subject area. Moreover, several other subject areas were represented by fewer papers (such as decision science and social sciences). This trend confirms a rather fragmented picture, typical of a research area that is multidisciplinary and at an early stage of maturity. Additionally, the fragmentation of journals demonstrates that researchers studying this phenomenon have different perspectives and that the subject does not yet have established publishing outlets. and the industrial sector with the aim to identify trends within this body of literature. The journals are ranked by the number of published papers and their impact factor. The journal impact factor (IF) was retrieved from the Journals Website. The 84 articles in our database appeared in a total of 59 journals. Only 16 of these journals published two papers or more, showing a high degree of fragmentation of the literature. As an exception, two journals (the Journal of Business Research and Technological Forecasting and Social Change) published four articles each.

Tab. 1: Journals, Articles' focus and Impact factor

Journal	Focus	No. Articles	%	Impact Factor
Journal of Business Research	Business	4	4,76%	10.96
Technological Forecasting and Social Change	Technology	4	4,76%	10.88
Research in Transportation Business and Management	Policy	3	3,57%	4.23
Research Policy	Policy	3	3,57%	9.47
Electronic Markets	Marketing	3	3,57%	6.02
Journal of Service Management	Service	3	3,57%	11.77
Technology Analysis and Strategic Management	Technology	2	2,38%	3.75
Strategic Management Journal	Strategy	2	2,38%	7.82
Journal of Cleaner Production	Environment	2	2,38%	11.07
Technology in Society	Technology	2	2,38%	6.87
Creativity and Innovation Management	Innovation	2	2,38%	3.64
Others	-	54	64,29%	-
Total		84	1	

Evidence 1. The increasing interest in digital platforms and platform business models is recent but shows a fast-growing trend, with the knowledge stocks fragmented among different journals, such as innovation, strategy, business, policy, marketing and environment.

3 Methodological approach analysis

The papers were classified according to the methodological approach as either 'theoretical' or 'empirical'. The theoretical papers were further divided into three subcategories: a) literature reviews, b) taxonomy papers, and c) conceptual papers. Papers in the first category present a review of the studies of a given topic; papers in the second category develop taxonomies about the research topics; the articles published in the third category develop interpretative models about the digital platform business models. We also used three sub-categories to further classify the empirical papers: a) qualitative, which employ empirical research methods such as case studies, focus groups, or the Delphi method; b) quantitative, which employ surveys, simulations, or other model-based analyses, and c) mixed-method papers, which combine the above-mentioned methods. As indicated in Table 2, 63.1% of the studies were classified as empirical. Qualitative empirical research is the most prevalent (36 papers, 42.86%). As expected in such an emerging field of studies, this subset mostly relies on analyses of exploratory case studies (83%) (Paschou et al., 2020). Case studies (single or multiple) dominate the sample. Moreover, in general, emerging fields of research are predominantly conceptual and qualitative as researchers at this phase try to establish a common vocabulary, define concepts, and explore the phenomenon.

Focus groups and GT studies are the less frequent methods adopted. Quantitative and model-driven research accounts for only eight articles (16.47%), with mixed-method studies recording the lowest ranking (three articles, 3.57%). Conversely, there are 31 theoretical papers, which account for 36,90% of the sample, divided among literature reviews (twelve articles, 14.29%), taxonomy (three articles, 3.57%), and conceptual papers (sixteenth articles, 19.05%).

Tab. 2: Methodological approach

Paper Type	Method	Total	Percentage %
Theoretical	Literature review	12	14,29%
	Taxonomy	3	3,57%
	Conceptual paper	16	19,05%
	Total	31	36,90%
Empirical	Qualitative	36	42,86%
	Quantitative	14	16,67%
	Mixed	3	3,57%
	Total	53	63,10%
Overall Total		84	100,00%

Evidence 2. *The reviewed literature addresses the digital platform business model, mainly through empirical and qualitative methods, but quantitative and conceptual studies are also represented. In particular, most of the work was based on case studies, thus confirming the early stage of this research stream, wherein confirmatory and normative papers are almost non-existent.*

The platform sectors

The papers were classified according to the sector and industry analyzed. According to the idea that the business platform fits with digital service and servitization, the service sector contains about 75% of the papers, further divided into mobility and energy (38%), healthcare and payment (25%) and tourism and retail (12,5%). The resting 25% of the papers (4 in total) analyze the automotive and fashion industries.

Evidence 3. *The service industry is most addressed by empirical studies as it constitutes one of the most promising domains for exploring and/or exploiting the benefits of digital platforms. The energy and mobility sector has attracted significant attention from researchers. The rest of the literature is quite sparse on the different industrial sectors.*

Tab. 3: Platforms and sector analyzed

Sector	Industry	Total	Percentage%
Service	Mobility	3	18,75%
	Energy	3	18,75%
	Healthcare	2	12,50%
	Payment	2	12,50%
	Tourism	1	6,25%
	Retail	1	6,25%
Manufacturing	Automotive	3	18,75%
	Fashion	1	6,25%
	Overall Total	16	100,00%

3. Thematic analysis

The thematic analysis of the selected articles concerned three main areas. These include the challenges, the processes and the output of the digital platform business models.

1. *The digital platform challenges. An important streamline related to the digital platform business model is the digital transformation process of the platform (Andrade et al., 2021). It requires promotion and sensitization, suitable platform architecture and strategic judgment of platform providers as well as a start-up culture. But it also presents implementation barriers perceived by both customers and service providers for building a critical mass of producers and consumers (Hazée et al., 2020). In particular, an important challenge is related to the digital experience of the platform and the monetization opportunities, the exploitation of the synergy of digital and physical assets, and the innovation beyond the digital experience. Finally, an important challenge for the platformization is the avoidance of the fatal weakness of disintermediation of buyers and sellers on which they find each other on the platform and then bypass that platforms and its commission to complete their transaction directly, off of the platform.*

2. *The evolution of the digital platform business model. The idea of the business model transition from a linear business model towards a platform business model is quite pronounced in literature. This category groups studies that show how digital business models evolve when organizations move to digital platforms (Chen et al., 2022) and manage the complexities and the interplay of regulative, normative and cognitive challenges (Dell’Era et al. 2021), on platform competition (Parmentier et al., 2017). Longitudinal case study (dos Santos et al., 2022), theory of change (Mukhopadhyay et al., 2022), and process models are used for understanding the emergence of dominant platforms (Michelini et al., 2020), and explaining the ways in which innovation, sensing and integrative capabilities impact on value creation and capture dimensions (Khanagha et al., 2022).*

3. *Digital platform output: the service experience. This category groups the study related to the understanding of service experience toward retailers’ digital platforms (Lian et al., 2021; Nahr et al., 2022) and the relationships between platforms and customers (Cao et al., 2022), included the impacts on the servitization pathways (Tian et al., 2022) on platform value proposition and revenue model. (Holland et al., 2018). Service experience is also determined by critical antecedents both, from the entrepreneurial point of view, including entertainment, tangibility, reliability, and empathy and from the customer’s point of view, including entertainment, interactivity, tangibility, and empathy. Meanwhile, also platform consequences of service experience directly affect both use intention and satisfaction (Lian, 2021). Clients’ evaluation of the platform represents an important aspect (Cao, L., et al., 2022).*

Evidence 4. *It is important to understand how these platforms are extended and how customers evaluate them. Several themes have been associated with the digital platform concept (e.g., new business models, value creation and capture, change and digital transformation); however, a fragmented view of them prevails. Given the sparseness of the research on the topic in the literature and the absence of a common definition of the phenomenon, the extant research tends to focus on one or a few of the themes only. Although a detailed investigation of the single concepts can increase the knowledge of digital platforms, we suggest that future research should adopt a holistic and interconnected approach to the digital platformization phenomenon.*

Research limits. *Our work-in-progress review presents some limitations. The first limitation of our review is in the exclusion criteria: we are aware that including papers only in the English language and excluding publications (such as conference papers) might have circumscribed our main findings and implications. This limitation is particularly related to the procedure we follow for analyzing the papers that provide different mandatory exclusion criteria. We are also aware that due to the journal type selected and the keyword-based selection method for refining the sample analyzed, some papers that are related to the research focus but contain different keywords or have been published in other Journals could be excluded. Finally, related to the previous limitations, our findings are consistent due to the reliability of the systematic literature review approach, despite they are basically depending on the authors' background and the interpretivist approach for analyzing the papers' content.*

Practical implications. *Practitioners may find our review particularly useful as we summarized the state of the research on the digital platform business model. Particularly, the challenges of Digital Platforms are useful for practitioners who want the platformization of their business model as it indicates the trends such a topic is dealing with. The digital transformation process, the platform digital architecture and the start-up culture are important pillars for overcoming the implementation barriers of the digital platform business model. In addition, the summary of the relationships between platforms and customers, including the impacts on service experience as well as on the critical mass of producers and consumers as critical antecedents of platform business models are important insights that practitioners should pay attention to.*

Originality of the study. *This systematic literature review provides new elements for analyzing digital platform business models in an integrative perspective focused both on the digital platforms issues as well as on the business model perspective. Despite previous literature having been focused more on the specific streamline of the digital aspects of the platforms or on the business model perspective, by highlighting respectively the technological challenges or the economic perspectives, we provide a more comprehensive approach that considers how digital platforms business models find consideration in current literature and how is it characterized, including the main research directions suggested by the systematic review of the literature.*

Key words: *Digital platform; Business model; Digital Transformation; Service Experience; Systematic literature review.*

Social organizations towards a digital mindset: an exploratory analysis of third sector organizations and their digital needs

RICCARDO MAIOLINI* FRANCESCA CAPO* PAOLO VENTURI[▲]

Framing of the research. *Social organizations represent a pivotal element in the global socioeconomic landscape, equipped with the capability to confront the myriad challenges of our contemporary era (George et al., 2016). Despite their integral role in combating issues such as climate change, socioeconomic disparities, poverty, and unemployment, these entities often find themselves deficient in the necessary resources to attain their goals (Bacq and Eddleston, 2018), especially in the context of an increasingly digitized economic and social sector (Kim and Raggo, 2023). The advent of the COVID-19 pandemic has underscored the urgency for the adoption of digital tools and innovative technologies (Priyono et al., 2020; Hartshorne et al., 2020; Belitski et al., 2021; Berger et al., 2021; Masiero & Bailur, 2021). In this critical period, social organizations are necessitated to augment their digitization capabilities Punziano et al., 2023) and reconfigure their organizational and collaboration procedures (Corvo et al. 2022) to innovate their operational models. However, the digitization process presents a distinctively intricate challenge for third-sector organizations (Kraus et al., 2018). This complexity stems from the requirement for not only technological tool acquisition, but also organizational process reformulation, specialized personnel training, and the development of novel business models (Mos, 2021). Additionally, the process of digitalization could potentially aggravate disparities within third-sector organizations, as entities with superior financial resources and technical competencies may be positioned to adopt digital technologies more swiftly and effectively, while others with fewer resources may risk falling behind. Through an exploratory methodology, this study aims to elucidate the digital needs of social organizations. Additionally, it intends to provide recommendations for third-sector actors to optimally embrace and leverage digital transformation.*

Purpose of the paper. *The goal of this study is to conduct an exploratory analysis of the main categories of digital needs expressed in response to the health emergency caused by COVID-19 and to evaluate the different solutions identified within the proposed projects for the various categories of social organizations, also based on their main characteristics (e.g., years of activity, size). Indeed, many social organizations found themselves playing catch-up in terms of digital skills when compared to their diverse stakeholders (Pavesi et al. 2021). The pandemic exposed a pressing need for these organizations, their volunteers, and beneficiaries to boost their digital literacy in order to adapt to the new challenges imposed. However, a wide gap in digital competencies both within these organizations and in the wider society can potentially limit the effectiveness of proposed solutions and hinder the achievement of goals related to social inclusion and reducing inequality. Furthermore, it's crucial to acknowledge that many of the solutions introduced by these organizations during the pandemic might be temporary and may prove challenging to sustain in the long term without a more substantial integration of digital technologies into their operational processes. In this sense, the purpose of this paper is to examine the following research question: how have social organizations incorporated the use of digital technology as a component of their organizational transformation processes in response to the COVID-19 crisis?*

Methodology. *In order to answer this question, we focus on a qualitative research survey carried out between March and May of 2020 on a representative sample of Italian social organizations. To be more specific, 481 applications were received for the call for proposal "Impatto Sociale Reloaded – 1st Edition" that was initiated by a group of primary Italian Foundations. The purpose of this call was to "facilitate the identification of organizational transformation processes initiated to overcome the COVID-19 crisis that can be transferred or duplicated as good practices in the Italian third sector" (Grant Proposal Text, Archival Data 2020), with the end goal of satisfying the digital requirements of Italian social organizations. The authors possess the requisite authorization to utilize the data. One of the authors assumed responsibility for the design and initiation of the grant, additionally serving as a member of the jury panel and presently overseeing the implementation progress of the recipients.*

From a methodological point of view, the research was divided into four phases:

1. Phase 1 involved a manual restructuring of the dataset containing information about proposing organizations (n. 481) and their project proposals. This involved reorganizing the data in the dataset, including the restructuring of cells and the quantitative-qualitative contents, with the aim of enabling subsequent analysis through statistical software. This phase was essential in ensuring that the dataset was organized and structured in a way that allowed for efficient and effective analysis.
2. In Phase 2, a quantitative analysis of the descriptive variables related to proposing organizations contained in the dataset was conducted. This involved analyzing the numerical and categorical data related to the proposing organizations, such as the number of employees, the sector they operate in, and the geographical location of the organization. This phase provided a comprehensive overview of the characteristics of the proposed organizations in the dataset.
3. Phase 3 involved a qualitative analysis of the open fields in the dataset that contained information related to project proposals. This phase aimed to extract relevant information from the open fields in the dataset, which contained unstructured data. This involved analyzing the textual data in the dataset, such as project descriptions, to identify any common themes or patterns that emerged.
4. In Phase 4, a cluster analysis was conducted using the meta-features of the keyword network. The aim of this phase was to identify any similarities or patterns in the data that could be used to group the project proposals into distinct categories. This involved analyzing the co-occurrence of keywords in the project proposals and identifying any clusters of keywords that appeared together frequently.

In the phase of keyword identification, a rigorous process was undertaken to extract pivotal information from the database fields. The scrutinized fields encompassed the organizational description, the emergent digital problem, and the requisition for resources and competencies crucial for project development. During this phase, a meticulous removal of “stop words” was executed, signifying commonplace and less semantically significant words. This meticulous culling ensured a focused set of keywords, accentuating relevance and representing the database content optimally. By expunging stop words, the subsequent analysis was fortified and streamlined, allowing for a more accurate exploration. Consequently, the derived keywords constituted the foundation for subsequent analytical stages, namely open coding, axial coding, and cluster analysis. During the second phase, open coding was applied, entailing an in-depth examination of data through the encoding of pertinent information emanating from the unstructured fields within the dataset. This systematic process engendered a comprehensive overview of the diverse presented projects, ultimately culminating in the identification of primary categories of needs. Subsequently, in the third phase, the axial coding technique was adopted. This phase centered on discerning interrelationships among the previously identified categories of needs. Through an examination of co-occurrences among the variable tags in the dataset (analysis carried out with the aid of the MaxQda text analysis software), an associative model was constructed, elucidating the connections between the diverse needs categories. In the subsequent phase, commonly referred to as a cluster analysis was conducted to identify the meta-characteristics of the network. This rigorous analysis facilitated the grouping of the needs categories into four macro categories. Subsequent empirical validation of these macro-categories was executed by comparing the winning projects against the entire dataset, thereby ensuring the robustness and credibility of the identified characteristics. The resulting clusters allowed us to identify underlying themes and patterns in the data. It's important to note that the cluster solutions were then interpreted and labeled based on our knowledge and understanding of the dataset's context. The success of the cluster analysis significantly relies on careful data preprocessing, choice of the suitable clustering algorithm, and thoughtful interpretation of the results. For each qualitative category, the identification of keyword meso-categories was employed to quantify the closeness and co-occurrence of the keywords. In addition, separate analyses were conducted for each of the qualitative categories; after that, differences and similarities were examined in order to build a synthetic cluster analysis. The methodological approach employed throughout this study facilitated a comprehensive understanding of the presented projects and the articulated needs of the participating organizations. These insights were vital for discerning emergent trends and potential areas of intervention, thus fostering innovation and societal progress.

Results. The 481 proposing organizations (more than 2 out of 5 associations and social enterprises, of which 3 out of 5 operating in Northern Italy) are larger in terms of human capital than the national data on non-profit institutions (Istat, 2018), and they are characterized by operations that are medium-to-long term in nature (7 out of 10 have been active for more than 5 years). In comparison to the highest sum that could be paid out in the call, which was €100,000, the average request was €38,000, and virtually one out of every two groups asked for amounts that were less than €10,000. The highest request for funding, more than 50,000 Euros, was sought by newly formed companies and organizations.

Fig. 1: Economic request by type of organization

Source: elaboration by the authors on the Reloaded Social Impact dataset.

Within the findings, we classified ten primary digital needs expressed by the organizations participating in the call. These needs are presented in Table 1 below:

Tab. 1: Categories of needs expressed by proposing organizations

CATEGORIES	
1	A reinterpretation of the idea of “proximity/mobility” in the context of the connection between users and companies operating in the third sector
2	A rethinking of the idea of “social distancing” in relation to the social needs that are often met by the third sector generally constitutes an intervention.
3	Any “digital” requirements, new or old, that have never been satisfied before
4	Marketing and fundraising tools and strategies
5	Resources and Competencies for organizational design
6	Resources for entrepreneurial opportunities and business development
7	Internal organizational transformation processes
8	Acquisition of specific skills – functional or transversal
9	Increased external effectiveness (networks, connections or open governance models)
10	Implementation of social impact assessment systems

Source: elaboration by the authors on the Reloaded Social Impact dataset.

Within the scope of the call, social organizations submitting their proposals exhibited diverse requirements and potential solutions and strategies to address their needs. Amidst the variety of responses and approaches put forth, several recurring elements emerged as noteworthy. Firstly, a prevalent solution proposed by organizations was the utilization of Human Resources (HR) and People Management practices to analyze and reconfigure the skills of their staff, employees, and volunteers. This strategy was particularly favored by consortia and foundations, with 38% of consortia and 27% of foundations employing this approach, respectively.

Secondly, the adoption of various tools facilitating digital communication emerged as another popular method. Social organizations widely embraced this strategy, with 29% of associations and 18% of social enterprises utilizing digital communication tools to enhance their interactions with service consumers.

Thirdly, a significant number of organizations demonstrated an inclination toward the use of online platforms to streamline service delivery by facilitating the matching and management of supply and demand between beneficiaries and service providers. Notably, this strategy found substantial traction among profit-oriented businesses, accounting for 23% of all for-profit entities employing such platforms.

The identification of these solutions and tactics by the presenting organizations underscores the importance of comprehending the demands and preferences of consumers within the Third Sector. By discerning the specific requirements of the communities, they serve, organizations can enhance the quality and accessibility of the services they provide. This necessitates the development of tailored solutions and strategies to effectively address these needs.

Tab. 2: Types of solutions and strategies to respond to the identified needs

Solutions associated to financing requests	Percentage
HR & People Management for analysis and reorganization of the skills of operators, employees and volunteers	28%
Tools to promote digital communication (peer to peer & one to many, remote assistance, remote monitoring, distribution of training/educational content)	21%
2-sided platforms to manage match between supply and demand (beneficiaries and service providers)	16%
Digital content creation tools	8%
Business Intelligence management for marketing & Fundraising (customer acquisition, donor management, performance analysis of fundraising campaigns, crowdfunding)	7%
Distance Learning tools (repository, content management and learner review tools)	6%
Management platform for monitoring services for users/consortium members/partners	4%
E-commerce software for selling products or services online	3%
Data Storage Tools (Cloud solutions)	3%
Supply chain management + IOT	1%

Source: elaboration by the authors on the Reloaded Social Impact dataset.

After the elaboration of all the different classes of requirements and the keywords associated with them, the study proceeded to dive further into the specific requirements of each proposal according to the related organizational form. Our findings show that each organizational form faces specific challenges and is in need of a one-of-a-kind solution to satisfy its requirements and keep its operations running smoothly. The findings derived from this study reveal that organizations across different sectors encounter distinct challenges, necessitating customized solutions to effectively address their respective needs. By gaining a deep understanding of the specific difficulties faced by organizations, they can continue providing essential services to their users, beneficiaries, and communities. This awareness of challenges enables organizations to develop tailored solutions that are attuned to their unique circumstances (Zandonai & Venturi, 2019; Peredo & Chrisman, 2006). Understanding the specific needs of the social sector is of utmost importance in driving effective digitalization initiatives. The social sector operates within a distinct context, where beneficiaries play a pivotal role in shaping the direction and success of digital interventions. By comprehending the unique requirements and preferences of beneficiaries, organizations can design digital solutions that align with their needs and aspirations.

Furthermore, the relationship between organizations and the local communities they serve holds significant influence over the digitalization process. Recognizing the dynamics of this relationship enables organizations to develop contextually relevant strategies that resonate with the local community. The engagement and participation of beneficiaries in the digital transformation efforts foster a sense of ownership, inclusivity, and sustainability, ultimately leading to more impactful outcomes. Therefore, in order to drive meaningful digitalization within the social sector, it is imperative to not only understand the specific needs of beneficiaries but also establish collaborative relationships with the local community, ensuring that digital solutions are contextually appropriate, responsive, and beneficial to all stakeholders involved.

Associations, as exemplified, employ a range of resources, such as online platforms, volunteer labor, and financial contributions, to sustain their operations. Their primary focus lies in establishing effective communication and engagement channels with their users and beneficiaries, allowing them to continue delivering services while fostering a meaningful relationship with these individuals (Tricarico, 2018). To achieve this, associations must enhance their marketing and information technology capabilities, enabling them to effectively navigate the challenges posed by physical distance.

Social enterprises face the challenge of ensuring the continuity of service delivery despite physical barriers. In this regard, deploying digital monitoring and remote assistance systems becomes crucial, especially in the field of social health. These measures are essential for ensuring the availability and accessibility of their services, even when direct physical contact is limited or restricted. By leveraging digital technologies, social enterprises can adapt their operations to overcome spatial constraints and ensure uninterrupted service provision.

Furthermore, there is a pressing need for organizations to establish e-commerce channels that effectively handle direct payments and attract new clients. This necessitates proficiency in information technology, marketing, and leadership, along with the adoption of scalable business models that generate employment opportunities. For-profit businesses, in particular, place a primary emphasis on acquiring new clients, users, and beneficiaries who contribute to the success of their business models. They are keen on developing artificial intelligence applications and systems, while also seeking marketing expertise to promote their services and products. Additionally, they need to focus on the long-term viability of their business models and explore novel approaches to developing efficient logistics systems.

Foundations, often engaged in financing initiatives, require effective project management and the cultivation of new partnerships to sustain operations and expand their income streams. They also require monitoring and remote assistance methods to conduct interventions in the social-health domain, especially in response to limitations imposed by public health emergencies. Coalitions of social cooperatives, faced with the challenges posed by the current public health crisis, need to leverage digital technologies. To ensure the continuity of their business models, they place emphasis on internal organizational aspects, such as human resources and digital technologies (Ibáñez et al., 2021). Improving their knowledge of information technology and management is essential for effectively overseeing their operations and navigating the evolving digital landscape.

Research limitations. *As the current research is an initial investigation of the digital weaknesses of third-sector organizations, it has several drawbacks that impact its generalizability (Maxwell and Chmiel, 2014). To begin, the study was only carried out in Italy; therefore, it might be interesting to repeat the research in other European or non-EU countries in order to investigate differences not only of cultural nature but also of specific organizational models of third sector that are developed in other parts of the world (Levitt, 2021). In addition, it is important to keep in mind that the classification of the Italian third sector is impacted by a particular legal and regulatory infrastructure, which may be very different from the infrastructure in other countries (Iannello, 2020). For this reason, it is essential that future research study the ways in which various rules and regulations impact the growth patterns of the third sector and its digital transformation. One further limitation is the connection that exists between organizations operating in the third sector and the public administration, as this study has not focused on how the connection with the public administration might impact this digital transformation (Corvo et al., 2022). In addition, the connection between organizations in the third sector and citizens or volunteers who participate in the operations of such organizations was not investigated, despite the fact that it may be an essential component in the process of encouraging digital transformation and innovation. As a result, it may be interesting to focus future research on these issues in order to give a more thorough knowledge of how organizations in the third sector may solve digital difficulties and increase their performance in the digital era.*

Managerial implications. *The findings of this research underscore the critical importance of addressing digital challenges in the Third Sector, a void that has been highlighted by the widespread impact of the COVID-19 pandemic. In response to the crisis, many organizations have swiftly adapted by incorporating new technologies for remote work, transitioning events to online platforms, and placing greater emphasis on online fundraising. However, addressing digital issues in the Third Sector goes beyond mere communication and funding considerations. It encompasses a broader and more comprehensive transformation that must be addressed in order to avoid falling behind in an increasingly digital world (Venturi and Zandonai, 2022). The COVID-19 pandemic has demonstrated that nonprofit organizations in the Third Sector with a pre-existing digital mindset were better equipped to navigate the crisis and continue delivering vital services to their communities (Biancuzzi et al., 2021). Conversely, organizations that lacked digital capabilities found it exceedingly challenging to adapt to the new circumstances imposed by the pandemic, and some may have been forced to cease operations altogether. Developing a digital mindset involves not only adopting digital tools for communication and fundraising but also integrating advanced technologies such as artificial intelligence, blockchain, and augmented reality to enhance the effectiveness and efficiency of Third Sector operations. Achieving these goals necessitates financial investment, as well as a strong culture of innovation and adaptability to change. Those responsible for managing the Third Sector and formulating policies must consider ecosystem models capable of providing solutions and infrastructures that meet the complex requirements of the social sector (Bernardoni, 2020). This requires significant investment in training and developing digital skills within Third Sector organizations. Furthermore, coordination across the public, commercial, and social sectors is essential to establish synergies and exchange information effectively. In summary, cultivating a digital mindset is vital for the success of the Third Sector. This requires a dedicated focus on education and the development of digital skills, along with the integration of cutting-edge technology and a culture of creativity that embraces change. The ability of Third Sector organizations to continue delivering important services to their communities hinges on their ability to adapt and leverage digital competences effectively (Tricarico and De Vidovich, 2021). By embedding digital competences and embracing digital transformation, these organizations can navigate the challenges of the COVID-19 crisis and chart a sustainable path forward, positioning themselves for resilience, growth, and continued positive impact on society.*

Originality of the paper. *The process of digital transformation significantly impacts how social organizations conceptualize their provision of services and goods. It opens up new possibilities for these organizations to address social issues in scalable and effectively monitored ways (Tricarico and Venturi, 2020). Leveraging digital tools and platforms, such as social media, online fundraising platforms, and mobile applications, can enable social organizations to expand their reach and engage stakeholders more productively. For instance, the establishment of online communities of practice through digital platforms facilitates collaboration among users to collectively address social issues and share expertise, resources, and best practices. Our study aligns with prior research (Ghatak et al., 2020; Gordon, 2016) highlighting the pivotal role of social organizations in advancing social objectives and benefiting diverse stakeholders. However, our research emphasizes that these organizations must consider a broader spectrum of stakeholders beyond just direct beneficiaries of their products or services. To effectively promote social impact while harnessing the advantages of digital transformation and its associated tools, third-sector organizations must adopt an ecosystem perspective that encompasses multiple actors, moving beyond a mere supplier-user relationship. Moreover, digital transformation offers the potential for streamlining the assessment of social outcomes. Social organizations can gather and analyze data on program and service results and impacts, leveraging data analytics tools and platforms to enhance effectiveness and efficiency. Additionally, digital technology can assist social organizations in developing more transparent and accountable reporting systems, thereby bolstering credibility and stakeholder confidence. However, it is crucial for social organizations to be mindful of the challenges and risks that accompany digital transformation (Venturi and Zandonai, 2022). These encompass concerns related to privacy, data security, data protection, digital exclusion, and the exacerbation of social inequalities. Hence, social organizations need to adopt a comprehensive strategy that considers both the benefits and challenges of digital transformation, while fostering collaborative and inclusive connections with stakeholders.*

In summary, the process of digital transformation presents social organizations with novel opportunities to address social issues at scale and in a more accountable manner. By embracing digital tools and platforms, engaging stakeholders collaboratively, and adopting an ecosystem perspective, social organizations can drive positive social impact. However, they must also navigate potential risks and challenges, ensuring privacy, security, and inclusion. A holistic approach that integrates the benefits and challenges of digital transformation is key for social organizations to effectively leverage this transformative process and forge impactful connections with stakeholders.

Key words: social organizations; digital transformation; digital innovation.

Feminist perspective in management.

A bibliometric analysis and literature review

CARMELA ELITA SCHILLACI* MARCO GALVAGNO*

Framing of the research. In 1989 Marta Calas and Linda Smircich published a paper in the *Academy of Management Proceedings* titled “Using the F Word: Feminist Theories and the Social Consequences of Organizational Research”. The paper highlighted the importance of considering the social consequences of organizational and management research and practice and proposed the feminist perspective as a way of addressing the issue.

More than 30 years later, feminist theories and methodologies have spread to all fields of science. Despite the broad range of feminist approaches, it is generally accepted that a person can be considered feminist if she recognizes that there are disparities in modern society that unfairly harm women compared to men, and she works towards eliminating these disparities¹. Although all feminists strive for gender equality, there are various ways to address this issue. Three different approaches can be discerned: gender-reform, gender-resistant, and gender-revolution feminism (Lorber, 2001).

Gender-reform feminism includes liberal, Marxist, social, and development feminism, which focus on achieving equality for women through various means such as advocating for equal rights under the law, providing full-time employment opportunities for women, and addressing economic exploitation and cultural practices that oppress women. Gender-resistant feminism despite emphasizing gender differences, argues that these distinctions should not be eradicated, but instead, acknowledged and appreciated. This viewpoint underscores the significance of in-depth examination and theorization of women’s circumstances and experiences, maintaining that women have distinct experiences and concerns that are fundamentally distinct from those of most men, especially regarding how these experiences are shaped and expressed within the current patriarchal system. Belong to such a perspective radical feminism, standpoint feminism and psychoanalytical feminism. Gender-revolution feminism rather than focusing on the female advantage and how women can contribute to the existing system, challenges the gender order directly by multiplying the categories and examining the disadvantages of more numerous marginalized groups. This perspective includes post-structuralist/post-modern feminism and intersectional feminism. The former challenges fixed gender categories and explores the fluid nature of gender and sexuality, and critiques the ideological discourses embedded in cultural representations such as art, literature, and the media. The latter contests the notion that the experiences of primarily Western, middle-class, white women represent the entire spectrum of women’s oppression. Intersectional feminists argue that gender, race, sexual orientation, gender identity, and other social categories are not mutually exclusive but are deeply interconnected and can result in varying degrees of oppression. This type of feminism offers insight that not all women experience oppression in the same way. For instance, the wage gap shows that women of color and men of color are penalized relative to the earnings of white men.

The integration of feminist perspective into management was initially influenced by liberal feminism and the Women in Management (WIM) research, much of it conducted by those associated with the Women in Management division of the Academy of Management (now retitled *Gender and Diversity in Organizations*) (Calas and Smircich, 2014). Nevertheless, feminist writers and theorists from other domains have diverged from the discourse of sex differences, becoming more general critics of a male-dominated society. Despite the initial expectation that WIM research might follow this path, in essence it never deviated from conventional organizational literature. Hence, so many years after Calas and Smircich (1989), feminist theories and methodologies remain marginal and overlooked in mainstream management studies (Bell et al., 2020; Pierazzini et al., 2021). In the same vein, the only literature review written on feminism in management - i.e. Nienaber and Moraka (2016) – confirms the idea that feminist approaches are lacking, limited, or have a minimal impact in the field. That said, one might be tempted to assume that feminist perspective is of little relevance outside the narrow circle of management scholars dealing with equality and gender issues and even of little use in advancing the knowledge of those in general management. In our view, this interpretation would be

¹ In the present day, feminist perspectives go beyond issues of equality and include inquiries into the methodology, epistemology, and ontology of scientific research. Feminists have challenged traditional methodologies and proposed alternative approaches that align with feminist objectives.

incorrect. Rather, we still think that feminist theories could be fruitful in advancing management research, while at the same time providing answers to the growing demand for studies on ethical and social issues.

Purpose of the paper. Based on these premises, this paper aims to understand the development of feminist perspective in management, taking stock and moving forward in producing new knowledge. Accordingly, we performed a mixed-method literature review aimed at answering the following research questions:

RQ1: What are the major research topics addressed by the feminist approach in management?

RQ2: What are the main feminist theories applied?

Methodology. To provide a comprehensive view of the feminist perspective in management research, we used a mixed-method approach by combining bibliometric and qualitative analyses. We decided to precede the qualitative analysis with a bibliometric one for several reasons. First, bibliometric analysis is highly suitable when the analyzed topic is fragmented between different literature streams (Boyack and Klavans, 2010). Second, since it is a quantitative methodology, it “introduce a systematic, transparent, and reproducible review process and thus improve the quality of a review” (Zupic and Čater, 2015, p. 430). Third, among the available techniques, it allows to handle large volumes of scientific data (Donthu et al. 2021). Following the latest methodological recommendations (Caputo et al., 2021; Donthu et al. 2021), we divided the analysis into four steps: i.e., (1) data collection and sample identification, (2) sample description, (3) bibliographic coupling analysis, and (4) qualitative analysis and interpretation.

(1) Data collection and sample identification. Data were extracted from the Social Sciences Citation Index and the Emerging Sources Citation Index databases of Web of Science of Clarivate Analytics®, by searching for documents whose title, abstract, or keywords contained the following keywords: “feminist perspective*”; “feminist theor*”; “feminist approach*”². The search generated 6,539 documents, which were then filtered in order to limit the analysis only to articles and reviews (excluding book chapters, editorial comments, and conference proceedings), published in English in journals listed in the following research categories: Management; Business; and Business Finance. This process resulted in a set of 285 articles. Subsequently the title and abstract of each article were read by all the authors in order to remove those which focused on aspects considered irrelevant to the research. This final selection made it possible to identify an ultimate sample of 215 articles published between 1990 and 2023.

(2) Sample description. A preliminary analysis was carried out on bibliographic records. It allowed to identify the most cited papers among those considered, and several descriptive elements, such as the source of publication, their temporal evolution, and the keywords co-occurrences network. This analysis was implemented by means of the R-Package Bibliometrix (Aria and Cuccurullo, 2017).

(3) Bibliographic coupling analysis. Bibliographic coupling allows to draw a map in which all documents enclosed in the sample have been assembled and placed depending on the references they have in common. More specifically, this methodology pairs a couple of documents when there is an overlay in their references. The higher is the score achieved by the coupling, the higher is the possibility that both papers relate to the same topic and are included in the same cluster. Hence, to investigate the connections among all the papers considered in our analysis, the clustering algorithm estimated the level of the association strength, finally separating them in clusters. We performed the analysis by using VOSviewer 1.6.20 (Van Eck and Waltman, 2010).

(4) Qualitative analysis and interpretation. To achieve a more rigorous evaluation and get further elements on the bibliometric findings we conducted a qualitative analysis. We selected the most representative articles based on the bibliometric results and analyzed the full texts. The analysis allowed a richer understanding of the theoretical roots and topics within the field.

Results. Table 1 describe some data about the selected sample. On average, the 215 articles received an average citation count of 40.4 each. They appeared in 78 different journals and were written by 411 authors, counting a mean of 0.523 articles per author.

Tab. 1: Data Description

Description	Results
Timespan	1990:2023

² The asterisk is a symbol that allows heterogeneous endings of the adopted keywords to be searched for (e.g., perspective or perspectives).

As shown in Figure 2, the annual scientific production is constantly growing with an annual growth rate of 6.94%, confirming a growing interest among scholars. Moreover, starting from 2015, the attention of the scholars grew exponentially, reaching a peak in 2019. Citations have also grown in recent years, and in particular from 2015 onward (see Figure 2).

Fig. 2: Annual scientific production and citations

A subsequent analysis of the articles revealed some interesting elements (Table 2). The first 10 journals out of 78 published the 46.0% of the articles and received 43.5% of the total citations.

Tab. 2: The first 10 journals ordered by number of articles

Journals	Articles	% of total	Citations	% of total
<i>Gender Work and Organization</i>	27	12.6%	964	11.1%
<i>International Journal of Gender and Entrepreneurship</i>	16	7.4%	259	3.0%
<i>Organization</i>	15	7.0%	1,045	12.0%
<i>Journal of Business Ethics</i>	10	4.7%	384	4.4%
<i>Gender in Management</i>	9	4.2%	46	0.5%
<i>Equality Diversity and Inclusion</i>	6	2.8%	67	0.8%
<i>Journal of Organizational Change Management</i>	6	2.8%	108	1.2%
<i>International Journal of Human Resource Management</i>	5	2.3%	59	0.7%
<i>Journal of Business Venturing</i>	5	2.3%	845	9.7%
Total	99	46.0%	3,777	43.5%

To explore the underlying ideas and the most frequent topics of feminist literature in management, we utilized a method called thematic analysis, using the free R-Package Bibliometrix (Aria and Cuccurullo, 2017)³. This allowed to identify the co-occurrence of keywords within the documents and create a network of closely related terms. The software then grouped these terms into subgroups based on their strong connections, each representing a specific research topic within the analyzed literature. By using Callon centrality and Callon density (Aria et al., 2020), it was possible to determine the significance and level of development of each topic. These results were then plotted in a thematic diagram, which provided an overview of the major themes and areas of focus within the collection of literature (Figure 3). The visual representation makes it possible to identify four different categories of topics based on the quadrant in which they appear:

- Themes located in the upper-right quadrant are referred to as “motor themes” i.e., feminist epistemology, ethics, women entrepreneurship, academia, discourse and narratives, and gender identity. These topics have high centrality and density, indicating that they are both significant and well-developed within the research field.
- Themes in the lower-right quadrant are referred to as “basic and transversal themes”, i.e., feminist theory, gender theory, CSR, intersectionality, post-feminist, and resistance. These topics have high centrality but low density, indicating that they are essential for a particular area of study and cover topics that are relevant across various research fields.
- Themes located in the lower-left quadrant are considered “emerging or declining themes”, i.e., i.e., poverty, organizations’ resilience. These topics have low centrality and density, suggesting that they are underdeveloped and occupy a marginal position in the field.

³ “The Bibliometrix R-package (<http://www.bibliometrix.org>) provides a set of tools for quantitative research in bibliometrics and scientometrics”. (Aria and Cuccurullo, 2017: 963).

- Themes in the upper-left quadrant are categorized as “highly developed and isolated themes”, i.e. reflexivity and institutional feminist research. These topics have high internal density but low external centrality, indicating that they have limited importance within the field.

Fig. 3: Strategic diagram of feminist research in management

To identify the main themes within feminist research in management we implemented a bibliographic coupling analysis (Kessler 1963) in two steps. In the first step we explored the connections among all 215 papers considered in our sample, and divided them in 3 clusters, based on the level of their total association strength identified by the clustering algorithm, with a resolution of 1.00 and named them accordingly (Table 3):

- Cluster 1 - Feminism in Organization Studies
- Cluster 2 - Feminism in Entrepreneurship
- Cluster 3 - Feminism in Business & Marketing

Tab. 3 - Main clusters description

	Cluster 1 <i>Feminism in Organization Studies</i>	Cluster 2 <i>Feminism in Entrepreneurship</i>	Cluster 3 <i>Feminism in Business & Marketing</i>
Color	Blue	Red	Green
N. of articles	107	62	43
Total number. of citations	4,140	3,104	1,380
Average citations per article	38.7	50.1	32.1
Time span	1990 – 2023	1993 – 2023	1992 – 2023
Average year of publication	2014	2018	2012
Median year of publication	2018	2018	2018
Variation of year of publication ^a	33	30	31
Main Journals	Gender Work & Organization (23); Organization (14);	International Journal of Gender & Entrepreneurship (14); Journal of Small Business Management (5);	Journal of Business Ethics (7); Journal of Marketing Management (4);
Homogeneity index of journals ^b	0.40	0.45	0.65
Top cited articles (n. of citations in brackets)	Holvino, 2010 (398) Martin, 1990 (345)	Fischer <i>et al.</i> , 1993 (438) Calas <i>et al.</i> , 2009 (359)	Bristor & Fischer, 1993 (171) Murray, 2015 (133)
Most frequent words within title:	- Feminist theory - Gender equality - Organization studies	- Women's Entrepreneurship - Gender	- CSR - Feminist ethics - Consumer research
Main theories/approaches applied	- Post-structural feminist theory - Intersectional approach	- Post-structural feminist theory - Liberal feminist theory	- Post-structural feminist theory - Ethics of care

^a Variation in the year of publication is the difference between the most recent article and the oldest one among those belonging to the cluster.

^b Homogeneity index of journals is the ratio between the number of journals and the total number of papers within the cluster. Smaller values indicate the highest homogeneity between sources.

In the second step we run the analysis again, but with a resolution of 1.30. This step allowed to divide the 3 main clusters, identified in the previous step, in 2 sub-groups each. Finally, we draw a map representing together the 3 main clusters and each of the 6 sub-groups, by showing only the most cited articles (more than 40 citations), in order to make it more comprehensible (Figure 4). A qualitative analysis and interpretation of the 6 sub-groups of papers allowed a richer understanding of topics and related theoretical roots, as reported below.

Fig. 4: Map of feminist research in Business & Management

Cluster 1 – Feminism in Organization Studies (Blue). This broad research stream represents the largest proportion of the sample. The most frequent outlet is *Organization*. Within it, we have identified two sub-groups of papers.

Cluster 1A - Gender in Organizations & Leadership: This research stream is specifically oriented toward the study of gender issues related to organizations and leadership. Papers in this cluster mainly focus on gender differences and the ways to eradicate them. All authors, within this group, criticize the liberal feminist approach which proposes a rebalancing of the presence of women in power and apex positions in organizations. Instead, the main perspective adopted is the post-structural feminist approach, according to which gender identities are social constructed within the organizations and language and discourses are the way organizations perpetuate power relations that determine gender inequality (Ely and Padavic, 2007). The main idea is that gendering processes occur not through formal policies, but through work practices, predominant narratives and interactions. It is the latter that need to be identified and changed. Researchers should enter into organizations and identify those informal practices and routines in order to promote change from the inside. In this vein, several authors propose a process - based on critique, narrative revision, and experimentation - that helps to identify those informal practices and lead to changing them (Meyerson & Kolb, 2000; Shaw and Frisby, 2006). Some examples include self-organizing team, change management projects, or critical analyses which help to recognize gendering language and practices to be changed.

Cluster 1B - Feminist perspective in Organization studies: This sub-group deals with research approaches and methodologies in organization studies based on a feminist perspective. Almost all papers are literature reviews which analyze past research on gender in organizations and propose a more contemporary intersectional feminist approach. This approach extends the feminist perspective and considers how gender intersects with race and ethnicity as well as social class to generate discrimination.

Cluster 2 – Feminism in Entrepreneurship (Red). Papers in this research stream are oriented toward the application of feminist approaches to entrepreneurship research. The most frequent outlet is *Journal of Business Venturing*. Within it, two subgroups of papers can be distinguished.

Cluster 2A - Gender in Entrepreneurship: This research stream focuses on examining the differences in entrepreneurial characteristics and performance between males and females. The results of empirical studies in this area are varied and sometimes contradictory. While some studies suggest that there are few differences between male and female entrepreneurs in terms of their experiences and needs (Kalnins and Williams, 2014; Pergelova et al., 2019), other research indicates that there are significant gender biases in entrepreneurship (Ahl and Marlow, 2012), as well as differences in resource accessibility (Fischer et al., 1993), entrepreneurial intention (Camelo-Ordaz et al., 2016), performance (Justo et al., 2015), and export propensity experiences (Orser et al., 2016; Robb and Watson, 2012).

Cluster 2B - Feminist perspective in Entrepreneurship: This group of papers call for the application of the feminist perspective in entrepreneurship studies. Several papers claim that a feminist perspective would give to entrepreneurship research fresh and positive theoretical frameworks, methods, and results (e.g., Calas et al., 2009;

Hamilton, 2013). Others propose new concept as gender capital, which could help to explain the role networks play in entrepreneurial ecosystems (e.g., Mcadam et al., 2019).

Cluster 3 – Feminism in Business & Marketing (Green). This research stream, is the least homogeneous compared to the others and contains two sub-groups of papers.

Cluster 3A - Ethics & CSR: Papers in this group utilize feminist ethics in the context of business ethics. The most frequent outlet is *Journal of Business Ethics*. They focus on the feminist ethic of care and how it can be applied to various aspects of business, such as stakeholder theory, corporate governance, sustainable business practices, and corporate social responsibility. Some examples of papers in this category include Machold et al. (2008), Spence (2016), Buchholz and Rosenthal (2005), and Grosser and Moon (2019). One article in this group presents a critical view of feminist theory, questioning its conceptual and empirical validity in relation to economics and stakeholder theory (Buchholz and Rosenthal, 2005).

Cluster 3B - Feminist perspective in Marketing & Consumer research: this set of papers report on the application of feminist approaches to marketing and consumer research. The most frequent outlet is *Journal of Consumer Research*. The argument being made is that a feminist reassessment and revision of consumer research would be advantageous (Bristor and Fischer, 1993; Hirschman, 1993).

To identify the different feminist theoretical approaches used in the articles reviewed, each full text has been read and analyzed to identify the theories and models that the articles contributed to. More than 30% of the articles does not take any specific approach, but refers, in a generic way, to feminist theories and perspective. The 40% of the papers take a gender-revolution approach, particularly the post-structuralist and intersectional perspectives. The 20% of the articles adopts a gender-reform approach, mostly the liberal feminist and the social feminist perspectives. Finally, those papers dealing with ethics, adopt the feminist approach to ethics, namely ethics of care.

Important insights have emerged from the analysis of papers with a feminist perspective published in management. Firstly, research on feminism in management remain at the margin of the mainstream literature and is used as a conceptual framework applied to a specific subject such as business ethics, entrepreneurship, or leadership (e.g., Machold et al., 2008; Robb and Watson, 2012; Ford, 2006). This tendency relegates the feminist approach to particular issues, preventing it from establishing itself and spreading to mainstream management debate such as strategy. Secondly, feminism is used as an organizing practice in specific organizations (i.e., academia). This places feminism in a subordinate role within the broader field, limiting its relevance to conventional organizations. Finally, feminism is proposed as a theoretical framework or a methodological tool. This emphasis on methodology determines the use of the feminist approach as an alternative perspective with the purpose of critiquing established frameworks and theories (e.g., Bristor and Fischer, 1993; Calas et al., 2009; Hirschman, 1993; Holvino, 2010).

Regarding empirical research articles, there is a preference for qualitative methods, particularly ethnography and participant observation, along with deconstruction. The primary focus of all articles is on women's experiences, with no explicit analysis of masculinity or men present, except for implicit references. Furthermore, most articles do not contain policy implications.

Although the results of the analysis confirm the marginality of the feminist approach in mainstream management, we still believe that feminist theories can significantly contribute to the development of the field by providing a critical evaluation of the prevailing frameworks and by proposing alternative conceptualizations.

Future research should focus more on firms' strategies and decision-making processes from a feminist perspective.

Research limitations. The study has some limitations related to the research design, the database used, and the analysis of results. Concerning the research design, the choice of the articles is based on keywords, which does reduce the scope of the study. However, although increasing the number of keywords may improve the sample's scope, it also tends to add noise (irrelevant articles) and makes the sample increasingly challenging from a practical perspective. The main limitation related to the database is the exclusion of books, book chapters, and conference papers. Relatively to the third limitation, since we provided a qualitative interpretation of the results achieved through bibliometric analysis, we admit that our considerations are somehow accountable of our subjective vision and interpretation.

Managerial implications. Our research could be relevant in terms of practical implications for managers and policymakers. For the former, the study can direct managers' attention to the impact that diversity management at large and the consideration of all types of discrimination, not only gender issues, can have in both operational and strategic decision-making processes. For the latter interested in reducing discrimination, the feminist approach can be a unique perspective on which to build policies, laws, rules, or more effective Gender Equality and Non-Discrimination Indicators (GEND).

Originality of the paper. The study offers an up-to-date and comprehensive investigation of the feminist approach in management research. According to our findings, it can be concluded that feminist approaches can offer fresh perspectives on crucial questions in management, leading to an improvement of the field.

Keywords: feminist perspective; gender in management; literature review; bibliometric analysis

Nurse Clinical Leadership and Psychological Empowerment in Healthcare. The Role of Holistic Competence and Emotional Agility

SEMA ÜSTGÖRÜL* BULENT AKKAYA*
MARIA PALAZZO* MARIA ANTONELLA FERRI**

Framing of the research. Nurses can have an influence on patients' experiences and outcomes if they develop clinical leadership (Stanley et al., 2022). Persistence and improvement in healthcare are driven by empowerment and leadership (Cook & Leathard, 2004; Mrayyan et al., 2023). To foster a healthy work environment, it is crucial to develop a culture that psychologically empowers employees and enables them to realize their potential (Ashworth, 2022).

In fact, it is recognized that leadership is essential to providing direction and aligning professional teams within an organization (Ashour et al., 2022; Jones, 2023).

For this reason, there is a strong endorsement of nurse clinical leadership as a catalyst for interprofessional collaboration worldwide (Hofmann & Vermunt, 2021). Leadership in clinical care should also involve modifying the care process by fostering new competencies for several professional roles, directing patient care and controlling conflicting interests (Nieuwboer et al., 2019). Several studies have shown that leadership leads to enhanced user satisfaction, reduced user mortality, and less errors in hospitals (Thiagarajan & McKimm, 2019; Hitch et al., 2020).

Consequently, the scope of this study is to deepen the understanding of nurse clinical leadership. In order to reach this goal, the paper will test the mediating role of holistic nursing competence and the moderating role of emotional agility between nurse clinical leadership and psychological empowerment.

To assess this connection, the data were gathered from nurses. The data were collected by scales and examined with the use of SPSS program.

Purpose of the paper. The present research will shed the lights on four main items: (i) first of all, it will highlight the existence of a positive relation between nurse clinical leadership and psychological empowerment; (ii) secondly, it presents the existence of the mediating role of holistic nursing competence between nurse clinical leadership and psychological empowerment; (iii) thirdly, it shows that emotional agility exerts a mediator role between nurse clinical leadership and holistic nursing competence; (iv) finally, it is ascertained that emotional agility has a mediator role between holistic nursing competence and psychological empowerment.

This paper has the following structure. A brief review of related literature is presented, as well as hypotheses regarding nurse clinical leadership, psychological empowerment, holistic nursing competence and emotional agility. Next, we describe the method. Afterwards, a large-scale field survey is described to test the research hypotheses, followed by discussions, managerial implications, theoretical contributions, conclusions, limitations and potential research directions.

Throughout the following sections, the nexuses between the selected concepts are described and the research hypotheses are showed in a conceptual model (see Figure 1).

Nurse clinical leadership and psychological empowerment

The role of clinical leadership is vital to guaranteeing efficient and effective health improvement, and it entails creating conditions for success and achieving organizational objectives (Hitch et al., 2020). Nurse clinical leadership is important for creating a culture of safety at work, providing quality care, and ensuring optimal healthcare performance, as evidenced by theoretical and empirical studies: it is one of the key factors in organizational change, quality care provision, and ensuring optimal outcomes (Mrayyan et al., 2023). Depending on the position and setting, nurses can take on clinical leadership formally or informally (Cook & Leathard, 2004). There is circumscribed research on informal nurse clinical leadership, and on how it may positively affect psychological empowerment,

practice, and finally, patient care, despite the fact that nurse leadership influence is recognized among practitioners who achieved high professional roles (Thiagarajan & McKimm, 2019). In fact, in most healthcare organizations, clinical services are the primary focus, and providers have power and strength to influence user care value. It is in this context that the link between psychological empowerment and nurse clinical leadership has developed in the world of nursing. Thus, the paper suggests that:

H1: Nurse clinical leadership impacts psychological empowerment in healthcare organizations.

Nurse clinical leadership and holistic nursing competence

Effective nurse clinical leadership needs to be developed thanks to a huge variety of functions and competence (Takase & Teraoka, 2011). A holistic approach to nursing competence is the basis for hospital care, as it can boost the system performance, accomplishment of goals, suitable care supply, efficacy, and efficiency (Aydin & Hiçdurmaz, 2019). Indeed, having holistic nursing competency is crucial, since hospitals are complex structures that differ in size and complexity depending on the functions they offer within the huge health care system (Aydin et al., 2022).

Services supplied by hospitals are defined by competences of all human resource. However, health care organizations, regardless of their differences, rely on key central functions, as it is at this level that users primarily interact with the overall system (Takase & Teraoka, 2011). The nurses at this point must be able to develop both clinical leadership and holistic competence, as they are involved and able to observe how the system works, assessing the system's strengths and inefficiencies, and experiencing conflict and collegiality between and among different groups of healthcare professionals (Aydin & Hiçdurmaz, 2019). In line with these considerations, this paper stated that:

H2: Nurse clinical leadership impacts holistic nursing competence in healthcare organizations.

Holistic nursing competence and psychological empowerment

The advancement of holistic nursing competence has become gradually more valuable in the past 20 years (Erickson et al., 2013). Improvements in healthcare digital technology have enabled the therapy for patients with complex medical problems. Furthermore, the reduced duration of hospital stays due to cost-control tactics has led to an escalating amount of users who expect intensive nursing treatments. Besides, users' expectations of the value of nursing care have been rising. Nowadays, users are under pressure as they have to be able to offer services totally inspired by holistic nursing competence to a wide public. Thus, the public need for quality care has pushed them not only to try to attain this essential competence, but also to feel, at the same time a huge sense of empowerment (Wagner et al., 2010). This phenomenon is observed especially among expert nurses, who are in the field by years. The chief reason for this is that these nurses had many opportunities to apply their knowledge in clinical practice (Knol & Van Linge, 2009). To promote holistic nursing competence, psychological empowerment can be the key. Therefore, this paper highlights that:

H3: Holistic nursing competence relates with psychological empowerment in healthcare organizations.

The mediating role of holistic nursing competence

Nurses offer continuous care to individuals with a holistic viewpoint and accept professional duties to help daily routines (Wagner et al., 2010). Thus, it is essential for nurses to expand their specialistic competencies and employ them in practices. Holistic nursing competencies are based on experience, feelings, and abilities gained through knowledge and practice. Getting a holistic viewpoint is the core capability of nurses, in fact, it can be described as involving in care the results which determine higher level of satisfaction and enhanced user outcomes while valuing the totality of patients' wellbeing. Transferring holistic competencies to the clinical setting is strictly linked with the nurse clinical leadership and psychological empowerment of the individual that starts this virtuous circle (Mrayyan et al., 2023). A result of this positive perspective is the establishment of job engagement, as engaged nurses devote themselves to their duties, while boosting their level of leadership and feeling more empowered (Knol & Van Linge, 2009). Thus, the paper suggests that:

H4: Holistic nursing competence has a mediating role between nurse clinical leadership and psychological empowerment in healthcare organizations.

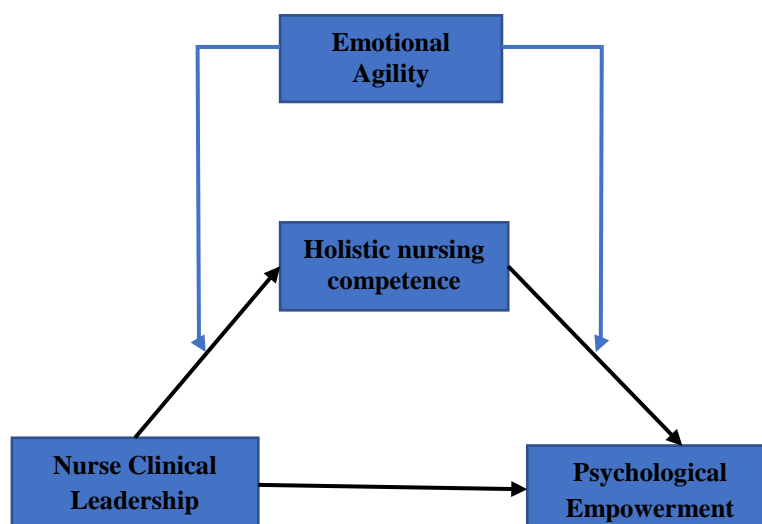

The moderating roles of emotional agility

The topic of emotional agility is an original concept that needs to be better explored with theoretical and practical research to enhance its understanding among scholars and managers (Cox, 2018). In the existing literature, a circumscribed number of reviews is offered by the promoters of the concept of emotional agility. In particular, authors that created the topic, decide to analyse it thanks to case studies and qualitative methods (David & Congleton, 2013). In this paper, it is stated that this new concept can be considered as:

H5: Emotional agility has a moderator role between nurse clinical leadership and holistic nursing competence in healthcare organizations.

H6: Emotional agility has a moderator role between holistic nursing competence and psychological empowerment in healthcare organizations.

Fig. 1: Research Model

Methodology. The research model was based on Model 58 by Hayes (2017), and it was formulated as below.

Research Model Statistical Diagram

Conditional indirect effect of X on Y through $M_i = (a_{1i} + a_{3i}W) (b_{1i} + b_{3i}W)$

Direct effect of X on Y = c'

X= Nurse Clinical Leadership; Y= Psychological Empowerment; M= Holistic nursing competence; W= Emotional Agility

Population and Sample

Data were collected from 296 nurses of Turkish healthcare organizations by five different scales. The questionnaire had 4 sections: the first section was regarding sample characteristics of the participants, such as gender, age, level of education, etc. The second scale was about nurse clinical leadership developed by Patrick et al. (2011). It consists of 15 items. The third section is about holistic nursing competence by Aydin & Hiçdurmaz (2019). It has 36 items. The fourth scale is about psychological empowerment scale developed by Spreitzer (1995). It consisted of 12 items. The last scale is emotional agility developed by authors. It consisted of 10 statements. The tool for collecting data was chosen to be a five-point Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree).

Characteristics of participants are as follows:

The mean of age is 32.6; 54.2% of the respondents were above 32 years, while 45.8% were below than 32 years.

72.2% of respondents was female while 28.2% was male.

66.9% of the respondents had bachelor's degrees, 16.1% had high school degree while 17.0% had a master's degree.

58.6% participants were married while 41.4% were single.

Tab. 1: Cronbach's Alpha Coefficient for Study variables

Construct	Cronbach's Alpha
Nurse Clinical Leadership	0.789
Psychological Empowerment	0.876
Holistic Nursing Competence	0.992
Emotional Agility	0.774

Statistical Analysis

The analysis was executed using structural equation modelling with the SPSS 26 program. Before testing Hypotheses, we checked data normal distribution and reliability analysis. Cronbach Alpha (α) coefficient was used to measure and verify internal consistency for reliability and the Skewness and Kurtosis were used to check the data normality distribution. Table 1 displays acceptable levels of reliability for all four scales, with the reliability coefficient ranging from (0.77-0.92) and all constructs being above (0.7) This indicates that the design and scale of the questionnaires were able to assess the research variables and dimensions, and that the questions in the questionnaire were able to reflect each variable of the study (Hair et al., 2010).

The Skewness and Kurtosis values should be between +2 and -2 that presents data has normal distribution (George, 2011). Table 2 presents the skewness and kurtosis has normal distribution. Thus, we applied parametric analysis methods such as regression, ANOVA and correlation in current research.

Tab. 2: Normal Distribution Analysis (N=296)

Test of Normality				
Descriptive Statistics				
Variable	Skewness		Kurtosis	
	Statistics	SE	Statistics	SE
Nurse Clinical Leadership	,053	-,258	,104	-,778
Holistic Nursing Competence	,049	-,316	,104	-,555
Psychological Empowerment	,048	-,533	,104	-,371
Emotional Agility	,047	-,190	,104	-,497
Valid N (listwise)	296			

Results. As recommended by, there are three categories of the mean values of variables that recommended in literature (Sekaran & Bougie, 2016). low, less than or equal to 2.99, medium from 3 to 3.99 and high where mean score is greater than 4.00. Mean values of all the variables in the current study range of 3.02 and 3.78 so all variables come in the category of medium. In this study, emotional agility has the highest mean score ($M=3.77$). Psychological empowerment has the lowest mean score 3.02. Table.3 present the mean and standard deviations scores of all variables of the study.

Tab 3. Descriptive Statistics

Descriptive Statistics					
Variable	N	Minimum	Maximum	Mean	Std. Deviation
Nurse Clinical Leadership	296	1.00	5.00	3.167	1.261
Holistic Nursing Competence	296	1.00	5.00	3.201	1.175
Psychological Empowerment	296	1.00	5.00	3.023	1.128
Emotional Agility	296	1.00	5.00	3.777	1.152
Valid N (listwise)	296				

Tab. 4. The link between Nurse Clinical Leadership and Psychological Empowerment(H1)

Model	R	R Square	Std. Error of the Estimate	t value	F value	df1	Sig.
1	,802 ^a	0,643	0,72	7,061	529,155	1	,000 ^b

Dependent Variable: PE

Predictors: (Constant), NCL

R value showing the positive and significant relationship Nurse Clinical Leadership and Psychological Empowerment is 0.802. It can be stated that 64% (R^2) of Psychological Empowerment depends on Nurse Clinical Leadership behaviours. (Table 4). Thus, Hypothesis 1 is supported ($p<0.001$) (H_1 : Nurse clinical leadership impacts Psychological Empowerment in healthcare organizations).

R value showing the positive and significant relationship Nurse Clinical Leadership and holistic nursing competence is 0.805. It can be stated that 65% (R^2) of holistic nursing competence depends on Nurse Clinical Leadership behaviours. (Table 5). Thus, Hypothesis 2 is supported ($p<0.001$) (H_2 : Nurse clinical leadership impacts holistic nursing competence in healthcare organizations).

Tab. 5: The link between Nurse Clinical Leadership and holistic nursing competence (H2)

Model	R	R Square	Std. Error of the Estimate	t value	F value	df1	Sig.
1	,805 ^a	,648	,69	9,061	541,002	1	,000 ^b

Dependent Variable: HNC

Predictors: (Constant), NCL

R value showing the positive and significant relationship holistic nursing competence and Psychological Empowerment is 0.87. It can be stated that 76% (R^2) of Psychological Empowerment depends on holistic nursing competences. (Table 6). Thus, Hypothesis 3 is supported ($p<0.001$) (H_3 : holistic nursing competence impacts Psychological Empowerment in healthcare organizations).

Tab. 6: The link between holistic nursing competence and Psychological Empowerment (H3)

Dependent Variable:PE

Predictors: (Constant), HNC

Mediating Analysis of Holistic Nursing Competence

We tested the mediating role of holistic nursing competence between nurse clinical leadership and psychological empowerment in healthcare organizations. Nurse clinical leadership has direct positive impact on psychological empowerment (Table 4). When we added holistic nursing competence into model as the mediator role the effect of nurse clinical leadership on psychological empowerment decreased and the relationship became insignificant ($p > 0.05$). Table 7 presents the mediating role of holistic nursing competence.

Tab. 7: The mediating role of holistic nursing competence (H4)

Coefficients^a

a. Dependent Variable: PE

Moderation Analysis of Emotional agility

This study has investigated the role of emotional agility as a moderator between nurse clinical leadership and holistic nursing competence. Data analysis has concluded that emotional agility significantly strengthens the relationship between the nurse clinical leadership and holistic nursing competence ($\beta = 0.44$, $P < 0.05$). So, the moderating role of emotional agility is confirmed. Results have been presented in below Table 8.

Tab. 8: Moderating role of emotional agility between nurse clinical leadership and holistic nursing competence.

Hypotheses	B	S. E	T-values	P	LLCI	ULCI
nurse clinical leadership *emotional agility > holistic nursing competence	0,4396	0,0361	12,1616	,0000	0,3686	0,5106

Based on the data analysis, this study has also presented the graphical results of moderator-emotional agility. The graphical analysis shows that in the presence of higher emotional agility, nurse clinical leadership amplifies its impact on holistic nursing competence of healthcare organizations (Fig. 2).

Fig. 2: The multiple line mean of PE by HNC by EA

This study has investigated the role of emotional agility as a moderator between holistic nursing competence and psychological empowerment. Data analysis has concluded that emotional agility significantly strengthens the relationship between holistic nursing competence and psychological empowerment ($\beta = 0.74$, $P < 0.05$). So, the moderating role of emotional agility is confirmed. Results have been presented in below Table 9.

Tab. 9: Moderating role of emotional agility between holistic nursing competence and psychological empowerment.

Hypotheses	B	S. E	T-values	P	LLCI	ULCI
holistic nursing competence*emotional agility > psychological empowerment	,7372	,0506	14,5764	,0002	,6377	,8367

Based on the data analysis, this study has also presented the graphical results of moderator emotional agility. The graphical analysis shows that in the presence of higher emotional agility, holistic nursing competence amplifies its impact on psychological empowerment of healthcare organizations.

Research limitations. The conceptual model needs to be tested in different sectors and in other countries in order to enhance generalizability of the achieved findings.

Managerial implications. The aim of this study was to determine the relationship between nurse clinical leadership, holistic nursing competence, emotional agility and psychological empowerment in health care employees. The moderating role of agility and the mediating role of holistic nursing competence between nurse clinical leadership and psychological empowerment of health care employees in Turkey was the focus of study in this research. Thus, we tested basically six hypotheses.

Nurse clinical leadership impacts psychological empowerment in healthcare organizations (H1).

Nurses has clinical leadership are active and empowered participants in making decisions about their patients' plan of care. They have an active voice and presence in organisational decision making their this empower is increased their psychological empowerment and the degree quality of patient care. In our study, it was found that nurse clinical leadership affects psychological empowerment. Previous studies (Oducado, 2019; Armstrong & Laschinger, 2006) and this paper supports Kanter's (1993) theoretical propositions that when leaders are effective in using empowering behaviors, nurses feel empowered to take on the tasks. Contrary to our results, Connolly et al. found that the clinical leadership characteristics of emergency nurses were not sufficient and this situation negatively affected their psychological empowerment (Connolly et al., 2018).

Nurse clinical leadership impacts holistic nursing competence in healthcare organizations (H2).

According to ICN the goal of health care is to provide high-quality care and safe, and this places nurses' competence in focus (ICN, 2019). Clinical competence is the ability to perform a task and achieve a desirable outcome under certain circumstances (Benner, 2001). In last decade, studies of clinical competence has been investigated in association with variables such as nurse's ethical relationship with patients and peers, educators' and managers' assessments of competence and occupational commitment, practice environment and nursing competence (Numminen et al., 2015). In our study, we also investigated the effect of nurse clinical leadership on holistic nursing proficiency and found that it did. We obtained similar results to that achieved by Willman et al. (2020) and Numminen et al. (2016).

Holistic nursing competence relates with psychological empowerment in healthcare organizations (H3)

Psychological empowerment has been determined as a means of improving employee performance (Dust et al., 2014). There are few studies, in the nursing, that have investigated psychological empowerment (Shapira-Lishchinsky & Benoliel, 2019; Oyeleye et al., 2013).

In these studies, the relationship between nurses' perception of leadership, stress, burnout levels, intention to leave, job satisfaction and psychological empowerment was determined. Competence in holistic nursing relates among the nurses about their proficiency, personal characteristics, attitudes, values, skill and knowledge, along with their professional roles and responsibilities (Aydın & Hiçdurmaz, 2019; Fukada, 2018). In our study, a relationship was found between holistic nursing proficiency and psychological empowerment, and it is similar to the literature.

Holistic nursing competence has a mediating role between nurse clinical leadership and psychological empowerment in healthcare organizations (H4).

However, in our study, we found that holistic nursing competence has a mediating role between nurse clinical leadership and psychological empowerment in health institutions. In previous studies, it was determined that there was a significant relationship between the mediating role of psychological empowerment between job satisfaction and organizational commitment (Saif & Saleh, 2013), psychological empowerment has a mediating role between empowering leadership and job performance (Kundu et al., 2019) and it is similar to our research result.

Emotional agility has a moderator role between nurse clinical leadership and holistic nursing competence beside it has a moderator role between holistic nursing competence and psychological empowerment in healthcare organizations (H5-H6).

Emotional agility, having emotional awareness, perspective, and emotional regulation skills, is associated with increased ability to cope with stressful situations and greater self-esteem (Wilson, 2021; David, 2016). Nurses are exposed to many situational factors that can complicate their work in the hospitals, including psychosocial factors. They struggle with all these difficulties with their emotional agility. Holistic nursing competence and leadership perceptions enhances the quality of care (Soto-Rubio et al., 2020). In our study, we determined that emotional agility has a mediating role between nurse clinical leadership and holistic nursing competence in health institutions.

Originality of the paper. Our findings push hospital management to pay attention to nurses, considering them as pillars able to build a positive work environment. Moreover, the paper also suggests several policies that can support and develop nurses' clinical leadership in the hospital context, as it enhances nurses' ability to solve practical problems cooperatively while maintaining a sense of emotional agility, holistic competency, and psychological empowerment.

Consequently, managers in the healthcare while boosting leadership, are able to enhance the value of care, enhance nurse satisfaction, and retention, and develop effective intervention methods.

This means that to develop nurses' clinical leadership behaviours, the development of holistic nursing competence, empowering emotional agility and psychological empowerment are all important items which can benefit healthcare organizations' performance.

Keywords: *Emotional Agility; Holistic Nursing Competence; Nurse Clinical Leadership; Psychological Empowerment.*

Cyber resilience in Supply Chain Management: an empirical investigation in Italian firms[♦]

BARBARA GAUDENZI^{*} BENEDETTA BALDI^{*} MARCO FATTORELLI[♦]

Framing of the research. *Supply chains (SCs) are more vulnerable than ever due to the complexity of today's business environment. Accordingly, SC resilience (SCRES) has attracted the attention of academic scholars, and the interest in it increases whenever major disruptions - such as natural disasters - hit SCs, leading to severe business interruptions (Blome and Schoenherr, 2011; Jüttner and Maklan, 2011; Wieland and Wallenburg, 2013; Heckmann et al., 2015). Several studies focus on supply chain risk management (SCRM), investigating how to assess and mitigate supply chain risks to protect the value creation and competitiveness of the firms (Christopher and Peck, 2004; Gaudenzi and Borghesi, 2006; Fan and Stevenson, 2018). However, even though the SCRES and SCRM literature have grown significantly in recent years, there are only few studies dealing with SCRES for specific emergent risks (Tukamuhabwa et al., 2015), such as cyber risks (Colicchia et al., 2019; Melnyk et al., 2022).*

In time of digital transformation, cyber risk represents an increasing threat for organizations, supply chains and societies. Eling and Schnell (2016, p. 483) describe cyber risk as "any risk raising from the usage of information technology (IT) that trade-off the confidentiality, availability, or integrity of services or data". Several reports highlighted that cyber risk is growing in severity and frequency, being listed among the top 10 risks for firms and a primary source of business interruptions (Protiviti, 2022; World Economic Forum, 2022).

Cyber risks can have detrimental effects on SCs and has been recognized in the literature as a key theme that is still under-investigated (Gaudenzi and Siciliano, 2018; Gadge et al., 2019; Melnyk et al., 2022). For this reason, this paper aims to fill this research gap, exploring perceptions and managerial approaches adopted by Italian firms to create cyber resilience. As highlighted by previous studies, the first challenge for supply chain decision-makers should be investing in cyber risks' awareness (Davis, 2015; Eling and Wirfs, 2019). The next challenge is adopting a multi-functional portfolio of strategies to assure cyber resilience. Besides more traditional reactive approaches to cyber risk, based on the adoption of IT tools to cope with recent legal requirements (Stallings, 2018), decision-makers should proactively evaluate cyber risk and its potential impacts along all the key processes, defining the most appropriate mitigation strategies for the firm and the entire supply chain, thus contributing to building cyber resilience (Bartol, 2014; Wieland, 2021).

Purpose of the paper. *The research purpose is to investigate how firms: 1) perceive the exposure of their SCs towards cyber risk and related consequences; 2) manage cyber risk using different cyber resilience strategies; and 3) perceive an effective protect their SC after the adoption of cyber resilience strategies.*

The empirical research is conducted on a sample of Italian firms. The conceptual model, and the related hypotheses, is depicted in Figure 1.

Fig. 1: Conceptual model

The perceived detrimental consequences of cyber risks along SCs have been categorized, behind the solely economic losses, into the two main categories of reputation damage and business interruption (de Gusmao et al., 2018, 2016; Arcuri et al., 2020; Diesch et al., 2020), shedding light on the importance to build a cyber resilience strategy for firms and their SCs (Franke and Wernberg, 2020; Perera et al., 2022; Allianz, 2022). The academic literature recognized two professional frameworks that offer governance strategies and policies to cope with cyber risk, the ISO 28000 and the ISO/IEC 27001 (Zimon and Madzík, 2019). The first one proposes the key steps for evaluating cyber risk and protecting the SCs, while the second framework proposes the Information Security principles to determine, manage and enhance information security along business processes (Culot et al., 2021). To build an effective cyber resilience in SCs, there is a need to coordinate strategies, managerial behaviors, and human resources from different functions and processes (Creazza et al., 2021, Bartol, 2014). Thus, we formulate the following hypotheses:

H1: When managers perceive a risk of supply chain disruption due to a cyber risk, there is a commitment to adopt cyber resilience governance and policies for the firm and the SC.

H2: When managers perceive a risk of reputational damage due to a cyber risk, there is a commitment to adopt cyber resilience governance and policies for the firm and the SC.

The training programs for the employees in the focal firm and along the entire supply chain are crucial for identifying and managing the multifaceted cyber risk that can be related to digitalized SC processes. In fact, cyber-attacks can stem in different ways from internal personnel or external actors (Gaudenzi and Siciliano, 2018). Training programs are essential to up-skill the organization's employees to identify, avoid, and respond to cyber risks in the supply chains (Bulurcu et al., 2010; Flores et al., 2014; Singh et al., 2014; Windelberg, 2016; Williams, 2017; Gadge et al., 2019). Thus, we state the following hypotheses:

H3: When managers perceive a risk of supply chain disruption due to a cyber risk, there is a commitment to implement cyber training programs for the employees and partners (supply chain key actors).

H4: When managers perceive a risk of reputational damage due to a cyber risk, there is a commitment to implement cyber training programs for the employees and partners (supply chain key actors).

Among effective and efficient cyber resilience strategies to successfully deal with cyber risk, a key role is represented by the so-called risk control strategies, typically divided into preventive tools (such as vulnerability assessment tools) or detective tools (such as security audits), that are typically managed by IT managers in close coordination with supply chain managers (Mazzoccoli and Naldi, 2020; Secci and Murugesan, 2014). In fact, all these tools focus on guaranteeing continuity to the IT functions and to the ERP systems throughout the supply chain. These strategies spin around SCs' networks, addressing supply chain strengths and weaknesses (Tao et al., 2016). Based on these studies, we state the following hypotheses:

H5: When managers perceive a risk of supply chain disruption due to a cyber risk, there is a commitment to adopting cyber risk control strategies.

H6: When managers perceive a risk of reputational damage due to a cyber risk, there is a commitment to adopting cyber risk control strategies.

The cyber insurance sector can offer a significant impact in the management of cyber resilience, by contributing to the recovery of risk consequences and also by offering incentives to invest more in cyber resilience strategies (Eling and Schnell, 2016; Meland et al., 2015). Cyber insurance can protect cash flows of those firms that are experiencing severe consequences of a cyber risk (Romanosky et al., 2019; Camillo, 2017). However, several studies underline how insurance investments are still lacking for cyber risks, shedding light on the importance to investigate the commitment to invest in these specific tools (Marotta et al., 2017). Based on that, we state the following hypotheses:

H7: When managers perceive a risk of supply chain disruption due to a cyber risk, there is a commitment to use cyber insurance.

H8: When managers perceive a risk of reputational damage due to a cyber risk, there is a commitment to use cyber insurance.

The adoption of the above-mentioned cyber resilience strategies allows firms and their SCs to assess, avoid and mitigate cyber risk and to reduce the negative consequences of these serious events when they happen (Bartol, 2014; Safa et al., 2016). A critical aspect to consider is the fact that the 'real' effectiveness and the benefits of these cyber resilience strategies can't be measured only when the negative events occur. Contrarily, a good cyber resilience is based on a continuous improvement and the investments that should be linked to the capability to address the effectiveness of the cyber resilience management process in place (Collier et al., 2014). Thus, we built the following hypotheses:

H9: The adoption of cyber resilience governance and policies is positively related to the perceived effectiveness of the cyber resilience in SCM.

H10: The implementation of cyber training programs for the employees (supply chain key actors) is positively related to the perceived effectiveness of cyber resilience in SCM.

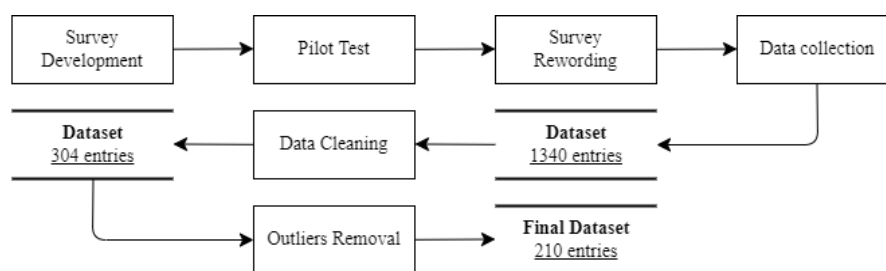

H11: The adoption of cyber risk control strategies is positively related to the perceived effectiveness of cyber resilience in SCM.

H12: The adoption of cyber insurance is positively related to the perceived effectiveness of cyber resilience in SCM.

Methodology. Through an empirical investigation on a sample of 210 Italian firms, we tested the conceptual model by using a structural equation modelling (SEM) technique, IBM SPSS Amos 26 software (Arbuckle, 2019). The SEM analysis provides a way to test the set of specified relationships between observed and latent variables as a whole and allows to conduct theoretical tests (De Carvalho and Chima, 2014).

We collected data from executive-level managers, supply chain managers, chief information officers and risk managers, from different sectors, i.e., industrial sectors (53%), finance companies (29%) and services organizations linked to SCM (18%), in the period of 2021-2022. A pilot survey was preliminarily conducted within a convenience sample of 5 managers from medium-sized and large enterprises in order to validate the questionnaire in terms of comprehensibility and adequacy. As indicated in Figure 2, the final questionnaire was submitted to 1341 participants using the web-based survey provider Qualtrics. The collected data were analyzed, and 1037 responses removed relying on the three exclusion criteria (Abbey et al., 2017), as follows: (i) answers for which respondents failed the attention checks, (ii) responses for which the total questionnaire length was less than or equal to 5 minutes, and (iii) answers for which the respondents did not fall within the scope of the research. Furthermore, all the questionnaires collected were manually analyzed in order to verify the completeness and consistency of the responses. The data cleaning process resulted in 304 valid responses. Before starting the analysis, a Mahalanobis distance inspection was conducted to identify possible outliers (Hawkins, 1980; De Maesschalck et al., 2000). A total of 94 outliers were detected and then removed from the final dataset. The analysis was structured in two stages, as recommended by Hair et al. (2014). In the first step the measurement model was estimated by using the confirmatory factor analysis (CFA) to determine convergent and discriminant validity. The second phase compared the theoretical model with the measurement model. Based on the test results, the structural model was used to compute the path coefficients to test the hypotheses. Additional fit measures were estimated, such as the RMSEA, CFI, NFI, and TLI, as suggested in Gerbing and Anderson (1992) and Mueller and Hancock (2019).

Fig. 2: Phases of the survey development

The analysis and evaluation of the measurement model, through the CFA, allowed to check for reliability and validity of the specific relationships between the observed variables and the theoretical model (Pittino et al., 2018). The internal reliability of the individual items was found to be valid since the factor loadings of all items related to the relevant construct were greater than 0.5 (Hair et al., 2014, p. 605). The internal consistency of the constructs was evaluated through the calculation of the composite reliability (CR), which was greater than or equal to 0.6 (0.681-0.913) for each construct, ensuring adequate convergence and internal consistency for exploratory research (Hair et al. 2014, p. 605). In order to examine convergent validity, we relied on the AVE measure, which value is recommended to be greater than 0.50 (Hair et al., 2014; Pittino et al., 2018). The results show that all constructs meet the standards (see Table 1).

Tab. 1: Model analysis

Construct	Item	Loading	CR	AVE
PSCBIA	PSCBIA1	0,711	0,681	0,516
	PSCBIA2	0,727		
PRDA	PRDA1	0,91	0,757	0,617
	PRDA2	0,637		
RGSP	RGSP1	0,911	0,913	0,778
	RGSP2	0,859		
	RGSP3	0,876		
IST	IST1	0,837	0,883	0,791
	IST2	0,939		
RC	RC1	0,72	0,762	0,617
	RC2	0,846		
RTA	RTA1	0,806	0,845	0,733
	RTA2	0,903		
PICR	PICR1	0,777		
	PICR2	0,861		

Model-fit indicators were computed by using the IBM Amos 6.0 tool (Anderson and Gerbing, 1988). The chi-square test of the measurement model was found to be significant (Hair et al. 2014). The fit characteristics of the measurement model indicated a good fit according to Mueller and Hancock (2019). The Normed Fit Index (NFI) and Tucker-Lewis Index (TLI) were 0.932 and 0.944, respectively. The Comparative Fit Index (CFI) was 0.963. The mean square error of approximation (RMSEA) was 0.072, which is below the desired 0.10 cut-off. Finally, the goodness of fit index (GFI) was 0.922, the root-mean-square residual 0.05 and CMIN/DF < 3, which indicated an acceptable fit between the conceptual model and the data sample (Schumacker and Lomax, 2016). All the results are listed in Table 2. Since the evaluation of the measurement model produced satisfactory results, we moved on to the second phase of the evaluation of the structural model.

Tab. 2: Fit index

Index of fit	Value
CMIN/DF	2,091
RMSEA	0,072
CFI	0,963
NFI	0,932
TLI	0,944
GFI	0,922
RMR	0,05

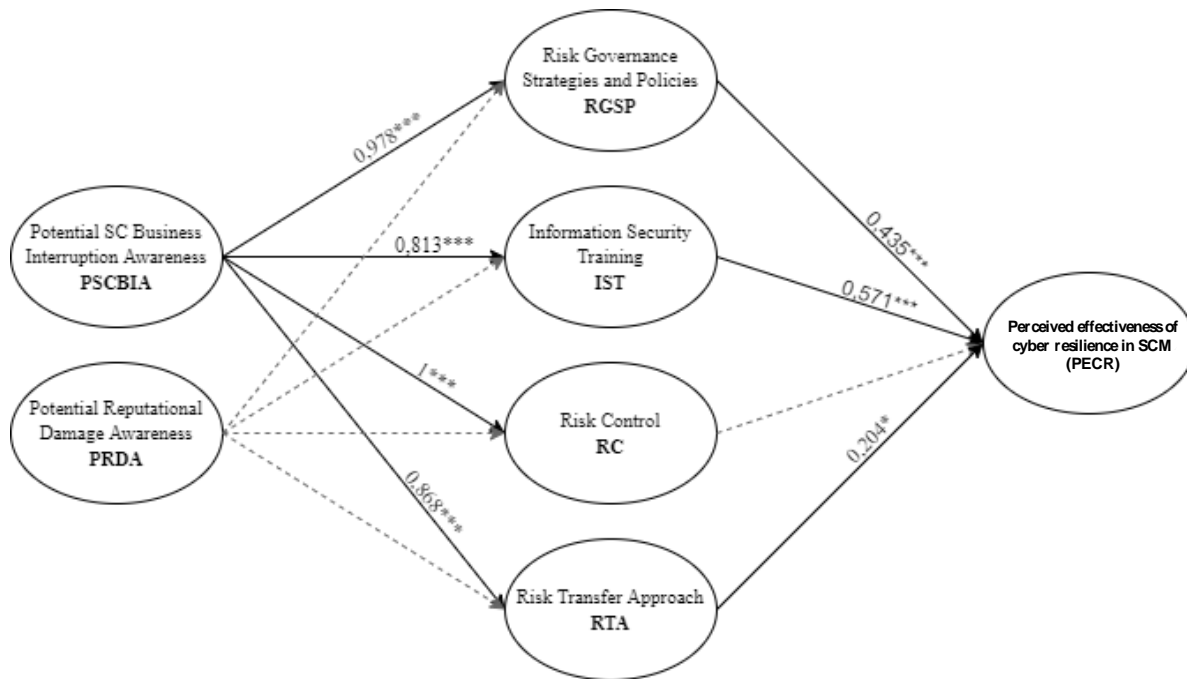

The structural model testing yielded the following SEM indices to demonstrate the adequacy of the model. First, as recommended by Gerbing and Anderson (1992) and Hult et al. (2006), the RMSEA was analyzed, which resulted of 0.083 indicating a satisfactory fit of the model. In addition, the CFI, NFI, and TLI resulted in good fit measures slightly below 0.95 (Schumacker and Lomax, 2016).

Tab. 3: Indexes results

Indices	Value
CMIN/DF	2,455
RMSEA	0,083
CFI	0,945
NFI	0,911
TLI	0,925
GFI	0,899
RMR	0,064

Results. The key evidences resulted from the analysis are depicted in Figure 3, where just the statistically significant relations are reported and highlighted.

Fig. 3: Results

The test of the hypotheses and the path coefficient values between latent constructs, *p*-values, and *t*-values are summarized in Table 4. On one hand, the findings indicate that all the relationships between Potential SC Business Interruption Awareness (PSCBIA) and constructs related to cyber resilience strategies are statistically significant ($p < 0.001$), thus positively supporting H_1 , H_3 , H_5 , and H_7 . On the other hand, the driver related to the awareness of the impact of a cyber risk on organizational reputation (PRDA) does not affect the cyber resilience strategies adopted by managers, as none of the relationships between the associated constructs are statistically significant. Therefore, the hypotheses H_2 , H_4 , H_6 , and H_8 are not supported ($p > 0.05$). The analysis also reveals that the cyber resilience strategies leading to cyber resilience effectiveness are the adoption of risk governance strategies and policy (RGSP) practices and the adoption of employee information security training programs (IST). In fact, both the RGSP and IST constructs positively contribute to the perceived effectiveness of cyber resilience, according to which the hypothesis H_9 and H_{10} are supported ($p < 0.001$). By contrast, surprisingly, controlling cyber risk through the physical defense and protection tools was found to be not perceived as an effective strategy, so the H_{11} is not supported ($p > 0.05$). Finally, as far as the adoption of cyber insurance policies (RTA) is concerned, the model shows a weak positive relationship ($p < 0.05$) with the dependent variable PICR, thus the H_{12} is only partially supported.

Tab. 4: Model results

			Path coefficient	<i>t</i> -value	Result	
H_1 :	PSCBIA	→	RGSP	0,978***	8,009	Supported
H_2 :	PRDA	→	RGSP			Not supported
H_3 :	PSCBIA	→	IST	0,813***	6,966	Supported
H_4 :	PRDA	→	IST			Not supported
H_5 :	PSCBIA	→	RC	1***	7,722	Supported
H_6 :	PRDA	→	RC			Not supported
H_7 :	PSCBIA	→	RTA	0,868***	6,906	Supported
H_8 :	PRDA	→	RTA			Not supported
H_9 :	RGSP	→	PECR	0,435***	3,666	Supported
H_{10} :	IST	→	PECR	0,571***	6,491	Supported
H_{11} :	RC	→	PECR			Not supported
H_{12} :	RTA	→	PECR	0,204*	2,3	Partially supported

Note: Significance levels * $p < 0.05$; ** $p < 0.01$; *** $p < 0.001$ (two-tailed test); *t*-value = 1.96

Theoretical implications. The current research contributes to prior literature in several ways. Firstly, at the best of authors' knowledge, this research is one among few that investigates cyber risks and cyber resilience within the SCM context and from a SC perspective, demonstrating in particular the key role of managerial approaches, that appears more relevant than risk control and IT-based solutions in managing cyber resilience. In fact, cyber risks are supply

chains' threats that are emerging in recent years due to the increasingly digitalized and interconnected business environment. Furthermore, the study contributes to knowledge advancement in the SCM research field by creating a link between the SCRES and the SCRM literature. Additionally, this research builds on previous studies by establishing direct links between potential SC business interruption awareness and cyber resilience strategies, and between these latter and the perceived information security effectiveness. Furthermore, the study offers a comprehensive theoretical framework, which could be improved in future studies to further foster knowledge development.

Managerial implications. This research provides several implications for practitioners. First of all, the research approaches one of the major challenges that SCs are facing in times of digital transformation, i.e., cyber risk and the related business interruptions; thus, the study provides insights for managers about an actual concern for businesses. More in detail, the results highlight the crucial role played by potential SC business interruption awareness on justifying the commitment towards practices and strategies' adoption. Based on that, managers should invest in those practices that foster the awareness and knowledge development about potential cyber resilience. Moreover, our results show the key role of managerial approaches, rather than IT-based physical control solutions, in assuring cyber resilience, suggesting more investigations and investments in this direction. In particular, the study shed light on the effectiveness of the implementation and adoption of cyber resilience governance for SCs, cyber training programs for the managerial employees (thus highlighting the key role played by employees as supply chain key actors) and lastly cyber insurance practices.

Research limitations. Even though the study is strongly grounded in the literature and the analysis has been rigorously conducted, it is not without limitations. Firstly, the empirical evidences resulted from the analysis are based on a sample of Italian companies, hence the generalizability of results is limited. Furthermore, the survey data has been gathered in a limited timeframe. Thus, future research should consider different countries for the analysis and several time periods, for possible longitudinal analyses too. Moreover, the SEM analysis is just one among the available methodologies, thus future research should conduct the analysis by using different methods. Lastly, the study has been conducted by focusing on a specific supply chain risk, i.e., cyber risk. Future research could consider different sources of risks and the concurrence of several risks on the supply chain resilience strategies and insurance policies.

Keywords: Resilience; supply chain management; cyber risk; cyber resilience; structural equation modelling

How to cope with emerging tensions in operational processes: the case of a SMA facing contemporary market challenges

ELISA CARLONI* ELISA GONINI• SERENA GALVANI▲
ALESSANDRO PAGANO** ROBERTA BOCCONCELLI**

Framing of the research. *Marketing Agencies are a particular type of Professional Service Firms (PSFs) (Lone et al., 2021) that play an essential role in the development and diffusion of marketing-related innovations, acting as valuable knowledge providers for firms operating in a wide variety of sectors (Moorman and Day, 2016; Lynch, 2019). PSFs - and Marketing Agencies - are typically characterized by high knowledge intensity, low capital intensity, and professionalized workers (von Nordenflycht, 2010; Vafeas and Hughes, 2020). The main resources of this type of business are intangible and substantiated in human capital, namely knowledge, relational skills, and reputation (Kaiser and Loscher, 2015)*

Recent changes in the business context, such as increasing competition and emerging technologies, and dramatic events as the Covid-19 pandemic, are putting strong pressure on PSFs in terms of capabilities and organizational models (Empson, 2021; Kronblad and Pregmark, 2021), questioning established strategies and pushing towards the adoption new organizational structures and expansion of their offerings (Rubik, 2021). In such an evolving context, Marketing Agencies are called to be no more just technically competent, but also experts in digital and technical skills, data interpretation, customer engagement, and value-added processes (Cluley et al., 2019). Studies have started to show how market changes are reflecting into the emergence of paradoxical tensions within PSFs (Manzoni and Volker, 2017; Gaim, 2018). Operational processes of such firms are challenged by the need to respond to increasingly volatile market requests in a more flexible, quick, and effective way. On the organizational standpoint, this implies revising a series of diffused routines, mechanisms, and practices, inevitably leading to hard-to-solve tensions (Loch and Sommer, 2019). This is particularly evident for Small Marketing Agencies (SMAs), characterized by limited size and resources, seem to be especially hindered by the emerging tensions brought by new market dynamics. For instance, the increasing wish to adopt mobile work practices is raising tensions about the already limited context of human resources (Raguseo et al., 2015).

Notwithstanding the difficulties smaller companies face in the attempt to overcome organizational tensions, the topic seems to be still under-investigated. In particular, there is fragmented research on the typology of emerging organizational tensions faced by SMAs along their operational processes. Furthermore, even less attention has so far been paid to possible coping managerial practices that firms can implement to deal with such tensions.

Purpose of the paper. *In light of these considerations, this paper aims to investigate the emerging tensions along operational processes that SMAs are called to face in contemporary markets, with the intent to understand if and how coping practices are helpful in solving them. To do this, the following research questions are addressed: Which organizational tensions emerge when SMAs change their operational processes to face contemporary market needs? How can SMAs deal with such tensions?*

To achieve this goal, this paper discusses an explorative case study of a SMA located in central Italy, which has undergone organizational changes to sustain its growth in the market of marketing-related business services. The analysis relies on the Actors-Resources-Activities (ARA) framework (Håkansson and Snehota, 1995): for the three dimensions, emerging paradoxical tensions have been identified along with the organizational responses implemented to manage them.

Theoretical background: adopting a paradox framework to understand emerging organizational tensions. *Paradoxes are defined as contradictory yet interdependent elements that cannot be easily resolved (Poole and van de Ven, 1989;*

Putnam et al., 2016). Paradoxes define contradictions, conflicting demands, opposing perspectives (Lewis, 2000), which are an intrinsic characteristic of organizations and a manifestation of complexity (Berti et al., 2021). Paradoxes describe the increasingly competing demands faced simultaneously (Gaim and Wählin, 2016) by firms which can derive from organizational tensions. Organizational tensions are, in turn, defined as “two phenomena in a dynamic relationship that involve both competition and complementarity” (Epstein et al., 2015: 37). The paradoxical nature of organizational tensions stems from the contradiction yet interrelation that characterizes these elements (Lewis, 2000; Gaim, 2018). Indeed, paradoxical tensions “result from the perception of opposing, conflicting, and interrelated characteristics of paradoxes and are reflected, cognitively and emotionally, when one attends to both demands simultaneously” (Gaim and Wählin, 2016: 35). Understanding organizational tensions as having a paradoxical nature implies that the organization will not attempt to get rid of the tension, but rather to sustain it as competing demands (Smith and Lewis, 2011) through the adoption of a “both/and” perspective (Smith et al., 2017).

The paradox perspective can be understood as a useful managerial lens to investigate firms’ organizational configurations and processes employed to manage the tensions they confront (Hargrave and van de Ven, 2017). What characterizes tensions is dynamicity, as they change over time, and tackling one of them can open other tensions (Berti et al., 2021).

Previous studies on creative PSFs (Manzoni and Volker, 2017) have shown how their nature as well as external factors, including increased competition, demanding clients, and technological changes lead to emerging competing paradoxical tensions, whose features and management practices still remain largely unexplored.

Methodology. This paper adopts a qualitative single case study methodology (Eisenhardt, 1989). The case study concerns a digital marketing agency, Alpha. Alpha is a marketing agency of 35 employees, located in the center of Italy and specialized in digital marketing services and web platform management. Alpha was established in 2009 during a period of strong growth in the market of innovative digital marketing services. Its goal is to enhance its clients’ e-commerce performance and the main market segment is represented by small and medium enterprises (SMEs). The surge in demand for Alpha services has been caused by the impact of the Covid-19 pandemic and by the financing opportunities linked to national and regional programs on SMEs’ digitalization.

Recently, Alpha has become part of a business group that brings together different marketing agencies with complementary specializations and aimed to increase the range of marketing-related services to be offered to a wider market in geographical terms, thus achieving an adequate company scale to become a full-range provider in marketing services.

Currently, one of the main challenges is represented by the alignment of assigned roles, interdependencies, and homogeneity of internal and customer-related organizational processes.

Data collection is ongoing and relies thus far on three semi-structured interviews (Kvale and Brinkmann, 2009), conducted with the Project Manager (PM), the Digital Advertising and Analyst Specialist, and the Digital Advertising Junior. Secondary data has been collected through corporate presentations and the website. Additionally, researchers took part in a public, two-hours seminar held by the Project Manager (PM) focused on illustrating the operational processes of Alpha and the main challenges related to their management.

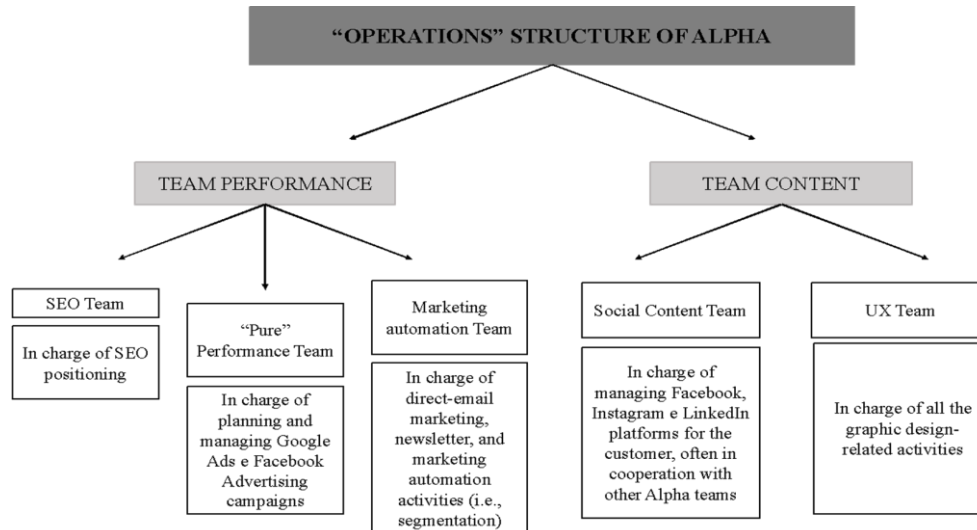

Primary and secondary data has been analyzed by adopting a systematic combining approach (Dubois and Gadde, 2002) to highlight the interplay between the research object, methodology and theory. The empirical analysis relies on the Business Network approach (Håkansson et al., 2009) to explore organizational dynamics at the inter and intraorganizational levels. Data were coded and interpreted based on the ARA framework (Håkansson and Snehota, 1995), which describes the content of business interaction in three interrelated layers: actors’ bonds, resource ties, and activity links. Emerging paradoxical tensions have been identified along these three dimensions, along with managerial practices in place or to be implemented to manage them.

Results.

1. Key actors: emerging organizational tensions and organizational responses

Alpha has an articulated organizational structure composed of highly interdependent positions and units/functions. A key role is played by the team of Account New Business, which manages the first contact with customers. Once the contract is signed, the Account Team takes charge of managing relationships with the customer under both the strategic and operational sides, along the project/campaign. Services and projects are implemented by the Alpha teams, which compose the “Operations” structure. Figure 1 shows the main areas in which Alpha teams are divided.

Fig. 1: The operations structure of Alpha

Source: Authors' elaboration

In addition to internal teams, the agency uses partnerships with freelance marketing professionals to carry out specific activities. Freelancers can have the full responsibility of managing relationships with assigned customers in a wide range of marketing activities or collaborate on ad hoc projects. Their involvement depends on the level of demand for customer-related services and on the need to gain the required expertise.

Recently, due to an increasing market demand, Alpha expanded its human resource base. In particular, to further support the various teams and each team member, new organizational positions have been introduced: Project Manager (PM), Service Developer, and Human Resource (HR) Manager. The PM position – which is not common in marketing agencies - has been introduced and integrated to facilitate the planning of activities and resources and coordinating them daily and weekly. The Service Developer has the aim to coordinate innovative processes concerning digital tools and procedures. Lastly, an internal HR Manager has been put in charge of supporting the PM in planning, managing HRs involved in internal teams or as freelance collaborators, and of HR administration, including HR selection and training. This expansion was aimed at improving internal coordination of activities and therefore allowing for greater flexibility and efficiency in answering customers' requests.

However, it has led to the emergence of a relevant organizational tension related to the increased involvement of team members in various activities and the fragmented supervision role played by managers in different positions – Account Manager, PM, Service Developer, and HR Manager. The diffusion of “control” tasks is generating a lack of clear hierarchical relationships in the perception of team members and frictions among managers while planning their own activities. Alpha is facing this by fostering horizontal communication among managers and vertical communication with team members, to promote further organizational alignment among the various activities played by teams and by single team members.

In such a context, a further change in the organizational routines of Alpha has been introduced: the opportunity to work remotely. This change witnesses a quick reaction of Alpha to two emerging market needs: on the one side, the Covid-19 Pandemic, which hampered physical interactions; on the other side, the growing expectations from employees to be supported by their employers in balancing work and personal commitment, as declared by 87% of interviewees in the Global Workplace Report (Gallup, 2022). Nevertheless, this change triggered an organizational tension about the need to maintain physical interaction to promote knowledge exchange and organizational alignment while implementing remote work. This challenge is being faced by experimenting with hybrid work solutions, strengthening team communication, and adopting digital tools for real-time coordination.

2. Key activities: emerging organizational tensions and organizational responses

The activities implemented in Alpha depend on the content of services provided – mainly e-commerce-related – and on their timing. The main distinction is between spot services, which are planned ad-hoc with a fixed starting and ending, and ongoing ones, implemented regularly for one year and renewable upon the customer's request. In recent times, an increase in the customer base, as well as in the technical skills required to deliver digital services, led to additional complexity in the management of service operations, also because of the interdependencies of the various services.

As a consequence, a new organizational tension has emerged: on the one hand, each team is highly specialized in one single activity, taking full responsibility for it, while, on the other hand, there is an increasing need to foster integration between activities, as they might be concerned with the same customer and have technical complementarities. The same challenge concerns free-lance professionals, who might be in charge of one specific activity or of providing full services for a single customer. This organizational tension is being coped with fostering stronger coordination in service operations, mainly thanks to the PM's effort in terms of “resource planning”. During

the pandemic, this has been combined with management activities related to hybrid work planning. Another adopted mechanism is the introduction of coordination procedures and tools, which, however, have not yet fully solved difficulties related to interaction among Alpha teams, particularly with the UX staff, whose professional culture and technical knowledge have a more creative nature and substantially differ from those of the other teams. In addition to the setup of new procedures, the internal staff uses a variety of digital tools to exchange knowledge and data to foster coordination among teams. Notably, an ERP is used to manage knowledge flows between Sales, Administration, and Project Management, while a planning tool is adopted for coordination of activities.

Finally, another emerging organizational tension is the simultaneous pursuit of customization and standardization of services. Indeed, if it is true that customers look for ad hoc solutions and co-created, tailor-made services, they also more and more require short delivery times and restrained costs. On the one hand, the company is trying to provide a customized service offering combined with flexible management of interactions with the customer. On the other hand, these activities should be implemented to guarantee efficiency in the use of time and resources. This organizational tension is faced by the company promoting stronger interaction among Sales and Account managers and among the Heads of Service Teams and the PM. Moreover, providing customers with tailor-made solutions becomes more and more complex over time. One way this complexity manifest itself is through the incremental adoption of digital technologies: indeed, frequently, customers adopt one type of digital solution at the time, adding new ones incrementally. While, on the one hand, this approach allows Alpha to continuously reinvest in the relationship with customers by reinforcing trust and providing additional value, on the other hand, it also challenges the management of operational processes. Alpha, indeed, is called to iteratively revise the number of activities dedicated to each customer, as well as the necessary competences and resources to sustain them. A Project Management style is of tremendous support in such a volatile and complex scenario.

3. Key resources: emerging organizational tensions and organizational responses

Over the years Alpha personnel has developed specialized expertise in e-commerce-related digital marketing, with SMEs as market targets about the management of digital projects with SMEs having a different degree of knowledge and experience in digital marketing. The variety in customer SMEs' profiles and capabilities required Alpha to develop adaptation and flexibility in the service offering and in the management of the interaction with customers. The growth in the size of the company and of the various operational teams has been possible also thanks to the involvement of young graduates from universities located in the region.

This pattern has led to one emerging organizational tension: the pursuit of incremental involvement of new hires in team activities during the onboarding phase and the need for each team member to guarantee autonomy and homogeneity in service provision. This organizational tension is being managed by the company thanks to the advanced digital marketing training for new hires – mainly through the close supervision by the Head of Service Team - and the active role played by the PM, whose main concern is to organize internal and external human resources to be involved in activities, also in a hybrid work setting. The PM is involved in frequent “alignment meetings” with every collaborator to discuss any relevant issue emerging from daily work practice, such as difficulties in implementing activities, training opportunities and personal problems affecting the workplace.

Providing innovative services in an efficient manner implies promoting innovation in terms of new procedures and digital tools. This implies that organizational tensions emerge in the pursuit of exploration of innovative solutions and exploitation of the existing knowledge base in the provision of the service offering. This organizational tension is being addressed by introducing the Service Development Manager and allowing each team member to devote time to developing new organizational procedures to guarantee higher efficiency and homogeneity within their team and to assess and learn new digital marketing technologies and tools. In addition, the company recently started launching a more structured internal data analysis related to the main organizational processes, to gain a more detailed picture of performance levels and to strengthen reporting activities.

Table I summarizes the main emerging organizational tensions and responses for each layer of the ARA framework.

Tab. 1: Summary of emerging organizational tensions and responses along the three dimensions of the ARA framework

Layer	Emerging organizational tensions	Organizational responses and impact on operational processes
Actors	Integrated vs diffused supervisory role	<ul style="list-style-type: none"> Promotion of organizational alignment through horizontal communication among managers and vertical communication with team members
	Fostering interaction among employees vs pursuing a hybrid work configuration	<ul style="list-style-type: none"> Introduction of hybrid work solutions Promotion of team communication Adoption of digital tools for real-time coordination
Activities	Pursuing separation vs stronger integration of service provision	<ul style="list-style-type: none"> Resource planning activities implemented by the PM Introduction of management activities for hybrid work planning Adoption and coordination of procedures/tools Use of an ERP to manage knowledge flows
	Customization vs standardization of service provision	<ul style="list-style-type: none"> Promotion of interaction among Sales and Account managers and between the Head of the service teams and the PM
Resources	Incremental involvement of newly hired employees vs HR's autonomy and homogeneity in service implementation	<ul style="list-style-type: none"> Advanced digital marketing training for the new hires Supervision and active role of the PM through alignment meetings
	Exploration vs exploitation of innovative solutions	<ul style="list-style-type: none"> Introduction of the Service Department Manager position Development of new organizational procedures from teams for efficiency and learning Adoption of structured internal data analysis related to the main organizational processes

Source: Authors' elaboration

Preliminary discussions, conclusions and limitations of the research. *This study explores changes in SMAs' organizational configurations and operational processes implemented to meet the evolving market challenges through the analysis of the explorative case study of Alpha and the use of the paradox perspective along the three dimensions of Actors, Resources, and Activities, based on the Business Network analytical framework (Håkansson and Snehota, 1995). Findings confirm that SMAs represent a typology of PSFs under strong pressure for changes in the market and technological contexts (Lynch, 2019), with various emerging organizational tensions and related organizational responses having an impact on operational processes. The preliminary empirical analysis provides key insights, filtered through the three dimensions of the ARA framework.*

With regard to the actor dimension, organizational tensions emerge due to the growing complexity of processes leading to the involvement of various actors in supervision and control. This pattern is further pushed by the need to balance physical interaction and remote working (Summerfield, 2022). These two organizational tensions have been addressed by fostering alignment and communication among key managerial positions and within operational teams and through more careful planning of hybrid work configurations (Whillans et al., 2021).

With regard to the activities dimension, organizational tensions concern the balance between separation and integration of activities performed by different teams and the pursuit of standardization and customization in the service provision (Bettiol et al., 2015; Kohtamäki et al., 2020). The complexity in managing activities is largely due to the higher levels of interdependence (Lynch, 2019), requiring specific and innovative organizational solutions. Alpha has been dealing with such tensions by strengthening the planning of activities through the PM and by introducing more effective coordination mechanisms through new procedures and digital tools.

Regarding the "assembly" and development of resources (Ciabuschi et al., 2012), two main organizational tensions emerge concerning the effective involvement and training of new hires in the service provision processes and the need to combine the pursuit of exploration and exploitation of solutions (Jensen et al., 2010; Hargrave and van de Ven, 2017). These tensions have been coped with strengthening key positions (Service Development Manager, PM), introducing specific procedures, and fostering knowledge transfer and exchange.

This preliminary research suggests that SMAs are currently facing various organizational tensions and adopting coping organizational mechanisms, which require rethinking and reconfiguring existing operational processes. This is a "game" thus far played mainly by large PSFs. The case of Alpha shows that also SMAs can undertake more structured organizational solutions, such as new positions and specific procedures allowing for the use of "time" as a resource to pursue more effective coordination and knowledge exchange. Future research could provide a more extensive view of the current organizational challenges and configuration of SMAs, which represent key actors in market-related innovation, considering the conflicting challenges of pursuing efficiency and innovation and the interrelated phenomena of human resources retention and activation of remote working configurations.

Managerial implications. *At the managerial level, the analysis of organizational tensions is helpful to support small companies struggling with the extreme dynamism of contemporary markets. Becoming aware of the potential organizational tensions is the first step for managers in understanding how to recognize them and promptly react when they occur. In general terms, key tools in the efficient management of operational processes seem to be a tight coordination of activities and priorities, implemented through a Project Management approach, a cooperative-based working style among teams, and the exploitation of digital tools to optimize information flows.*

Originality of the paper. *Though this research is still at its infancy, some preliminary contributions can be drawn based on the empirical findings. In terms of literature the study attempts at enriching knowledge on how the operational processes of SMAs are transforming due to the recent changes in contemporary markets, ranging from the great push toward digitalization to the challenges imposed by Covid-19. On the one side, the case of Alpha reinforces what suggested by Rubik (2021) or Kronblad and Pregmark (2021) about the increasing complexity to manage intricate operational processes faced by SMAs, especially in terms of generating additional value for customers within such processes (Cluley et al., 2019). On the other side, the adopted paradox theory lens (Smith and Lewis, 2011) allows to highlight a series of original tensions and coping strategies.*

Assessing the Impact of 4.0 Technologies on Product and Process Innovation: A Review of Existing Literature

DANIELE VISCHETTI* CRISTIANO CIAPPEI* RICCARDO RIALTI[▲] LAMBERTO ZOLLO**

Objectives. *Over the last decade, the emergence of new digital technologies has shuttered the ways managers are running businesses. In particular, digital technologies caused the so called fourth industrial revolution (4IR). Among the most disruptive effects of this revolution, businesses started to update their processes to match the technological evolution pace (Bortoluzzi et al., 2020). Nowadays, managers have are aided by machines and tools in scheduling the production. Likewise, material processes changed due to new emerging way of producing product. The most relevant effects of this technological changes are anyway represented by the new available data at disposal of businesses. Data, whether suitable analyzed through artificial intelligence (AI), could provide a whole new detailed level of information to managers, which could increase process efficiency and strategic foresight (Giannini, 2019). Production processes have been consistently affected by these new technologies. As an example, 3D printing and advanced design interfaces are allowing businesses to develop innovative solutions at a faster pace. Then, emerging technologies allow the possibility to develop smart product (i.e., product embedded with a certain degree of connectivity thanks to Bluetooth applications or Internet of Things). Finally, more complex products may be developed as a consequence of the availability of new technologies.*

Literature has consistently started to explore the importance of these topics. Yet, extant literature has rarely been systematized and has rarely focused on the impact of these technologies on product and process innovation.

In such a regard, the objective of this research is to perform a bibliometric and a systematic literature review in respect of these topics.

Research Context. *Digital technologies are at the center of interest of current business literature. The fourth industrial revolution (4IR) is utterly changing the way in which companies operate, their organization, and the entrepreneurial decision-making processes.*

It's unfeasible to discuss about 4IR without introducing Artificial Intelligence (AI). The term AI was coined in 1956, and performed a waver evolutionary path during years. During the 80's it starts to be used also in manufacturing in solving complex problems related to machine programming. Yet, it was in the 00s that the diffusion of internet subverted the amount of data available (Wamba-Taguimdje et al., 2020). Hereby, in this technological era, AI embedded tools started to complement Big Data Analytics. AI thus started to deal with sources of Big Data thank to machine learning approaches and more powerful computers supporting the computing of Big Data. Data analytics is determining nowadays for the inspection and the monitoring of companies' performances. Data are thereby the principal support of decision-making processes od managers. As a results of the intersection between AI, Big Data and manufacturing tools Intelligent Manufacturing (IM) resulted. IM systems are nowadays used in design, scheduling, and production. IM provides the use of data analysis, AI, and Machine Learning in the production process to deal with the increasingly frequent need of customization, constant changes in customers' preferences and increasing production complexity (Chari et al., 2022).

The 4IR showed its full potential in thanks to the progressive emergence and integration in AI and Big Data of technologies such as 5G, IoT, and Cloud computing (Wang et al., 2022). The fact that the application of effective data mining procedure brings to satisfying economic results is not just a matter of theory, but something that can be demonstrated practically. Walmart, one of the world's largest companies by revenue, used software like "Apache Hadoop" and "NoSQL" to gather data to fully optimize the customer experience in the shop and to customize the shopping experience through the website. Walmart tracks and targets every consumer individually. Walmart has thorough customer data of about 145-millions of Consumers. The company acquired information on what customer's buy, what are their habits, what products they like. The big data team at Walmart Labs analyses every clickable action on Walmart.com, they pay close attention on what consumers buy in-store and online, what is trending on social media,

scheduled local events (like Super Bowl or NBA finals), how local weather deviations affect the buying patterns and so on.

Still, digital technologies related to Industry 4.0 need a deep understanding before being applied in an industrial context, in term of consciousness toward the topic in general, but also speaking of benefits in economic, time-saving, and sustainable terms.

Noticeably, the US, China, UK, and EU-27 are among the biggest player in the I4.0 context and are continuously boosting the diffusion of 4IR technologies through national and supranational policies and incentives (Felsberger et al., 2022). The heterogeneity of the development level of different countries demonstrate that Europe has different levels of implementation of the most important technologies characterizing 4IR (like IoT, Robotics or Big Data analytics) with Scandinavian countries like Finland and Denmark that are leaders in this scenario, while the weakest players are Greece, Romania, Bulgaria, Hungary, and Latvia (Fatorachian and Kazemi, 2021).

In such a context, the differences between countries are explained according to greater availability of skilled workforces or diverse level of capabilities in businesses. Likewise, existent knowledge management mechanisms are important means by which companies can gain information about the usage of digital technologies. Both formal and informal collaborative approaches seemed to be something mandatory especially for SMEs with limited resources.

This work has the purpose of analyzing the current state of the literature about process and product innovation especially for those firms that are implementing digital Industry 4.0 technologies. A literature review to understand the potential of digital technologies is mandatory, in particular for the fact that authentic case studies are really limited in this area. Process Innovation and Product Innovation are both analyzed together for the strict relation that they have. In the past some works were made (Kraft, 1990 and Fritsch & Meschede, 2001) in trying to assess this relation between product and process innovation, but with scarce results, and during decades the necessity to prove this interaction has faded. Other works more recent focus on Green process innovation for green product innovation (Xie et al., 2019) and some exceptions but with few citations concentrate on the impact that process innovation with new digital technologies had empirically on products (Saleem et al., 2020). The reason why this relation between Process and product innovation wants to be proven is the strong belief that the introduction of new technologies (in particular supportive technologies for Industry 4.0) in the production process can lead to positive result in New Product Development, subsequently positively impacting the financial and economical return of companies.

This first literature review will be a first step for a wider project proposal for PhD, were this relationship between Product innovation and digital technologies will be proved also with the aid of quantitative methodologies.

To understand which are the benefits of 4IR technologies in diverse contexts, this work will attempt to analyze the current state of the literature about process and product innovation. A literature review to understand the potential of digital technologies has been deemed relevant, as most of literature is still fragmented and need further exploration.

Methodology. In recent time, bibliometric analysis is a largely diffused methodology for the analysis of large volumes of data, especially to highlight the evolution of different fields and areas of certain literature streams (Donthu et al., 2021). In such a regard, bibliometric analysis allows to develop comprehensive structural maps of the knowledge characterizing a research topic. This has been deemed possible thanks to cluster maps emerging from the analysis. The idea of this work is to combine the bibliometric analysis with a systematic review of the literature, that could permit also to understand in depth the contents of the clusters by analyzing the research papers composing them (Aromataris, and Pearson, 2014). The literature review will be focused on both, Product and process innovation in companies that are familiar with Industry 4.0 technologies. The bibliometric component of the analysis was conducted first. The analysis is rooted specifically on the “visualization of similarities” (VOS) technique (Van Eck and Waltman, 2010).

For the systematic literature review, the procedure proposed by Tranfield et al. (2003) was followed. In practice, this research path started on Scopus, where after a research based on the following query “Digital Technolog*” OR “4.0” AND “Innovation*” AND “Product Innovation*” AND “Process Innovation*” was run. More than 200 papers were identified. After that, these results were filtering depending on some important features like: the publication year from 2018 to 2023 (particularly, this span of time was chosen cause in the past, as previously specified, some contributions about the relation between product innovation and process innovation were made, but with scarce result, hence the query here was focused more on the last five years were some work on the impact of digital technologies on product innovation were made, particularly in the year in which the implementation of digital technologies that we were interesting in was massive), the subject area (Agricultural and Biological Sciences, Environmental Science, Economics, Econometrics and Finance, Decision Science, Social Science, Business Management and Accounting), the Document Type (Article, Conference Paper, Book Chapter, Book and Editorial). Reaping the benefits of this filtering the article obtained were 153. A similar procedure was also run on HEBSCO and Web of Science (WOS) databases, results were substantially analogous and no other relevant paper was deemed excluded. Additionally, we checked for predatory journals and we excluded them from the analysis.

Most diffuse keywords emerging from this research were Industry 4.0 (138), Digital Technologies (92), Digital Transformation (53), Innovation (34), Digitalization (26), IOT (25), Artificial Intelligence (23), Industrial Revolutions (23), Big Data (17) and Sustainable Development (16)

Proceeding in this way now the resultant were four clusters that are clearly visible from the bibliometric map in below.

Fig. 1: Clusters' Emerging from the Bibliometric Analysis

Source: Author's Elaboration

Results. The bibliometric analysis generated 4 clusters. Building on this, the most cited papers belonging to each cluster have been reviewed.

The sensitization among digital Industry 4.0 technologies is a tough matter especially regarding those firms (principally SMEs), that need to be well-trained and informed about the potentiality of a digital transition rather than betting on the same old traditional production methodologies. This topic is at the foundation of what are the relevant themes treated in the first cluster (the red one). Basically, the agile approach seems to be the most suitable in order to stimulate people in technology development (Ivaldi et al., 2021). Case studies are helpful in this situation for checking the evolutionary level of a company that is implementing Industry 4.0 digital technologies, and in these cases, collaborations were subject matters of some researches. These studies help to see that collaborations play a real important role in the adoption of new technologies and also the mentoring role of firms could be promoted at a regional level with Industry 4.0 plans (Lepore et al., 2022). After analyzing the 4IR technologies development at a micro level (regional), there's the possibility for a broader scenario. Papers in this cluster indeed shows up the situation in respect of 4.0 technology adoption in the European Union. In particular, it is showing up how regulators are really pushing into the adoption of new technologies for waste-reduction and sustainable ways of production, a diversified scenario is unavoidable, with Scandinavian countries more in an advanced position while other countries are not so updated like Greece and Romania. Clearly the adoption of new digital technologies in a wealthy country is easier and barely replicable in smaller and less rich countries, so if the EU wants to maintain a leader status in the implementation of new innovative technologies, an individual process for country development is mandatory. This cluster thus show how technologies are adopted in many businesses and which are the main effects on sustainability. These effects are explained by the lens of process innovation caused by 4IR technologies (Dubey et al., 2022) In particular, it emerged how thanks to new technologies businesses are nowadays more capable to trace their production processes, reduce waste, and energy consumption. Also, the green transition is a fundamental theme when talking about process and product innovation, in particular also when talking about Smart Agriculture. Climate changes and also agriculture are crucial topics for the application of new 4.0 technologies (Ghobakhloo, 2020). As highlighted previously the awareness toward digital technologies in SMEs is pivotal to implement their adoption and this is also a real indicator when talking about the farmers knowledge regarding SA (Smart Agriculture) technologies.

The second cluster (the green one) is more focused toward manufacturing topics. Small companies are usually refractory to changes, in particular for their family structure that led to path dependence cases and also to few investments in R&D (Morelli, et al., 2022). Of course, we cannot overlook the fragmented scenario experiences by many SMEs, as some tend to adapt and develop the structures in a faster way than other ones. Important research was conducted in Taiwan on 321 businesses, showing that actually the awareness and perceived importance about 4.0 topics is quite high, but sometimes the inadequate information led to a lack of knowledge in important themes. So, as previous anticipated the main issue in the spread of digital technologies remains the distance between the possible benefits that these technologies could bring and the possibility for entrepreneurs (and in this case farmers) to properly understand it. Probably R&D institutes need to concentrate on the improvement to market access for established SA technologies (Chuang et al., 2020). In such a regard, this cluster concentrates on the role of knowledge management (i.e., internal absorptive capabilities) on the adoption of new technologies. Research stresses how SMEs may become competitive in the technological arenas whether they are capable to integrate insights coming from the environment and to integrate these within the system (Pencarelli, 2020). The openness of the system is then the principal key

underlying this cluster. In particular, the internal-side of system receptiveness in respect of innovation emerged as fundamental (Vu et al., 2023).

The third cluster (the blue one) explains how product innovation occur as a result the potential application of 4.0 technologies. In particular, tools such as 3D printers and others may influence the possibility for businesses to create new product. Likewise, it emerged how new smart products may be developed as a consequence of emerging technologies. These smart products may influence the level of satisfaction in businesses and the success of the company. Again, even in this cluster research show how new sustainable products may be developed as a consequence of new technologies (Fleming et al., 2021). These results emerged as it was observed how digital innovation cannot be a stand-alone process, there's the need of cooperation and collaboration, networking is fundamental and the adaptation capacity is the key (Lioutas and Charatsari, 2021). Digital technologies have an immense potential to shape the society in a proper way, but is mandatory to describe a trajectory that will drive the path in a social-responsible direction (Fleming, Jakku, et al., 2021).

Finally, the analysis of the last cluster (the yellow one) highlights some of the most important subject-matters when speaking about 4.0 technologies, that is reshaping of business models, decision-making process and changing in structure. A lot of studies were conducted about the consequences of digital technologies adoption regarding business models adaptations, and the resultant is that there isn't a "one-size-fits-all" approach when speaking about digital-driven business models (Ancillai et al., 2023). Moreover, the decision-making process for firms is deeply changed since the huge amount of data that nowadays is possible to gather for companies. The processing of data is crucial in data-driven decision making, and is also a big opportunity for companies in reducing costs, but carefulness is required when adopting multiple emerging digitalization technologies, otherwise bad results in terms of cost performance could be faced (Colombari et al. 2023). Henceforth, this cluster observes the main structural effects of 4.0 technologies. In particular, it was observed how technologies shape also internal structure of the organization, and how everyone in the business has to adapt to new ways of working and new procedures to reap the benefits of the technology.

Research Limitations. The research, as any other research employing similar methods, is limited by the a-priori selection of the query. In such a regard, the selection of a different query, even just in one term, may brought diverse findings. Likewise, even if other databases have been checked, the selection of different databases may generate other results. Additionally, the analysis may be further extended by developing authors' network maps.

Discussion and Practical Implications. Several implications for theory and practice emerged from the study. In respect of the first, the research represents a first attempt to systematize literature on 4.0 technologies and innovation. In particular, results show how process and product innovation are at the same time related and distant. Indeed, while part of the results show how it may be possible to achieve product innovation through process innovation, they are also separated. This phenomenon may be explained considering how authors with diverse background tend to scantily collaborate, thus exploring the topic diversely. Another important insight concerns the great attention paid to sustainable innovation thanks to 4.0 technologies. In such a regard, it may be assessed how literature is starting to consider 4IR and Green Revolution as related topics. Yet, this occurrence should not prevent future research to explore the effects of technology as self-relevant.

In term of practical ones, as stressed by the most of extant literature, it is possible to observe two main implications. First of all, the role of regulators and policy-makers is still fundamental in fostering business digital transformation. Incentives and training courses provided by national and local institution is fundamental as they may provide new knowledge to businesses wishing to digitally transform. The second implication pertains the need by managers to observe the importance of internal factors underlying the adoption of these technologies. In particular, whether the organization is not ready to accept a new technology, it won't be possible to change internal processes and deliver new outcomes.

Originality of the Study. The preliminary research contributes to the identification of the paths underlying process and product innovation deriving from emerging technological trends. In such a regard, part of the hype surrounding 4IR has been shed and systematized. Results also show the importance of regional differences for businesses wishing to become compliant in respect of digital transformation. This last topic necessitates to receive further attention from research.

Keywords: Industry 4.0, Digital Transformation, Product Innovation, Process Innovation, Bibliometric Analysis, Systematic Literature Review.

Unlocking the Blockchain Potentials through Oracles: Empirical Evidence on Supply Chain Challenges and Performance

DANIEL RUZZA* BEHZAD MALEKI VISHKAEI[•] PIETRO DE GIOVANNI[♣]

Abstract

The first objective of the study is to investigate whether blockchain can be a technology capable of supporting companies in overcoming supply chain challenges and the possible benefits that it can have on business performance. The second objective of the study is to investigate the influence that oracles have on the relationship between blockchain, supply chain challenges, and business performance. In order to reach the paper objectives we collected the data through a structured survey. Our sample is composed of 156 companies. We have analyzed the data using a PLS-PM. The results demonstrate that Blockchain has a positive impact on supply chain challenges and that supply chain challenges have a positive impact on business performance. However, we do not identify any direct impact of blockchain on business performance, but we do identify a positive and indirect impact of blockchain on business performance through supply chain challenges. Outbound oracles and human oracles have no significant impact. Conversely, when hardware oracles and inbound oracles are used Blockchain has a higher positive impact on business performance. When hardware oracles, inbound oracles, or software oracles are employed, supply chain challenges have a higher positive impact on business performance and blockchain has a higher positive and indirect impact on business performance through supply chain challenges compared to the condition without oracles.

Framing of the research. Blockchain is a distributed ledger that records information in multiple copies in several different physical locations (Hastig and Sodhi, 2020). Because of its versatility and extensive impact on multiple aspects of business, it has been defined as a general-purpose technology (De Giovanni, 2020). The academic literature has investigated its applications in operations and supply chains. Pournader et al. (2020) in a literature review consider the application of blockchain to supply chain, transportation, and logistics. The authors identify four main clusters in the literature and develop a model called 4Ts: technology, trust, trade, traceability/transparency. Wang et al. (2019) study blockchain's potential to disrupt supply chains and the challenges to its deployment. The area where blockchain has the greatest impact is product visibility and traceability, disintermediation, digitization of trade, and information sharing. Similarly, Wang, Singgih, et al. (2019), use a sensemaking perspective to study how blockchain can transform supply chains. They identify seven areas in which blockchain has the greatest effects: visibility and traceability to stakeholders, simplification, digitalization and optimization, smart contracts, trust building, disintermediation, and crucial supply chains/industries. Hastig and Sodhi (2020), analyze blockchain for traceability in the supply chain and identify the business requirements from the perspective of focal companies and the critical success factors for blockchain implementation. Some authors have identified the supply chain challenges that blockchain can influence. The most cited are traceability, dispute resolution, cargo integrity and security, supply chain digitalization, compliance, trust, and data management (Azzi et al., 2019; Chang et al., 2020). However, while some explorative studies found the blockchain impact on supply chain challenges, quantitative studies that empirically demonstrate this relation are missing. Similarly, the impact of blockchain on performance is unclear. After the hype where blockchain looked like a panacea and its benefits were probably overestimated, recently its real impact on business performance has raised conflicting opinions (Cole et al., 2019). Some studies find a blockchain positive impact on supply chain performance (Nandi et al., 2020) and a positive impact on business performance depending on the market environment (Ji et al., 2022). Other papers identify a non-correlation between the use of blockchain and the current performance of companies that adopt it (Sharma et al., 2023) or a weak marginal influence (De Giovanni, 2022). For this reason, our first two research questions investigate the relationship between the concepts of blockchain, supply chain challenges, and business performance. RQ1: What is the blockchain impact on supply chain challenges and business performance? RQ2: What is the impact of supply chain challenges on business performance? The introduction of blockchain brings additional challenges both from a technological point of view, such as the slowness of some blockchains and from an operational

point of view, such as the onboarding of all the members of complex supply chains on the blockchain (Wang et al., 2019; Singgih, et al., 2019). From the technological point of view, the connection between blockchain and the real world is one of the most relevant issues. Blockchain to be effective in business activities requires the so-called oracles that allow data exchange from the real world to blockchain and vice versa. Oracles can be of different types (De Giovanni, 2021) classifies them as inbound, outbound, software, hardware, and human. Without oracles, many blockchain applications would be limited or impossible. Consider for example the collectibles sector where recently blockchain has extensive use for the creation of digital collectibles or the certification of the physical collectibles' authenticity. Among the cases of successful applications, there are Collectable.com, Fantastec Swap, and Genuino (Ruzza et al., 2022). Genuino takes care of the certification on the blockchain of the football players' match-worn Jerseys to limit the counterfeiting rate which reaches peaks of 90% in this sector. To make this solution possible, a chip is attached to the jerseys which act as a hardware oracle and records on the blockchain all the information related to the jersey. Given the oracle's pivotal role, our third research question is RQ3: What are the oracles' effects on the relations among blockchain, supply chain challenge, and business performance?

Fig. 1: Conceptual model

Purpose of the paper. The first objective of the study is to investigate whether blockchain can be a technology capable of supporting companies in overcoming supply chain challenges and the possible benefits that it can have on business performance. The second objective of the study is to investigate the influence that oracles have on the relationship between blockchain, supply chain challenges, and business performance.

Methodology. To test our research hypotheses, we created a comprehensive survey that gathered crucial information on various aspects, including the industry and company type of the respondents, the level of investment in blockchain technology, the implementation of reverse omnichannel strategies, the effectiveness of the CLSC network, and business performance. In total, we received 156 usable observations, after removing any invalid responses. To achieve the objectives of our study, we employed Partial Least Squares Path Modeling (PLS-PM). PLS-PM is an estimation algorithm that utilizes components to predict the relationships between constructs and provide their scores at the original scale. The present investigation aims to model firms' traits related to their business by means of reflective scales. To achieve this goal, we followed the procedure outlined in De Giovanni and Cariola (2020) to assess the internal consistency, convergent, and discriminant validity of the reflective measurement models. The first construct examined is Blockchain (B), which explores the practices that managers use to adopt this technology. Specifically, B includes the collaboration with developers (B1) to implement blockchain, the analysis of new exchanging platforms (B4) resulting from the collaboration between the supply chain partners, and the integration and combination with existing digital technologies (B7) for the full exploitation of its potential. In addition, the use of smart contracts (B2) allows for new and innovative ways to manage agreements and transactions, while ensuring compliance with existing regulations (B6), such as data protection and privacy rules. However, two variables, namely the development of tokens (B3) and the establishment of ad hoc training programs (B5), were excluded from the construct based on our analysis. The second construct examined is Business Performance (BP), which includes items related to market share (BP1), profits (BP2), and return on investment (BP3). These measures provide insights into the firm's performance compared to competitors, the firm's capacity to generate economic value, and the firm's capacity to recover investments through economic outcomes, respectively. Notably, cost savings, cost of energy, and cost of environmental impact were excluded from the analysis based on exploratory factor analysis.

Finally, the construct Supply chain challenges (SCC) can arise from a range of factors that impact the efficiency, reliability, and transparency of the global supply chain network. One key challenge is the high transaction costs (SCC1) as well as the costs for managing (SCC4) the complex and geographically dispersed network of suppliers and

customers: this can lead to delays, errors, and other inefficiencies that can impact product quality and customer satisfaction. Another challenge is ensuring product traceability (SCC2) and transparency (SCC3) throughout the supply chain, particularly in industries such as food and pharmaceuticals where safety and quality are critical. Furthermore, delivery risks (SCC5), such as theft, damage, or delays, can also pose significant challenges for supply chain management. The SCC construct also includes the verification of suppliers and third parties (SCC6), which is particularly difficult in industries where there is a high risk of fraud or counterfeiting. The latter also reflects in the reputation and the trust of customers and stakeholders (SCC7), especially regarding the implementation of transparent and ethical business practices, as well as effective communication and engagement strategies.

Results. Looking at the first objective, our results demonstrate that blockchain has a direct and positive impact on supply chain challenge H1. This result empirically demonstrates the relationship previously theorized in exploratory studies based on multiple case studies and literature reviews (Chang et al., 2020; Azzi et al., 2019). Therefore, we can state that blockchain offers the ability to overcome some of the most important supply chain challenges thanks to the increase in transparency, efficiency, reliability of the supply chain, and the reduction of risks. We find no direct impact of blockchain on business performance H2. This result is aligned with De Giovanni, (2022) and Sharma et al., (2023), while denying the results of other studies that identified a positive impact of blockchain on business performance (Ji et al., 2022; Nandi et al., 2020). However, we find an indirect impact of Blockchain on business performance through supply chain challenge H4. Therefore, companies that introduce blockchain should expect an indirect impact of blockchain on business performance once that blockchain has made it possible to overcome supply chain challenges. This statement is confirmed by the H3 result which demonstrates that the ability to overcome supply chain challenges has a positive impact on business performance. We complement and elevate the findings of previous studies that had demonstrated a positive effect on performance due to overcoming the challenges of "inventory management" (Han et al., 2013), "development of supporting technologies", "development of effective governance policies", "transparency", "privacy", and "security" (Ghode et al., 2023). We broaden the supply chain challenge concept by including and demonstrating the positive effect on cost reduction, traceability, transparency, reduction of the risk of disruptions, reputation, and trust.

Looking at the second objective of the paper, oracles play a pivotal role in the blockchain's effectiveness for business purposes as they allow the exchange of information between the blockchain and the external world. For this reason, we have verified the effect of the oracles on the previously identified relationships. When hardware oracles are used in H1b, 2b,3b, 4b the impact of supply chain challenges on business performance, and the indirect and direct impact of blockchain on business performance are higher than the condition without oracles. Hardware oracles enable businesses to gain a competitive advantage through improved supply chain performance, cost reduction, and improved customer relationships. Similarly, when inbound oracles are used H1c, 2c, 3c, 4c the impact of supply chain challenges on business performance, and the indirect and direct impact of blockchain on business performance are higher than the condition without oracles. These results are justified by the information coming from multiple sources that can be on the blockchain thanks to inbound oracles. When software oracles are used H1a, 2a, 3a, 4a the impact of supply chain challenges on business performance and the indirect impact of blockchain on business performance are higher than the condition without oracles. Oracle software is an important tool due to its speed and ease of use. However, compared to inbound oracles and hardware oracles they have no direct influence on business performance. This is because the information that is collected by software oracles is often not as reliable as the blockchain and could compromise the integrity of the data in the system. Human oracles H1e, 2e,3e, 4e and outbound oracles H1d, 2db,3d, 4d have no influence on the identified relationships. The outbound oracles result can be justified by the lack of protocols and standards that make it possible to make the data extracted from the blockchain usable. Instead, human oracles, although they allow information that cannot be captured by machines to be recorded, they do not provide the required level of automation and optimization. Furthermore, a human oracle may be more prone to errors and needs trust in the human component.

Research limitations. This search is not without limitations that we present here to inspire future research. Blockchain technology is analyzed without taking into account other technologies while very often it is applied alongside other technologies that enhance its potential such as, for example, IOT or artificial intelligence. Future studies could investigate the effect of combining other technologies with blockchains. Furthermore, the technologies used as hardware oracles could represent an avenue for future studies as they are constantly improved using innovative technologies. The supply chain challenges considered refer to the major supply chain challenges identified in the literature. Future studies could take into consideration the challenges that are emerging due to disruptive events such as the covid-19 pandemic, sustainability, and the current geopolitical condition. Among these, for example, we can mention the challenges associated with the phenomena of reshoring or raw materials shortage. Finally, future studies could investigate the cost-benefit link of oracles, an aspect that was not considered in this study, but which could influence the practical usability of oracles.

Managerial implications. Blockchain technology has the potential to revolutionize supply chains, by addressing several challenges and issues that have traditionally hampered their efficiency and effectiveness. By using blockchain technology, businesses can gain greater visibility and control over their supply chain operations, reducing the risk of fraud, errors, and delays. Even though, the adoption of blockchain technology in supply chains is not without its issues, which preclude its current exploitation to fully solve the supply chain challenges:

Adoption, Complexity, Scalability, Interoperability, Lack of standards, Security concerns, Cost, Limited use cases, Competition, Lack of regulation, Trust, Network effects, Innovation, Value proposition, User experience, Education, Resources, Demand, Flexibility, Transparency, Compatibility, Data privacy, Governance.

We discover that none of the oracles useful to unlock the blockchain can help to directly solve the supply chain challenges. Therefore, the current state of blockchain technology is not helpful to find optimal resolutions to supply chain issues. In the future, blockchain developers should work on the previous limitations to develop new blockchain platforms that can suit supply chains in a global context. However, the marginal SC improvements obtainable from the blockchain can give significant economic benefits. This turns out to be specifically verified when complementing the blockchain with software, hardware, and inbound oracles. At the same time, supply chain managers should look forward to implementing the blockchain by adopting the following practices:

1. *Conduct a thorough analysis of the supply chain network to identify areas that can benefit from blockchain implementation.*
2. *Collaborate with other supply chain partners to develop a shared blockchain platform that can provide transparency and traceability.*
3. *Explore the use of smart contracts to automate supply chain transactions, which can reduce verification costs and improve speed.*
4. *Implement appropriate security measures to ensure the integrity of blockchain data and protect against potential cyber threats.*
5. *Invest in appropriate training and education to ensure employees are equipped to use blockchain technology effectively.*
6. *Explore the use of oracles to integrate external data sources with blockchain data to provide additional validation and verification.*
7. *Develop clear governance and decision-making processes for managing the shared blockchain platform.*
8. *Utilize data analytics tools to analyze supply chain data and identify areas for optimization.*
9. *Foster a culture of innovation and continuous improvement to ensure the blockchain platform is constantly evolving to meet the needs of the supply chain network.*
10. *Regularly evaluate the effectiveness of the blockchain platform in addressing supply chain challenges and make adjustments as necessary to improve performance. The joint work that blockchain developers and supply chain managers will jointly make together will surely allow them to exploit the full potential of blockchain and unlock its power through the oracles.*

Originality of the paper. *In our knowledge this paper is the first to empirically investigate whether blockchain can be a technology capable of supporting companies in overcoming supply chain challenges and the possible benefits that it can have on business performance. It is the first to investigate the influence that oracles have on the relationship between blockchain, supply chain challenges, and business performance.*

Structured to be agile! A theoretical framework on the contribution of supply base structure on agility

EMANUELA DELBUFOLO*

Framing of the research. *In modern economies, supply chain agility (SCA) is widely considered as a driver of firms' success and one of the fundamental capabilities for survival in turbulent and competitive environments (Gligor et al., 2013). Firms with agile supply chains react and respond better to unforeseen changes in the business environment (Delbufalo, 2022; Dubey et al., 2018; Humdan et al., 2020). SCA allows firms to switch quickly from forecast-driven to demand-driven strategies or to adjust tactics and operations when the market conditions swiftly change or when disruption happens, thus providing a higher degree of responsiveness and flexibility to the entire supply chain (Eckstein et al., 2015). The literature universally recognizes the suppliers' role in fostering or comprising the focal firm's SCA (Fayez et al., 2017). In fact, just-in-time purchasing and time-based management strategies are possible only if the suppliers react quickly and effectively to the firms' requests (Choi and Krause, 2006). In addition, SCA implies that the focal firm acts as an "orchestrator" of the supply network, the membership of which - and thus its arrangement - will change according to the firm's requirements (Christopher et al., 2004).*

Purpose of the paper. *The characteristics of a supply base determine its degree of complexity (Choi and Krause, 2006). Literature classifies complexity drivers into two categories: structural (or static) and dynamic drivers (Akin Ateş et al., 2021). Structural drivers refer to the number and variety of elements defining the supply base, while dynamic drivers refer to interactions between the actors (Bode and Wagner, 2015). Most of SCA literature focuses on the dynamic drivers - such as, for example, the degree of collaboration and communication among the suppliers - and neglected the structural ones. So far, relatively little is known about the link between the structural characteristics of the supply base and the focal firm's SCA. This article aims to fill this gap by investigating how the supply base structural characteristics influence SCA. Specifically, we focus on three structural drivers of supply base complexity in order to evaluate their overall implications on SCA: 1) the number of suppliers, 2) the number of tiers, and 3) the suppliers' geographical dispersion. These three elements reflect the decisions made by the focal firm to orchestrate external resources and suppliers' competences to increase SCA. They are also the levers for accessing supply chain wide data and making operational and strategic changes when needed. Furthermore, we use a dual perspective based on two theories - Normal Accident Theory (NAT) and Portfolio Theory (PT) - in order to account for both the benefits and threats of a complex supply base for SCA (Choi and Krause, 2006).*

Methodology. *The empirical context is the Italian footwear industry. This industry is appropriate to study SCA for three main reasons. Firstly, footwear manufacturers are strongly dependent on their suppliers, which are often involved in product design and industrialization stages; thus, they leverage the suppliers' knowledge and resources to anticipate and react to unpredictable demand changes and fashion trends (Cerruti et al., 2016). Secondly, despite the efforts to depict a concept of SCA that can be used for cross-industry comparison, the meaning of SCA still needs to be interpreted in different ways for different industries; for example, being agile in the footwear industry means addressing challenges - such as short-life cycles, high impulse purchasing and a shorter forecasting horizon - which may not be equally present in other contexts. Thus, every time the concept is translated into specific contexts, it takes a meaning that is relevant only for the firms that share the same language and environment. Consequently, to measure SCA in cross-industry contexts, rather than increasing the generalizability of the results, may reduce the consistency of the definition with negative implications for both the external and internal validity (Gligor et al., 2013). We propose a single-industry research design in order to address the validity problem and to provide results in which the constructs employed have the same interpretation and meaning for all the participants. However, - and here is our third argument - the results emanating from the footwear industry can be extended to those industries in which SCA is market sensitive and linked to process integration and coordination between suppliers and manufacturers (such as, for example, the automotive industry). They also represent a good proxy of the functioning of the entire fashion industry, which is one of the largest and more challenging industries in Western economies (Delbufalo, 2022). We collected data by using a panel of 12 footwear manufacturers and their suppliers. We contacted the manufacturers by email from a list of 482 firms provided by the Italian Buyers' National Association. The research sample was selected by using three criteria: a) willingness to participate; b) firms' international orientation (measured by the internationalization of both supply and customer bases); c) presence of extensive and longitudinal records of supply base characteristics. All the manufacturers were medium-large enterprises (average number of employees: 128; average turnover: €108m). [Insert Figure 2 here]*

e-mail: emanuela.delbufalo@uniroma2.it

Data were collected between January 2021 and June 2022 using a face-to-face survey based on a standardized questionnaire. Face-to-face survey is useful to reduce misunderstandings about specific questions and ensure that questionnaires were filled out by expected respondents (Cheng and Krumwiede, 2018). The manufacturers' archives yielded detailed information about the firms' characteristics and their supply base over the investigation period. We considered a twelve-year investigation period: January 2010 to January 2022. We visited each company and asked them to provide data for each year considered in the study. Two informants from each firm were involved (Pagell and Krause, 2005): the Chief Procurement/Supply Chain Officer and a boundary-spanning manager with at least 15 years' seniority. We selected these key respondents because we deemed them the most knowledgeable about SCM processes and our related subjects of interest. In order to address the common method variance, this study employed a two-respondent design to separate independent variables from dependent variables (Chang et al., 2010; Craighead et al., 2011). The first respondent (Chief Procurement/Supply Chain Officer) was asked to provide information for the independent variables, while the second respondent was asked to provide information about SCA measures. Both of them compiled the control variables' information in a dedicated face-to-face data collecting session. We used established scales from the literature as much as possible. The data were elaborated by using a set of panel regressions. A panel of 144 observations (12 firms over 12 years) was used.

Results. Our results support all our hypotheses with the only exception for the influence of horizontal complexity on SCA. Here, only the prediction of PT perspective is supported: i.e., the numerousness of 1st tier suppliers is positively related to SCA. These results agree with the studies recognizing that a greater number of suppliers potentially foster the focal firm's responsiveness and flexibility (Christopher et al., 2004). In the footwear industry, most of the manufacturers build their supply base by combining single and multi-sourcing strategies (Cerruti et al., 2016). Single sourcing strategy assures continuity and quality for a wide range of standard components, while multi-sourcing provides flexibility for those components that are highly influenced by fashion trends (e.g., shoe accessories). Redundancy - when the supply base numerousness increases - becomes an opportunity for the manufacturers; a larger portfolio helps the manufacturer in assuring both volume and mix flexibility (Delbufalo, 2022). Besides, a large number of suppliers allows flexible arrangements and order splitting among suppliers to manage different product categories without increasing the manufacturer's inventory costs (Christopher et al., 2004). With regard to vertical complexity, our results support both NAT and PT prediction since SCA is expected to increase, reaching a maximum and then decreasing as the number of tiers increases. In our setting, the number of tiers - and the related level of supplier specialization - allows the focal firm to leverage and combine diverse competences to address frequent volume and product changes. However, consistently with knowledge-based theory, specialization is beneficial until coordination is possible and efficient (Gao et al., 2015; Amit and Will, 2022). Coordination is critical when SCA is pursued by common practices such as suppliers' early involvement (i.e., when strategic suppliers participate to the new product development process, thus contributing to the product and process design). This practice needs an upstream supply chain that is highly interconnected; this means that - when the focal firm experiences loss of visibility and control over the supply base - decisions and activities slow down with detrimental consequences on SCA (Dowlatshahi, 1998; McIvor and Humphreys, 2004). Our results confirm the arguments provided by both PT and NAT for spatial complexity and SCA. They specifically show that the (transaction) costs associated with the geographical dispersion of suppliers outweigh the benefits at high levels. However, they also show that a moderate degree of spatial diversification of the supply base fosters SCA due to the possibility of combining diverse knowledge and benefit from lower sourcing costs (Lu and Shang, 2017). These results are consistent with a large body of research suggesting how difficult it can be to synchronize activities and processes in highly dispersed (or global) supply chains (Brandon-Jones et al., 2014; Vachon and Klassen, 2002). However, the non-linear path between spatial complexity and SCA is somewhat new in SCM literature. It suggests that a geographically dispersed supply base can be a double-edged sword; up to a point - corresponding to the span of control of the focal firm - it is beneficial (by granting the focal firm with complementary resources), but past that point, the coordination costs tend to outweigh the benefits and the risks of accident increase, thus harming the cognitive area of SCA (Gligor et al., 2019). Finally, our results confirm that product complexity negatively moderates the linkage between the three main supply base complexity features on SCA. This means that the increase in product complexity harms SCA because it requires the focal firm to increase integration, supply base specialization and coordination (Sivadasan et al., 2002). However, the moderating results do not change the nature of the path discussed above, thus confirming the existence of two substantial trade-offs between local vs. global and low vs. high depth of the supply base. The point where the direction of the relationships changes (from positive to negative for SCA) is the critical question for SCM literature; it depends on many different contingences (Delbufalo, 2022) and it is highly firm specific, being strongly linked to the managerial attributes and decision-making process (Collin and Lorenzin, 2006). What we know - by analyzing our results - is that this point is symmetrical for both vertical and geographical complexity; this means that the span of control - and the related stress points - needed for the focal firm to manage these two trade-off is very similar.

Research limitations. This study has some limitations, which also suggest possible directions for future research. Firstly, this study focuses exclusively on the structural dimensions of supply base complexity. Considering that the complexity of the supply base is also a function of the relationships among the nodes - i.e., the flows of information, input and knowledge among the suppliers (Choi and Krause, 2006) - this choice is a limitation that opens up future development areas for research. Secondly, this study does not consider the variety of the supply base, i.e., how much the suppliers are different in technical capabilities and R&D directions (Akin Ateş et al., 2021). Previous studies suggest that supply base variety impacts on supply chain flexibility and SCA (Choi et al., 2002; Fayezi et al., 2017). Future

studies should incorporate this variable into our theoretical model to offer a more comprehensive view of the phenomenon. Similar arguments can be developed for the suppliers' size that might influence both the complexity of the supply chain and the development of SCA (Gao et al., 2015). Future studies should include control variables measuring the diversity in size and expertise of the suppliers to increase the external validity of the results. Finally, we empirically test our hypotheses with a longitudinal research design and a 12-year panel database. Endogeneity has been tested, but the time frame adopted is too short to fully analyze it. Future research could run the same analysis using a larger panel to test the robustness of the statistical interpretations. Future research may generalize the estimation method to multilevel models to better disentangle the effect of firms' heterogeneity and possible endogeneity in the data.

Managerial implications. Our results suggest managerial implications. Firstly, they suggest that supply base complexity is not a monolithic construct. In fact, each facet of supply base complexity affects differently SCA, with both linear and not linear path. Decision makers should not treat horizontal, vertical and spatial complexity equally (since they have their own implications) but they have to consider them in parallel when decision on SCA are made. Secondly, firms should be aware of both positive and negative consequences of vertical and spatial complexity for SCA; equally, they should consider the linear path that numerosness has on SCA and try to benefit from some degree of redundancy for increasing it. Furthermore, managers should consider that, *ceteri paribus*, the turning points (and thus the span of control of the focal firms) are symmetrical for vertical and spatial supply base complexity. This means that the decisions on the typology of suppliers (i.e., their specialization) and on their geographical location should be made in parallel as they show similar paths with regard to SCA. Finally, firms should consider the implications of increasing the product complexity while pursuing SCA. We demonstrate that product complexity makes it harder to reach a high level of SCA, but it does not change the paths of the main relationships for all the complexity dimensions. This suggests reconsidering the way in which the products are designed and industrialized - for example by reducing the number of phases and components - in order to reduce the need for coordination and integration within the supply chain. On this matter, product and process modularity have already been proved to positively contribute to SCA (Vickery et al., 2016).

Originality of the paper. This study offers three main contributions. First, it investigates the trade-offs linked to SCA and widely discussed in most of the SCM literature: localized vs. dispersed; low vs. high numerosness; and low vs. high depth of the supply base (see, for instance, Bode and Wagner, 2015; Choi and Krause, 2006). Second, the study is grounded into a specific industry in order to make a first step in the universalization of the SCA concept (Humdan et al., 2020). This process necessarily passes through the clarification of what SCA really means for a specific category of manufacturers in order to understand how those firms capture the topic of agility in their supply chain. Because the meaning of SCA changes considerably from one sector to another (Christopher et al., 2004), we propose a deep investigation into one of the industries whose commercial success or failure is largely determined by SCA (Cerruti et al., 2016; Delbufalo, 2022), i.e., the footwear industry. The longitudinal approach also accounts for the dynamics of SCA and its time-dependent nature (Collin and Lorenzin, 2006). Third, we consider an industry-specific moderator, i.e., product complexity, to keep the framework useful for future cross-industry development and benchmarking. In doing so, we account for the operational uncertainty and complexity that both the focal firm and its suppliers face when they design, produce and deliver a specific product (Sivadasan et al., 2002).

Flexibility and saturation of production capacity during the COVID-19: evidence from the field

VALERIA BELVEDERE* ALBERTO GRANDO* ANDREA CHIARINI* VIVIANA D'ANGELO**

Framing of the research. *Following the recent tensions, to which companies have been subjected during the period of the COVID-19 pandemic and in particular in the 2020 lockdown, many industrial companies have been able to convert their production lines promptly and efficiently to produce items such as gowns, disinfectant gels, surgical masks or health devices. These choices of temporary industrial conversion have certainly represented a response to the emergency moment, during which many companies have felt the moral duty to support the communities of reference and to guarantee the maintenance of employment in their plants. These experiences reveal the existence of specific intrinsic operating conditions of production systems that enable quick industrial conversion, allowing companies to start new productions that, at least in some cases, have been maintained even after the lockdown. This ability to quickly convert the industrial production seems to be a crucial factor to respond to exogenous shocks, for example to overcome the drop in demand caused by the pandemic.*

Purpose of the paper. *This contribution aims to explore the determinants of production systems which allow manufacturing companies to pursue production diversification strategies, with the goal of reaching plant saturation (at least in the short period) of the production capacity in situations of decrease of demand in the markets traditionally served by the company. The empirical analysis, aimed at exploring these relationships, is conducted through the administration of a questionnaire conveyed by the sections of Confindustria of Bergamo and Trento. The preliminary results, which are based on data provided by 39 companies, show that during the 2020 lockdown, due to the COVID-19 pandemic, companies characterized by greater production flexibility were able to launch new products (such as disinfectant gels, masks, gowns or sanitary devices), whose production was allowed by current legislation, managing to contain the reduction in the degree of saturation of the production lines and to guarantee the maintenance employment more effectively than other less flexible firms.*

The aim of the study is to understand the role of production flexibility as determinant and the ability to modify volumes and products in a "proactive" way, i.e. by turning the stresses/opportunities of the external context to its advantage. This allows to tactically saturate production capacity and to maintain the employment levels by introducing new productions, on their own or on behalf of third parties. This capability, in this paper, is called Proactive Flexibility. In fact, this ability can in fact be considered enabling conditions for other relevant performances of production systems, connected for example to delivery times and methods, product innovation, customization and productivity (Camison and Lopez, 2010).

Productive Flexibility which is the ability to respond to adaptation needs induced by the changes in internal and external conditions of the production system (Pérez Pérez et al., 2016; Slack, 2005; Zhang et al., 2003; D'Souza and Williams, 2000; Beamon, 1999; Slack, 1987), is based on several determinants (Belvedere, 2015):

- 1. volume flexibility, which consists in the ability to modify the overall output of the system and, therefore, to guarantee high timeliness, punctuality and completeness of delivery, even in the face of fluctuating and unpredictable demand;*
- 2. delivery flexibility, referring in particular to the possibility of accepting changes in delivery dates requested by the customer and accepting new urgent orders;*
- 3. mix flexibility, i.e. the number of different items (within the existing range) that can be produced in a given time interval, compatible with an efficient use of production resources;*
- 4. product flexibility, understood as the ability to start the production of a new article, which allows to reconcile the need for a timely response to the market in relation to new needs expressed by demand with the need to guarantee adequate efficiency standards.*

As can be seen from the brief descriptions just explained, the different forms of production flexibility refer to the ability to meet the needs and the demand of the sector in which the company operates.

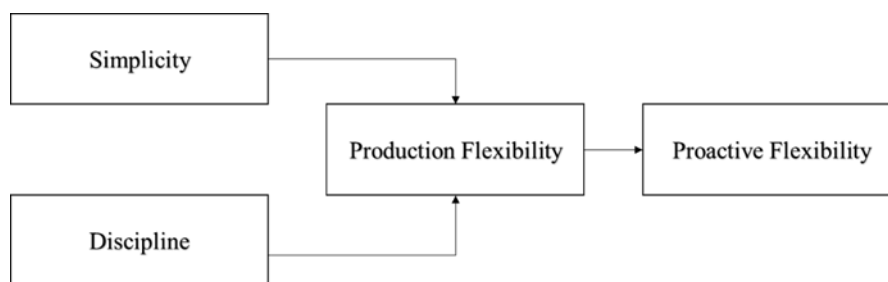

On the other hand, we argue that there is an additional form of flexibility that can be defined as *Proactive Flexibility*, that is, the ability to use different forms of flexibility to develop and introduce new products. Such *Proactive Flexibility* results from the combination effect of *Productive Flexibility* under certain levels of the two determinants of the rigid flexibility according to (Collins et al., 1998; Collins and Schmenner, 1993), according to which the various forms of productive flexibility are to be found in the constructs of *Simplicity* and *Discipline* (model of Rigid Flexibility). The first is the ability to simplify business processes by eliminating major inefficiencies, for example through lean practices. The second concerns the reliability and continuity of processes, to be sought through training initiatives, the adoption of best practices in a variety of industrial processes such as quality management and best practices in maintenance management.

Therefore, we argue that *Proactive Flexibility* grounds on two different pillars: the ability to promptly and efficiently adapt the production to reach plant saturation, which is a typical determinant of *Production Flexibility* (D'Souza and Williams, 2000; Beamon, 1999; Slack, 1987), and the ability to introduce new products within the production system, which is the novel feature of the *Proactive Flexibility* compared to *Productive Flexibility*.

The interpretative framework used for the purposes of this study is based on the rigid flexibility model (Collins et al., 1998; Collins and Schmenner, 1993), according to which the determinants of the various forms of *Productive Flexibility* are defined by the construct of *Simplicity* and *Discipline*. The first is the ability to simplify business processes by eliminating major inefficiencies, for example through lean practices. The second concerns the reliability and continuity of processes, to be pursued through training initiatives, the adoption of best practices in a variety of industrial processes such as quality management and best practices in maintenance management.

The hypothesis of this study is that the various forms of *Production Flexibility*, which can arise from *Simplicity* and *Discipline*, are determinants of *Proactive Flexibility*. The theoretical reference model is represented in Figure 1.

Fig. 1: Theoretical Model

Methodology. In order to test the theoretical model, we conducted a quantitative study based on survey data collected through a questionnaire (Forza, 2002). The questionnaire developed for this purpose represents a replication of the measuring instrument used by Da Silveira (2006), which quantifies *Simplicity*, *Discipline* and *Production Flexibility* through a series of questions with answers on perceptual scales. In particular, the constructs *Simplicity* and *Discipline* are evaluated respectively through 7 and 5 statements, for which a response is required on a scale of Likert from 1 (no adoption) to 5 (high degree of adoption). The construct *Production Flexibility*, on the other hand, is measured through 4 statements, referring to four of the main forms of flexibility identified in the literature on the subject, with respect to which a response is required on a Likert scale from 1 (much worsened in the last 3 years) to 5 (much improved in the last 3 years).

Proactive Flexibility, in line with the aims of the study, was measured through questions developed ad hoc and aimed at verifying: i) what was the impact of the 2020 lockdown on the degree of saturation of the plants, in relative terms compared to previous levels (*Proactive Flexibility 1*); ii) how many new product codes were created during the 2020 lockdown, whose production was linked to the pandemic emergency (*Proactive Flexibility 2*).

The questionnaire also includes a personal data section, in which the respondent is asked to indicate the reference sector of the company, the possible membership of a multinational, the number of employees, their role in the company and the length of service. The collection of questionnaires was conducted with the support of the Confindustria sections of the provinces of Bergamo and Trento. The questionnaires currently collected and useful for the analysis are 39.

Results. Table 1 shows the average values for the constructs of the model described in Figure 1 and the two variables used to quantify *Proactive Flexibility*. From the available data, a good overall level of *Production Flexibility* emerges, whose average value stands at 3.58. The average for *Disciplina*, equal to 3.31, also appears significant as it is above the threshold of 3, above which are the values associated with an improvement of this size. On the contrary, the average of *Simplicity*, equal to 2.98, suggests a lower attention to this aspect.

The analysis of the two variables that describe the phenomenon defined here as *Proactive Flexibility*, it can be observed that the decrease in the degree of saturation of the plants due to the 2020 lockdown (*Proactive Flexibility 1*) was on average equal to 19.6 percentage points. At the same time, the average number of new products launched in the same period (disinfectant gels, masks, sanitary devices, etc.), evidently different from the usual productions carried out

by the sampled companies, was 56.1 stock keeping units - SKUs (Proactive Flexibility 2). Considering that the average pre-Covid range breadth of these companies was 2,513 items, the percentage incidence of new SKUs was 2.2%.

For what concerns Simplicity, Discipline and Production Flexibility, the Cronbach Alpha has been calculated, which in all cases records values above 0.8, largely in line with the reference values used to evaluate the degree of reliability of a measurement (Nunnally, 1978). Moreover, to evaluate the adequacy of the statements used for the description of the three constructs in question, a confirmatory factor analysis was conducted, which confirmed the validity of the measurement scale employed, providing among other things evidence of the fact that for each construct emerges a single factor with Eigenvalue greater than 1 (Hair et al., 2006).

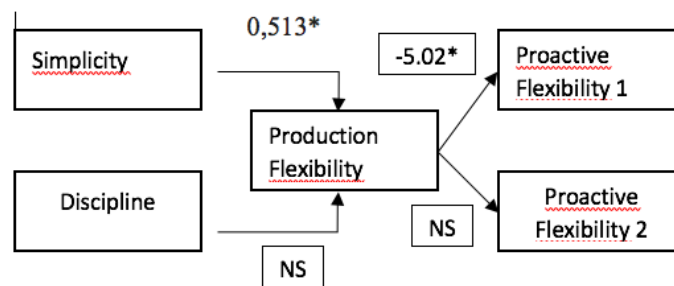

Tab. 1: Descriptive statistics of variables

Construts and variable	Mean	Cronbach's Alpha
Simplicity	2,98 (1-5)	0,806
Discipline	3,31 (1-5)	0,873
Production Flexibility	3,58 (1-5)	0,829
Proactive Flexibility 1: delta saturation	-19,6%	/
Proactive Flexibility 2: no. new products launched	56,1	/

(*) computed as the difference between the percentage of saturation of the plants during the 2020 lockdown and the saturation percentage before the 2020 lockdown.

To test the validity of the proposed model, a linear regression was conducted in which the dependent variable is Production Flexibility and the independent variables are Discipline and Simplicity. The result is described in Figure 2.

Fig. 2: OLS results - *, ** and *** stand for $p < .10$, $p < .05$ and $p < .01$ respectively

The values shown in Figure 2 show that the rigid flexibility model, overall, explains the 0.399 of Production Flexibility, with a high degree of statistical significance. It can also be observed that Simplicity has a regression coefficient of 0.513 which is also statistically significant (p -value <0.1).

As subsequent step to test our model we have conducted a second regression, to explore the link between Production Flexibility and Proactive Flexibility 1, and the results show that the link between the two variables, while generating a very low R^2 , is still characterized by statistical significance. The negative sign of the non-standardized regression coefficient, which is also significant, indicates that as flexibility increases, the saturation differential between the pre-pandemic period and the lockdown decreases.

The linear regression between Production Flexibility and Proactive Flexibility 2 (new products launched during the lockdown) did not provide significant results. However, to further explore this link, we have compared the mean between two subgroups through a t -test, in which the two reference subgroups are related to companies that launched at least 1 new product during the lockdown and those that did not. The data are shown in Table 2.

Tab. 2: New products launched during lockdown: T-test

Subset	Mean of Production Flexibility	Number of observations
At least 1 new product launched during lockdown	4	19
None new product launched during lockdown	3,175	20

As can be seen from Table 2, the companies in the first subgroup are characterized by a higher level of Production Flexibility, equal to 4 against 3,175 of the second subgroup. The t -test conducted on these values confirms the statistical significance of this difference, with a p -value of 0.0005.

Finally, companies were asked if they intended to continue producing the items launched during the lockdown even after the pandemic emergency. The answer had to be provided on a Likert scale from 1 (absolutely not) to 5 (absolutely yes). The linear regression between this last response used dependent variable and the degree of Production Flexibility shows that R^2 assumes an appreciable value of 0.287 (p -value <0.01). In addition, the positive regression coefficient (p -

value<0.01) indicates a more marked interest in strategies for diversifying production capacity by companies characterized by greater flexibility in operations.

Research limitations. The study is not exempt from limitations that however offer interesting insights for future research. First, the data focuses on Italian context, while other future studies may explore what happens in other countries. Second, our analysis measure proactive flexibility through two different variables, while other studies could explore different composite indexes. Moreover, the dataset does not allow to have temporal information on the moment of introduction of new products: future research could fill this gap. Finally, our study does not account for the industrial sector, while future studies could include this control variables as well as other additional control variables. We encourage future studies to address these issues, as we believe that the joint effect of managers and academics can be crucial to addressing the great challenges of our time.

Managerial implications. In addition to contributing to a better scientific knowledge of the phenomenon, our study also offers managerial contributions. First, production flexibility is an enabling condition for "proactive flexibility", i.e. the possibility of operating in a wider variety of markets, even if only temporarily and in order to saturate capacity and maintain employment in the territory. Second, the ability to simplify business processes by eliminating the main inefficiencies, for example through lean practices is the main driver of production flexibility and can benefit the companies' performance especially in uncertain market context and unpredictable demand, ensuring continuity to the production.

Originality of the paper. The preliminary evidence of this study offers a contribution to the studies on production flexibility, highlighting its nature as an enabling condition for "proactive flexibility", i.e. the possibility of operating in a wider variety of markets, even if only temporarily and in order to saturate capacity and maintain employment in the territory. From a managerial perspective, the results of this study highlight, on the one hand, the need to adopt plans to improve flexibility due to the significant beneficial effects that it can produce. On the other hand, companies need to identify the factors and actions that can make temporary operations in new markets more effective and lasting, such as the ability to enter production networks, an agile approach to the development process of new products, performance measurement systems capable of quantifying the economic contribution generated by new productions. Further empirical investigations need to be carried out on these last aspects.

Internal and external drivers of corporate social responsibility

EMILIA FILIPPI* MARIASOLE BANNÒ* SANDRO TRENTO* MASSIMILIANO VATIERO**

Framing of the research. *In recent years concerns about sustainability have increased, and more and more firms are pursuing corporate social responsibility (CSR) practices (Govindan et al., 2021). Several internal and external drivers influence CSR practices and performance. By adopting the social role theory, the stakeholder theory, the agency theory, and the resource based theory, this paper investigates how internal and external drivers simultaneously affect CSR performance.*

Internal drivers of CSR

Previous studies have identified several internal drivers of CSR practices and performance including corporate governance (El-Bassiouny and Letmathe, 2018) and board of directors (BoD) composition and structure (e.g., Amran et al., 2014; Govindan et al., 2021; Velte, 2016), top management commitment (Ng et al., 2022; Yin, 2017), multinational status (Cordeiro et al., 2018; Luxmore et al., 2018), state ownership (Cordeiro et al., 2018; Li and Zhang, 2010), family ownership and control (Cordeiro et al., 2018; Ortas et al., 2018), cross-listing (Del Bosco and Misani, 2016), innovation spending (Jain and Krishnapriya, 2020), organizational support (Lee et al., 2016).

The main internal driver of CSR refers to the BoD: the BoD promotes firm non-financial goals (Liao et al., 2015), negotiates among different stakeholders' interests and demands (Burke et al., 2019; Liao et al., 2015), and contributes in improving CSR performance (Hussain et al., 2018). According to most studies, BoD composition and structure strongly determine firm decisions related to CSR (e.g., Ben-Amar et al., 2017; Cucari et al., 2018; Jarboui et al., 2022; Post et al., 2011). Specifically, the presence of women directors, the presence of independent directors, and the presence of a CSR committee have been identified as important drivers of CSR. To explain their effect on CSR performance, social role theory is used in relation to women directors, stakeholder theory and agency theory in relation to independent directors, and the resource based theory in relation to CSR committee.

Based on social role theory, women directors bring different perspectives and stakeholder-related values to the BoD (Erhardt et al., 2003; Shaukat et al., 2016). This in turn has several positive consequences in relation to CSR: the BoD can take better decisions, effectively address CSR issues (Bear et al., 2010) and stakeholder management (Ben-Amar et al., 2017), and act in an environmentally responsible way (Setó-Pamies, 2015). Empirical studies confirm the positive effect of women directors on CSR. The presence of women directors promotes the adoption of CSR practices (Ben-Amar et al., 2017; Hussain et al., 2018; Post et al., 2011; Setó-Pamies, 2015), the formulation of a comprehensive CSR strategy (Orazalin and Baydauletov, 2020) and higher CSR performance (Govindan et al., 2021; Shaukat et al., 2016; Uyar et al., 2020; Velte, 2016; Wu et al., 2022).

Based on stakeholder theory and agency theory, the presence of independent directors leads to higher CSR performance given that external directors are less subjected to the pressure and control of firm managers and shareholders (Hussain et al., 2018). Thanks to this, independent directors and, more generally, the BoD can better interact with external stakeholders and better consider their interests (Amran et al., 2014; Michelon and Parbonetti, 2012). Previous studies have found inconsistent results about the effect of the presence of independent directors on CSR performance. According to Govindan et al. (2021), their presence has a weak association with only the governance component of CSR performance. Instead, according to other authors, the presence of independent directors has a positive and significant effect on CSR performance (Jarboui et al., 2022; Shahbaz et al., 2020; Shaukat et al., 2015).

Finally, CSR committees are established to formulate and implement CSR practices (Amran et al., 2014) and improve the relationship with stakeholders (Michelon and Parbonetti, 2012). Based on the resource based theory, the knowledge and expertise of these committees are valuable in managing the interactions with stakeholders and improving CSR performance (Michelon and Parbonetti, 2012). Several studies confirm the positive effect of the

presence of a CSR committee on CSR performance (Cucari et al., 2018; Godos-Díez et al., 2018; Govindan et al., 2021; Hussain et al., 2018; Jarboui et al., 2022; Orazalin, 2019; Shahbaz et al., 2020; Uyar et al., 2020; Velte, 2016).

Endrikat et al. (2021) have examined the joint effect of the presence of women directors, the presence of independent directors, and the presence of a CSR committee, finding that the presence of women and independent directors are interrelated and jointly influence CSR performance both directly and indirectly via the presence of a CSR committee.

External drivers of CSR

The institutional context in which the firm operates affects its CSR practices and performance and acts as a moderator in the relationship between internal drivers of CSR and CSR performance (Endrikat et al., 2021). Several characteristics of the institutional context have been investigated as a potential driver of CSR, including the quality of the institutional context (e.g., Bandeira Pinheiro et al., 2021), legislation (e.g., El-Bassiouny and Letmathe, 2018; Ng et al., 2022), community's and suppliers' influence (Nejati et al., 2014), pressure from competitors, society and stakeholders (e.g., Berg et al., 2018; Ng et al., 2022), cost pressure (Wu, 2013), globalization pressure (Yin, 2017) and regional economic development (Li and Zhang, 2010).

A favourable institutional context in terms of governance quality, low corruption, transparency, access to credit by countries, quality of the education system and labor relations induces firms to engage in CSR (Bandeira Pinheiro et al., 2021; Orazalin and Baydauletov, 2020). Corruption also affects CSR performance: it reduces CSR performance as it implies a lack of transparency and an inefficient use or misallocation of firm resources and it promotes CSR irresponsibility (Bryant and Javalgi, 2015; Wu, 2013). Higher CSR performance is obtained by firms located in countries with lower democracy and political stability (Mooneepen et al., 2022) as well as in countries with developed credit and equity markets and enhanced generalized trust (Ortas et al., 2018). In these contexts, firms engage in CSR to gain legitimacy (Mooneepen et al., 2022).

Legislation has an ambiguous impact on CSR practices: according to Ng et al. (2022) legislation induces firms to engage in CSR practices, while according to El-Bassiouny and Letmathe (2018) legal regulations do not affect CSR practices. Finally, according to Del Bosco and Misani (2016), the stringency of investor protection regimes negatively affects CSR performance: stronger regimes are associated with poorer CSR performance.

Several external pressures play a role in promoting CSR practices and performance. Peer imitation pressure and normative social pressure promote firm's involvement in CSR practices and increase CSR performance (Ng et al., 2022; Yin, 2017). Instead, the impact of stakeholder pressures on CSR is not clear. According to Berg et al. (2018), stakeholder pressures induce firms to adopt CSR practices: for example, banks can apply lower capital constraints to firms engaging in CSR practices, employees prefer to work in firms sensitive to CSR issues, customers may prefer products with socially responsible and environmental friendly characteristics. Lee et al. (2016) confirms that stakeholder pressure is an important antecedent for CSR practices. On the contrary, according to El-Bassiouny and Letmathe (2018), stakeholder pressure is insignificant in relation to CSR.

Finally, regional economic development has a negative impact on CSR practices for state-owned firms because of the lower political interference in more advanced areas (Li and Zhang, 2010).

Purpose of the paper. Previous studies have generally examined the influence of internal and external drivers of CSR separately and in this way offer a limited view of the drivers of CSR practices and performance. This study aims to fill this gap. Specifically, by adopting the social role theory, the stakeholder theory, the agency theory, and the resource based theory, this paper investigates the role of internal and external drivers simultaneously and aims to answer the following research question: How do internal and external drivers of CSR interact to foster CSR performance?

Three internal drivers referring to BoD composition and structure are considered in this analysis: the presence of women directors, the presence of independent directors, and the presence of a CSR committee. Instead, to investigate the moderating role of the institutional context, all the previously exposed external drivers are considered with only one measure of the quality of the institutional context.

The impact on CSR performance is analysed in general and in the three components (i.e., environmental, social, and governance).

Methodology.

Data and sample

Data used in the analysis are derived from two sources.

Data on firm CSR performance indicators, the presence of women directors, the presence of independent directors, the presence of a CSR committee, firm financial data, firm industry and firm country are obtained from the Thomson Reuters Asset4 database.

Data about the quality of the institutional context are retrieved from the World Bank. Specifically, the Worldwide Governance Indicators (WGI) are used. These indicators refer to six dimensions: voice and accountability, political stability and absence of violence/terrorism, government effectiveness, regulatory quality, rule of law, and control of corruption. Indicators range from -2.5 to +2.5, where -2.5 indicates a weak governance performance and +2.5 a strong governance performance. For the analysis, values are rescaled from 0 to 5.

10,183 firms are considered in the analysis: all firms operating in the top 50 countries by GDP and for which CSR data were available are included.

All data refer to 2021.

Models: Several regression analyses were performed to investigate the influence of internal and external drivers on CSR performance. In Model 1, the impact of the presence of women directors, the presence of independent directors, the presence of a CSR committee, and the quality of the institutional context on CSR performance has been evaluated separately. In Model 2, the interaction between the internal drivers (i.e., the presence of women directors, the presence of independent directors, and the presence of a CSR committee) and the external drivers (i.e., the quality of the institutional context) is evaluated. Formally, the models are defined as follows:

Model 1:

CSR performance = f (Women directors; Independent directors; CSR committee;
Quality of the institutional context; Control variables)

Model 2:

CSR performance = f (Women directors; Independent directors; CSR committee;
Quality of the institutional context;
Women directors \times Quality of the institutional context;
Independent directors \times Quality of the institutional context;
CSR committee \times Quality of the institutional context;
Control variables)

where:

- Women directors measures the number of women directors;
- Independent directors measures the number of independent directors;
- CSR committee is a dummy variable equal to 1 if the firm has a CSR committee, and 0 otherwise;
- Quality of the institutional context measures the quality of the institutional context by averaging the six Worldwide Governance Indicators (i.e., voice and accountability, political stability and absence of violence/terrorism, government effectiveness, regulatory quality, rule of law, control of corruption). Values range from 0 to 5;
- Control variables include Board size (measured as the number of directors), Firm age (measured as the number of years since firm foundation), Firm dimension (measured with total assets), Leverage, ROA, ROE, Industry, and Country.

As a robustness check, the impact of internal and external drivers on CSR performance has been evaluated by focusing on the three components of CSR (i.e., social, environmental, and governance performance).

Results. The regression results are shown in Tab. 1.

Tab. 1: Regression results

	Model 1 CSR performance	Model 2 CSR performance
Women directors	3.0106 *** (0.1378)	-2.8168 *** (0.6378)
Women directors \times Quality of the institutional context		1.7783 *** (0.1895)
Independent directors	2.4621 *** (0.0904)	3.4969 *** (0.4488)
Independent directors \times Quality of the institutional context		-0.3164 ** (0.1240)
CSR committee	19.2025 *** (0.3239)	23.3750 *** (1.5980)
CSR committee \times Quality of the institutional context		-1.3249 *** (0.4701)
Quality of the institutional context	33.0133 (31.1511)	22.8003 (31.1057)

Observations	10,183	10,183
R ² / R ² adjusted	0.535 / 0.531	0.539 / 0.535

Standard errors in parenthesis.

Significance levels * $p < 0.1$ ** $p < 0.05$ *** $p < 0.01$

In Model 1, Women directors, Independent directors, and CSR committee all have a positive and significant coefficient, meaning that as the number of women directors or independent directors increases, so does the CSR performance and that the presence of a CSR committee increases CSR performance. Quality of the institutional context has a positive but not significant coefficient.

In Model 2, Women directors has a negative and significant coefficient, Quality of the institutional context has a positive but not significant coefficient, while Women directors \times Quality of the institutional context has a positive and

significant coefficient. On the complex, in better institutional contexts, the positive effect of women directors on CSR performance is amplified. Figure 1 Panel A shows the interaction effect.

Independent directors has a positive and significant coefficient, Quality of the institutional context has a positive but not significant coefficient, while Independent directors \times Quality of the institutional context has a negative and significant coefficient. On the complex, in better institutional contexts, the positive effect of independent directors on CSR performance is higher. Figure 1 Panel B shows the interaction effect.

Finally, CSR committee has a positive and significant coefficient, Quality of the institutional context has a positive but not significant coefficient, while CSR committee \times Quality of the institutional context has a negative and significant coefficient. On the complex, in better institutional contexts, the positive effect of independent directors on CSR performance is higher. Figure 1 Panel c shows the interaction effect.

Fig 1. Interaction effects

Panel A: Interaction effect Women directors \times Quality of the institutional context

Panel B: Interaction effect Independent directors \times Quality of the institutional context

Panel C: Interaction effect CSR committee \times Quality of the institutional context

Control variables also yield interesting results. Board size has a negative and significant coefficient, meaning that larger BoDs reduce CSR performance. Firm age have a positive and significant coefficient, meaning that older firms have a higher CSR performance. Firm dimension has a null and significant coefficient. The impact of leverage is not statistically significant. ROA and ROE have a positive and significant coefficient, meaning that higher ROA and ROE increase CSR performance.

Regressions performed as a robustness check examine the impact of internal and external drivers on the three components of CSR (i.e., social, environmental, and governance performance). These analyses, which are available upon request, confirm previous results regarding the impact of the presence of women directors, the presence of independent directors, the presence of a CSR committee and the moderating role of the quality in the institutional context.

Research limitations. This analysis has some limitations, which can guide future research. First, three dimensions of BoD composition and structure (i.e., the presence of women directors, the presence of independent directors, and the presence of a CSR committee) are considered in the analysis. Future research could focus on how other internal drivers of CSR (e.g., top management commitment, multinational status, state or family ownership) are moderated by external drivers in affecting CSR performance. Moreover, in the present study, only the BoD gender composition has been considered, whereas it might be interesting to analyse other dimensions of diversity such as age and ethnicity. Second, the various external CSR drivers were considered with one overall indicator given by the average of the Worldwide Governance Indicators. Despite in robustness check the moderating role of each indicator has been examined, and a more in-depth analysis of the individual aspects measured by the indicators is desirable. Third, the impact of internal and external drivers of CSR performance has been analysed by using a quantitative method and standard indicators measuring CSR performance. Although this analysis provides useful and interesting evidence, it should be accompanied by qualitative analyses that look more deeply into the mechanisms that allow internal drivers to impact CSR performance and external drivers to play a moderating role in the relationship. Furthermore, a qualitative analysis would allow for a better and more in-depth assessment of the CSR performance achieved.

Managerial implications. This study's results indicate the critical internal drivers of CSR performance and how the quality in the institutional context affects the relationship. Based on our results, firms aiming at increasing CSR performance should promote the presence of women directors, the presence of independent directors, and the presence of a CSR committee, especially if these firms operate in low-quality institutional contexts. Instead, firms operating in high-quality institutional contexts could still act on the highlighted internal drivers of CSR and obtain an even higher CSR performance.

Originality of the paper. Existing studies have generally examined the influence of internal and external drivers of CSR separately. This paper's originality lies in considering how these drivers affect CSR performance. In this way, the limited analyses of previous studies are advanced, offering a complete view of the issue.

Keywords: Corporate social responsibility; internal drivers; external drivers

An analysis of cooperation, trust, risk attitudes and inclusiveness in nonprofessional male and female football players as drivers of social responsibility and sustainability

NICOLA DAVOLA* FRANCESCA VICENTINI*

Motivation and related literature. *Social responsibility (Ewald, 1997) is not only an imperative for companies, either for reasons of moral adhesion or due to pressure from other stakeholders (Bradish and Cronin, 2009) but could also be an opportunity to increase revenues, improve the image of a brand, and facilitate fund raising (Katz-Be' nichou, 2004; Tribou and Auge', 2006). The reputation of a company includes the implementation of politically correct behaviors that could, in fact, be highly appealing for marketing purposes with beneficial consequences related to increased demand and revenues in any kind of economic activity and define the mission of a company and its identity in the market.*

The literature discusses and categorizes different levels of responsibility consistent with the concept of CSR (Carroll, 1979, 2004; Carroll and Buchholtz, 2006) and considers the survival objective to be in any case profitable. This could be applied to the business of sports, such as male football, in which human capital constitutes the core unit of the company (García et al., 2021) and not only determines its basic performance but also can lead to impressive economic results (Blumrod et al., 2013).

Examples of initiatives leading to a greater involvement in corporate social responsibility in European football (Geoff and Tacon, 2011) are those implemented by the German Bundesliga in terms of social initiatives through foundations and school projects (Reiche,2014), by English football (Rosca,2011 and Hovemann et al., 2011), also from their different cultural background point of view (Jager and Fifka, 2020), and by US leagues intended to "engender mass feeling..., invoking...family values,suburban comfort, national sentimentality, soft masculinity", ..."reducing racial marginalization" (Benson,2017).

Football is also the most popular entertainment sport activity, especially in Europe (SportbMarkt, 2007; Sportfive, 2007). However, recent events (such as Qatargate and other scandals) have raised questions about the ethical aspect of a sport which creates strong attachments and, at the same time, important added value: the image of this sport is suffering under the shadow of corruption (CSA, 2002, 2007). Sponsors may withdraw themselves because of financial of doping scandals of their teams (Chantelat,2001).This has a negative impact both on follower loyalty (see Liu et al., 2018, for the impact on fan patronage intentions of CSR in Chinese football), and on the community, which does not benefit from the educative role of fair play (Fernandez-Villarino,2021) and by the proximity of their social activities to their community stakeholders (Kulczycki and Koenigstorfer, 2016).

Trust, inclusiveness, equity concerns, respect and reciprocity are at ground of social role of sports, especially of those highly appreciated both by followers and sponsors. We believe that these could increase in turn not only reputation but also the market evaluation of the firm and its financial appeal, inducing a virtuous circle of social engagement and profits (Delhez and Robert,2014 for an analysis of Belgium).

The relevance of those aspects raises the question: increasing the weight and the visibility in football of female teams and of their championships, that appear to be more characterized by social and inclusion of diversity issues, which remain still far from male football in many ways (Pfister, G., 2010) could promote actual and perceived corporate social responsibility in football business?

Female players seem to adopt, regardless of their physical performances, different behaviors that reveal different scales of values in terms of both play and commitment. This different approach to play is not only explained by the relative contributions of nature and nurture which naturally characterize the gender but more crucially, by the different way of seeing individual and team effort and results. A greater presence and participation of the female component in football could then lead to a different development of expertise and team building (Hawkins et al., 2016). This greater heterogeneity of approaches to football could eventually lead to a revised concept of this sport that better fills the gap between ethics and profitability and between voluntary contribution to group public good and individual spectacularism (Solow and Kirkwood, 2002; Andersen et al., 2008).

We believe that gender differences could be meaningful for increasing overall social welfare, and especially in sports, where they should be better investigated and employed to improve wealth, in terms of image and social and

economic success and can be utilized to nudge (Thaler and Sunstein, 2008) the process. This concept will dismantle and/or de-dramatize gender differences that become assets to be exploited in sports giving birth to a “new gender order” that includes and benefits from diversities. Instead, focusing on the consideration of dual gender hypothesis in sports, it would be more valuable to allow their expression and take advantage of their different characteristics (Cunningham, 2008).

Female football could add to the football game some aspects of ethical and entertainment values broadly perceived and appreciated both by followers and communities. Indeed, from its origins in England female football has been highly appreciated by families and considered a surer and more educative fair play environment for children. The fact that in UK female football dates back to the First World War when it substituted the traditional role of soccer as entertainment played by men who were employed in the war effort, is indirect evidence of such hypothesis. The evidence of the different diffusion in the world of female football could be also considered an indirect proof of such main differences: female football is more widespread in the United States than Europe, and more popular in developed countries, such as North European countries, compared to Latin America and other developing countries where male soccer is more popular, since it is perceived to strongly improve not only individual, social and economic conditions, but also visibility: success in male football in those areas is seen as a way to escape poverty and is related also to the wide gender salary gap that corresponds to the success achieved by male players. On the contrary, the playing of football among females in Iran represents a way to defend rights and escape segregation and unfair prejudices (Steel and Richer-Devroe, 2003).

To give greater relevance to female football will benefit also male football inducing a less profit and more cooperative oriented environment whereas the former will become capable better identify its points of strength and building up its own approach to the game as expression of its own capabilities (Pfister et al., 2010) and benefitting from them (Hawkins and Bishop, 2016) without mimicking males' football.

This make relevant also to assess how both followers and potential investors perceive the social commitment of sports clubs to corporate social responsibility (CSR). This responsibility might be observed at various levels, including social and diversity inclusion, environmental issues, legal aspects, and other relevant business concerns (Bourg and Gouguet, 2007).

The final objective of this research is to understand if introducing female football teams in large well-established clubs could be considered as a corporate social responsibility (CSR) action leading to an improvement of the overall brand image. If this is the case, investing in an activity that currently is not able to generate income flows equivalent to the male sector assumes a crucial role of complementarity that benefits the overall profitability of a club.

However, to prove that the strategy of investing in female football teams constitutes a profitable direction for the more prestigious football clubs, we should previously demonstrate that they are able to generate appreciation and approval beyond those traditionally generated by male football and if these constitute added value for clubs and society.

Therefore, our main research question is: “Do specific elements exist in female football player behaviors that are more related to CSR than in male behaviors?”

Such hypothesis is in line with most of the behavioral literature emphasizing gender differences in choices, decision-making and strategizing in interactive tasks. There exists an extensive experimental literature that show women to be less risk prone in many situations (Choudhury, 2014; Eckel and Grossman, 2008), exhibiting a higher propensity to cooperate in groups (Charness and Rustichini, 2011), and to contribute to joint projects and fair division (Andreoni and Vesterlund, 2001). Moreover, the literature on gender-based differences highlights the agentic characteristics (assertiveness, competitiveness, self-confidence, aggressivity and ambition) typical of men compared to communal characteristics (concern about the others, sympathy, kindness, nurturing and contribution to problem solving situation) of women (Eagly, 2003).

The alternative hypothesis is that the differences that still exist between the genders in football teams are not structural and natural, but stem from the gap in development still existing between male and female football. In the last case the two management models would eventually converge towards the masculine target.

To answer these questions, the analysis presented in this work aims to evaluate whether gender differences exist in the way in which football is perceived by female and male players and in the priorities of play and performance assigned by different gender players.

We report here the results of a preliminary investigation aimed at discovering any difference developed by female and male teams in terms of cohesion of the group, attachment to the club, respect for opponents and attitude to sacrifice. This could be attributed not only to individual characteristics and perceptions but also to the motivations underlying the participation in a game and the involvement in making group activities. Moreover, we are interested in investigating whether women perceive football more as a team sport (emphasizing cooperation and trust aspects) than a business (aimed to enhance individual capacity and personal gains).

In the second step of the analysis, we will try to understand to what extent followers, managers, social groups and mass media perceive these differences as a signal of good practice and an expression of communication of ethical values to be transmitted and preserved. Sports clubs are increasingly observed by the media and the public regarding financial, ecological and social impact related to human rights, working conditions, sustainable consumption (Anagnostopoulos et al., 2013; Vitolla, 2019)

If both these hypotheses stand, an advantageous policy move for football clubs would be to invest in female football to increase their reputation for social commitment and the number of followers attached to the brand increasing through this the appeal and spectacularism of matches and long run potential profits.

Therefore, investing in female football could become a key issue for stabilizing the financial attractiveness of a club that could benefit from the inclusive characteristics of female football. In this respect, we might think of the two gender branches of the same club as two different parts of the same business reinforcing each other through rather different goals and strategies.

Methodology

2.1- The sample

To understand if the reinforcement of the implementation of a women's soccer team could be a happy choice in order to increase football teams' engagement in corporate social responsibility on the basis of their different approach to the game, we collected data from amateur women's and men's football players. To this aim we wanted first to assess how female and male football players perceive their sport through a purpose-built questionnaire which allows to enlighten differences that could explain not only the persistence of a different approach and perception in popularity but also a different economic evaluation in the two gender ways to play the same game. In order to avoid introducing in gender motivations, evaluations linked to actual salary gaps (even if income perspectives could remain very different for the two teams on gender basis) the sample utilized for this analysis consists of the members of two non-professional football teams.

We compared data stemming from two 11-a-side football teams where the players are aged between 18 and 22 and show a similar balanced training (2 training sessions per week, plus match, 23 players in each team). The two teams analyzed are: LUISS futsal (University championship) for males' players and Lupa Frascati soccer 11 (Series D) for females.

We compare male and female footballers focusing on mental attitudes and game components related to players' team feelings and characteristics, their mental approach to sport both in terms of group and individual performance, by gender.

2.1.1 - Main observed variables: Mental attitudes and Gaming components

We insert in our investigation the following mental and interactive aspects:

- 1) Cooperation (mental attitude and game component)
- 2) Confidence (individual mental attitude)
- 3) Risk attitude (individual and game component)
- 4) Inclusivity (mental attitude)

1) Cooperation represents the most important component of the game analysis, since football is a team game, and it is therefore crucial to investigate whether the gender component makes it more prone to individualism or not. From the analysis of our data, women seem more willing to collaborate both in terms of mental attitude and in terms of the style of play than males.

2) Confidence (mental attitude) Confidence is probably something that goes beyond football and, despite having repercussions on football, it represents more than a mental attitude of the members of a group and a team. From the results of our questionnaire, women seem much more confident towards their teammates and towards the coach.

3) Taking Risk is the variable (individual attitude and game component) that perhaps most of all distinguishes the interpretation of football in the two genders. Unlike women, men put risk assessment in the foreground import and believe that, together with the physical attributes, the existent gap represent the most difficult mental characteristic to bridge between the two genders.

4) Inclusiveness (game component and mental attitude) has been analyzed in terms of recognition of a person in a group and in a society, but also at a psychological level of how much a person feels part and included in a group (embedded). Both genders declared a high level of perceived inclusiveness not statistically different in our sample. However, we find that women seem to recognize themselves better in the group intended as teammates 'cooperation, while men consider mostly teammates as a mean to express themselves individually and to achieve victory.

2.1.2 The questionnaire

The questionnaire handed is divided into three main parts:

- in the first part, subjects declare their basic demographics (sex, geographical origin, age, education, occupation). Questions 1-4;
- in the second part, they answer questions related to their activity as football players (time devoted to the activity, effort devoted, psychological relevance attributed to their tasks) and their perceptions and opinions about the characteristics of physical and technical performance and spectacularism of the two gender activities and about the social versus professional actual and expected role of football activity. Questions 5-11;
- in the third part, they answer multiple questions aimed at evaluating their individual capability to trust (Berg et al.,1995), to cooperate (Prisoner dilemma game, Axelrod,1984) (Questions 12-14) and (18-19), to take risk and ambiguity in decision-making (Holt and Laury, MPL method, 2002, and Ellsberg urn, Ellsberg,1961), Question (20)

and take the Cognitive Reflection Test (Friedrick, 2005), Questions (15-17) and the Big Five Personality Test (Gerber et al., 2011), Questions (21-25).

Main Results. The overall picture from the answers collected offers an interesting and different approach to football in terms of gender. Women seem to be more cooperative and more willing to contribute to the welfare of their group rather than to personal affirmation. Moreover, they demonstrate that they are more prudent than male players and more trusting and trustworthy. Aware of the existing physical differences affecting performance and spectacularism, female football players strongly believe in their ability to equally entertain and attract followers.

Results show that both males and females see football activity as a sport (none of them views it job) and they devote, on average, less than six hours per week to training. This avoids income effects on their answers but give raise to the need to control for it with professional players.

Considering the extent to which physical characteristics account for playing football, males interviewed consider them crucial in this sport whereas female players believe that they do not constitute a fundamental characteristic for playing football. Instead, they almost all (males and females) perceive the same level of importance of mental capabilities and strategizing in football playing (attention and cooperation are more frequently indicated respectively by males and females).

As regards the relationship between spectacularism and gender in football, 80% of male players think that gender matters a lot, whereas 90% of female players answered that gender does not affect the spectacularism of football.

Considering football as a means of social inclusion, 70% of males answered, "I do not know" and 30% are equally divided between Yes and No; on the other hand, all female players agreed that football represents a powerful instrument of inclusion.

Trust indicators show that female players trust their team mates more than males (75% and 60% respectively) regardless of their individual level of general trust, but that both sexes show the same level of trust towards their coaches.

Cognitive Reflection Test answers (proxies of impulsive versus reflexive mental attitudes) are not on average different by gender showing that impulsive and rational thinking is not differently distributed in our sample by sex; as far as ambiguity aversion is concerned, surprisingly, women demonstrate themselves to be less ambiguity averse than men; for perception of inclusiveness in their own team, female players declared on average more frequently (6) compared to males declaring (3), this means that they perceived themselves to be more embedded in the team than the corresponding players of the other sex; for Personality Traits, female players seem to be more open to challenge both in terms of opportunities and social activities (people to meet and places to visit) both prefer physical activities in open spaces.

Conclusions. Corporate Social Responsibility is nowadays an imperative both for popularity and corporate economic strategies: at present most professional football teams are implementing social balance sheets and company policies addressing this main goal. We believe that a way to introduce a mentality more open to social aspects in terms of inclusivity, collaboration and trust is to give more importance to female football that is characterized by behaviors and approaches that seem less prone to individualism and personal profit.

The results of our survey confirm the validity of this path: female non-professional players seem to be: equally motivated, more attached to their teammates, more trustworthy and perceiving themselves more embedded in their own team than their corresponding male players.

Modello di misurazione del posizionamento sostenibile aziendale basato sugli SDGs

ILENIA CEGLIA* MASSIMO BATTAGLIA* NORA ANNESI[▲]

Inquadramento della ricerca. Negli ultimi decenni le crescenti pressioni e l'accresciuta concorrenza hanno reso più complesso l'ambiente istituzionale (Hoffman, 1999; Testa et al., 2018). Le aziende devono gestire diverse pressioni istituzionali (Meyer e Rowan, 1977; Zucker, 1977; DiMaggio e Powell, 1983; Baldarelli et al., 2014), come la crescente preoccupazione per il consumo eccessivo di risorse, il degrado ambientale, la disuguaglianza sociale, le sfide della transizione ecologica (Wang et al., 2022), della rigenerazione del capitale naturale (Tost et al., 2018), della trasformazione digitale (Camodeca e Almici, 2021) e del benessere organizzativo (Miller, 2016). Queste pressioni istituzionali richiedono alle aziende di trasformare i propri modelli di business verso modelli di produzione più resilienti, socialmente responsabili e sostenibili (Adams et al., 2016). Le pressioni istituzionali spingono le imprese a concentrarsi su temi sostenibili (Iarossi et al., 2011) come quelli delineati dall'Agenda 2030 per lo Sviluppo Sostenibile, che promuove i 17 obiettivi sostenibili globali (SDGs) (Annesi et al., 2021). L'Agenda 2030 è un programma d'azione per le persone, il pianeta e la prosperità firmato nel settembre 2015 dai governi dei 193 paesi membri delle Nazioni Unite (UN, 2015). I contenuti dell'Agenda 2030 sono innovativi per il coinvolgimento diretto del settore privato (Sachs, 2012), perché i governi non possono attuare da soli gli SDGs (UN, 2015). L'Agenda 2030 rappresenta un impegno per le tre componenti della sostenibilità (Cumming et al., 2017; Desa, 2016; Kumar et al., 2016). Una caratteristica vitale dell'Agenda 2030 è la concezione dello sviluppo sociale ed economico in funzione dell'ambiente (Boto-Álvarez e García-Fernández, 2020). L'Agenda 2030 ha descritto cinque sfere di azione abbinate ai 17 SDGs: Persone, Pianeta, Prosperità, Pace e Partnership (le 5 P) (Mpabanga e Sesa, 2020; UN, 2015). Pertanto, l'enfasi e l'attenzione devono essere poste sulle cinque P, che devono essere basate su inclusività, intraprendenza, innovazione e benessere per tutti, nonché sulla riuscita attuazione degli SDGs (Khajuria et al., 2022; Carlsen e Bruggemann, 2021; Mpabanga e Sesa, 2020; UN, 2015).

I governi non possono attuare gli SDGs da soli (ONU, 2015), quindi sono necessari partenariati strategici tra governo, società del settore privato e civile, mondo accademico, media e partner per lo sviluppo (Mpabanga e Sesa, 2020). Le imprese sono chiamate a dare il loro contributo per raggiungere tali obiettivi (Mpabanga e Sesa, 2020) e sono incoraggiate a trovare i mezzi per raggiungere una crescita economica sostenibile. In questo scenario il ruolo dell'innovazione è cruciale nel raggiungimento di questi obiettivi (Adams et al., 2016). Le aziende devono sforzarsi di raggiungere gli SDGs ed incorporarli nella loro strategia (Santos e Bastos, 2020; Calabrese et al., 2021; van Zanten e van Tulder, 2021). Le aziende non devono solo massimizzare i propri benefici (Garrido-Ruso et al., 2022) ma devono farlo in modo sostenibile (van Zanten e van Tulder, 2021; Liu et al., 2021) contribuendo al raggiungimento degli obiettivi dell'Agenda 2030. Secondo la letteratura, le organizzazioni che perseguono gli SDGs sono in grado di affrontare le sfide globali attivando soluzioni innovative e (ri)generando il proprio modello di business (Boons e Lüdeke-Freund, 2013).

Obiettivo del paper. Le imprese devono far fronte ad una moltitudine di pressioni istituzionali (Meyer e Rowan, 1977; Zucker, 1977; DiMaggio e Powell, 1983; Baldarelli et al., 2014) e l'obiettivo della ricerca è introdurre un modello in grado di aiutarle a gestire queste pressioni, misurando il loro livello di sostenibilità e identificando idonee strategie adottabili. Gli SDGs sono ampiamente utilizzati per misurare le prestazioni di sostenibilità (ad esempio Schipper et al., 2021; Calabrese et al., 2021; Di Vaio e Varriale, 2020) ed hanno un alto potenziale; tuttavia, sono pochi gli studi che mostrano come utilizzarli allo scopo di supportare le organizzazioni nell'individuazione di strategie adottabili. Attraverso questa ricerca vogliamo colmare questa lacuna della letteratura creando un modello, basato sui 17 SDGs, che descriva l'attuale posizionamento sostenibile aziendale e identifichi le possibili azioni che le imprese possono implementare per migliorare le loro performance sostenibili e gestire le pressioni istituzionali. Gli SDGs incorporano elementi di innovazione e di sostenibilità, e possono essere utilizzati come base per sviluppare uno strumento utile alle aziende, per misurare le loro prestazioni rispetto alla complessità di questi problemi. L'obiettivo

finale del modello è quello supportare l'impresa nella identificazione delle azioni implementabili per integrare gli obiettivi di sostenibilità legati alla transizione ecologica, la rigenerazione del capitale naturale, la trasformazione digitale ed il benessere organizzativo. Attraverso i risultati ottenuti dal modello è possibile stabilire una strategia innovativa grazie alla quale le imprese possono raggiungere contemporaneamente sia obiettivi di competitività che di sostenibilità (Yusuf e Lytras, 2023). La ricerca mira, quindi, a verificare se gli SDGs possono essere utilizzati per misurare l'efficacia delle iniziative adottate (in termini di contributo agli SDGs), nonché a definire il posizionamento sostenibile dell'azienda ed a supportare il management nella definizione delle strategie di sostenibilità più appropriate. Sulla base di una dettagliata ricerca della letteratura esistente, abbiamo creato un modello di autovalutazione, basato sui 17 SDGs raggruppati attraverso le cinque P: Persone, Pianeta, Pace, Partnership e Prosperità (Mpabanga e Sesa, 2020; UN, 2015), considerando la misurazione della sostenibilità sia dal punto di vista gestionale che prestazionale.

Metodologia. Attraverso l'analisi della letteratura, partendo dalle aree della sostenibilità (economico, sociale e ambientale) abbiamo identificato le cinque aree tematiche descritte dall'Agenda 2030 e per ogni P abbiamo identificato i diversi SDGs connessi. Molte organizzazioni, autori e paesi differiscono nel modo in cui classificano gli SDGs nelle cinque P perché i temi trattati sono trasversali e possono essere letti da diverse prospettive. Le figure seguenti descrivono in che modo abbiamo realizzato questa fase della ricerca.

Fig. 1: Schema di scomposizione delle dimensioni della sostenibilità, 5 P e 17 SDGs

Fonte: Elaborazione degli autori

Fig. 2: Raggruppamento degli SDGs nelle 5 P

Fonte: Elaborazione degli autori

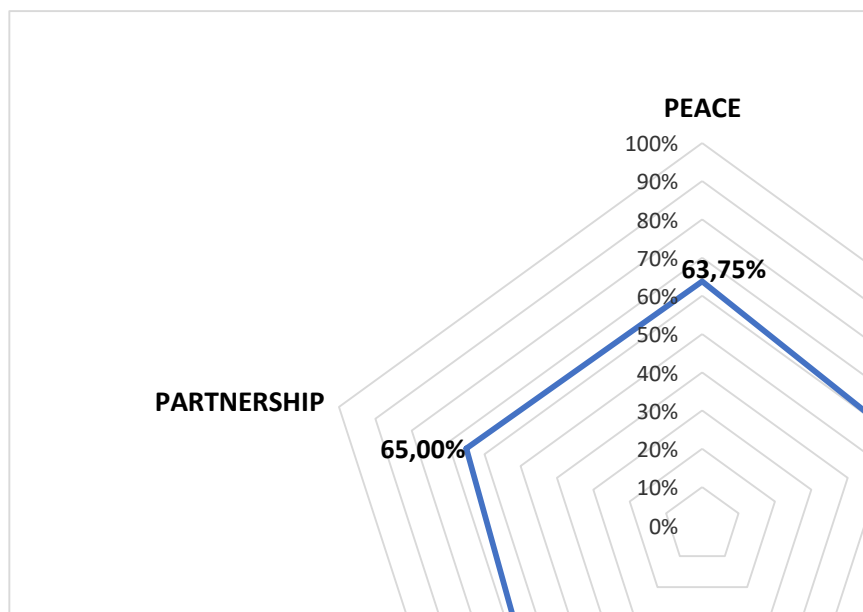

Dalle aree della sostenibilità definiamo le cinque P: Prosperità deriva dall'area economica; Persone, Pace e Partnership derivano dall'area sociale; infine, Pianeta deriva dall'area ambientale. All'interno di ogni P abbiamo raggruppato diversi SDGs. L'area "Persone" è composta dagli SDGs che riguardano il benessere delle persone. Questi SDGs mirano a porre fine alla povertà (SDG 1), alla fame (SDG 2), alla buona salute e al benessere (SDG 3), all'istruzione di qualità (SDG 4) e alla parità di genere (SDG 5) (ONU, 2015). L'area "Pace" è costituita dagli SDGs che hanno come obiettivi pace, giustizia e istituzioni forti (SDG 16) e città e comunità sostenibili (SDG 11). L'area "Partnership" è formata dall'SDG 17 che ha l'obiettivo di partenariato per gli obiettivi, perché come sottolineato dalle Nazioni Unite (2015) il successo nel raggiungimento degli obiettivi di sviluppo della sostenibilità si avvale di

partenariati tra governi, società civile e settore privato. L'area "Pianeta" descrive gli SDGs che hanno un impatto sull'ambiente e sul pianeta. Gli SDGs descrivono acqua pulita e servizi igienico-sanitari (SDG 6), energia pulita e accessibile (SDG 7), consumo responsabile e produzione (SDG 12), azione per il clima (SDG 13), vita sott'acqua (SDG 14) e vita sulla terraferma (SDG 15). L'area "Prosperità" comprende gli SDGs che incidono sui risultati economici dell'impresa, legati anche alla sostenibilità, quindi industria, innovazione e infrastrutture (SDG 9), riduzione delle disuguaglianze (SDG 10) e lavoro dignitoso e crescita economica (SDG 8).

Dopo aver raggruppato i diversi SDGs abbiamo deciso di unire gli SDGs 1 e 2 perché gli argomenti si basano sulla stessa logica. Abbiamo scelto 10 domande per ogni SDG, di tipo gestionale e prestazionale, analizzando la letteratura. Abbiamo considerato la logica gestionale perché il cambiamento sarà una costante nel prossimo millennio e adottare corrette modalità di gestione risulta utile per comprendere le esigenze e per dimostrare idee creative e soluzioni efficaci al problema in questione (Thierauf, 1999). La gestione aziendale caratterizza la struttura organizzativa ed è costituita dalle attività di pianificazione, le pratiche e le risorse per lo sviluppo (Fresner, 1998). Inoltre, abbiamo considerato il tema prestazionale perché è importante capire quale sia il posizionamento dell'organizzazione in termini di risultati ottenuti, nonché come le modalità gestionali adottate influenzano le prestazioni (Nawrocka e Parker, 2009) e perché l'implementazione delle pratiche di gestione è associata a prestazioni aziendali migliori (Joiner, 2007). Le prestazioni sono i risultati misurabili della gestione da parte di un'organizzazione (International Organization for Standardization, 2013) ed è importante capire come misurarli (Endrikat et al., 2014; Horváthová, 2010). Le performance rappresentano un'informazione "concreta" o verificabile (Clarkson et al., 2011) indispensabile per misurare e verificare gli obiettivi di sostenibilità raggiunti. Considerando queste due dimensioni, gestione e performance, abbiamo creato il nostro modello di autovalutazione. Il modello è composto da un totale di 160 domande. Ogni domanda ha 5 possibili risposte. In base al livello di sostenibilità della risposta diamo un punteggio da 1 a 5 (con il valore 3 corrispondente ad una situazione di gestione non formalizzata ma presente in azienda, o una prestazione di mera conformità alle norme o a standard prestazionali di base). Alla fine, calcoliamo le medie dei risultati per ogni SDG e per ogni P e otteniamo due rappresentazioni grafiche che descrivono il posizionamento sostenibile dell'organizzazione, a livello di singola P e a livello di singolo SDG.

Risultati. Nella nostra ricerca abbiamo considerato una grande impresa italiana del settore commerciale. Abbiamo scaricato l'ultimo report di sostenibilità disponibile dal sito web. Abbiamo analizzato il report di sostenibilità e abbiamo inserito le risposte alle domande del modello con le informazioni disponibili. Successivamente abbiamo contattato l'azienda per fissare i colloqui con i responsabili aziendali. Attraverso le interviste abbiamo chiesto le informazioni necessarie per rispondere alle domande del modello e abbiamo verificato la correttezza delle risposte inserite leggendo il bilancio di sostenibilità. Dopo aver analizzato le risposte ottenute dalle interviste abbiamo assegnato a ciascuna risposta un punteggio in base al livello di sostenibilità della risposta ricevuta. Dopo aver risposto a tutte le 160 domande del modello abbiamo ottenuto i due grafici riassuntivi. Il grafico a radar mostra l'attuale posizionamento sostenibile dell'azienda rispetto alle cinque P (in ogni P abbiamo raggruppato diversi SDGs). Il grafico a barre, invece, mostra il posizionamento dell'azienda rispetto a ciascun SDG. Attraverso l'analisi dei risultati del modello, possiamo individuare le modalità con cui tradurre punti di forza e di debolezza in strategie innovative ed identificare le azioni strategiche mirate che l'azienda può mettere in atto per rispondere alle pressioni esterne, raggiungere gli obiettivi sostenibili, e contribuire, così, al raggiungimento degli obiettivi globali dell'Agenda 2030, aumentando la propria competitività (Yusuf e Lytras, 2023) sul mercato con innovazioni sostenibili e strategiche. I seguenti grafici mostrano i risultati ottenuti dal modello.

Fig. 3: Grafico a radar sul posizionamento sostenibile dell'azienda commerciale considerando le 5 P

Fonte: Elaborazione degli autori

Figura 4. Grafico a barre sul posizionamento sostenibile dell'impresa commerciale considerando i 17 SDGs

Fonte: Elaborazione degli autori

Complessivamente, considerando le cinque P, l'azienda commerciale è sostenibile al 64,52%. Ha un posizionamento sostenibile medio-alto ma ci sono aree che potrebbero essere migliorate. Vediamo nel dettaglio le azioni che l'impresa potrebbe realizzare per aumentare il livello di sostenibilità. L'impresa ha ottenuto una percentuale del 69,17% sul tema Prosperity. L'impresa ha avuto un trend delle vendite in peggioramento negli ultimi anni. Per aumentare il proprio livello di sostenibilità rispetto a questo tema, potrebbe realizzare una pianificazione annuale e un controllo sui risultati in termini di efficacia degli investimenti in ricerca e sviluppo e aumentare gli investimenti dedicati alle attività sociali. Inoltre, potrebbe introdurre una percentuale di retribuzione dei senior manager legata anche a obiettivi di CSR/Sostenibilità con quote prestabilite. L'azienda ha ottenuto il 65% sul tema People. L'azienda per migliorare questo tema potrebbe introdurre più opportunità lavorative per i gruppi svantaggiati, cercare di ridurre il numero di infortuni sul lavoro, attraverso la sensibilizzazione dei lavoratori, aumentando le ore di formazione ai dipendenti sulla salute e la sicurezza. L'azienda, inoltre, potrebbe aumentare le opportunità lavorative delle donne dotandosi di politiche interne e procedimenti ad hoc, perché attualmente ci sono poche donne che ricoprono posizioni apicali e potrebbe aumentare le iniziative di benessere organizzativo a vantaggio delle donne, ad esempio, dotandosi di asili, o permettendo orari flessibili o smart working alle donne. L'azienda ha ottenuto il 65% anche sul tema Partnership. L'azienda per aumentare la sostenibilità su questo tema potrebbe aderire ad iniziative di carattere internazionale sul tema della sostenibilità (es. Global Compact, Rainforest Alliance, ecc.). Inoltre, l'azienda potrebbe aumentare le attività di promozione alla sostenibilità a livello locale, nazionale ed internazionale. L'azienda ha ottenuto il 63,75% sul tema Pace. L'azienda per migliorare dovrebbe integrare la tutela della biodiversità nel business anche in chiave strategica, potrebbe realizzare iniziative di incentivazione del personale nella mobilità casa-lavoro e promuovere politiche orientate alla sicurezza stradale per i propri lavoratori. Inoltre, l'azienda potrebbe inserire nella formazione ai dipendenti anche i temi della tutela dei diritti umani e potrebbe inserire informazioni riguardanti il tema trasparenza e anticorruzione all'interno del proprio report di sostenibilità che ad oggi non è presente. L'azienda ha ottenuto la percentuale più bassa sul tema Planet (59,69%). Per migliorare questo tema dovrebbe monitorare il consumo delle risorse idriche nella propria value chain e realizzare investimenti per rendere più efficiente l'uso delle risorse idriche, anche attraverso il riuso o il riciclo di acqua. L'azienda, inoltre, potrebbe ridurre il consumo di combustibili fossili nell'ambito delle proprie strutture, e realizzare formazione al personale sul tema energetico e delle emissioni. L'azienda non effettua le misurazioni sulle emissioni in termini di carbon footprint e potrebbe realizzarle in futuro per identificare le azioni correttive per cercare di ridurre le emissioni non solo dirette ma anche indirette, monitorando le emissioni sulla catena di fornitura. Infine, potrebbe aumentare il riutilizzo dei rifiuti prodotti.

In conclusione, l'azienda ha un posizionamento sostenibile medio-alto. Grazie a questa analisi abbiamo identificato alcune possibili azioni che l'impresa può attuare per risolvere le tensioni esterne, modificando il proprio modello di business verso modelli di produzione più resilienti, socialmente responsabili e sostenibili (Adams et al., 2016). Attraverso la descrizione dell'attuale posizionamento sostenibile aziendale abbiamo identificato i temi sostenibili che l'azienda considera maggiormente e quelli che, al momento, vengono considerati meno, e che potrebbero essere implementati nella strategia aziendale per aumentare il livello di sostenibilità. Le grandi aziende sono le più strutturate

e attente alla sostenibilità e alla comunicazione di azioni sostenibili ai loro stakeholder, ad esempio attraverso i rapporti sulla sostenibilità (Gray et al., 1995; Deegan e Gordon, 1996). Inoltre, possono influenzare e coinvolgere la catena di approvvigionamento per collaborare con loro e raggiungere obiettivi di sostenibilità (Dauvergne e Lister, 2012). Attraverso richieste sostenibili possono migliorare la produttività della catena di approvvigionamento (McKinsey, 2011). Le aziende realizzando queste azioni hanno la possibilità di gestire e risolvere le tensioni esterne e allo stesso tempo possono migliorare l'efficienza degli utili, aumentare le entrate, accedere a nuovi mercati e ottenere un vantaggio competitivo (Dauvergne e Lister, 2012). Per questi motivi, lo studio propone un modello per l'integrazione sistematica dei principi di sostenibilità come strumento di gestione delle tensioni di tipo istituzionale, in grado di supportare i manager nella definizione delle strategie di sostenibilità più appropriate definite in base agli obiettivi globali dell'Agenda 2030.

Limiti della ricerca. Come ogni ricerca, anche questa non è priva di limitazioni. Il modello è composto da una quantità considerevole di domande per avere un quadro completo e chiaro rispetto al livello di sostenibilità aziendale. Le domande sono state inserite sulla base dell'analisi della letteratura ma potrebbero essere inserite altre tipologie di domande o potrebbero essere più orientate agli aspetti di performance, piuttosto che agli aspetti gestionali. La metodologia è stata testata soltanto su una grande impresa italiana. La ricerca futura potrebbe testare il modello su diversi tipi di imprese e su un panorama internazionale di imprese per verificare il diverso posizionamento sostenibile delle imprese. Inoltre, sarebbe interessante fare interviste ai manager aziendali anche in un secondo momento per verificare come le aziende hanno implementato le azioni correttive e se hanno aumentato il loro livello di sostenibilità.

Tali limiti costituiscono gli obiettivi di miglioramento previsti per la ricerca degli autori.

Implicazioni manageriali. La ricerca fornisce un doppio contributo dal punto di vista manageriale. In primo luogo, il modello è uno strumento utile per le aziende che vogliono misurare il loro livello di sostenibilità rispetto agli obiettivi globali dell'Agenda 2030. Inoltre, l'analisi dei risultati supporta il processo di definizione delle strategie adottabili e l'introduzione di innovazioni che permettono di gestire gli aspetti critici e le pressioni istituzionali. Il modello supporta le strategie di business basate sulla sostenibilità identificando le aree critiche, i punti di forza e le opportunità commerciali e identifica le azioni da implementare per migliorare il livello di sostenibilità aziendale.

Il secondo contributo manageriale riguarda la diffusione di un modello utile per le aziende per identificare e misurare il posizionamento sostenibile in una visione completa basata sugli obiettivi globali dichiarati dall'Agenda 2030. Il modello considera aspetti ambientali, sociali ed economici e fa riferimento ai 17 SDGs e alle cinque P.

Originalità del paper. Il modello è originale perché fa riferimento ad un quadro istituzionale e abbraccia non solo la sostenibilità ma anche altri temi associati ad altre forme di innovazione, e perché cerca di identificare soluzioni atte a regolare le tensioni esterne con idonee strategie adottabili. Il modello considera gli obiettivi descritti dall'Agenda 2030 e può essere utilizzato come strumento di supporto per i manager aziendali per incorporare gli obiettivi sostenibili nella loro strategia aziendale (Santos e Bastos, 2020; Calabrese et al., 2021; van Zanten e van Tulder, 2021) per rispondere alle pressioni istituzionali. Esistono attualmente molti modelli basati su ESG ma questi sono strettamente correlati alla dimensione finanziaria. Il nostro modello, invece, ha una lettura più ampia, perché considera priorità di natura istituzionale e globale e va oltre i modelli ESG. Il valore aggiunto del nostro paper è l'introduzione di un modello di misurazione omogeneo per tutte le aziende basato sugli obiettivi descritti dall'Agenda 2030 con un'interpretazione basata anche sulle cinque P, a partire dalla 3 aree di sostenibilità definite dalla Triple Bottom Line, che aiuta le imprese a gestire le pressioni istituzionali.

Parole chiave: innovazioni orientate alla sostenibilità; Agenda 2030; SDG; 5 P; modello di misurazione del posizionamento sostenibile

Perché “scomodare” l’etica: riflessioni su una apparente contrapposizione tra shareholderismo e stakeholderismo

ANTONIO RENZI* SALVATORE ESPOSITO DE FALCO*
NICOLA CUCARI[▲] GAETANO MARIA GOLINELLI**

Inquadramento della ricerca. *Se dovessimo individuare un possibile colpevole dei “mali” che affliggono la moderna società contemporanea, dalle diseguaglianze di natura sociale alle catastrofi ambientali, questi sarebbe il capitalismo profit-oriented. Non ci sarebbe, infatti, altra spiegazione del “ripudio”, sempre più crescente, verso tale forma di capitalismo a favore di un capitalismo stakeholder-oriented, in cui le imprese non solo ottimizzano i profitti a breve termine per gli azionisti, ma cercano la creazione di valore a lungo termine, a favore di tutti i loro stakeholders e della società in generale (Schwab, 2021).*

Diversi sono però i dubbi in merito a questa contrapposizione di fondo, ovvero che il valore creato per gli azionisti vada automaticamente a scapito del valore per gli stakeholders, con la conseguente necessità, per il primo, di essere ridotto per alimentare il secondo.

Due gli ordini di fattori dai quali tale lavoro prende spunto: da un lato, il dibattito circa un unico obiettivo/interesse vs una pluralità di interessi perseguiti dall’impresa; dall’altro lato, la disputa, non solo in ambiente accademico, circa l’orizzonte temporale, a breve termine vs lungo termine, dei comportamenti imprenditoriali.

Il mainstream che più si è affermato negli anni, specie a partire dalla crisi finanziaria del 2007/08, è il seguente: la costante ricerca del profitto massimo pregiudica, nel breve termine, il ruolo sociale dell’impresa e, nel lungo termine, la capacità dell’impresa di perseguire la sua finalità generale, ossia la sopravvivenza nel tempo attraverso la creazione di “valore allargato”. Del resto, in quanto istituzioni sociali a finalità plurime, le organizzazioni imprenditoriali si pongono come obiettivo prioritario la creazione di valore allargato, quest’ultimo da intendersi come ricchezza (sia finanziaria, sia legata ad elementi intangibili, quali la soddisfazione psicologica dei dipendenti, l’attenzione alle istanze non economiche di natura interna o provenienti da entità esterne, ecc.) verso cui vantano un “diritto” non solo gli shareholder, ma tutti gli altri stakeholders che, con l’impresa stessa, intrattengono rapporti, diretti o indiretti, di varia natura.

Prendendo spunto da tali considerazioni, l’idea in base alla quale la massimizzazione meccanicistica e periodale del profitto si scontri con il ruolo sociale dell’impresa e sia, al contempo, foriera di un deperimento delle capacità di sopravvivenza nel medio/lungo termine, è sicuramente condivisibile. Meno condivisibile, invece, è la logica semplicista e superficiale che vede nella ricerca del profitto massimo il presupposto dello shareholder value e nella teoria finanziaria di stampo neoclassico l’antecedente teorico di tale presupposto.

Alla luce di ciò, la scienza economica e manageriale avverte da tempo l’esigenza di prendere in considerazione valutazioni di carattere morale in merito all’inadeguatezza del mercato - come sistema di allocazione efficiente delle risorse - e dell’individualismo - come norma comportamentale regolatrice dei rapporti d’impresa. A ciò si aggiunga che appare difficile distinguere comportamenti “etici” di breve e di lungo periodo, per cui non necessariamente comportamenti volti a soddisfare gli stakeholders sono etici e di lungo termine (Bebchuk et al., 2022).

Obiettivo del paper. *Il presente lavoro, di natura concettuale, intende riflettere, in maniera provocatoria, sull’apparente contrapposizione tra una visione a breve termine, a vantaggio degli azionisti, ed una visione a lungo termine, a vantaggio degli stakeholders. Partendo dai presupposti logici dello stakeholderismo, inteso come approccio strategico volto ad un purpose (scopo) che tenga insieme non solo l’aspetto economico, ma anche sociale, in senso ampio (Mayer, 2021), il lavoro intende chiedersi se un purpose di questo tipo implicherebbe un comportamento etico delle organizzazioni imprenditoriali e/o degli individui. La domanda a cui tale contributo, infatti, intende rispondere è: davvero è necessario scomodare l’etica d’impresa per identificare comportamenti virtuosi a vantaggio degli stakeholder aziendali? Tale quesito implica una seconda domanda, ovvero l’etica d’impresa è una scienza che si adatta*

ad interpretare i comportamenti manageriali? Facendo ricorso ad alcuni dei più noti concetti di etica è facile ricordare che questa è la filosofia della pratica, ossia la riflessione sul comportamento dell'uomo e sui valori che orientano le sue scelte. Il termine fu introdotto nel linguaggio filosofico da Aristotele ed è stato generalmente usato come sinonimo di morale. Aristotele fondò l'etica sulla natura, ossia sulle facoltà e disposizioni che l'uomo possiede naturalmente. Poiché la più alta facoltà dell'essere umano è il pensiero, il massimo bene (e, quindi, la felicità) consiste nell'esercizio del pensiero. Sulla scia dell'etica come misura del comportamento orientato al bene o al male, anche Platone indicò l'etica per identificare i comportamenti conformi all'«idea del Bene». Guardando alle idee, l'uomo ragionevole può riconoscere il giusto e l'ingiusto e formulare sicuri giudizi morali. Il sommo bene per l'uomo è la pura contemplazione delle idee, senza ulteriori fini pratici. In estrema sintesi diverse sono state le definizioni ed i concetti sull'etica, non solo Platone ed Aristotele, ma anche Hobbes, Kant, Marx, Engels, Nietzsche; quest'ultimo in particolare ricondusse le principali nozioni dell'etica (giusto/ingiusto, buono/cattivo) a rapporti di forza, presenti non solo all'interno della società ma anche all'interno di ogni individuo. Senza entrare quindi in disquisizioni filosofiche che non attengono al background di chi scrive, è dato facilmente osservare che tali concetti appaiono poco inclini a individuare le finalità dell'impresa, in quanto orientati a delineare il comportamento dell'uomo tra bene e/o male; tra giusto ed ingiusto. Non sempre, infatti, con riferimento all'impresa è possibile parlare di comportamenti assolutamente giusti o sbagliati; tutto infatti è relativo in funzione delle finalità dell'impresa.

Sulla base di questi principi si ritiene inutile scomodare il termine etica per indicare ciò che attiene alle finalità dell'impresa, che dev'essere invece socialmente responsabile, in linea con i concetti emergenti di Corporate Social Responsibility (CSR), ovvero responsabile in ottica sistemica, con riferimento al governo ed al contesto sociale ed ambientale, con ciò introducendo il nuovo tritico dell'“Environmental, social and governance” (ESG); il tutto evidentemente non riferito al comportamento dell'uomo, che discerne tra il bene ed il male, bensì ai processi aziendali, alle scelte strategiche, nonché agli orientamenti degli azionisti (Esposito De Falco, 2022; Cucari e Iandolo, 2022). Non è, quindi, da escludere la possibilità di comportamenti sociali e sostenibili da parte dei soggetti chiamati a governare l'impresa; occorre piuttosto prestare attenzione, negli studi di management, all'adeguatezza terminologica, evitando di utilizzare impropriamente termini quali l'etica, per identificare le finalità dell'impresa. È evidente che possiamo parlare di comportamenti socialmente responsabili, ma chi scrive ritiene che non sia corretto confondere concettualmente l'etica con la responsabilità sociale. I comportamenti socialmente responsabili dipendono dai singoli valori degli individui/attori, i quali diventano una conditio sine qua non anche per la realizzazione del profitto. Ad esempio, lavori recenti hanno incorporato la teoria socio-cognitiva per esaminare un'ampia gamma di comportamenti legati all'ambiente (Zhao e Zhou, 2021). Molte delle questioni di cui oggi si discute (cambiamenti climatici, discriminazione sul lavoro, diversità e inclusione, anticorruzione, etc) sono già regolati dalla legge, e la stessa legge è un insieme di “valori dei governi in carica” e dei “vari gruppi di pressione e di interesse che i governi consultano” (OECD, 2001). Di conseguenza, seppur il dibattito non appaia certamente nuovo (Donaldson e Fafaliou, 2003), esso ha assunto una rinnovata attenzione, anche mediatica, che impone le assunzioni di fondo dell'agire imprenditoriale, con il rischio, altrimenti, di perdere di vista il fine ultimo, ovvero produrre ricchezza, dando massimo valore alle risorse scarse.

Metodologia. *Essendo un contributo concettuale, le argomentazioni si basano meno sui dati in senso tradizionale, ma implicano l'assimilazione e la combinazione di prove che provengono da una varietà di fonti. Seguendo le indicazioni di Whetten (1989), il presente abstract adotta un approccio incentrato sul problema e affronta la domanda di ricerca sulla possibile applicazione dei concetti sull'etica all'impresa, cercando di collegare teorie e discipline esistenti.*

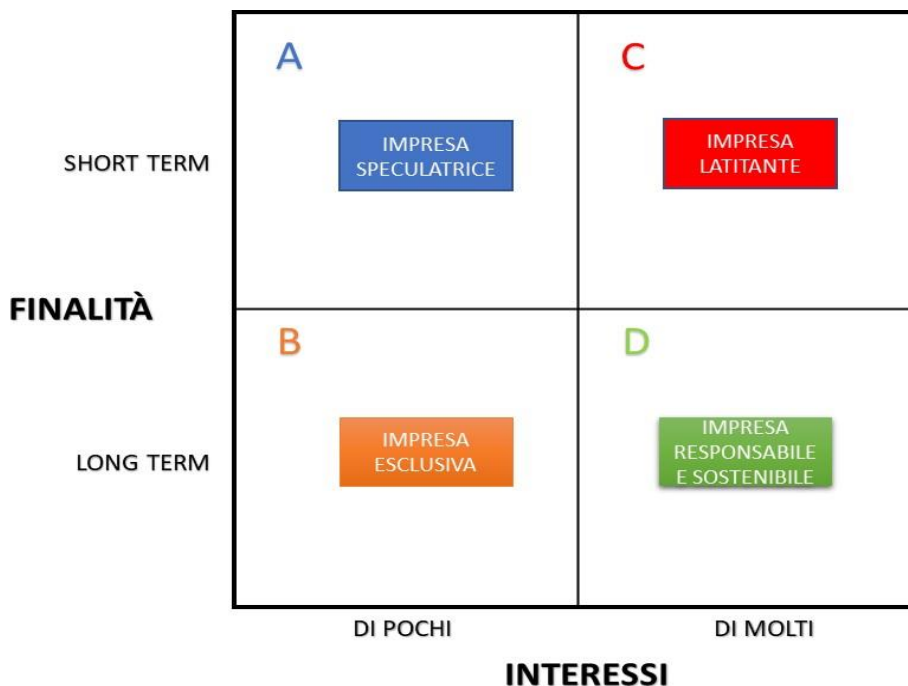

Risultati. *Il concetto di etica può essere declinato secondo diverse prospettive ed è difficilmente riassumibile in una singola definizione. Del resto, gli studi filosofici incentrati sull'etica nascono con la filosofia stessa e sono, pertanto, frutto di un'evoluzione del pensiero umano che trova le sue principali origini nell'antica Grecia. In questa sede sarebbe ridondante richiamare come, nel corso dei secoli, l'etica sia stata approfondita e concepita da scuole filosofiche eterogenee nello spazio e nel tempo. Ciò premesso, la domanda su cui fonda il presente lavoro necessita di qualificare un'interpretazione del concetto di etica che sia potenzialmente applicabile a logiche manageriali. Pertanto, se l'etica degli affari è definita come “un insieme di principi che guidano le pratiche commerciali per riflettere una preoccupazione per la società nel suo insieme mentre perseguono i profitti” (Nisberg, 1988, p. 43), appare evidente come essa sia un “metro di giudizio” rispetto alle decisioni aziendali. Nella realtà imprenditoriale odierna, infatti, i comportamenti imprenditoriali “non possono essere considerati il presupposto di scelte obbligate di responsabilità sociale volte a diffondere in modo equo, giusto e trasparente il valore economico tra gli stakeholders” (Genco, 2005, p. 82). Bartlett e Preston (2000) che hanno trattato il tema dell'impresa etica dal suo interno, sottolineano come i dipendenti siano i primi a mettere in dubbio l'esistenza di un'impresa etica e non sono propensi all'adozione di comportamenti etici, sia perché non riescono a vederne i benefici di lungo periodo, sia perché non si sentono parte dell'organizzazione aziendale. Ne risultano delle policy etiche aziendali che, non essendo supportate da un'adeguata comunicazione, costituiscono delle mere finzioni, alle quali non corrispondono concreti comportamenti etici. Al riguardo, limitiamoci a distinguere tra etica assoluta ed etica relativa: la prima persegue condotte comportamentali ottime e oggettive basate su un filone razionalista; la seconda opera, invece, una distinzione tra il bene e il male secondo un approccio empirista. Il modo più immediato per comprendere a quale delle due suddette forme di etica sia possibile associare le azioni manageriali è quello di porsi delle domande e verificare la possibilità di fornire risposte “assolute” sulla base di un ragionamento razionale. Al riguardo, proponiamo tre semplici domande: i) è etico licenziare un elevato numero di dipendenti per garantire la continuità aziendale? ii) è etico spostare la produzione*

verso Paesi low cost per aumentare la marginalità economica dell’impresa? iii) è etico investire per rispettare i cosiddetti parametri ESG anche nel caso di imprese strutturalmente inadeguate per tale tipo di investimenti?

Ciascuna delle domande proposte pone in evidenza una tipica questione oggetto di studio nelle scienze economiche e aziendali, ossia il problema dei costi opportunità: la risposta, in senso positivo o negativo, implica un beneficio cui si associa un danno. Licenziare dipendenti per assicurare la continuità aziendale significa creare le condizioni per continuare a generare benefici a favore di vari stakeholder, ma al contempo implica un evidente danno (sacrificio) per i soggetti sottoposti al licenziamento. La delocalizzazione produttiva viene giudicata, sul piano etico, in modo negativo nei Paesi economicamente più avanzati, in quanto tende a danneggiare posti di lavoro e valore economico prodotto nel Paese di origine; diversamente, il discorso si inverte nei Paesi ove si realizza il processo di delocalizzazione: il “giudizio etico” tende ad essere positivo, sia a livello governativo, sia nella prospettiva di coloro che ne beneficerebbero in termini di nuove opportunità lavorative. Riguardo agli “obiettivi ESG”, prescindendo dalle difficoltà di introdurre principi di misurazione oggettivi, questi possono essere interpretati come “strumenti etici” da organismi internazionali interessati al benessere del Pianeta, ma anche quali strumenti di distruzione di valore economico allargato per una moltitudine di PMI e dei loro stakeholder.

Si precisa che rispetto alle suddette tre domande la posizione degli autori è del tutto agnostica. Si tratta di banali esempi che servono ad escludere l’ipotesi di applicare l’etica assoluta al management aziendale. Inoltre, anche rispetto all’etica relativa, l’emergere di costi opportunità pone dubbi circa l’esistenza dell’etica d’impresa quale branca delle scienze manageriali. Il fatto che l’etica relativa si basi su evidenze empiriche non significa che un’azione manageriale che origina un “bene relativo” possa essere giudicata eticamente giusta, ove il “bene relativo” sia controbilanciato da “un male relativo”. Sul punto, si considerino anche le posizioni di coloro i quali ritengono che l’approccio politico sia sovraordinato a quello etico (Ciappei et al., 2021) e, di conseguenza, la responsabilità sociale d’impresa diventi un fatto politico e non certo etico di diretta responsabilità tanto degli azionisti quanto dei managers.

Al fine di rendere più espliciti i nostri concetti, si riporta una matrice che incrocia le finalità short e long term dell’impresa con i comportamenti imprenditoriali, finalizzati agli interessi di pochi o di molti.

Il quadrante **D (impresa responsabile e sostenibile)** è quello evocativo di un comportamento imprenditoriale socialmente responsabile e, quindi, orientato all’ESG ed alla CSR; il quadrante **A (impresa speculatrice)**, al contrario, riguarda i comportamenti imprenditoriali finalizzati a difendere l’interesse di pochi (coalizione di comando), con l’obiettivo di massimizzare il profitto nell’immediato. Il quadrante **B (impresa esclusiva)** riguarda quei comportamenti imprenditoriali orientati a conseguire un profitto per pochi (proprietari familiari, coalizione di comando), ma con un orizzonte strategico di lungo periodo, volto a salvaguardare la sopravvivenza nel tempo dell’impresa; è il modello di impresa familiare che tende al controllo ed all’accentramento di tutte le funzioni. Infine, il quadrante **C (impresa latitante)** riguarda quelle entità che non manifestano l’interesse dell’impresa, né esercitano alcune funzioni ma nascono con obiettivi funzionali al raggiungimento di altri scopi slegati dall’impresa stessa. Una volta raggiunto l’obiettivo l’impresa si scioglie. In questa matrice è evidente che l’impresa che adotta un comportamento sostenibile e responsabile è quella che tende alla tutela di più interessi nel lungo termine. Tra gli interessi vi è anche il profitto, che potrà raggiungersi con comportamenti equilibrati verso tutti gli stakeholder. È questo il modello di impresa che incarna la filosofia ESG.

Limiti della ricerca. Questo lavoro è di natura prettamente concettuale. Pertanto, il suo limite principale nasce proprio dal presentarsi come una provocazione puramente teorica. La sfida, quindi, è quella di stimolare futuri studi a

validare le concettualizzazioni teoriche proposte, ad esempio attraverso indagini statistiche condotte su un campione d'impresе oppure attraverso una metodologia dei casi o altro ancora.

Implicazioni manageriali. Occorrerebbe considerare gli aspetti e le influenze contestuali, ad esempio in termini di ordinamento giuridico specifico, tutela degli investitori e cultura nazionale (DasGupta e Roy, 2023; Licht et al., 2021). Sembrerebbe, invece, evidente la presenza di un elemento di discontinuità, influenzato dal proliferare di orientamenti non economici-finanziari, dettato dalla necessità di considerare altri interessi che potrebbero determinare l'emergere di una rinnovata scienza manageriale. Alla luce dei repentini cambiamenti della società contemporanea, infatti, c'è stato un crescente riconoscimento che le misure di redditività, di natura economica, non riescono da sole a catturare l'essenza delle performance di un'organizzazione imprenditoriale, sia come entità in cerca di profitto, sia come attore della società.

A tal proposito, riteniamo utile sfatare un equivoco legato alla teoria del valore di stampo finanziario. Se i manager seguissero le teorie finanziarie prevalenti in tema di shareholder value, verrebbe meno la dicotomia tra azioni massimizzanti i benefici per gli shareholder e azioni orientate alla soddisfazione di tutti gli stakeholder che interagiscono con l'impresa. La massimizzazione del ROE nelle teorie di stampo neoclassico è considerata come fattore di creazione del valore azionario solo quando consegue alla massimizzazione della redditività operativa, quindi alla qualità degli investimenti reali posti in essere dall'impresa, nonché, nell'attuale contesto socio-economico, alla percezione degli stessi in un'ottica di valore allargato e di responsabilità sociale. In altri termini, investimenti reali inefficienti sul piano economico e/o non rispondenti alle aspettative dei diversi stakeholder e del contesto sociale di riferimento, distruggono valore per l'azionista, anche in corrispondenza di un ROE crescente (in virtù, per esempio, di un forte sfruttamento della leva finanziaria). Al riguardo, è stato osservato come sussista una costante negli studi attinenti alla teoria finanziaria del valore, in base alla quale "il più elevato rischio che un investimento subisce in quanto finanziato con capitale di credito viene a gravare sull'azionista" (Fanni, 2000, p. 777). Ciò che spesso non viene colto da alcuni studiosi e manager (che confondono profittabilità per l'azionista con valore intrinseco del capitale azionario) risiede nel fatto che la massimizzazione meccanicistica e contabile del rendimento azionario, se non legata alla dimensione reale dell'impresa, non fa altro che aumentare il costo dell'equity e, quindi, distruggere il valore attuale del capitale di rischio in una prospettiva di medio/lungo termine.

Quindi, come teorizzato da più di settanta anni e dimostrato da innumerevoli evidenze empiriche, accrescere la redditività immediata per l'azionista non significa necessariamente massimizzare lo shareholder value.

In tale quadro, la ricchezza di coloro che detengono quote azionarie di una data impresa entra in contrasto con il ruolo sociale della stessa, solo nell'ipotesi di azionisti orientati a speculazioni di breve periodo. Nella prospettiva manageriale, tuttavia, piuttosto che "scomodare l'etica" sarebbe sufficiente rimodulare consolidate teorie economiche in funzione di attuali scale valoriali: il connubio tra valore azionario e sopravvivenza dell'impresa lega la ricchezza dell'azionista a processi di condivisione del valore e, specie nei Paesi economicamente più evoluti, al rispetto di regole morali emergenti. Peraltro, all'interno di uno Stato laico, regole morali largamente diffuse trovano spesso una codificazione di ordine giuridico. In ogni caso, dette regole (unitamente alle aspettative utilitaristiche dei diversi stakeholder) formano un sistema vincolare che inevitabilmente circoscrive il margine discrezionale del decisore aziendale, nel senso che il mancato rispetto di istanze morali particolarmente diffuse causa una distruzione di valore economico, sia in un'ottica ristretta (shareholder value), sia in un'ottica allargata (stakeholder value). Ciò non implica la qualificazione del "manager etico", ma più banalmente quella di manager dotato di capacità interpretative rispetto a "vincoli morali", mutevoli nello spazio e nel tempo, in alcuni casi codificati sul piano legislativo, in altri di natura informale.

Originalità del paper. L'idea che la finalità a cui l'impresa dovrebbe mirare è rappresentata dalla ricerca del "benessere sociale in una ritrovata coscienza sociale aperta ai problemi della collettività" (Fazzi, 1982) ha da sempre condizionato gli studi manageriali della nostra disciplina e, da più parti, è stato evidenziato il fatto che il tema della responsabilità sociale ha acquisito, nel tempo, sempre più rilievo nel quadro delle problematiche inerenti al governo delle imprese (Esposito De Falco, 2003). Pertanto, discutere della finalità di impresa, ampliabile fino a considerare le sorti del nostro pianeta, appare certamente intrigante, ma allo stesso modo ad nauseam, considerando la copiosa letteratura sul tema. Ciò che appare originale in tale contributo è che allo stato attuale degli studi in materia di etica applicata all'economia e alle imprese, lo studioso di management non dispone degli strumenti per delineare una cornice teorica, anche solo parziale e relativa, che definisca l'impresa etica. Il contributo dell'esperto di management può essere circoscritto a due ambiti di studi: 1) in presenza di costi opportunità, la contestualizzazione delle decisioni aziendali rispetto a ciò che gli stakeholders d'impresa ritengono giusto o sbagliato in uno o più contesti socio-economici; 2) l'implementazione, efficace ed efficiente, all'interno delle imprese, di un sistema crescente di vincoli (formali e/o sostanziali) legati ad obiettivi di sostenibilità. I suddetti ambiti di studio non sono sufficienti alla nascita della disciplina "etica d'impresa". Possono, tuttavia, essere prodromici a stimolare un dibattito scientifico non solo tra gli studiosi di management, ma anche ad avviare interrelazioni con studiosi di etica interessati ad inquadrare i fenomeni d'impresa attraverso nuove chiavi di lettura. Da tali interrelazioni potrebbe nascere la disciplina "etica d'impresa", così come si potrebbe giungere alla conclusione di inconciliabilità tra le scienze manageriali e la branca della filosofia focalizzata sull'etica.

Leadership responsabile e orientamento alla giustizia sociale: il ruolo della mindfulness

YANINA RASHKOVA* ISABELLA SULIS* FRANCESCA CABIDDU[▲]

Inquadramento della ricerca. *Alla luce delle persistenti disuguaglianze sociali che emergono dalle pratiche organizzative (Amis et al. 2020), ai leader aziendali viene chiesto sempre più spesso di adottare un orientamento alla giustizia sociale, per prendere decisioni informate ed essere consapevoli del loro impatto sulla società (George et al. 2016). Infatti, quando guidano con un orientamento alla giustizia sociale, i leader integrano nei loro team persone con stili e background culturalmente diversi, includono varie persone nel dialogo ed esaminano le questioni da prospettive differenti, il che gli consente di risolvere i conflitti di interesse con persone diverse e di prendere decisioni solide e sostenibili (Maak e Pless, 2006).*

Nell'ambito della letteratura sulla leadership responsabile, studi precedenti sullo sviluppo dell'orientamento alla giustizia sociale, oltre ai tratti della personalità, ai valori condivisi e ai dati demografici (Stahl e Sully de Luque 2014), sottolineano l'importanza di uno stato mentale caratterizzato da maggiore consapevolezza (Pless et al., 2021). In particolare, è stato sostenuto che la consapevolezza (mindfulness in inglese), derivante da una maggiore complessità cognitiva, consente ai leader di differenziare interessi, richieste e bisogni su diverse dimensioni e livelli (sé stesso, l'organizzazione e gli altri nel business e nella società) (Maak et al. 2016).

Lo sviluppo di questa capacità è ampiamente supportata dalla mindfulness, che è un'abilità cognitiva derivante da una "pratica che porta la persona ad una consapevolezza etica, intenzionalmente situata nel qui e ora" (Nilsson e Kazemi 2016, p. 190). Quando si è consapevoli, si è coscienti delle proprie azioni e dell'impatto che esse hanno sugli altri nella società. Le persone con un alto livello di mindfulness hanno meno pregiudizi cognitivi (Lueke e Gibson 2014), il che implica una minore propensione al pregiudizio e alla discriminazione (Berger et al. 2018). Inoltre, grazie all'attenzione per l'ambiente circostante, la mindfulness permette alle persone di acquisire una prospettiva sociale (Baer et al. 2004), che può facilitare una maggiore inclusione e diversità all'interno delle organizzazioni.

Finora, la ricerca sulla mindfulness nella letteratura sulla leadership si è concentrata principalmente sui risultati a livello individuale e organizzativo, come il benessere personale del leader, la produttività lavorativa, la crescita interiore e le relazioni all'interno del team (Urrila 2021). Mentre, la ricerca sull'impatto della mindfulness dei leader su orientamenti sociali più ampi, come la giustizia sociale, è quasi assente (Wamsler et al. 2018; Mielke 2021).

Inoltre, sebbene, al livello micro della ricerca sulla leadership responsabile, si sappia molto sulle qualità, le caratteristiche, le competenze e le abilità che i leader responsabili dovrebbero sviluppare, si sa poco su come queste qualità siano collegate ai vari orientamenti responsabili (Miska e Mendenhall 2018). È stato proposto che la mindfulness possa informare la leadership responsabile (D'Silva, 2019). Tuttavia, studi empirici che dimostrino che la mindfulness possa essere considerata uno strumento utile per sviluppare leader responsabili sono ancora modesti (Goldman-Schuyler et al. 2017; Eriksen e Cooper 2018).

Obiettivo del paper. *Tenendo conto delle suddette lacune nella ricerca, in questo studio ci proponiamo di capire se la mindfulness abbia una correlazione positiva con l'orientamento alla giustizia sociale dei leader. In particolare, ci proponiamo di rispondere alla seguente domanda di ricerca: "Qual è la relazione tra la mindfulness di un leader e l'orientamento alla giustizia sociale?" e testare le seguenti ipotesi:*

Ipotesi 1. La mindfulness avrà una relazione positiva con gli atteggiamenti di giustizia sociale.

Ipotesi 2. La mindfulness avrà una relazione positiva con gli atteggiamenti verso la responsabilità sociale delle imprese.

Ipotesi 3. La mindfulness avrà una relazione negativa con la percezione della giustizia distributiva.

Ipotesi 4. La mindfulness avrà una relazione positiva con il sostegno al movimento #Metoo.

Metodologia. *Nel nostro studio, ci siamo focalizzati sui dipendenti a tempo pieno che ricoprono ruoli senior, come i direttori di dipartimento e gli amministratori delegati. Abbiamo utilizzato un campionamento probabilistico, in cui i partecipanti sono stati selezionati casualmente dalla popolazione generale (Bell et al. 2018). In particolare, ci siamo*

concentrati sui leader aziendali europei provenienti da paesi con punteggi elevati (superiori alla media) e bassi (inferiori alla media) nell'Indice di giustizia sociale (Bertelsmann Stiftung, 2011). Il nostro campione comprende leader provenienti dall'Italia, Spagna, Germania e paesi del Nord Europa. Inoltre, il nostro studio non si è concentrato su settori specifici, pertanto il nostro campione comprende risposte provenienti da diverse aree di business. Infine, per facilitare la raccolta dei dati, abbiamo utilizzato un software di terze parti chiamato Qualtrics. Un totale di 572 leader hanno partecipato al sondaggio. Abbiamo testato l'ipotesi 1 utilizzando il campione 2, mentre le ipotesi 2, 3 e 4 sono state testate utilizzando il campione 1. L'indagine 2 include nel questionario una scala aggiuntiva per indagare gli atteggiamenti di giustizia sociale che non era stata inserita nell'indagine 1. Il resto del questionario non è stato modificato, così come le modalità di selezione dei partecipanti e di somministrazione del questionario. Pertanto, consideriamo le risposte dei due campioni comparabili come appartenenti allo stesso campione per le scale che le due indagini hanno in comune. Abbiamo utilizzato la teoria della risposta agli item (IRT) per operationalizzare le variabili latenti. Le nostre ipotesi sono state testate utilizzando Stata 17 (Acock, 2013). Per testare le ipotesi sono stati applicati i modelli SEM.

Risultati. Per testare le ipotesi sono stati applicati due modelli SEM. Il primo modello ha testato simultaneamente le ipotesi 2, 3 e 4 e ha valutato la previsione che la mindfulness fosse positivamente correlata al movimento #Metoo e alla responsabilità sociale d'impresa e negativamente correlata alla percezione della giustizia distributiva. Il secondo modello di percorso ha testato l'ipotesi 1 e ha valutato la previsione che la mindfulness fosse positivamente correlata agli atteggiamenti di giustizia sociale dei leader. Per verificare la bontà di adattamento dei modelli, li abbiamo adattati alla matrice di covarianza. Gli indici di adattamento del primo modello: p , $\chi^2 = 0$; CFI = .1; RMSEA = .09.; SRMR = .05; e gli indici di adattamento del secondo modello: p , $\chi^2 = 0.01$; CFI = .08; RMSEA = .07.; SRMR = .03; sono risultati di adattamento accettabile. Unificando i risultati dei due modelli, presentiamo i percorsi standardizzati nella Fig. 1 e gli intervalli di confidenza al 95% per i coefficienti standardizzati delle variabili focali del modello. Come mostrato nella Fig. 1, controllando il paese, il reddito, la posizione lavorativa, il sesso, l'etnia, l'esperienza di meditazione, il settore organizzativo e le dimensioni dell'azienda, la mindfulness è risultata un predittore significativo degli atteggiamenti di giustizia sociale, pari al 5% della varianza ($b = .27$, $p < .05$), a sostegno dell'Ipotesi 1. Utilizzando le stesse variabili di controllo, la mindfulness è risultata un predittore significativo degli atteggiamenti verso la responsabilità sociale d'impresa, pari al 2,3% della varianza ($b = .16$, $p < .01$), a sostegno dell'Ipotesi 2. La mindfulness ha avuto una relazione negativa significativa con la percezione della giustizia distributiva, pari al 2,9% della varianza ($b = -.17$, $p < .01$), che ha portato a sostenere l'Ipotesi 3. La mindfulness ha anche predetto in modo significativo la simpatia verso il movimento #Metoo, pari all'1,5% della varianza ($b = .12$, $p < .05$), quando sono state incluse le variabili di controllo evidenziate, che hanno dato sostegno all'Ipotesi 4.

Limiti della ricerca. In primo luogo, impiegando un insieme ristretto di paesi, la ricerca futura dovrebbe esaminare la generalizzabilità dei risultati ad altri contesti culturali. Sarebbe anche interessante analizzare se dimensioni culturali come, ad esempio, indulgenza contro moderazione (Hofstede, 1984) moderino il rapporto tra mindfulness e orientamento alla giustizia sociale. Inoltre, il contesto o l'impostazione organizzativa, così come la cultura organizzativa e i valori, possono avere un impatto diverso sulla relazione tra mindfulness e giustizia sociale. Inoltre, ipotizziamo che il contesto sociale in cui opera l'organizzazione possa avere un impatto sull'orientamento alla giustizia sociale. In particolare, la pressione istituzionale, l'attivismo sociale e il potere delle parti interessate possono aumentare l'effetto della mindfulness sull'orientamento alla giustizia sociale dei leader.

In secondo luogo, riconosciamo che un bias di desiderabilità sociale può influenzare l'autovalutazione dei partecipanti coinvolti in questo studio. Esprimere atteggiamenti positivi nei confronti delle questioni di giustizia sociale può essere visto dai leader come socialmente desiderabile. Sebbene abbiamo tentato di mitigare il pregiudizio della risposta alla desiderabilità sociale attraverso l'uso dell'anonimato nella gestione del sondaggio (per ridurre la misura in cui un soggetto si sente direttamente o personalmente coinvolto nelle risposte fornite), la ricerca futura dovrebbe fornire ulteriori prove dei nostri risultati utilizzando metodi alternativi.

Infine, sebbene secondo la teoria del comportamento pianificato (Ajzen, 1991) la mentalità normativa dei leader guidi il loro comportamento, non abbiamo osservato empiricamente l'impatto della mindfulness sul comportamento socialmente giusto dei leader. La ricerca futura dovrebbe espandere le nostre scoperte e mettere specificamente in relazione la mindfulness con una serie di comportamenti socialmente responsabili dei leader in un contesto organizzativo.

Implicazioni manageriali. Se riusciamo a instillare una maggiore consapevolezza dei leader per riconoscere l'interconnessione delle pratiche organizzative e del benessere sociale, è probabile che il processo decisionale etico migliorerà. La ricerca precedente riconosce la mindfulness come un'abilità allenata raggiunta attraverso la meditazione e le pratiche di consapevolezza (ad esempio, Berger et al., 2018; Donald et al., 2018; Donaldson-Feilder et al., 2019; Hafenbrack et al., 2020).

Per sviluppare una maggiore consapevolezza, tuttavia, i leader non necessariamente dovrebbero essere regolarmente coinvolti nelle pratiche di meditazione. Per sviluppare una maggiore mindfulness, i leader devono sviluppare un atteggiamento per ristabilire l'attenzione verso la loro organizzazione ed evitare di confrontare o valutare gli eventi attraverso processi di categorizzazione automatica e modi abituali di fare o ragionare (Langer & Moldoveanu, 2000). Ciò può scaturire da frequenti autointerrogazioni/valutazioni dell'impatto che questa o quell'azione può avere sulla società.

Per facilitare lo sviluppo di leader consapevoli, una filosofia di mindfulness dovrebbe essere accompagnata da un progressivo allineamento di tutte le strutture e dei processi organizzativi (Rashkova, Moi e Cabiddu, 2022). In

particolare, l'adozione di valori di giustizia sociale e l'incoraggiamento a prospettive diverse possono portare a una maggiore mindfulness dei dipendenti, nonché allo sviluppo di una mindfulness collettiva della giustizia sociale.

Originalità del paper. Al giorno d'oggi, per affrontare la complessità delle sfide sociali, i leader dovrebbero sviluppare nuove capacità (Maak et al., 2016; Stahl et al., 2018) per considerare in modo integrato l'interconnessione delle agende aziendali e sociali (Maak et al., 2016). Rispondendo a precedenti ricerche che chiedevano di ampliare gli studi sull'impatto delle qualità personali su uno specifico orientamento responsabile (Miska e Mendenhall, 2018) e di rafforzare l'attenzione dei leader su la più ampia inclusione, collaborazione e coinvolgimento degli stakeholder (Pless et al., 2022), in questo studio abbiamo spiegato come la mindfulness sia legata a uno specifico orientamento RL, quello alla giustizia sociale. In particolare, riconoscendo la complessità del costruito di giustizia sociale, abbiamo misurato l'impatto della mindfulness su quattro diverse operazionalizzazioni degli atteggiamenti di giustizia sociale dei leader (individuale, collettiva e sociale).

I risultati di questo studio sono promettenti per quanto riguarda la forza e l'ampiezza della relazione tra mindfulness e giustizia sociale. Essi indicano che la mindfulness individuale dei leader è significativamente correlata agli atteggiamenti e alle percezioni di giustizia sociale. I nostri risultati hanno supportato tutte e quattro le ipotesi: i leader più attenti hanno riportato una maggiore preoccupazione per le questioni di giustizia sociale. L'ampiezza dei risultati indica che le persone con un livello più alto di mindfulness hanno maggiori probabilità di avere una serie di atteggiamenti positivi verso le questioni di giustizia sociale, piuttosto che essere campanilisti o limitati a una sola area. La maggiore simpatia per il movimento #Metoo può suggerire che le persone con un livello più alto di mindfulness hanno una propensione intrinseca a smantellare i sistemi ingiusti. Le percezioni di giustizia distributiva suggeriscono che i leader mindful si impegnano per una distribuzione più equa di diritti, privilegi e opportunità nella società rispetto a quella attuale. La relazione positiva tra mindfulness e atteggiamenti di responsabilità sociale d'impresa indica che i leader con un livello di mindfulness più elevato possono considerare come le loro azioni influenzino non solo le loro organizzazioni, ma la società nel suo complesso. Inoltre, i nostri risultati indicano che le persone con un livello di mindfulness più elevato hanno anche atteggiamenti di giustizia sociale e possono avere una migliore comprensione di come le loro azioni da manager influenzeranno la società nel suo complesso.

I nostri risultati, da un lato, confermano le ricerche precedenti che suggeriscono la mindfulness come caratteristica importante della RL (George 2003; Maak e Pless 2006; Pless 2007; Pless et al. 2022) e, dall'altro, le ampliano fornendo prove empiriche, anche se ancora marginali, sulla mindfulness come caratteristica utile per la leadership responsabile (D'Silva, 2019; Eriksen e Cooper, 2018; Goldman-Schuyler et al., 2017). Poiché la leadership responsabile presuppone la capacità di prendere decisioni morali e di principio considerando il loro impatto sugli altri (Pless e Maak 2011), i nostri risultati offrono l'evidenza empirica che la mindfulness può dare origine a tale capacità. Poiché la mindfulness implica l'osservazione dei sentimenti, dei pensieri e delle emozioni degli altri e l'agire con mindfulness, potrebbe essere più facile per i leader mindful valutare il loro impatto sulla società e ristrutturare le pratiche organizzative irresponsabili che alimentano le disuguaglianze sociali. Basandoci sui risultati di cui sopra e sulla teoria del comportamento pianificato (Ajzen 1991), in cui la mentalità normativa dei leader (compresi gli atteggiamenti) guida il loro comportamento (ad esempio, il processo decisionale) (ad esempio, Chin et al. 2013), proponiamo la mindfulness come una caratteristica importante della RL che può informare il comportamento socialmente responsabile.

Inoltre, contribuiamo alla letteratura sulla mindfulness nella leadership. Finora i risultati della ricerca sulla mindfulness sono stati conosciuti a livello individuale e organizzativo (Mielke, 2021; Wamsler et al., 2018); noi estendiamo i risultati della mindfulness al livello sociale, fornendo una chiara visione della società.

A preliminary investigation about metaverse in international hotel chains

STEFANO FRANCO* ANGELO PRESENZA* ANTONIO MESSENI PETRUZZELLI[▲]

Framing of the research. *Digital technology has long been redesigning the market landscape in many sectors, including the hospitality industry. COVID-19 has speeded the penetration of this phenomenon by spreading several pervasive digital technologies (big data, blockchain, artificial intelligence, robotics, etc.), that have transformed both how tourism and hospitality businesses operate and how customers/tourists live their experiences. Furthermore, lockdown gave rise to virtual travelling as a way for firms to reach their target market and for consumers to escaping the everyday. It follows that hospitality sector “is experiencing a wave of digital disruption that threatens to restructure some traditional business models and make others obsolete” (OECD, 2017, p. 7).*

Thereby, in the current scenario, the challenge for the tourism and hospitality industry is to understand how to boost the introduction of transformative technologies to enhance the real-world guest experience, hence taking advantage to being in a new space where the digital and physical worlds converge (The Verge, 2021). The interplay between these issues has been recently identified with the term metaverse (Del Chiappa, 2022) recognizing it as the next disruptive technology (Gursoy et al., 2022) that will revolutionize how hospitality customers and organizations facilitate the co-creation of transformational experiences and values (Buhalis and Karatay, 2022).

The metaverse has been described as a virtual reality (VR) space that utilizes VR headsets, blockchain technology, software agents, and avatars within a new integration of the physical and virtual worlds (Joshua, 2017; Lee et al., 2021). Although examples that can be described as antecedents of the metaverse have been available since the early and mid-2000's with large numbers of global users, the new metaverse concept - as outlined by Mark Zuckerberg with the launch of Horizon Worlds in 2021 by Meta Platforms - has heavily increased the interest of academics and practitioners opening many questions that require just as many answers (Fernandez and Hui, 2022). With reference to tourism, Go and Kang (2022, p. 2) have defined metaverse as “tourism that provides a product or experience with collective spatial environments enhanced by multi-sensory information processing in the converge of physical and virtual environments”.

Even though metaverse is still largely conceptual and not clearly executed, scholars expect this technology to disrupt tourism challenging existing models of tourists planning behaviors and supplier management (Buhalis et al., 2023). The challenge for practitioners as well as researchers is now to understand how players from the hospitality industry can use metaverse to provide tourists with new customer experience, both before (in the purchasing phase), during, and even after the touristic experience (i.e., the so-called never-ending tourism). Buhalis and colleagues (2023) argue that in the purchasing phase, tourism experience providers can use metaverse for promotional and experience design purposes. During travelling and whilst on-site, “metaverse effectively supports users to become active participants or virtual actors in the context they choose to be” (Buhalis et al., 2023, p. 5). After travelling, finally, metaverse can be considered as a good tool to recall and share tourist experiences (Buhalis et al., 2023). Furthermore, first practical evidences suggest that the metaverse will also give the opportunity to virtually live experiences that tourists may not be able to physically try for several reasons (e.g., too expensive, risky, not accessible).

The National Geographic VR, for example, allows individuals to use Oculus VR gear to virtually kayak through icebergs in Antarctica or explore the hidden treasures of Machu Picchu. According to Hotelverse - a network of 1,500 hospitality companies aimed at promoting the use of digital technologies in the industry - the use of metaverse in the purchasing phase will increase customer experience and in turn companies' revenues. This means that metaverse will soon allow consumers to be actively involved, participate, and co-create using experiences (Buhalis et al., 2022) and hospitality and tourism organizations to establish interaction with them (Gursoy et al., 2022). Other examples can span from building a decentralized hotel in the metaverse to more immersive virtual tours, with potential for interaction with some of the room features - dimming the lights, exploring the minibar, checking the floor space for accessibility needs, etc. In addition, further possibilities refer to hybrid experiences and events, which could host remote business attendees, wedding guests, and so on in a more participatory and present way than before, as well as interactive itineraries, giving

guests the opportunity to explore the area with expert guidance, uncovering local insider tips, restaurant recommendations, and lesser-known places to discover.

Duan et al. (2021) identified a three-layer metaverse architecture: the virtual world, the physical world, and the intersection between them, while Go and Kang (2022) have added a fourth layer, i.e., the inclusion of tourist experiences within metaverse environments. The physical environment includes various types of infrastructures such as tourism attractions, facilities, and supporting technological devices. The virtual environment contains ecosystems formed with user-generated content, economics, and artificial intelligence. As a consequence, metaverse environments are shaped by the intersection of physical and virtual environments. Promoting or allowing tourists to share, review and reproduce their metaverse experiences on social media is the fourth layer (Go and Kang, 2022). A further layer could be foreseen with reference to the relationship with other stakeholders such as the human resources. Examples are the development of metaverse training courses for operational staff to provide an in-situ experience in an immersive and realistic simulated environment or the use of VR and AR for auxiliary and off-site working processes, engaging workforces remotely in an efficient and stimulating format (SITA, 2022).

In sum, metaverse is expected to have considerable impacts on the hospitality and tourism industry that will be increasingly pushed to reengineer its servicescape and experiencescape to ensure that the new metaverse potential is capitalized (Kandampully et al., 2022). It follows that metaverse effectively extends the Augmented Reality (AR) and VR by integrating 3D projection technology (Rauschnabel, Babin et al., 2022), going towards a near-realistic experience via integrating sensory feedback for sight, hearing, smell, taste, and touch (Buhalis et al., 2022). In particular, hospitality services will be greatly influenced with impacts that will invest a very wide range of services, including accommodation, food and beverage, entertainment, and MICE services (Buhalis et al., 2022). As stated by Buhalis et al. (2022, p. 6), metaverse “propels a dynamic transformation of the hospitality ecosystem, forcing a business process reengineering in all functions and processes as well as in operational and strategic hospitality management”. This transformation will give to organizations new drivers to promote products and services through immersive engagement and to deepen their knowledge about consumers’ needs, wants and preferences (Buhalis et al., 2023).

Hotel firms can conduct meta-advertising and lease digital billboards of their metaverse properties to other companies for placing digital advertisements. Furthermore, they can promote their brands and increase their brand awareness in the virtual space whilst offering virtual tours and personalization (Buhalis et al., 2023; Hollensen et al., 2022). Taking advantage of immersion, they can organize virtual tours and experiences, whilst engaging in real-time conversations with concierge or sales executives on the platform. Hotels can re-create their digital twins and services in the virtual space and augment information about the history and attractiveness. Hotels can also use metaverse to change their events into hybrid (fully or partially) virtual format. In other words, metaverse can help create an unprecedentedly strong sense of embodiment for users because they can watch the scene and hear the sound but also experiment the sense of engaging, interacting and touching in the digital world.

Metaverse can be used for the development of facilities and service prototypes. Developing virtual facilities, attractions, and activities is faster, cheaper and more flexible, than constructing physical facilities. Destinations can leverage metaverse to develop attraction prototypes, invite people to gain lifelike experiences, using their MR/VR devices, and solicit their feedback for further improvement. Many aspects are easily adjustable, so tourism organizations can test several iterations virtually before deciding the option to construct (Rauschnabel et al., 2022). Through employing metaverse to involve and acquire input from prospective travelers, this proactive collaboration is expected to help identify more consumer-centric design and ultimately lead to value co-creation (Buhalis et al., 2022).

Metaverse also supports market intelligence and facilitates research and development. Similar to website browsing, travel blog writing and travel photo uploading, users leave digital footprints when entering the metaverse and interacting with others. These big data can enrich tourism suppliers’ knowledge about who their customers are and what they need. Tourism suppliers can proactively use metaverse to engage in conversation, convert sales, and transform the data pertinent to their customers into business insights. Attribution can identify touchpoints and evaluate different methods to improve conversion (Buhalis and Volchek, 2021). These insights empower suppliers to provide consumers with the right product in the right place at the right time (Stylos et al., 2021). Simulations of tourism behavior and preferences can also explain travel routes, paths and patterns.

As highlighted so far, metaverse presents several potential opportunities. However, it also brings a range of challenges as it happens for any disruptive innovation. Among the many emerging issues, exploring how the hospitality industry can eager ways to capitalize on the metaverse becomes imperative (Gursoy et al., 2022). In particular, the identification of innovative processes and resources each hotel should initiate to transform its business model should be of primary interest since to understand how metaverse should enter the business model can support companies to unveil new sources of value creation and value capture. Yet, although several examples of the implementation of metaverse have been underlined, literature about the opportunities it offers in terms of business model innovation is still in its infancy.

The concept of Business Model (BM) defines the way in which a company creates value for customers and how it captures this value (Teece, 2010; Zott et al., 2011). It embodies the way a firm does its business, translating strategies into operative activities that allow it to create and capture value (Afuah and Tucci, 2001; Osterwalder et al., 2005; Zott and Amit, 2010). Companies are increasingly being pushed to go further and reinterpret their conventional way of doing business, and thus their BMs. This is imperative if they want to remain competitive in a market that is experiencing rapid changes characterized by fluctuating consumer behavior and economic conditions, as well as by technological progress (Dhaliwal et al., 2020; Yeoman and McMahon-Beattie, 2018). Indeed, the need to develop BMs

that reflect such trends makes it imperative to experiment new strategic directions such as applying disruptive technologies as metaverse by identifying new sources of value creation that trigger customers' willingness to pay (Bowman and Ambrosini, 2000). This means that to succeed and thrive in the new competitive environment, hotel companies are undergoing digital transformation which leverages digital technologies and requires the transformation of entire organizations and their activities, processes, structure and revenue models to remain relevant and competitive in the marketplace (Matt et al., 2015).

Purpose of the paper. Despite the relevance that metaverse is playing in the hospitality industry, how hotel chains are using it still remains an overlooked issue (Iranmanesh et al., 2022), since hospitality literature has mainly focused on the mere diffusion of other digital technologies (Fileri et al., 2021) and studies focused on metaverse are still in an infant stage. Starting from this premise, this Extended Abstract (EA) will show the preliminary results of a research project started in December 2022 finalized to identify activities generated by a strategic use of metaverse for exploring and exploiting new business opportunities. In other words, our aim is to investigate the role of the metaverse as a digital tool capable to pursue strategies of exploration and exploitation for hospitality firms. We expect that each of this strategic approach is implemented through different mechanisms. The research focuses on hotel chains due to their peculiar organization; in fact, they have the attributes of multinational enterprises and share the characteristics of service industry organizations (Ivanova and Ivanov, 2015) giving us the opportunity to reach more information in comparison with smaller organizations and to have the chance to be nearer to see nascent innovations as the case of metaverse.

Hotel chains dominate the global hotel industry (Pine et al., 2004) and are the most active actors in the hospitality internationalization process and because of this, they have received much attention in the literature (Brida et al., 2016). According to the broadly accepted definition of Ingram and Baum (1997, p. 68), hotel chains are "collections of service organizations, doing substantially the same thing (often the only differentiation is in physical space), that are linked together into a larger organization. The relationships between the components of a chain are horizontal, although typically there are centralized parts of the chain, such as a distribution facility, that have vertical relationships to the components". This form of business organization helps to develop and maintain identifiable image and unified hospitality products, to multiply standards, to transfer knowledge and best practices and to produce guaranteed quality service in the globalized environment.

Methodology. Given the limited attention the previous literature has placed on the role of metaverse in innovating hotel business models, this paper adopts an exploratory multiple case study approach (Eisenhardt, 1989). Following Eisenhardt and Graebner (2007), we adopted a multiple case study methodology due to the ability of qualitative data to explicate complex social processes.

The exploratory analysis takes in consideration four international hotel chains (Accor Hotels, CitizenM, Four Seasons and Marriott). The selected cases represent some of the most diffused and innovative hotel chains in the world, whose analyses would provide a good understanding of the current scenario about metaverse in the hospitality industry.

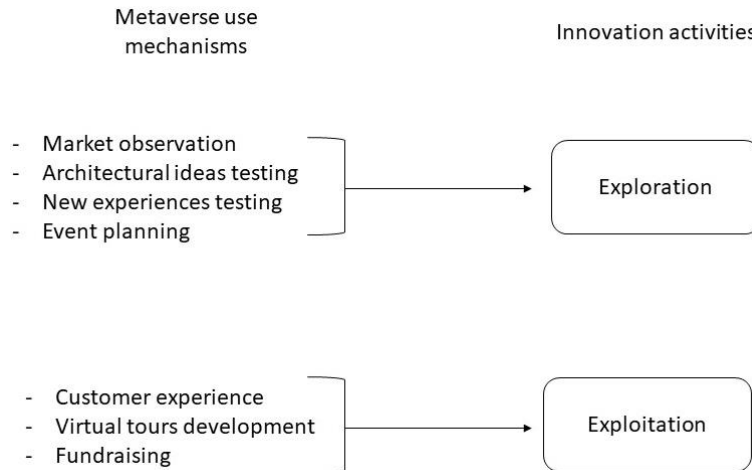

Being ongoing research, the EA can just sketch preliminary findings that emerge from the analysis of secondary data. For each chain we searched for press releases, public disclosure forms, and specific information shared through official websites and social media. At any rate, this can be considered the first step, preparatory to carrying out a more robust analysis done through interviews with key-informants and/or focus groups.

Results. First evidence suggests that metaverse is indeed a technology aimed at innovating business models in a way that allows firms to balance exploration and exploitation activities. The analysis represented in Figure 1 shows that there are seven mechanisms through which hotel chains implement exploration and exploitation. In particular, hotel chains are experimenting the use of the metaverse for observing how customers live the metaverse and the virtual hotel. This mechanism allows companies to grab ideas to test in the digital world. Once that the ideas prototypes are developed, the hotel chains can test them with the metaverse users. The ideas are related to the architecture and the management of the spaces, to new possible experiences and to events organization. These four mechanisms fall under the exploration activity as they give firms opportunities to try new solutions to be applied both in the digital or in the physical world. According to our findings, indeed, hotels also test ideas that can be implemented in the real world.

The other three mechanisms are associated to the exploitation activity. The metaverse, in fact, already provides opportunities to be exploited. One of the mechanisms is the fundraising through the selling of non-fungible tokens (NFT) that give special rewards to virtual tourists. A second mechanism is represented by the increased customer experience: designing offers in the metaverse may imply the development of new digital experiences that engage customers, in particular the tech-savvy, increasing the value of their experiences and consequently their brand loyalty. Finally, the metaverse allows to offer new experiences in the digital world that can be sold to customers.

Conference discussion will contribute to consider remarks and suggestions in order to finalize the empirical research. Meanwhile, preliminary results can be grouped in two main strands, understanding of the hotel chains selected as case studies and the analysis of their experiments related to the use of the metaverse.

Fig. 1: Preliminary results: the metaverse as a tool to explore and exploit innovative solutions

Research limitations. *The research is limited to four case studies and the extended abstract focuses on preliminary results. However, the hotel chains under analysis are emblematic examples to explore this emergent phenomenon as they can be considered as first movers in innovation's adoption.*

Further research steps will corroborate the preliminary highlights. Then, a broader research project will may be promoted also supported by a quantitative analysis.

Managerial implications. *Findings will be of great interest for managers and advisors of hotel chains and tourism organization in general. In fact, this research will depict not only the state-of-the-art about metaverse tourism but also how innovative strategies are shaping the BMs. The mechanisms identified will show managers how some of the most important hotel chains in the world are experimenting the use of the metaverse, shedding light on the innovation opportunities opened by this new and increasing technology.*

Originality of the paper. *This is among the first studies that tries to provide evidence about how metaverse can be used to innovate business models in a way that balances exploration and exploitation activities in the specific context of the hotel industry. In doing so, it tries to find the main mechanisms through which metaverse create innovation opportunities for hospitality companies.*

The role of internship in the process of human resources training. Application to hotel sport and recreation services

ELENI SPYRIDOPOULOU* GEORGIA YFANTIDOU*
VICKY KATSONI[▲] ATHANASIOS KOUSTELIOS**

Framing of the research. *Tourism is an amalgam of service industries (Otto and Ritchie, 1996). Service innovation encompasses the concept of service improvement. Service innovation always involves criteria that can be copied and identified and systematically replicated in the industry. These reproducible criteria can be the outcome of the services or the process of service provision. Comparing the most prevalent definitions of the concept of innovation, it is observed that there are four different perspectives, many authors define innovation as a process, while others state that innovation can also be a function, an activity or an outcome. In any case, innovation is equivalent to the creation or development of something new (Nagy, 2014).*

Therefore, defining innovation in services is not an easy process. Mudrak, Van Wagenberg and Wubben (2005), stated that service innovation is the process through which a firm undertakes changes in its philosophy, culture, operations and processes to add value to the outcome of the service or product for the benefit of the customer. Another definition of the concept was proposed during the Cornell Hospitality Roundtable: ‘Service innovation is the introduction of new or innovative service-focused ideas that provide new ways of delivering benefits, new service concepts or new business service models through continuous improvement in operations, technology, investment in employee performance or customer experience management’ (Verma et al., 2008).

The entry of new ideas of innovation has triggered further research and development in the areas of services that provide new ways of delivering benefits, developing new service concepts or new service business models through continuous improvement of operations, technology, performance from investing in human resources or managing the customer experience.

The hotel industry is increasingly offering more and more facilities through the large hotel chains that monopolize the tourism market. Trends such as, design, social and lifestyle changes, eco-hotel, historically significant hotel, sports hotel, spa hotel, quirky hotel, boutique hotel and modern hotel are constantly developing and differentiating themselves from traditional hotels (Hackett and Melia, 2012).

Hotels are focusing on differentiation to such an extent that the hotel is now the tourist attraction (Van Hartesvelt, 2006) and an integral part of the stay (Freund de Klumbis, 2005; McIntosh and Siggs, 2005). The hotel’s ability to develop and market successful new services is not only vital for its survival, but is a competitive advantage for the organization (Ottenbacher and Harrington, 2010). Investment in innovation is considered key ingredients for improving a firm’s competitive advantage, either in terms of cost or strategic differentiation. In both cases the result is that better performance indicators are achieved for the firm (Fernández and Suárez, 1996; Peteraf, 1993).

Wellness and well-being are important parts of the tourism industry, according to Konu (2010). Wellness, sports and healthcare products are usually associated with luxury properties and five-star hotels. A definition, for this type of hotel, is provided by the National Tourism Development Authority of Ireland “Failte Ireland” (2010), which states that it is a property whose main purpose is to provide a full service of wellness, therapy, spa or sports facilities while being a holiday destination.

The quality of recreation services in hotels has become of particular importance and can contribute to a high degree to the improvement of the quality of life of tourists (Costa et al., 2003; Yfantidou, 2009). Entertainment, as an important objective of tourism and recreation, has led to the emergence of recreation services (animation). The participation of people during holidays in sports activities, their introduction to physical education, games and movement is a step towards recovery. The introduction of new content, the promotion of tourism opportunities based on a modern marketing approach, the involvement of professional staff in the tourism sector, sport and physical culture are the main conditions for the development and confirmation of sport and recreation tourism in this sector (Bulatovic et al., 2019).

The different types of sport/recreation activities influence the return to the destination. Sports facilities and services, as well as health, spa and wellness facilities and services have a positive impact on the return of tourists. In addition, there is a positive effect on repeat visits and the generation of new tourist visits with potentially significant economic benefits. The emphasis on the role of spa, wellness and other hotel facilities in the recreation and physical activity sector draws attention to the fact that these types of services and facilities have managed to occupy a substantial position in the perception of consumers and certainly have a positive impact on the overall image of the hotel and, by extension, the destination. The findings suggest that managers and policy makers are making additional efforts to create a better environment that supports the synergy between sports and recreation activities (Markus et al., 2019).

Fayos-Solà, Alvarez and Cooper (2014), stresses that human resource training is a necessary condition for the competitiveness of firms. Even the smartest strategy can be fruitless if the firm is not supported by appropriate personnel (in terms of quantity and quality) placed in the right positions. By effectively managing Human Capital, a company can achieve maximum results with its own human capital and be superior to its competitors. Employment in hotels is characterized by a certain specificity due to the behaviour and ability of the workers employed and the nature of the work itself. Particular attention is drawn to the interactions created between customers and employees as the latter are a dominant theme of management practices (Pandit, 2003).

Purpose of the paper. The aim of the research was to investigate the human resources in sports and recreation services provided by five-star hotels operating in Greece, with Mitsis and Grecotel hotels as a case study where the students of the Department of Physical Education and Sports Science of DUTH carried out their internship.

Methodology. The sample of the research consisted of six Managers-Directors of Mitsis and Grecotel hotel groups (five-star hotels in Greece) with which cooperation has been developed in the framework of the implementation of the Internship of the Democritus University of Thrace from the academic year 2018-2019 until 2021-2022.

The five-star hotels of Mitsis and Grecotel groups provide sports and recreation services and have welcomed students of the Department of Physical Education and Sports Science of the Democritus University of Thrace, for their internship. They are listed as follows:

1. Mitsis Faliraki Beach Hotel & Spa
2. Mitsis Family Village Beach Hotel
3. Mitsis Norida Beach Hotel
4. Mitsis Rinela Beach Resort & Spa
5. Mitsis Rodos Maris Resort & Spa
6. Paneuropa S.A. (Mitsis Laguna Resort & Spa)
7. Grecotel S.A. (Olympia Riviera Resort)
8. Grecotel S.A. (Pella Beach)
9. Grecotel S.A. Corfu Imperial
10. Tholari Hotel Tourism Construction & Commercial Limited Company (Mitsis Blue Domes Resort & Spa)
11. Hotels of Crete Mitsis Company S.A. (Royal Mare Thalasso & Spa Resort)
12. Hotel Tourist Businesses Konstantinos Mitsis S.A. (Ramira Beach Hotel)

A new questionnaire was created for this research. Questions were selected from the scales of:

- i) Orfila-Sintesa & Mattsson (2007) - (Section 6 HR & 7 Hotel Director),
- ii) Akomaning, Voogt, & Pieters (2011) - (Appendix A1, Appendix A2 & Appendix A5)
- iii) Odio (2013) Appendix E.
- iv) "Study/Guide for the application and analysis of human resource indicators" Operational Programme "Human Resource Development" during the NSRF 2007-2013, indicators 3.2.1 and 3.2.3. (Epitropaki & Gerakari, 2014)

The questionnaire consists of 49 questions divided into four sections:

- The first section concerns the information on personal data and the consent of the research participant (1 question).
- The second section concerns the demographic characteristics and data of the hotel's manager, with five questions related to gender, age, years of experience in the specific hotel, years of experience in the specific field and level of education (5 questions).
- The third section contains questions on human resources (20 questions). These questions relate to the number of employees in the sports and recreation services and their working relationship with the company, their level of education and the hotel's human resources policy. At the same time there are questions concerning the training of human resources and possible innovation in sport and recreation services, processes, communication channels and organizational structures.
- The fourth section concerns the evaluation of the Internship Programme and includes 23 questions of closed-ended five-point Likert-type scale in relation to:
 - (a) the implementation of the programme,
 - (b) cooperation between the parties involved,
 - (c) placement,
 - (d) human resources roles and
 - (e) Efficiency.

For the collection of the survey data, telephone contact was made with the executives of the Mitsis and Grecotel hotels to agree the cooperation for this research. The hotel Managers-Directors who agreed to participate in the survey were six in total and they had to complete an electronic questionnaire.

Results. Factor analysis was performed. PCA revealed four factors which explain the 97,48% of the total variance:

- Factor 1 Placement 26,48% of variance eigenvalue 6,09
 - Factor 2 Cooperation 26,19% of variance eigenvalue 6,02
 - Factor 3 Efficiency 25,54% of variance eigenvalue 5,87
 - Factor 4 Implementation 19,27% of variance eigenvalue 4,43
- The total Reliability total for the 23 questions was tested with Chronbach α and was 0,97.
- Factor 1 Placement $\alpha=0,95$ (8 questions)
 - Factor 2 Cooperation $\alpha=0,97$ (7 questions)
 - Factor 3 Efficiency $\alpha=0,94$ (5 questions)
 - Factor 4 Implementation $\alpha=0,90$ (3 questions)
- Demographic characteristics of participants:
- Gender: Man 66,7% & Women 33,3%
 - Age: 17-39 years 33,3% & 40-59 years 66,7%
 - Previous Work Experience: 1-5 years 33,3%, 6-10 years 33,3%, 10+ years 33,3%
 - Educational Level: PhD 16,7%, MSc 50%, BSc 33,3%

Demographic characteristics of employees in the sports and recreation sector in hotels: In the sports and recreation section of the hotels whose managers participated in the survey, 14,72% of their staff are employed on a permanent basis, while 26,41% are employed on a contract basis as seasonal staff and 16,45% are hired as temporary staff. The need for staffing the hotels' sports and recreation services is also covered by project contracts with both outsourced professionals in the field at a rate of 17,32% and contracted out to contractors at a rate of 25,11%.

In terms of training and education of staff employed in the sports and recreation department, 45,81% of the staff selected to be employed have received university education. However, hotel managers stated that they recruit staff for the sports and recreation department who come from colleges, institutes of vocational training and vocational schools at 18,5%, as well as secondary school graduates at 19,82%. They also stated that 15,86% of their staff have received only compulsory education.

The participants in the survey were then asked to answer questions concerning the human resources employed in sport and recreation services. Regarding the policy followed by the companies in terms of staffing and job satisfaction of their staff, 100% of the respondents said that they prefer internal promotion of existing human resources and 83,3% of them prefer to strengthen their existing human resources. At the same time 33,3% of the respondents said that the policy of rewards/bonus in the range of 5% to 20% of employees' salaries is promoted by the companies.

In a question concerning the training of human resources in sports and recreation services in the last two years, 50% of the respondents stated that their staff is trained within the company with a specific training plan, while the remaining 50% do not agree with this view and stated that they do not train their staff and do not implement any training plan. The companies that implement a training plan stated that they implement it from time to time at a rate of 80% while 20% of the respondents answered that they implement a continuous training plan.

Regarding staff training methods, respondents answered that the training comes from already trained people, who provide a programme plan. At the same time, they implement in job training & seminars both internally by the central HR department and by external partners.

Regarding the Mean of the Factors:

- Placement Mean=3,71 std=0,91
- Cooperation Mean=4,21 std=0,84
- Efficiency Mean=4,10 std=0,72
- Implementation Mean=3,39 std=1,14

T-tests analysis between Gender and Factors:

- Placement $t_{(4)} = -0.285, p > 0.05$
- Cooperation $t_{(4)} = 0.888, p > 0.05$
- Efficiency $t_{(4)} = 1.675, p > 0.05$
- Implementation $t_{(4)} = 2.046, p > 0.05$

T-tests analysis between Age and Factors:

- Placement $t_{(4)} = 0.285, p > 0.05$
- Cooperation $t_{(4)} = -0.888, p > 0.05$
- Efficiency $t_{(4)} = -1.675, p > 0.05$
- Implementation $t_{(4)} = -2.046, p > 0.05$

Anova analysis between Educational Level and Factors:

- Placement $F_{(2,3)} = 0.149, p > 0.05$
- Cooperation $F_{(2,3)} = 0.205, p > 0.05$
- Efficiency $F_{(2,3)} = 1.462, p > 0.05$
- Implementation $F_{(2,3)} = 1.096, p > 0.05$

Anova analysis between Previous Working Experience and Factors:

- Placement $F_{(2,3)} = 1.787, p > 0.05$
- Cooperation $F_{(2,3)} = 0.184, p > 0.05$
- Efficiency $F_{(2,3)} = 2.208, p > 0.05$
- Implementation $F_{(2,3)} = 0.150, p > 0.05$

Placement

Regarding the question whether “the hotel industry cooperates with the professors of the departments for the education of students” only 16.67% answered that they strongly agree. 33.33% of the respondents maintained a neutral attitude while 16.67% responded that they disagree that there is cooperation with the Department Professors and the remaining percentage i.e. 16.67% responded that they strongly disagree.

In the question on whether the hotel industry cooperates with the Departments for the education of students only 16.67% responded that they strongly agree. 50% of the respondents maintained a neutral attitude as they replied that they neither agree nor disagree, 16.67% replied that they disagree with the opinion and 16.66% replied that they strongly disagree.

When asked whether it would be useful to create a curriculum that would take into account a commonly accepted skills framework for the effectiveness of the knowledge required for human resources in sport and recreation services, 33.33% of respondents answered that they strongly agree, 50% of respondents agreed and 16.67% answered that they neither agreed nor disagreed.

The question whether students evaluate their internship experience by providing feedback to the company was answered by 16.67% with absolute agreement and at the same time 33.33% responded that they agree. On the other hand, 50% of the respondents answered neither positively nor negatively.

At the same time, when asked whether students evaluate their internship experience by providing feedback through reports to the company, 33.33% of the respondents answered that they strongly agree, 16.67% that they agree and 33.33% answered that they neither agree nor disagree on this issue. On the other hand, 16.67% answered that they disagree.

As to the question whether the Internship gives the students the opportunity to apply their theoretical knowledge in the field of implementation of the internship, the respondents of the hotel managers answered that 50% strongly agree that they agree while 16.67% answered that they neither agree nor disagree.

When asked whether employers of the company are generally satisfied with the work performance of interns, 33.33% of respondents said they strongly agree and 33.33% said they agree. However, the remaining 33.34% did not want to be positioned and responded that they neither agree nor disagree.

The surveyed hotel managers, when asked whether the increase in performance has resulted in an increase in staffing in sports and recreation services, responded that 33.33% strongly agree and 33.33% also agree. However, 33.34% gave neither positive nor negative response.

Cooperation

In response to the question posed to the respondents whether the “duration of the Internship should be extended”, 66.66% of the respondents answered that they strongly agree and 16.67% that they agree that the internship should be implemented for a longer period. At the same time, 16.67% responded that they neither agree nor disagree, indicating that the duration the internship is implemented is sufficient.

The question asked whether “the hotel industry should strengthen its support for student education through Internship programs found 50% strongly agreeing in this direction and 33.33% agreeing, while only 16.67% of respondents answered that they disagreed with this view.

The question on enhancing the cooperation of all stakeholders (University - Companies - Students) in student internship found 66.67% of the respondents strongly agree and 16.67% agree. On the other hand, the remaining 16.66% stated that they disagreed with the cooperation of the parties involved.

The question of whether it is important to identify a common skills framework in sport and recreation services for the benefit of all parties involved (University - Companies - Students) found 50% of respondents strongly agree and 33.33% also answered that they agree, while 16.67% answered that they neither agree nor disagree with this issue.

When asked whether students are placed in the appropriate post based on their specialization area during their placement at the company, 16.67% of respondents said they strongly agree and 66.67% said they agree. The remaining 16.66% maintained a neutral opinion on this issue as they replied that they neither disagreed nor agreed.

When asked if there is a clear description of the outcomes that participants in the internship programme should achieve at the company, 33.33% of respondents said they strongly agreed and at the same time 33.33% said they agreed. However, 33.34% stated that they neither agree nor disagree on this question.

Also 33.33% of the respondent’s hotel managers who were asked the question whether the student participants in the Internship program are assigned specific tasks by the company for their work, responded that they strongly agree and 50% that they agree while 16.67 maintained a neutral attitude and stated that they neither agree nor disagree.

Efficiency

At the same time, when asked whether due to the training of human resources, accidents at workplace have decreased, 16.67% of the respondents answered that they strongly agree and 66.67% that they agree while only 16.66%

maintained their neutrality.

The question concerning the link between performance and payments and specifically whether the increase in performance has resulted in an increase in the salary of staff in sport and recreation services had a high percentage of positive responses as 16.67% of respondents said they strongly agreed and 66.67% said they agreed. At the same time, there was also a neutral attitude of the respondents which was expressed by 16.66%

Asked whether there is an increase in competitiveness in sports and recreation services in the hotel sector, 16.67% responded that they strongly agree and 66.67% also responded that they agree. The remaining 16.66% maintained their neutrality as they answered that they neither agree nor disagree with this opinion.

Finally, as regards the question of whether the score of tourists on Trip Advisor or other platforms for sport and recreation services is considered, 83.33% answered that they strongly agree and only 16.67% answered that they neither agree nor disagree.

The question that respondents were asked to answer whether “Departments’ Professors should be actively involved in Internship programmes” found 33.33% strongly agree, 33.33% agree, 16.67% of the respondents answered that they neither agree nor disagree while 16.67% answered that they disagree with the involvement of teachers in Internship programmes.

Implementation

Internship programmes for students are well organized.

The respondents seem to have a positive attitude towards this aspect as 33.33% said they strongly agree, 16.67% said they agree while 33.33% said they neither disagree nor disagree. On the contrary, only 16.67% said they disagree.

Traineeship programmes are accurately implemented.

Respondents have a positive attitude towards the question of whether Traineeship programmes are implemented accurately, with 33.33% saying they strongly agree and 33.33% saying they agree. 16.67% maintain a neutral position on this issue as they stated that they neither disagree nor agree, while the remaining percentage of respondents i.e. 16.67% stated that they disagree with the question.

In the question “Is the time allocated for Internship Programmes sufficient for students to be able to understand the objectives of the curriculum in relation to the work subject” 50% of the respondents do not seem to agree or disagree while the remaining 33% consider that the time allocated for Internship Programmes is not sufficient and only 16.67% consider the time sufficient for students to be able to understand the objectives of the curriculum in relation to the work subject assigned to them.

Concerning the questions asked regarding the integration of the interns in the workforce of the companies, the opinions were divided as 50% of the respondents answered that after the completion of the student’s internship, they proceeded to recruitment and the remaining 50% stated that they did not proceed to recruitment.

However, when asked whether after the completion of the student’s Internship at your company, you intend to hire interns in the future, 16.67% responded that they strongly agree and 83.33% responded that they agree, thus indicating the positive intention for the professional rehabilitation of the interns.

Research limitations. *The results are from a case study of two hotel groups of five-star hotels in Greece, where the Democritus University students made their internship.*

Managerial implications. *In recent years, the competitiveness of sports and recreation services in hotels has increased. Entertainment services have a significant impact on hotel marketing, competing with other resorts, increasing room sales, generating revenue, increasing sales of other services and creating consumer awareness and trust (Gokdeniz and Dinc, 2000; Cevik and Simskek, 2017). There is already a development in the recruitment of qualified staff and hotels are opting for internal promotion of human resources. However, the majority are not involved in human resources training because they choose already trained people. Of course, from time to time they follow in job training & seminars both internally by the central HR department and by external partners. The heads of the departments said that they would like to increase the duration of the internship and the cooperation with the university. They also stated that the hotel industry needs to strengthen its support for the education of students through internship programs and it would be useful to create a curriculum that takes into account a commonly accepted skills framework.*

They would also like to have feedback from students on their internship experience. They agree with the student assessment tools and consider that the internship gives students the opportunity to put theoretical knowledge into practice as they are assigned specific tasks on their subject. They stated that they are generally satisfied with the work performance of the interns and in fact, due to the training of human resources, accidents in the workplace have decreased. It is worth mentioning that the increase in performance has resulted in an increase in staff in sports and recreation services and has resulted in an increase in the salary of staff in sports and recreation services. There is an increase in competitiveness in these services and hotels take into account the tourists’ evaluation on trip advisor or other platforms for sports and recreation services. As the customer holiday experience will be enhanced, overall customer satisfaction and positive behaviours are also expected to increase. Recreation services are one of the most important elements for hoteliers. Today, a variety of recreation activities are available from hotels and their number is growing rapidly thanks to technological developments and staff creativity. Moreover, today’s customers expect interesting, amazing and innovative services from the hotels they visit (Albayrak, Caber & Öz, 2017). Finally, the results showed a positive intention for professional rehabilitation of interns and a willingness to develop further

cooperation between companies/hotels and educational institutions. Hotels that employ students could utilize the skills, up-to-date knowledge and ideas of young people at minimal financial cost, while also creating the infrastructure for their future human resources needs.

Originality of the paper. This research is part of a dissertation thesis and these results have not been published elsewhere.

Keywords: human resources training; five-star hotels; internship; sport; recreation

La scelta del servizio alberghiero: sostenibilità e percezione dei turisti

ROBERTA MINAZZI* DANIELE GRECHI*

Inquadramento della ricerca. *L'attenzione verso il tema della sostenibilità sta fortemente influenzando il settore turistico e la competitività della destinazione turistica (Buhalis e Main, 1998; Kozak e Rimmington, 1998; Bohdanowicz, 2005). Il business dell'ospitalità in particolare produce forti impatti negativi a livello ambientale, economico e socio-culturale sulla destinazione turistica (es. consumo di energia, di acqua, di cibo) (Crouch, 2007; Mazanec et al. 2007; Font and McCabe, 2017). Per queste ragioni le imprese alberghiere devono fronteggiare una forte pressione da parte degli stakeholder nazionali e internazionali (Dasanayaka et al. 2022; Buffa et al. 2015). Da un lato, la nuova regolamentazione in materia sostenibile a livello nazionale e internazionale influisce sull'operatività delle imprese. Dall'altro lato, i consumatori sono sempre più interessati agli attributi dell'offerta alberghiera legati alla sostenibilità con una predisposizione anche a pagare un "premium price" per soggiornare nei cosiddetti "Green Hotels" (Chang et al., 2015; Alonso-Almeida, 2018; Buffa et al. 2018). Risulta quindi estremamente importante per le imprese dell'ospitalità comprendere la percezione dei consumatori in merito alla sostenibilità come attributo considerato nella scelta del servizio alberghiero.*

Il tema degli attributi considerati dalla clientela durante il processo di scelta del servizio alberghiero è stato studiato dalla precedente letteratura. Dolnicar e Otter (2003) identificano la pulizia e la location come attributi di particolare importanza. Altri studi evidenziano il ruolo del prezzo (Ananth et al., 1992; Lockyer, 2005) e del rapporto qualità-prezzo (Caber and Albayrak, 2014). La ricerca più recente sottolinea l'importanza anche dell'ambiente e della sostenibilità come fattori rilevanti considerati dalla clientela nella scelta dell'hotel (Bohdanowicz, 2005; Lee et al., 2010; Han et al. 2011; Millar and Baloglu 2011). In particolare, lo studio di Verma and Chandra (2018) sottolinea il ruolo prominente delle pratiche sostenibili adottate dalle imprese nel processo di scelta del consumatore seguito da prezzo, location, rapporto qualità-prezzo, brand awareness, qualità del servizio. Tuttavia, in questo caso il fattore sostenibilità è fortemente correlato alla dimensione ambientale e in particolare alle pratiche di conservazione energetica, di waste management e greenscaping. Dall'analisi della letteratura emerge infatti una forte concentrazione degli studi sulla dimensione ambientale (Franco et al. 2021). Non è però possibile fornire un quadro completo del rapporto tra turismo, turista e sostenibilità senza considerare congiuntamente tutte le tre dimensioni. Aspetti come l'utilizzo delle risorse locali e la promozione del Km0 o il rispetto e la valorizzazione del patrimonio locale, materiale e immateriale devono essere analizzate con una doppia finalità: comprendere ciò che il turista desidera e fare in modo che la struttura sia in grado di soddisfare il bisogno nel modo più sostenibile (Nuragheni et al., 2020; Noonan e Rizzo, 2017). Pertanto, il presente studio si propone di esaminare il ruolo della sostenibilità durante il processo di acquisto dei turisti con un approccio multidimensionale che consideri quindi anche le dimensioni sociale ed economica (Tölkes C., 2018, Franco et al. 2021).

Obiettivo del paper. *Lo scopo di questo articolo è quello di analizzare il comportamento dei turisti in fase di scelta del servizio alberghiero con particolare riferimento agli attributi considerati nelle proprie valutazioni. L'obiettivo è principalmente quello di contribuire alla letteratura sul tema indagando in particolare il ruolo della sostenibilità considerata in tutte le dimensioni che la caratterizzano (ambientale, economia e sociale). L'indagine quindi si propone di comprendere l'importanza che i consumatori attribuiscono alle pratiche sostenibili attivate dalle imprese alberghiere, approfondire la conoscenza delle motivazioni e dei fattori che influenzano la scelta degli ospiti, concentrandosi sulle pratiche sostenibili attuate negli hotel raggruppate per dimensione (Xu e Gursoy, 2015; Han, 2021; Gerdt et al., 2019):*

- *ambientale: gestione dei rifiuti, utilizzo dell'energia rinnovabile, progettazione aree verdi, utilizzo di prodotti di pulizia ecologici, ecc.;*
- *sociale: coinvolgimento della popolazione locale, promuovere la mobilità dolce e sostenibile, coinvolgimento dell'ospite nelle pratiche sostenibili, comunicare all'ospite le proprie misure e scelte di sostenibilità, ecc.;*
- *economica: utilizzo prodotti Km zero, prediligere prodotti equo-solidali, favorire l'economia circolare, ecc.*

Di conseguenza, considerando il framework teorico proposto, il presente lavoro cerca di analizzare il profilo del turista sostenibile nelle scelte legate all'hôtellerie con le tre seguenti research questions:

* Associato di *Economia e Gestione delle Imprese* – Università degli Studi dell'Insubria-Como.
e-mail: roberta.minazzi@uninsubria.it

• Ricercatore T.D. di *Economia e Gestione delle Imprese* – Università degli Studi dell'Insubria-Como.
e-mail: grechi.daniele@uninsubria.it

RQ1: Qual è il profilo dei turisti (sostenibili e non) in termini di caratteristiche demografiche e abitudini di viaggio?

RQ2: Quali sono le pratiche sostenibili ritenute più importanti dal consumatore durante il processo di scelta del servizio alberghiero?

RQ3: Quali sono le dimensioni (fra ambientale, economica e sociale) ritenute più importanti dal consumatore durante il processo di scelta del servizio alberghiero?

Metodologia. È stata condotta un'indagine esplorativa per rispondere alle domande di ricerca presentate in precedenza. Il periodo di raccolta dati è legato ad un periodo storico molto interessante, poiché a cavallo della pandemia di COVID-19, infatti, i dati dello studio sono relativi al periodo novembre 2019-gennaio 2022 e, come menzionato nel paragrafo successivo, sarà possibile svolgere, in futuro, delle analisi comparative per verificare eventuali cambiamenti nelle scelte intertemporali dei turisti. Il questionario somministrato è diviso in 3 parti. La prima parte indaga le caratteristiche sociodemografiche dei partecipanti (come possono essere l'età, il genere e la professione). La seconda parte è relativa ad alcune variabili comportamentali del turista (ad esempio, i canali di acquisto, la frequenza delle prenotazioni, le motivazioni per il viaggio). Infine, nella terza parte del questionario si analizzano gli attributi utilizzati dai viaggiatori durante il processo di acquisto. Considerando il focus del lavoro è data particolare attenzione agli aspetti sostenibili del soggiorno e alle aspettative riguardo alle azioni sostenibili adottate dalle strutture ricettive. Gli attributi degli hotel sono stati identificati sulla base di una revisione della letteratura, illustrata nei paragrafi precedenti, e adattati allo scopo dello studio. Il questionario è stato testato inizialmente su un gruppo di studenti di laurea magistrale e, dopo alcune piccole modifiche, è stato somministrato online a più di 1.100 viaggiatori. Considerando l'aspetto preliminare del lavoro, i dati sono stati analizzati in modo descrittivo e inferenziale (attraverso l'utilizzo di test d'ipotesi al fine di vagliare le differenze tra le varie categorie di turisti). La statistica descrittiva si occupa di riassumere e descrivere i dati attraverso l'utilizzo di metodi grafici e numerici. La statistica inferenziale si occupa di fare previsioni e inferenze su una popolazione sulla base dei dati raccolti da un campione rappresentativo di tale popolazione (Paruolo, 1999). In altre parole, la statistica inferenziale utilizza le informazioni raccolte nel campione per fare conclusioni sulle caratteristiche della popolazione di riferimento. Queste conclusioni includono la stima di parametri e la verifica di ipotesi (nel nostro specifico caso utilizzando Z-Test Proportion e Mann Whitney U Test, per i quali si rimanda a Ruxton, (2006) per approfondimenti sul tema).

Risultati. Il campione dei rispondenti è composto da 407 uomini, 676 donne, 13 intervistati che non hanno dichiarato il loro genere. Considerando gli aspetti demografico sociali, il 43% del campione ha dichiarato di essere lavoratori ed il 42% di essere studenti. Valutando il grado di istruzione 234 intervistati hanno dichiarato di avere una laurea e 683 di essere in possesso di un diploma di scuola superiore. Inoltre, 767 rispondenti hanno dichiarato di non avere figli, e questo è coerente con il metodo di diffusione del questionario e l'età media dei rispondenti. Successivamente ci si è focalizzati sul concetto di generazione, classificando i rispondenti in base ad essa. Nel seguente grafico è possibile avere un riassunto dei rispondenti.

Fig. 1: Generazioni-Ripartizione

Dal grafico emerge che, il 42% dei rispondenti appartiene alla Generazione Z, il 25% alla Generazione Y e il rimanente alle generazioni precedenti.

In prima istanza, dopo la classificazione sociodemografica, è stato chiesto ai rispondenti di autovalutarsi sul concetto di "essere un turista sostenibile"; questa domanda (nello specifico "Ritiene di essere un turista attento ai principi di sostenibilità (green) nella scelta di una struttura alberghiera") è alla base di partenza per le analisi svolte. Sorprendentemente il campione è suddiviso in modo quasi equo, difatti 556 hanno risposto "Sì" alla precedente domanda, mentre 512 hanno risposto di non essere attenti ai principi di sostenibilità. Per rispondere alla RQ1 si sono svolti dei test, legati all'essere o meno un turista sostenibile, per la differenza tra due proporzioni riguardanti differenti aspetti.

Il primo test è stato svolto sul genere (il quale non è risultato significativo al livello del 5%, difatti il P-Value ottenuto è pari a 0.06). Pertanto, il genere non sembra essere una forte discriminante sul livello di autovalutazione di sostenibilità turistica per questo campione. Sempre a tal riguardo, come descritto nella Figura 2, non emergono differenze sostanziali sulla tipologia di destinazione scelta tra le due categorie di rispondenti. Infatti, le due categorie di rispondenti si recano (con percentuali simili) nelle medesime tipologie di strutture turistiche.

Fig. 2: Accomodation

Per comprendere in modo globale il concetto, sono stati svolti dei test per la differenza tra due proporzioni legati al concetto di generazione ed i risultati sono indicati nella seguente tabella.

Tab. 1: Test per la differenza tra due proporzioni- Generazione

Generazione	Generazione Silenziosa	Baby Boomers	Generazione X	Generazione Y	Generazione Z	Complessivo
No	7	31	84	153	230	505
SI	9	76	137	110	215	547
Somma	16	107	221	263	445	1052
P-Value	0.47	<0.001	<0.001	0.001	0.32	0.07

Come si può notare dalla Tabella 1, si hanno delle generazioni (Baby Boomers, X e Y) per le quali emergono delle differenze significative sull'autovalutarsi come turista sostenibile, mentre nel complesso non si ha (al livello del 5%) una significatività statistica. Il risultato è fortemente influenzato dai rispondenti della generazione Z, il cui P-Value è molto alto. In conclusione, si può affermare che queste analisi, basate su una autovalutazione personale basata sul concetto di "essere un turista sostenibile ed attento ai principi green nella scelta alberghiera", fanno emergere che il genere, l'accomodation e la generazione non sono variabili estremamente rilevanti e pertanto RQ1 è parzialmente rifiutata.

Spostandoci alle analisi legate a RQ2, ovvero le pratiche sostenibili ritenute più importanti dai rispondenti, ovviamente in comparazione tra turisti "sostenibili" e "non sostenibili", otteniamo la situazione descritta dalla Figura 3.

Fig. 3: Valutazione pratiche sostenibili

Considerando gli attributi, legati all'ospitalità della struttura alberghiera, dalla Figura 3 emerge una sostanziale similarità tra le medie dei due gruppi (la valutazione è stata fatta con una Scala Likert con valori da 1 a 7) anche se ci sono diverse distanze tra i turisti sostenibili e quelli non sostenibili, soprattutto nel contesto delle attività sostenibili promosse dall'hotel. Inoltre, dalla Figura 3 emergono, numericamente, due aspetti molto distintivi delle due categorie di turisti. In questo contesto i turisti sostenibili hanno una propensione a valutare tutti i servizi/attività con un punteggio mediamente più alto. Inoltre, è possibile notare come la maggiore differenza di valutazione sia per la voce "attività sostenibili" il che fa propendere per un'effettiva differente rilevanza per questo aspetto tra le due categorie di rispondenti. Considerando il ranking dei servizi/attività, questi risultati confermano alcuni studi precedenti (Ananth et al., 1992; Lockyer, 2005; Dolnicar e Otter, 2003) i quali hanno affermato che la pulizia, il prezzo e la posizione sono gli attributi più importanti per gli ospiti dell'hotel.

Inoltre, per completare l'analisi, si sono svolti dei Mann-Whitney test (per ulteriori informazioni sul test e sul suo utilizzo su dati non distribuiti normalmente si rimanda a Zimmermann, 1987) legati alla rilevanza delle tre dimensioni della sostenibilità per le due categorie di rispondenti. Si è cercato di comprendere se, il valore medio attribuito alle componenti economiche, sociali e ambientali sia valutato differentemente. Nella seguente tabella (Tabella 2) sono presenti i risultati dei test.

Tab. 2: Mann Whitney Test: Risultati

Dimensioni Sostenibilità	U-Test	P-Value
Economica	11760	<0.01
Ambientale	12211.5	<0.01
Sociale	5172.5	<0.01

I tre test effettuati per le tre dimensioni della sostenibilità sono statisticamente significativi e, di conseguenza, è possibile affermare che la percezione delle tre dimensioni della sostenibilità è molto diversa tra le due categorie di intervistati. Nel dettaglio, la dimensione ambientale è confermata come quella considerata maggiormente dai turisti sostenibili.

Limiti della ricerca. La presente ricerca, legata all'argomento delle pratiche sostenibili degli hotel e la relativa importanza percepita dai turisti ha, ovviamente, alcuni limiti data la sua natura preliminare. Innanzitutto, uno dei principali limiti è la complessità di delimitare in modo univoco il concetto di sostenibilità per l'utente finale. Infatti, esso, può essere interpretato in maniera differente dalle diverse categorie di stakeholder (Poli et al., 2009; Berezan et al., 2013; Dolores et al., 2011). In aggiunta, i rispondenti potrebbe non essere in grado di catturare la complessità delle interazioni tra gli hotel e gli altri attori del sistema turistico. Inoltre, il campione dei rispondenti, seppur ben stratificato, potrebbe essere incrementato e migliorato cercando di avere un maggior numero di risposte in modo omogeneo per poter toccare un maggior numero di differenti categorie di turisti. Infine, lo studio si focalizza solo sul settore alberghiero. Per il futuro potrebbe essere interessante: ampliare i settori di indagine (es. ristorazione, trasporti, attrazioni); ampliare le variabili di indagine (demografiche e comportamentali); procedere con una nuova wave del sondaggio per poter avere un confronto completo tra tre momenti chiave: pre-Covid 19, durante i due anni centrali della pandemia e post-Covid 19.

Implicazioni manageriali. Il tema della sostenibilità rappresenta una questione sempre più rilevante nel settore dell'ospitalità. Il lavoro affronta il tema dell'impatto delle politiche e delle pratiche sostenibili sulla scelta degli hotel da parte dei consumatori studiandone le percezioni. Dai risultati emersi derivano interessanti implicazioni manageriali per gli operatori del settore turistico con particolare riferimento ai manager dell'ospitalità. I turisti durante la scelta considerano la sostenibilità come attributo insieme ad altri già noti come il prezzo e la location. La sensazione è che il ruolo della sostenibilità per il consumatore stia crescendo, si nota però una particolare concentrazione sulla dimensione ambientale, forse anche perché è la più discussa negli ultimi anni anche a livello di comunicazione. Sulla base delle pratiche sostenibili ritenute più importanti per i turisti, le imprese alberghiere possono definire più corretti piani di investimento delle risorse e studiare al meglio le proprie strategie di comunicazione. Vista l'importanza che sia i turisti che si definiscono sostenibili sia quelli che non credono di esserlo attribuiscono agli attributi legati alla sostenibilità, risulta importante per le imprese dell'ospitalità ridefinire le proprie strategie di management e di comunicazione al fine di soddisfare i bisogni della clientela ed incrementare i tassi di fidelizzazione. Nel complesso, è fondamentale implementare politiche di riduzione dell'impatto ambientale attraverso la gestione efficiente delle risorse energetiche e idriche, l'adozione di sistemi di smaltimento dei rifiuti sostenibili e la promozione di comportamenti eco-friendly da parte degli ospiti. Risulta peraltro interessante per le imprese che investono nelle altre dimensioni della sostenibilità, attivare delle opportune campagne di sensibilizzazione della clientela.

Oltre agli operatori alberghieri, i risultati del presente lavoro sono di interesse anche per gli altri operatori della destinazione turistica e per le istituzioni di governance della destinazione in quanto il processo di scelta del turista non può considerarsi esclusivamente legato alla scelta del singolo servizio alberghiero. Al contrario, il processo di scelta del viaggiatore riguarda l'esperienza complessiva e integrata di servizi turistici quali, le attrazioni, i trasporti, la ristorazione, ecc. Anche questi operatori possono quindi beneficiare dei risultati ottenuti dallo studio in merito all'importanza che il turista attribuisce al fattore sostenibilità. Come però preannunciato sarebbe necessario un ampliamento del settore di indagine per poter verificare e comparare i risultati fra i vari settori del turismo.

Originalità del paper. Questo lavoro esamina il ruolo della sostenibilità nella selezione degli hotel e la priorità, data dai turisti, agli aspetti della sostenibilità nel loro processo di scelta. Un primo aspetto di originalità, e quindi di contributo alla letteratura sul tema, è lo studio degli attributi che influenzano la scelta dei turisti con particolare focus sul fattore sostenibilità. Inoltre, il concetto di sostenibilità, rispetto a molti dei precedenti studi, è affrontato con un approccio multidimensionale che considera tutte le dimensioni della sostenibilità (ambientale, economica e sociale).

Lo studio è fortemente incentrato sul raggiungimento di risultati che possano avere una diretta ricaduta sul territorio e quindi sulle imprese turistiche, come illustrato precedentemente. Infatti, il paper fornisce una panoramica dei potenziali vantaggi dell'incorporazione di pratiche sostenibili nella gestione alberghiera per ottenere una migliore soddisfazione del cliente, che porta ad una performance finanziaria ottimale per l'industria dell'ospitalità. In sintesi, l'articolo fornisce una visione originale e preziosa della crescente importanza della sostenibilità nell'industria del turismo e del suo ruolo nel plasmare il comportamento e le preferenze dei turisti.

Are you willing to share green eWOM? Exploring environmentally-framed reviews in hotel services

DAVID D'ACUNTO* RAFFAELE FILIERI*

Abstract

Consumers are increasingly concerned about sustainable accommodations. However, few of them incorporate environmentally-related elements when posting a review online about their experience of stay. Combining text analytics and ordered logistic regression analysis on a dataset of 496k TripAdvisor reviews, this exploratory study investigates green eWOM (i.e. environmentally-framed reviews) including its linguistic style and sentiment, and the recurring hotel service dimensions associated by guests. In addition, the study identifies a profile of green eWOM reviewer and explores the extent of which environmentally-framed reviews are associated with customer satisfaction (i.e. rating) and with the managerial response. The findings reveal that environmentally-framed reviews are more likely posted by women business travellers staying at chain hotels, and are generally associated with higher ratings and higher managerial response rates. The recurring hotel service dimensions relate with physical attributes (e.g. hotel features, room amenities) followed by intangible attributes (e.g. relationship with the staff, overall experience of stay, location) and services (e.g. breakfast, coffee). The study contributes to the sustainable consumption research by offering a preliminary understanding of green reviewers' online behavior. Managerial implications are provided to hoteliers suggesting them how to effectively convey their effort in eco-friendly initiatives to guests, and to review platforms on how to display green eWOM online.

Framing of the research. Environmental threats have led to substantial changes in consumers' attitudes towards eco-friendly services and products, with a growing number of customers willing to use green products and services (Chen et al., 2014). Accordingly, a growing number of travelers are likely to choose green tourism products and stay at green accommodations (Filieri et al., 2020). But how many of them are ready to share online about their green experience? The term "prosumers" identifies consumers' ability to openly share their product or service experiences online, thus producing informative data to peers and organizations through electronic word-of-mouth (eWOM) (Chan et al., 2022; Filieri & McLeay, 2014). Consumers are not anymore passive recipients of the content generated by brands, but rather they actively participate in the conversation with and about brands and their products on social media platforms. User-generated content is increasing in popularity, and firms actively ask consumers to generate content in order to create higher engagement levels. Consumers are increasingly acting both as producers and consumers of content, and they are popularly referred to as 'prosumers' (Hartmann, 2016). Prosumers are consumers who create value for firms by actively participating in creating innovative content and sharing their experiences to induce engagement with other fellow consumers (Plouffe, 2008).

Connected to the concept of prosumers is the concept of green eWOM, which has emerged more recently in consumer research, referring specifically to the eco-friendly content shared with others on social media platforms (Filieri et al., 2020). Green eWOM is understood as the extent to which customers inform their peers online about the positive (or negative) environmental messages related to a product, service or organization, with consumers' green motivation stimulating green eWOM.

Sustainable consumption research acknowledges how while some consumers may have an ideal self-concept of being environmentally responsible, others have a strong self-interest in perceiving themselves as green consumers (Freestone & McGoldrick, 2008). Individuals who perceive themselves as green consumers are likely to engage in pro-social behavior (Lee et al., 2006) and pro-environmental behaviors and green consumption to express their self-identity (Oliver & Lee, 2010), for example, through word-of-mouth about green products. Thus, this study builds on green self-identity theoretical foundations to explore the green eWOM phenomenon from a consumer perspective.

In this regard, service research still has to provide a comprehensive understanding of green eWOM, including its antecedents and consequences, as well as its association with tourism providers' performances. Furthermore, still little is known about green eWOM reviewers with regard to their profile. This exploratory study sheds light on green eWOM prosumers, including their socio-demographics characteristics, recurring themes discussed in green eWOM.

Furthermore, it provides a preliminary assessment of green eWOM linguistic style and its association with customer satisfaction.

Purpose of the paper. The study exploits green eWOM data from the tourism industry with the multiple aims of addressing the following exploratory research questions:

RQ1: To what extent green eWOM data differ from non-green reviews, including length, sentiment, and depth?

RQ2: What are the recurring themes and concepts regarding the hotel services mainly discussed in green eWOM?

RQ3: To what extent green eWOM is associated with customer satisfaction levels (i.e., rating) and managerial response?

RQ4: What is the green eWOM reviewer profile?

Methodology. A big dataset of 494,635 hotel reviews covering six of the most popular cities in Europe over a 10-year time frame (2007-2017) has been collected through Phyton from TripAdvisor. The dataset has been scrutinized for green eWOM, thus selecting a subsample of those reviews where guests specifically discuss green practices. Based on extant studies, a shortlist of keywords referring to green and sustainable lifestyle has been considered. Following Serrano et al. (2021), the words “organic”, “sustainable” and “sustainability” have been selected for this purpose. Furthermore, an iterative process was conducted by the authors with the aim of testing different terms relating to environmental sustainability and green consumption and evaluating how they are used publicly and their function (Kim et al., 2013). This search-identification process of terms characterizes content analysis techniques where a large amount of unstructured data is used (e.g., textual big data). The terms “green”, “environment”, “environmental”, “environmental-friendly”, “environmentally”, “recycling” and “eco-friendly” were included in the final shortlist of terms. Customer reviews, including at least one of these terms, were then selected. As a result, a subset consisting of 9,023 green eWOM reviews were retained for data analysis, meaning 1,82% of guests express or discuss green and related topics within their customer reviews.

The review content has been analyzed by means of text analytics. Specifically, the Linguistic Inquiry and Word Count (LIWC) (Boyd et al., 2022) software was adopted. Different dictionaries have been used to run the analysis, including the internal one with the Posemo and Negemo categories, respectively referring to positive emotions and negative emotions, and through a specific dictionary developed for the study of sustainability (Pencle & Malaescu, 2016) already adopted in the tourism and hospitality domain (D'Acunto et al., 2020; Mariani & Borghi, 2020). This latter has been used to detect the extent of environmental presence and environmental depth embedded in the text by guests when posting online.

Results. The first analysis compares the subsamples of green eWOM with non-green eWOM data. Investigating green consumers reviewing behavior by focusing on ratings (RQ3), the first finding reveals how these guests are more likely to rate their hotel experience higher than non-green customers. Environmental-related reviews rate on average 4.19 versus 4.12 of non-green reviews ($F = 42.951$; $p < 0.01$). This might indicate that customers discussing green and environmental practices online are slightly more satisfied with their stay than other guests.

Furthermore, when focusing on green eWOM linguistic style (RQ1), the main findings exhibit how a much longer text structure characterizes such reviews, with an average word count of 236.61 terms compared to 143.24 of non-green reviews ($F = 5316.203$; $p < 0.01$). This indicates a stronger effort green customers put in detailing their experience when it comes to writing feedback about their stay and where to discuss and inform others about green-related experiences. However, our data show how, despite rating higher and writing longer reviews, green eWOM reviewers are less emotional when disclosing online on green topics, and this happens with regards to both positive (1.41 vs. 1.65; $F = 168.166$; $p < 0.01$) and negative (0.82 vs 0.88; $F = 22.870$; $p < 0.05$) emotions that result lower than in non-green reviews.

Nevertheless, green eWOM reviewers' effort does not go unnoticed by hotel managers, given that they tend to reply more to green eWOM (0.49) rather than to non-green reviews (0.45) ($F = 60.785$; $p < 0.01$). To run this analysis, managerial response has been operationalized as a dummy variable where 1 indicates hotel managers answered the review, 0 otherwise. Extant literature tells us how negative reviews are more likely to be answered by hoteliers, given the stronger implications they have on firms' reputation and for peers. Interestingly, these results might be a peculiarity of green eWOM in that, despite getting higher ratings on average, they also tend to be answered more frequently by hoteliers. This result might also be evidence of how hotel managers are paying particular attention to green eWOM where customers emphasize environmental sustainability and green practices adopted by hotels.

The environmental-depth measure (Mariani & Borghi, 2021) indicates the intensity that online consumers ascribe to environmental-related concerns by going in-depth into their discussion. Our findings confirm how in green eWOM, this level is much stronger (1.304) compared to non-green eWOM (0.994) ($F=649.234$; $p < 0.01$).

Table 1 reports the ANOVA results for the abovementioned analysis.

Tab. 1: A comparison of green eWOM with non-green eWOM: Anova results.

Dimension		N	Mean	Std. Dev	Anova
Rating	Non-green eWOM	485612	4.12	1.009	F = 42.951 p < 0.01

Green eWOM

In this section, the focus is on green eWOM data only, thus running the analysis on a subset consisting of 9,023 observations. First, we run a co-occurrence analysis with the software Leximancer, with the aim of detecting the recurring themes and concepts discussed by customers in their reviews (RQ2). The main results show how guests are more likely to discuss in their green eWOM about the following themes: “hotel”, “room”, “nice”, “staff”, “night”, “stay”, “coffee”. Figures 1 and 2, respectively, report the Leximancer concept map based on co-occurrence analysis and the concepts ranked by relevance (i.e., number of hits in the text).

Fig. 1: Conceptual map of the environmental-related themes and concepts

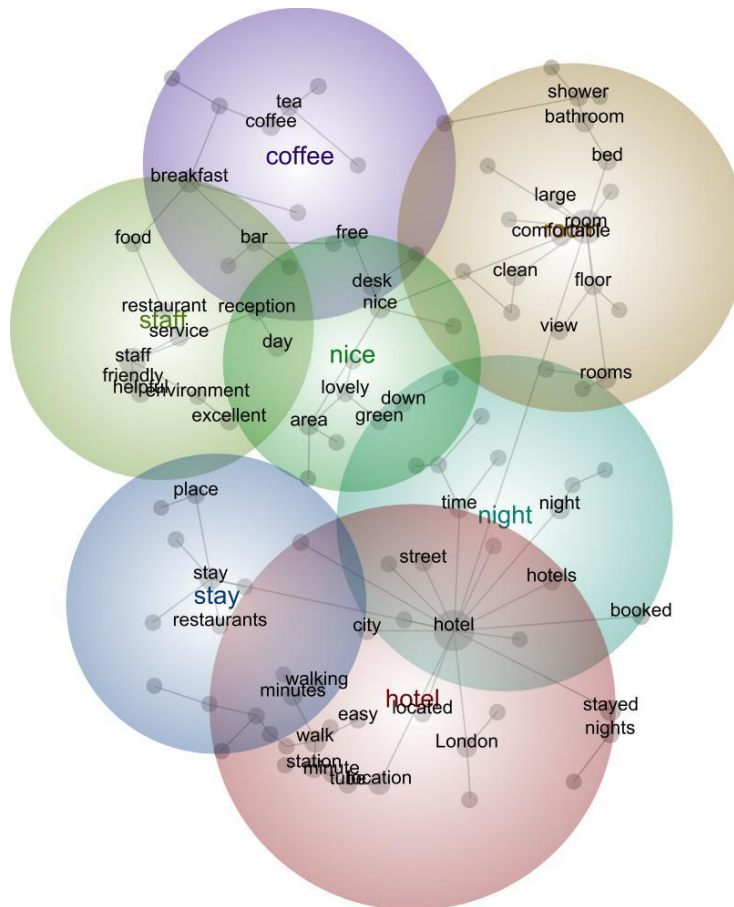

Fig. 2: Ranked concepts

	Count	Relevance	
hotel	9818	100%	
room	6883	70%	
staff	3927	40%	
stay	2900	30%	
breakfast	2556	26%	
stayed	2527	26%	
location	2465	25%	
rooms	2063	21%	
walk	1982	20%	
night	1909	19%	
nice	1799	18%	
clean	1572	16%	
time	1564	16%	
station	1517	15%	
service	1489	15%	
friendly	1419	14%	
nights	1415	14%	
bathroom	1410	14%	

These preliminary findings indicate how guests focusing on green practices are more likely to discuss such topics when reporting their experience about the physical attributes (e.g., hotel features, room amenities) followed by intangible attributes (e.g., relationship with the staff, the overall experience of stay, location) and services (e.g., breakfast, coffee)

The green eWOM reviewer's profile was then analysed to understand whose guests are more likely to discuss environmentally related topics when it comes to reviewing their hotel experience (RQ4).

We run a logistic regression analysis (DV: green eWOM 0/1) to determine the role played by reviewer demographics and by the type of hotel and type of trip on the willingness to post green eWOM messages (versus non-green reviews). Table 2 summarizes the constructs and the operationalization of variables used in our analysis. Regression results are reported in Table 3.

Tab. 2: Constructs and operationalization

Construct	Variable name	Model specification	Operationalization	Source
Green eWOM	GREEN_EWOM	Dependent variable	Dummy variables (1 if yes, 0 otherwise)	This study
Reviewer experience	n°_of_contributions	Independent variable	The overall number of reviews posted by the reviewer	Gao et al. (2018)
Review Length	Word_count	Independent variable	Word count of each review	Chevalier & Mayzlin, (2006)
Reviewer Gender	Man_woman	Independent variable	Dummy variable - reviewer gender	Gao et al. (2018)
Reviewer age	Age_class_code	Independent variable	Reviewer's age (categorical)	Gao et al. (2018)
Rating Score	Rating	Independent variable	Categorical variables ranging from 1 to 5	Xiang et al. 2015
Trip Purpose	Travelled_on_business	Independent variable	Dummy for business (1) or leisure (0)	Mariani & Borghi, (2022)
Hotel type	Chain_0_1	Independent variable	Dummy (1 if chained hotel, 0 otherwise)	This study
Year	review_year	Control variable	Year of review posting	Mariani & Borghi, (2022)

Tab. 3: Ologit model

Review Year	YES				

Note: DV: GREEN_EWOM (0/1). Statistical significance: ***p-value < 0.001; ** p < 0.01; * p < 0.05

The main findings exhibit how reviewer gender is negatively related to green eWOM, meaning that women are generally more likely to discuss on environmentally-related topics in their reviews than men. Reviewer age class is positively associated with green eWOM, meaning the older the reviewer, the higher his/her willingness to post green reviews.

Rating score results positively related to green eWOM, suggesting that when a customer rates a hotel higher (customer satisfaction increases), he/she is more likely to discuss green and environmental practices in his/her review. These results are in line with extant studies already finding a similar relationship with regard to ratings and the environmental dimension of CSR (D'Acunto et al. 2020).

When a guest reviews a hotel belonging to a global chain, he/she more likely to discuss environmentally related topics compared to guests staying at independent (non-chain) hotels.

Furthermore, when travelling on business (versus leisure), guests pay more attention to green/environmental dimensions and thus are more likely to discuss these topics in their reviews.

Finally, review length (i.e., word count) is found to be slightly positively associated with green eWOM, while the reviewer expertise (i.e., n° of contributions on the platform) is not significant.

Overall, the predictors with the stronger effect are: the type of hotel (chain vs. non-chain hotel) followed by the type of trip (business vs. leisure travellers), rating score and reviewer age.

Research limitations. This study has some limitations. It used a large sample of reviews for the years 2007-2017 to avoid the Covid-19 effect in our analysis. However, a dataset including more recent reviews, and specifically focusing on the post-Covid lockdown may provide different findings. Furthermore, this analysis excluded those customers who do not post online reviews to discuss their experience after staying at a hotel. Future research could use a survey to further confirm the results of our analysis. The analysis could be done at the country-level to understand cultural differences with regards to environmental eWOM.

Given the exploratory nature of this study, did not consider how service providers respond to green eWOM comparing to non-green reviews. Moreover, causal relationships should be tested in future research, for instance investigating how potential customers (i.e. review platform members) reading green eWOM react to such reviews, considering their willingness to book or their willingness to pay more for an hotel as dependent variables. Another limitation lies in the use of data collected from a single platform (i.e. TripAdvisor).

Managerial implications. This study provides indications to hoteliers on how to recognize guests that are more likely to express their green orientation online by means of green eWOM. In this regard, our findings suggest hotel managers of chained hotels particularly pay attention to business travelers, given that they are more likely to engage in discussing online about green and sustainability practices experienced during their stay. Furthermore, hoteliers are advised that when customer reviews include some extent of green content, they are more likely associated with a higher rating. Thus, hoteliers should emphasize their managed hotel's sustainability effort to increase its overall rating and, in turn, the parent company's online reputation. For instance, training the staff to recall guests about environmentally-friendly actions implemented during their stay and across different moments when they are more sensitive on such topics (e.g., at the check-in, at the restaurant, when in the room) can increase the possibility of guests sharing green eWOM. Furthermore, hoteliers are advised to also include green eWOM in their communication strategies on the corporate website to enhance their eco-friendly image online.

Similarly, review platforms should also prioritize green eWOM given that they are associated with a higher rate of managerial response, thus offering more informative data to platform members and customers.

The originality of the paper. This is the first study empirically investigating the green eWOM phenomenon, including its linguistic style and drawing a green-reviewer profile by considering guest demographics, trip purpose and type of hotel. Furthermore, the study investigates further green eWOM identifying the association of the green consumer discourse with hotel service dimensions, customer satisfaction, and managerial response, thus providing several implications for both customers and organizations and opening up future lines of research.

Smart Tourism and start-ups: a preliminary analysis in Italy

ANTONELLA MONDA* SILVIA BAIocco* PINALBA SCHILLECI[♠]

Framing of the research. Over the past decade, digital technologies such as the Internet of Things, big data, and artificial intelligence have played a crucial role in revolutionizing the tourism industry, driving its smart transformation. These technologies have enabled tourism stakeholders to connect dynamically, share more relevant information, adopt sustainable practices, and enhance the quality of services and tourist experiences (Gretzel et al., 2015).

Indeed, the evolution of the tourism phenomenon has occurred in connection with the development and application of a multitude of information and communication technologies (ICTs) at least since the 1970s (Buhalis and Law, 2008). Computerized booking systems, such as the Computer Reservation System and Global Distribution Systems, were among the earliest examples of technology being utilized in the tourism industry, even before the advent of the internet (Sheldon, 1997). These systems allowed travel companies to speed up transactions, distribute various tourism services (e.g., air transport, accommodation, car rentals, etc.), reduce costs, and improve service quality for tourists. Then, in the late 1990s, the introduction of internet-based technologies (Rayman-Bacchus and Molina, 2001; Standing et al., 2014), social media platforms (Zeng and Gerritsen, 2014), and a range of travel-related mobile apps (Wang et al., 2012) further transformed the industry, enabling digital connections between tourism companies, destinations and tourists. These technologies made information easily accessible and searchable, and facilitated electronic transactions on a global scale.

In recent years, technological advancements have allowed for increased connectivity between humans and machines, as well as networked information exchange. This has given rise to the concept of “smart tourism” (Gretzel et al., 2015), which involves the use of cutting-edge hardware, software, and network technologies to bridge the digital and physical worlds. This interconnectivity allows tourism firms, institutions, and other organizations to form a smart business ecosystem, improving resource availability, allocation, mobility, and service quality in the destination (Gretzel et al., 2015; Barile et al., 2017; Pencarelli, 2020; Polese et al., 2018). In such a smart tourism destination, tourists are engaged in co-created experiences that are personalized and characterized by context awareness, real-time monitoring, and technology mediation (Tussyadiah and Fesenmaier, 2009; Neuhofer et al., 2014; Leoni and Cristofaro, 2020; Polese et al., 2022). Indeed, these advancements improve not only the quality of tourism experiences but also the quality of life of local residents in urban areas (Romão, et al., 2018).

Table 1 summarize the main digital technologies and related applications in the tourism field emerging from studies on smart tourism.

Tab. 1: Main digital technologies and related applications in the tourism field

Technology	Description	Main Application	References
Cloud computing	Delivery of computing resources – including servers, storage, databases - over the internet	<ul style="list-style-type: none"> Data storage about tourist experiences and preferences as well as audio/video streaming, pictures/images regardless of video or image size Data synchronization between platforms Various cloud-based apps (e.g., car rental, hotel, airline reservation apps, map location guide app, journey planner app, weather information app) useful for tourism firms to provide tourists with personalized information to design and plan their holiday 	Imhanwa et al. Source: our elaboration

The evolving research and practice on smart tourism have highlighted the emergence of service providers who offer innovative solutions to enhance the tourist experience and facilitate movement within a destination (Guttentag, 2015; Wang et al., 2016; Hsu et al., 2017; Pencarelli, 2020; Perelygina et al., 2022; World Bank Group, 2018, WTTC, 2019). These include new electronic intermediaries, online platform managers, and other players who contribute to disintermediation and re-intermediation phenomena along the value chain, shaping the dynamic of competition and business models in the tourism sector. For instance, digital tour operators offer interactive websites with real-time personalized booking services, while search engines like Trivago compare flights, hotels, and car rentals from a broad range of providers. Sharing economy platforms like Airbnb and Uber allow individuals to offer accommodation and other tourism services to a global marketplace of consumers. Additionally, platforms such as Avatour facilitate remote event attendance, while various mobile applications provide cashless payment, ticketing, and city tours.

It is clear that embracing ICTs and implementing smart technology solutions is strategically essential, even critical, for enhancing innovation, sustainability, and competitiveness not only of tourism firms and destinations but also for the broader development of smart tourism. In this view, an important role in introducing new innovation by building a business model from scratch can be played by start-ups, i.e., a new company with a high character of innovation (García-Gutiérrez and Martínez-Borreguero, 2016; Paniccia and Baiocco, 2018; Kézai et al., 2020; Lytras et al., 2019). Although prior studies have focused on start-ups in the most varied fields, from the information and software technology (Paternoster et al., 2014), to the automotive (Parente et al., 2019), to the healthcare sector (Monda et al., 2020), new firms adopting digital technologies in the tourism field are almost under-researched (UNWTO, 2021; Filieri et al., 2021). Significantly, the Italian Ministry of Economic Development estimates that among the 14,621 innovative start-ups registered at the Chamber of Commerce only 0.47% belong to the tourism sector. This datum is relevant, not least because only accommodation and food and beverage start-ups are considered (Ministry of Economic Development, 2022). Thus, the current ambiguity surrounding tourism digital start-ups and related e-business models presents a unique opportunity to delve them as advocated in literature (Abbate et al., 2019).

Purpose of the paper. *This study aims to empirically analyse Italian start-ups adopting new digital technologies in the tourism field. Specifically, the research provides a classification of these start-ups based on the innovative solutions proposed. We argue that Italy is a proper context to conduct this study in the light of the relevance of the tourism sector for the economy of the country. In Italy, the tourism contribution to GDP have been higher than global and European average at least over the last 6 years up to 2021 (WTTC, 2017-2021).*

Methodology. For the analysis of the most used digital technologies in the tourism sector, the research methodology considers two main steps: 1) an in-depth analysis of the literature, 2) a classification of the tourism digital start-ups.

Starting from the analysis of the existing literature on smart tourism, the research emphasized the technologies currently used in the tourism sector.

Subsequently, a classification of innovative Italian tourism digital start-ups was conducted, aimed at developing an overview of the tourism sector in Italy.

The research was carried out between November 2022 and March 2023. It involved the collection of data through a portal: Startup Turismo (<https://www.startup-turismo.it/>), which collects information from more than 120 travel start-ups in Italy and collects information relating both to the financial aspects and investment strategies of the associated start-ups and to aspects of the business model, commercial strategies and technologies adopted.

In particular, the data was obtained through an advanced search, using twelve keywords representing fourteen different sectors: “3D printing/3D modeling”, “artificial intelligence”, “augmented reality/virtual reality”, “big data”, “content provider”, “digital marketing”, “experience provider”, “gaming/social engagement”, “marketplace”, “payment”, “technology provider”, “tour operator”.

Results. The classification of Italian digital start-ups provides insight into the characteristics of the smart tourism sector in Italy. In total, there are 120 start-ups that offer tourist services through apps and e-commerce. The majority of these start-ups (35.0%) are located in Lombardy, with other significant clusters in Lazio (14.2%), Emilia-Romagna (8.3%), Tuscany (8.3%), Piedmont (6.7%), Campania (5.0%), Veneto (5.0%), Apulia (4.2%), Marche (2.5%), Trentino-South Tyrol (2.5%), Friuli-Venezia Giulia (1.7%), Liguria (1.7%), Sardinia (1.7%), Sicily (1.7%), Basilicata (0.8%), and Umbria (0.8%) (see figure 1).

Fig. 1: Geographical distribution of Italian tourism digital start-ups (%)

Source: our elaboration

Three business models (B2B, B2C, and B2B2C) are employed by the analyzed start-ups. Figure 2 illustrates that the B2B2C model is the most common, used by 48% of the start-ups, while 32% use a B2B model and 20% use a B2C model. Many companies use a combination of these models. Regarding the end-users, tourists constitute 88 of the total, companies make up 85, and DMOs are the final recipient in 19 cases.

Fig. 2: Business models applied by Italian tourism digital start-ups (%)

Source: our elaboration

Figure 3 reveals that tourism digital start-ups primarily utilize the following technologies: Cloud computing (50.8%), Big Data (15.6%), AI (13.1%), Contactless technologies (9.0%), Immersive technologies (8.0%), IoT (3.0%), and 3D printing (0.5%).

Fig. 3: Technologies applied by Italian tourism digital start-ups (%)

Source: our elaboration

The smart tourism sector in Italy encompasses four primary fields of activity, namely work organization, territory enhancement, improving tourist experience, and generating income and cash flows (see figure 4). Results indicate that 42% of the analyzed sample focuses on providing services that aim to enhance the tourist experience. These start-ups have specific targets, including luxury travelers, pet lovers, sea lovers, disabled individuals, and those with reduced mobility. The mission of 29% of the analyzed start-ups revolves around enhancing the territory through digital tours, storytelling, promoting smart working in secondary territories such as villages, creating communities, and offering unique experiences. The core business of 26% of tourism digital start-ups is linked to providing services that improve hosts' work organization, including self-check-in and self-check-out options or utilizing big data to enhance services. Finally, some of the analyzed start-ups aim to improve income and cash flows.

Fig. 4: Fields of activity in Italian smart tourism (%)

Source: our elaboration

Research limitations. This study is not intended to be conclusive or exhaustive. Its main limitation is that it relies on secondary data. Future research can be supported by survey aimed at data collecting and by interviews with entrepreneurs of tourism digital start-ups as the basis for more in-depth analyses of the phenomenon. Moreover, future research could investigate the factors that can enable or inhibit the creation of tourism digital start-ups in the different regional contexts. Finally, some future critical reflections can concern the role of tourism digital start-ups in contributing to the development of smart tourism being aware that the associated impacts are not always positive. In fact, different scholars refer to various challenges related to the adoption of ICTs solution, from ethical dilemmas, privacy and security concerns regarding customers data (Xu et al., 2018), to the possible reduction of social interactions, negative effects of technologies on tourists' satisfaction (Grundner and Neuhofer, 2021), and existing work activities replacement (Müller et al., 2018).

Managerial implications. This study has significant managerial implications as it can assist policymakers in developing innovative and sustainable solutions to facilitate the successful digital transition of tourism cities. By understanding the trends and characteristics of tourism digital start-ups, policymakers can extend the use of innovative

technologies to new territories and create favorable conditions for the growth of the smart tourism sector. Additionally, by identifying the main technologies and scopes of newcomers in the industry, this study can guide aspiring entrepreneurs on the latest trends and less-focused areas that may present potential entrepreneurial opportunities in the future.

Originality of the paper. This study represents a first attempt to explore the Italian tourism digital start-ups, providing valuable insights into the emerging smart tourism sector in Italy. It focuses on the role of new digital technologies in the evolution of smart tourism and provides a comprehensive classification of start-ups in the Italian context. Starting from the analysis of the existing literature on new technologies in the tourism industry, the study highlights the technologies currently utilized by Italian digital start-ups. Additionally, this study showcases the geographical distribution, business models and fields of activity of Italian digital start-ups.

Keywords: tourism digital start-ups; smart tourism; tourism; digital technologies; start-ups.

How management uses AI in the museum field: from chatbots towards chat GTP

FRANCESCO CARIGNANI* LAURA CLEMENTE* GESUALDA IODICE[▲] FRANCESCO BIFULCO**

Abstract

Artificial intelligence is an innovative tool with considerable potential. In the cultural sector, the use of new technologies translates into the definition and design of a cultural offer based on the components of interactivity and customization. In this direction are inserted the Technological Advances through which the visitors of Cultural Sites can dialogue with deep learning inspired chatbot software, ask for information and even suggestions on the Cultural Experience. The aim of this work is to explore the use that cultural organisations, and in particular museums, make of Chatbot technology, in order to understand if this tool can be effective in enhancement and fruition museum management. To achieve this goal, the strategic choices by a selection of case studies were analysed. From the analysis carried out, the use of Chatbot technology appears to bring the museum audience closer, involving them in the museum narrative thanks to the possibility of making autonomous choices and providing important information on public behavior to management. The future application of elaborate AIs such as GTP chat may offer food for thought on how these processes will be automated and become increasingly efficient.

Introduction. *Technological innovation pervades every aspect of contemporary society. In the cultural and creative sector, the use of digital and immersive technologies is a fundamental pillar of attractiveness for organisations that use them. The process through which these organisations are called to create social, cultural and economic value implies the use of structures and tools that can provide innovative and interactive approaches in cultural-based enjoyment (Chung et al., 2015; Sfodera et al., 2020). The use of the most innovative technologies in the creation and co-creation of cultural value allows to overcome the physical distance in the cultural fruition and invest resources to establish a relationship not only on-site but also online with its users (Del Vacchio et al., 2022). The technology constituted by Artificial Intelligence, in particular, is able to guide and enhance the cultural experience in the phase before the visit, in the phase concomitant to the visit and also in the subsequent phase, triggering significant relational mechanisms between cultural organisations and stakeholders that gravitate in their orbit.*

In this direction, particular attention is covered by chatbot technology. For about a decade, the output from Artificial Intelligence has been receiving increasing attention from cultural organisations, and in particular from museums, as well as scholars (Boiano et al., 2018; Robinson et al. 2008; Vassos et al. 2016). The introduction on the cultural market of software able to dialogue with users and respond to their needs has upset the typical communication trajectories between users and professionals in the cultural sector. The paradigm shift is associated with technological advances introduced not only with written language but also with voice recognition (Gaia et al., 2019). The experiments focused on the use of chatbot technologies are many and varied. The solutions guided by deep learning, through systems that respond to specific requests and, recently, also to recommendation systems, aim to quickly and dynamically customize the interaction with users, improving the experience of cultural enjoyment (Bordoni et al. 2016). The innovativeness of digital solutions is such as to learn to understand the intent or context of a user with the aim of maximizing the effectiveness and efficiency of the chat system and return personalized answers and information (Fast et al. 2018).

This research project intends to explore, through a qualitative approach, the ways in which museums manage these technologies with the aim of understanding, from a managerial perspective, whether these tools constitute a real differential element in the online and online cultural fruition and enhancement of Cultural Heritage.

Literature review

Digital technologies in museum management

The museum sector is a particularly interesting scenario from a technological point of view: a relationship marked by revolutions in this sector, dictated precisely by digital innovations (Del Vacchio et al., 2020). These convergences between culture and digital have been the subject of numerous studies of a managerial nature, which have contributed to analyzing their dynamics (Antoniou & Lepouras, 2010, Russo Spina et al., 2021). The very management of these enhancement technologies has been based on these technologies above all with involving the public more with interactive processes: an example is augmented reality which in recent years has had a significant application in cultural contexts (Do et al., 2020), but also virtual reality (Williams & Hobson, 1995), and virtual tours (Caspani et al., 2017). It is precisely the search for new variations of these technologies in the cultural context, and in particular in the museum, which is extremely interesting in attracting new audiences, often even less interested in these contexts, such as the younger generations (Akmermer, 2022). For example, there are many contributions in the managerial field on how social media have influenced the relationship between users and subjects related to culture (Vassiliadis & Belenioti, 2017; Liang & Martin, 2021; Maniou, 2021;). In particular, it has been underlined how the use of social media by museums has generated strong loyalty with museums, improving users' skills, and making them more willing to financially support these institutions (Zollo et al., 2022). Museum marketing itself exploits these tools to better understand its audiences, sometimes starting profiling processes in order to detect the socio-demographic and behavioral characteristics of users, easier to detect on social media than in physical visits (Gargiulo & Carignani, 2022). There are therefore numerous studies stating that data from social network content analysis should be taken into account in the decision-making process of cultural heritage management (Liang et al., 2021). This analysis of data obtained from social media, the so-called big data, is therefore fundamental for the management of the museum in the relationship with the public and for developing co-planning relationships with visitors, increasing the value of their experience (Cuomo et al., 2021). The analysis therefore made by the museums of their social networks, therefore traces a scenario composed of users who are characterized in different groups, which together however form real communities with similar interests (Chang, 2022). The main problem of museums, however, is that not always tools such as social networks, but digital technologies in general, are exploited to the fullest, often due to a lack of specialized personnel among the museum staff (Carignani et al., 2022). If social networks are generally more focused on younger audiences, the contribution of digital should not be underestimated in improving the visit of other types of audience, especially the over 50s, particularly useful in providing useful information to users even in the pre and post visit (Traboulsi et al., 2018). Management literature has also focused on digital technologies such as augmented reality (AR) or virtual reality (VR), seen in the past as an element that could compete with a museum visit (Guttentag, 2010), today they are tools considered extremely useful for making the museum visit even more attractive (Passebois-Ducros, 2019). They are therefore a fundamental tool not only for attracting new audiences, but because they give the possibility of using cultural heritage from a distance, often damaged or lost (Styliani et al., 2009). A modern museum management cannot therefore ignore these forms of technology, also focusing on the training of dedicated staff and on communication, through modern digital storytelling (Trunfio et al., 2022). This type of museum management, which involves users in this way, can only create new forms of co-creation of services, where the subjects, curators, managers, visitors and artists, find themselves interacting in completely new dynamics (Massi & Turrini, 2020)

The use of AI in museum management

In recent years, cultural services have seen the implementation of the use of AI in their dynamics, in order to improve the quality of their services (Ivanov & Webster, 2019). In the museum sector there has been a growth in the use of AI in order to offer ever better services to its visitors, entering the perspective of Industry 5.0, and transforming itself from a tool to a real approach to the cultural world and making it possible to better understand users' wishes at different times: before, after and during the visit experience (Orea-Giner et al., 2022). If the lack of resources and the difficulty in managing these technologies at a technological level represent barriers involving economic and human resources (Villaespesa & Murphy, 2021), the evolution of these systems, which increasingly reduce response times, are particularly reconciled with the application in the museum field, where the visitor needs to access information in ever faster times, supported by available devices (Wang & Cai, 2022). The objective becomes twofold: if on the one hand these technologies preserve the cultural heritage, on the other they can give museum management important information on the level of visitor satisfaction in their museum experience (Recuero Virto & López, 2019). At the same time, museum management must not underestimate the importance of monitoring and analyzing the relationship that is created between users and AIs, which can turn into a real co-creation process (Merzagora et al., 2022). In fact, already with the first forms of chatbot, an important change in relations with these technologies takes shape: the relationship is transformed from a linear one to an extremely more interactive relationship, with the user who does not passively follow the visit, but is called to interact directly with the chatbot (Toumanidis et al., 2019). However, the use of these technologies has broadened the studies on the impact of management in the use of these technologies, such as chatbots, in order to facilitate interactions with visitors, but also to initiate processes that can be managed by staff of museums (Ivanov & Webster, 2019).

In fact, it should not be underestimated in the interface between chatbot and user, the possible anxiety that can be generated by the use of a technology and that could adversely affect the experience, although studies show that simple and intuitive interfaces can overcome the problem (Pillai & Sivathanu, 2020).

Methodology. *In order to investigate how museums manage the use of Artificial Intelligence technologies to personalize cultural experiences, the authors have chosen to adopt a qualitative approach (Dubois & Gadde, 2002), consistent with the nature of the theme linked to the analysis of the context in which these technologies are used and the community to which they relate. To achieve this goal, a direct observation was conducted to a selected basket of case studies. In particular, four international organisations related to the museum sector, responding to different legal forms, were found to be in line with the subject of the survey. The selected cases respond to territorial contexts and different audiences for origin and cultural attendance, they are also part of heterogeneous subsectors with each other. In addition to this distinction, each of the selected cases uses different extensions of chatbot technology. The selected cases are:*

- *Centre national d'Art et de Culture Georges Pompidou;*
- *Colosseum Archaeological Park;*
- *Ecomuseum Mare Memoria Viva;*
- *Museum of Tomorrow*

The collected data were analysed following a “logic of replication”, according to which the analysed cases carried out a cross-analysis, with the aim of identifying similar characteristics, differences and determining best practices (Yin, 2018). The multiple case study approach adopted (Gummesson, 2017) is based on a broad and heterogeneous dataset. Specifically, the study stems from an overlap between primary and secondary information sources, such as interviews, articles, website content, essays and reports (Creswell & Creswell, 2017).

Findings. *In the contemporary cultural and artistic scenario, there have been numerous attempts to engage audiences in a more dynamic and interactive way. As Noh and Hong pointed out (2021), cultural organizations exert much effort to engage visitors, provide knowledge, create meaningful experiences and make emotional connections. Artificial Intelligence (AI) proves to be a useful tool in pursuit of this goal as it can provide cultural managers with valuable support in numerous activities.*

The conducted analysis showed how artificial intelligence can have various fields of application in the cultural sector. The first one concerns the use of AI for the production of works of art: various artificial intelligence software and tools, such as Midjourney, are able to generate images and illustrations, with a considerable degree of complexity, from a written text. Nowadays, an increasing number of artists incorporate artificial intelligence into their installations, making this technology an intrinsic component of the experience itself and allowing viewers to become protagonists of the artwork. The U-DATInos project, realised by the Ecomuseo Mare Memoria Viva in Palermo in collaboration with the artists Salvatore Iaconesi and Oriana Persico, aims to create a fusion between the human ecosystem and technology. The installation representing a Mediterranean maquis forest takes the form of an interactive artwork that generates effects of light and sound to visualise and represent the conditions of the surrounding environment. The installation transforms itself based on data from sensors, open data and surveys, conducted by a group of selected visitors, and managed by artificial intelligence software.

The second field of application pertains to the use of artificial intelligence, in the form of chatbots, to assist and support customers of cultural institutions such as museums and archaeological sites.

Aiming to offer its visitors a new way to experience the museum and interact with the artworks, the Centre Pompidou developed, in collaboration with Ask Mona, an interactive mobile guide adapted to the needs of the public. The chatbot, named Tubo, is designed to accompany visitors throughout the visit experience. This tool facilitates the fruition of the artworks by answering frequent questions with the help of artificial intelligence. The user can access the service by taking a photo of the work of interest, which is recognised by the AI and provides access to exclusive content that explain the history of the work, as well as the possibility of asking the chatbot for further curiosities. The chatbot also responds to practical enquiries from users such as rates, opening hours, programmes and activities. Its features are designed to respond effectively at each stage of the visitor journey, from the needs of information before the visit, to specific questions during the visit and after it. Since its launch in December 2021, Tubo has been downloaded more than a hundred times a day and in the first two months has reached a total of 17,000 users, making it rightfully an essential part of the Centre Pompidou's digital toolbox to make visits more accessible and to attract a new target group of younger customers who are less inclined to follow the traditional museum tour.

At the beginning of 2023, the Colosseum Archaeological Park launched Nerone, an artificial intelligence software, designed to provide the public with information about the cultural site and its services. The main goal lies in reaching a more diversified audience and decreasing the response time to information requests made through traditional communication channels including email, telephone and social media. The chatbot is the result of an international collaboration between the Park, the Italian company Machineria srl and the French company Ask Mona, both active in the production of innovative services for cultural enterprises. A detailed analysis of the communication strategy of the Colosseum Park and of the audience it seeks to intercept led to the choice of the iconography representing the Roman emperor Nero, which turned out to be appropriate and led to relevant results in a short time. In the month of January, in fact, the platform was used by more than 160 users per day. The study of the most frequent questions asked by the users helped the cultural manager to intercept the most recurring themes and enabled an improvement in the chatbot's performance with more detailed answers in line with visitors' expectations. The data provided by the Colosseum Archaeological Park reveal that more than half of the questions posed to Nero (69%) are related to the ticketing system, but there is no shortage of requests for curiosities or anecdotes (parocolosseo.it).

Accessibility is a major area that cultural institutions are trying to address in new and innovative ways and artificial intelligence can also be a useful tool for cultural management to observe and understand customers' demands.

Rio de Janeiro's Museum of Tomorrow incorporates AI as a core part of the cultural experience. Through the tool IRIS+, which is a pioneering use of Watson Services, visitors can personalise their experience when interacting with exhibition components in the galleries. The artificial intelligence is designed to engage visitors through a conversational interface, to accept unconstrained responses from visitors and to give meaning to the data collected through these interactions. The information collected helps the museum to understand user needs and improve museum services.

Tab. 1: Use of AI by Cultural firms

Name	Identity	AI Application	Opportunity for visitors and cultural firms
Centre national d'Art et de Culture Georges Pompidou	Museum of Contemporary Art	Tubo Chatbot	Facilitate the enjoyment of works of art and improve the accessibility of the museum.
Colosseum Archaeological Park	Archaeological Site	Nerone Chatbot	Provide the public with information on the services offered and use the data collected to improve the promotion and attractiveness of the site.
Mare Memoria Viva	Ecomuseum	U-DATInos Data physicalization	Provide a new way of enjoying a work of art and stimulate the public to active participation.
Museum of Tomorrow Rio de Janeiro	Museum of Applied Sciences	IRIS+ Digital Assistant	Collect data to understand visitor needs and create tailor-made experiences.

Source: Author's elaboration

As can be seen from the information in Table 1, the institutions analysed have different applications of artificial intelligence. The goals that cultural enterprises and visitors can achieve through this tool are manifold and include: increased knowledge of the site and services offered, a higher level of engagement throughout each stage of the visitor journey and the reaching of different target groups, such as so-called young adults.

In particular, the exponential growth in the use of chatbots by cultural companies (Gaia et al., 2019) is also due to the use of deep learning systems that accelerate the learning process of such tools and make them suitable for providing increasingly personalised information that can increase user satisfaction and improve the enjoyment of the works but also the moments before and after the visit.

Implication. Digital technologies pervade every aspect of creating cultural value process. The use of artificial intelligence, together with other technologies such as augmented or virtual reality, is spreading to offer new experiences of artistic enjoyment. Artificial intelligence, in particular, is an effective tool to support cultural organizations to strengthen the link between them and their stakeholders by providing customers with innovative storytelling for a more immersive cultural experience. The analyzed cases have shown that the tools provided by AI, in the different forms of apps, software, chatbot technology, allow to guide and enhance the cultural experience in the phase before the visit, in the concomitant phase of the visit and also in the subsequent phase. From a theoretical point of view this process implies the strengthening of the relational links between cultural organizations and stakeholders that gravitate in their orbit. From a managerial point of view, these tools provide tangible and objective data about the number of people seeking information about the cultural organization and its proposals. In the same direction, it allows cultural firms to profile users and provide effective metrics on their experience satisfaction. The insights derived from the digital technology of AI allow, in summary, address the strategic and operational choices of cultural management, aligning them to the needs of their stakeholders.

Limitation and future research. The potential of using artificial intelligence for cultural organizations is manifold. This study investigated from a qualitative point of view the use of cultural management in relation to technologies derived from AI. The heterogeneity of the case studies tackled allows to photograph the general state of the art but also constitutes a limit of the research. In this direction also fits the belonging to different cultural subsectors. In view of the above, it seems necessary to extend the number of selected case studies and to observe also through quantitative methodologies the use that cultural organizations belonging to different sub-sectors make of AI. In the same direction, it could be interesting investigating the ways in which museum management achieve stakeholder newest needs regarding the use of AI such us data security and privacy, as well as induced unemployment. This innovative usage is at the early stages of its experimentation but its development could soon be of interest to museums and major cultural institutions that aim to provide their users with a diversified service that can be used remotely.

Conclusion. The applications of artificial intelligence in the museum environment can be extremely varied. Therefore, tools are created that can be extremely useful to museum management, which acquires important information about the user and has the possibility of correcting the cultural offer to better meet the needs of visitors and involve them more and more. At the same time, therefore, these tools are perceived positively by visitors, whose judgement is influenced by the use of simple and immediate interfaces, providing precise and detailed information.

Another great advantage is the speed of processing of the answers, other than the automation of these processes which allow the management to concentrate the workforce on other sectors. However, we must not believe that everything is automatic: it is essential for management to have competent staff who know how to correct the offer and above all interpret the data that these devices collect. Only in this way will the effort behind the adoption of AI be optimized. These processes could also be optimized in the future by the same AIs, such as Chat GTP, which, thanks to a considerable computing power, made available to more and more cultural subjects in an accessible way, could carry out these processes automatically in the future, suggesting any corrective measures are also sent to management.

Cultural sustainable reputation delle destinazioni unesco: uno studio tra comportamento sostenibile, soddisfazione e atteggiamenti di fedeltà[♦]

MAURO DINI^{*} ILARIA CURINA[•] BARBARA FRANCONI[▲] MARCO CIOPPI^{**}

Inquadramento della ricerca. Il concetto di turismo sostenibile è stato definito dall'organizzazione Mondiale del Turismo (UNTWO) come un turismo consapevole dei suoi impatti presenti e futuri, in grado di soddisfare le esigenze dei visitatori, delle comunità locali, dell'ambiente e delle aziende.

Partendo da questa definizione, il concetto di turismo sostenibile è stato ampiamente analizzato, alimentando un dibattito molto vivace focalizzato sul rapporto teorico tra turismo e sviluppo sostenibile in diversi contesti di applicazione (Sharpley, 2020).

Gran parte degli studi e della letteratura ha descritto il concetto di sostenibilità declinandolo attraverso le dimensioni sociali, ambientali ed economiche (Loach et al., 2017; Blancas et al., 2016).

Oggi a distanza di anni la letteratura si è allontanata da questo approccio tradizionale, applicando al concetto di turismo sostenibile una prospettiva olistica e multidimensionale che prevede ulteriori dimensioni: sociale, culturale, ambientale, politica, economica ed etnica (Woosnam e Ribeiro 2022).

Questa nuova prospettiva sottolinea il ruolo della dimensione culturale quale elemento fondamentale nella costruzione di una società e quale specifica dimensione della sostenibilità (De Oliveira et al., 2022; Migliacani e Francesconi, 2022; Throsby, 2016; Soini e Birkeland, 2014).

Per comprendere i principali aspetti legati alla sostenibilità di questa dimensione, occorre fare riferimento al concetto di turismo culturale, definito come “is a type of tourism activity in which the visitor's essential motivation is to learn, discover, experience and consume the tangible and intangible cultural attractions/products in a tourism destination.” (Richards, 2018, p. 13).

Nello specifico, le risorse turistiche culturali rappresentano le caratteristiche basilari di qualsiasi destinazione, comprendendo aspetti quali il “cultural heritage” (Bui et al., 2020), lo “human life style” e le tradizioni (Carreira et al., 2022), i cambiamenti sociali e culturali nelle comunità locali (Woosnam e Ribeiro, 2022; Stephens e Tiwari, 2015), il patrimonio museale (Cerquetti e Cutrini, 2023; Pencarelli et al., 2017), il patrimonio culturale immateriale (UNESCO, 2003), festival tradizionali (Deng et al., 2023) e la relazione in termini di impatti tra il fenomeno turistico e la comunità locale (Jamal et al., 2010).

Le destinazioni culturali sono considerate come centri di attrattività che contribuiscono in modo significativo allo sviluppo turistico a livello regionale e nazionale, specialmente in Italia.

Il significativo ruolo del turismo culturale ha sollecitato un maggiore interesse anche negli studi accademici (Spencer e Sargeant, 2022; Du Cros e McKercher, 2020; Richards, 2018). In particolare, la letteratura esistente ha soprattutto esplorato alcuni ambiti del turismo culturale in relazione alla sostenibilità, come la conservazione del patrimonio, la gestione del turismo, il suo impatto sia positivo che negativo sulle comunità locali e sui siti culturali (Dans e Gonzales, 2019).

Negli ultimi anni la crescente letteratura accademica, concentrata sul rapporto tra destinazioni culturali e sostenibilità di medio e lungo periodo, ha portato ad una maggiore attenzione degli studiosi verso i siti UNESCO (Tran et al., 2023; Aimar, 2022; De Oliveira et al., 2022; Migliacani e Francesconi, 2022; Scuttari et al., 2021; Dans e Gonzales, 2019; Colavitti e Usai, 2015), che indubbiamente rappresentano dei luoghi privilegiati per l'applicazione di casi empirici.

Nonostante la letteratura esistente, un ambito di studio poco esplorato è quello relativo alla reputazione della destinazione (destination reputation) (Su et al., 2018), che nel caso della sostenibilità è stato applicato alla dimensione ambientale “eco-friendly (Su et al., 2020) e a quella sociale “destination social responsibility” (Tran et al., 2023), ma raramente a quella specifica culturale.

Coerentemente con il lavoro di Su et al. (2020) e Barnett et al. (2006), questo studio considera la reputazione della destinazione da un punto di vista culturale (Cultural Sustainable Reputation - CSR), definendola come “cultural and social reputation of the destination as the tourists' combined assessments of a destination applying their overall evaluation of the cultural impacts attributed to the destination” (Su et al., 2020, pp. 560). La reputazione culturale di una destinazione potrebbe essere interpretata come una valutazione complessiva dell'immagine nel campo della sostenibilità culturale, che deriva dalle politiche di comunicazione della destinazione nonché dalle valutazioni dei turisti.

Una CSR positiva può portare a diversi vantaggi per la destinazione. In primo luogo può aumentare la sua competitività, sia internamente, migliorando le prestazioni organizzative dei vari stakeholder, che esternamente, influenzando e attirando, nella scelta della destinazione, specifici segmenti di clientela qualificati e sensibili ai temi della sostenibilità (Campos-Soria et al., 2021).

In secondo luogo, lo studio di Su et al. (2020) ha dimostrato che, in linea con la reputazione aziendale (Chang, 2013), una reputazione ecologica positiva della destinazione può avere un impatto diretto sulla soddisfazione del turista. Allo stesso tempo studi precedenti nell'ambito dell'“affective component” hanno confermato che la soddisfazione può assumere un importante ruolo nella creazione di comportamenti di fedeltà al brand di destinazione (Tran et al., 2023; Kumar et al., 2020; Su et al., 2016). Di conseguenza, i visitatori che si sentono maggiormente soddisfatti rispetto ad una specifica destinazione agiranno in favore della comunità stessa, adottando atteggiamenti legati a dinamiche di fidelizzazione come, ad esempio, l'intenzione di tornare nella destinazione culturale (Vareiro et al., 2018) e l'intenzione di raccomandare la destinazione (Altunel e Erkurt, 2015).

Infine, nel contesto delle esperienze turistiche (Pine e Gilmore, 1999), alcuni studi (Zatori et al., 2018; Altunel e Erkurt, 2015) hanno evidenziato l'effetto positivo che le attività di coinvolgimento (in particolare quelle legate all'**on-site e on-line involvement**) possono avere sulla soddisfazione (Cioppi et al., 2022; Hung et al., 2019).

Obiettivo del paper. Nonostante gli studi sopra citati, la letteratura più recente sottolinea l'esistenza di molteplici gap riguardanti l'analisi delle intenzioni e dei comportamenti dei turisti nell'ambito delle destinazioni culturali, come: 1) la scarsità di studi focalizzati sull'analisi empirica degli aspetti relativi alla specifica dimensione della sostenibilità culturale (Migliacani e Francesconi, 2022; De Oliveira et al., 2022) 2) la scarsità di studi che hanno analizzato l'impatto della reputazione della destinazione (destination reputation) sul comportamento dei turisti (Su et al., 2018); 3) la limitatezza di studi che hanno collegato la reputazione della destinazione alla soddisfazione del turismo (Su et al., 2020); 4) la concentrazione quasi totale degli studi esistenti sull'analisi del ruolo del turismo culturale dal lato dei manager dei siti UNESCO, a scapito della prospettiva della domanda (De Oliveira et al., 2022); 5) la scarsità di studi che si sono occupati di analizzare l'influenza della dimensione del coinvolgimento **on-site e on-line** rispetto alle attività sostenibili.

Partendo da questi presupposti l'obiettivo del presente lavoro è triplice: (i) indagare la relazione fra i comportamenti sostenibili generali dei turisti e la percezione della reputazione culturale sostenibile delle destinazioni; (ii) indagare la relazione tra la reputazione culturale sostenibile e la soddisfazione dei turisti; (iii) nell'ambito di questa ultima relazione, testare il possibile ruolo di moderazione del coinvolgimento **on-site**, sia per quanto riguarda le attività sostenibili culturali offline che online; (iv) esplorare se la soddisfazione possa portare i turisti ad assumere atteggiamenti come l'intenzione di tornare e di raccomandare la destinazione culturale, tali da innescare un processo virtuoso nella formazione di viaggiatori fidelizzati.

Lo studio si basa sulle seguenti ipotesi di ricerca (Figura 1):

H1: I comportamenti sostenibili generali dei turisti (sustainable behavior) hanno un effetto positivo sulla selezione delle destinazioni con livelli più elevati di reputazione culturale sostenibile (cultural sustainable reputation);

H2: La reputazione culturale sostenibile della destinazione ha un effetto positivo sulla soddisfazione dei turisti (satisfaction);

H3: Il coinvolgimento tramite i social media (social media activity involvement) modera il rapporto tra la reputazione culturale sostenibile della destinazione e la soddisfazione dei turisti;

H4: Il coinvolgimento nelle attività in loco (on-site activity involvement) modera il rapporto tra la reputazione culturale sostenibile della destinazione e la soddisfazione dei turisti;

H5 La soddisfazione dei turisti ha un effetto positivo sull'intenzione di raccomandazione (Recommendation intention);

H6: La soddisfazione dei turisti ha un effetto positivo sull'intenzione di tornare nella destinazione culturale (Intention to return in the cultural tourism destination).

Metodologia. I dati per l'indagine sono stati raccolti mediante un questionario strutturato, e somministrato a un campione di turisti della città di Urbino¹, una importante destinazione culturale mondiale, riconosciuta anche come sito UNESCO.

¹ Nello specifico, il questionario è composto da quattro sezioni. La prima sezione presenta lo scopo del sondaggio, mentre nella seconda vengono richieste alcune informazioni generali riguardanti il turista (es. quante volte ha visitato la città e se/quante notti

Per quanto riguarda la misurazione delle variabili, le scale adottate sono state appositamente selezionate dalla letteratura scientifica turistica.

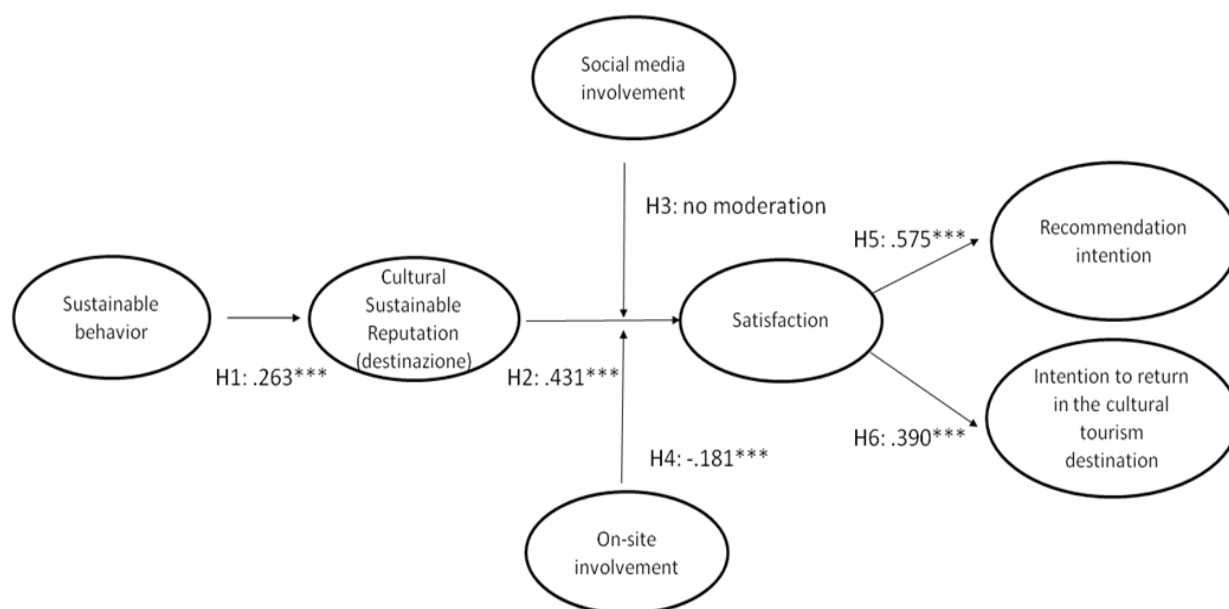

Al termine della somministrazione avvenuta tra agosto e ottobre 2022, sono stati raccolti 803 questionari completi (46 questionari sono stati scartati perché incompleti). Gli intervistati presentano le seguenti caratteristiche:

- il 62% sono turisti italiani e il 38% stranieri, principalmente europei;
- il 62% è alla sua prima visita a Urbino, il 18% alla seconda mentre il 20% ha effettuato più di 2 visite nel corso della propria vita;
- il 54% non ha pernottato ad Urbino, il 18% solo una notte e il 28% per più di una notte;
- il 47% sono uomini e il 53% donne;
- il 19% ha tra i 18-23 anni, l'11% tra 24 e 29 anni, il 15% tra 30 e 39 anni, il 16% tra 40 e 49 anni, il 24% tra 50 e 59 anni e il restante 15% più di 59 anni.
- il 31% ha conseguito un diploma di scuola superiore, il 60% è almeno laureato e il restante 9% è composto da turisti con licenza media.

Risultati. Per testare il modello, sono state adottate diverse analisi (analisi fattoriale esplorativa e di conferma e modellazione di equazioni strutturali).

I primi risultati esplorativi suggeriscono in primo luogo che il modello è accettabile: χ^2 $\frac{1}{4}$ 422.909; df $\frac{1}{4}$ 100; p $\frac{1}{4}$.000; χ^2/df $\frac{1}{4}$ 4.229; IFI $\frac{1}{4}$ 0,960; NFI $\frac{1}{4}$ 0,949 e CFI $\frac{1}{4}$ 0,960; $RMSEA$ $\frac{1}{4}$ 0,063. In secondo luogo, vengono confermate le ipotesi di ricerca, esclusa l'ipotesi H3 che non risulta significativa e l'ipotesi H4 che risulta significativa ma di segno negativo.

Fig. 1: Risultati analisi SEM sul modello concettuale

Dai risultati emerge come la CSR possa rappresentare un importante punto di forza per il successo a lungo termine delle destinazioni culturali, sia in termini di competitività che di sostenibilità. In particolare, lo studio permette di confermare, da un lato, il legame tra i turisti attenti alla sostenibilità e la CSR della destinazione e, dall'altro, il legame positivo tra la reputazione e la soddisfazione dei turisti (Su et al., 2020). Lo studio, in linea con altri (Tran et al., 2023), conferma come la soddisfazione dei turisti possa condurre, anche nelle destinazioni culturali, all'adozione di comportamenti di fedeltà nei confronti della stessa, come l'intenzione di ritornare e di raccomandare la destinazione.

Inoltre, pur non confermando le ipotesi di mediazione delle variabili on-site e on-line involvement (H3:H4), la ricerca offre importanti spunti di riflessione su questo risultato. Per quanto riguarda l'attività on-site, a differenza di altri contributi (Cioppi et al., 2022), lo studio conferma un ruolo moderatore negativo nella relazione tra la percezione della CSR della destinazione e la soddisfazione dei turisti. In una destinazione ritenuta culturalmente sostenibile da parte di turisti sensibili a questi temi, le condizioni della destinazione e le attività sostenibili **on-site** potrebbero non aver rispettato queste aspettative, contribuendo a peggiorare il livello di soddisfazione dei turisti. La non significatività dell'ipotesi del coinvolgimento dei social media nella destinazione potrebbe derivare dal fatto che le destinazioni e le DMO concentrano le proprie strategie social soprattutto nella fase di ricerca delle informazioni per la scelta della

ha pernottato durante la sua ultima visita). Nella terza sezione, invece, vengono indagate tutte le variabili presenti all'interno del framework concettuale proposto (Fig. 1). Per ogni variabile, è stata adottata una scala Likert a sette passi (dove 1=totalmente in disaccordo; 7=totalmente d'accordo). Infine, la quarta sezione contiene tutti i dati necessari per la profilazione dei turisti intervistati (es., genere, età, nazionalità, regione di residenza, livello di istruzione, professione, stato civile, area di residenza).

destinazione da parte dei turisti (Pop et al., 2022; Leung et al., 2013), trascurando quella della visita vera e propria, quando il turista vive in loco la destinazione.

Limiti della ricerca. I principali limiti dello studio sono riconducibili:

- alla raccolta dei dati che hanno riguardato un solo sito;
- alla mancata segmentazione del campione (es., età, condizione sociale, provenienza, livello di istruzione), che in base al contesto culturale e geografico di provenienza può incidere anche sulla percezione della sostenibilità.

Implicazioni manageriali. Lo studio offre interessanti implicazioni di natura sia teorica che manageriale. Dal punto di vista teorico, il lavoro si prefigge di colmare alcuni gap emersi dalla letteratura. In particolare, lo studio (i) analizza, dal punto di vista empirico, la specifica dimensione della sostenibilità culturale (Migliacani e Francesconi, 2022; Soini e Birkeland, 2014); (ii) contribuisce ad arricchire la letteratura esistente focalizzata sull'impatto della reputazione della destinazione sul comportamento dei turisti (Su et al., 2018); (iii) esplora empiricamente il legame tra la reputazione della destinazione e la soddisfazione dei turisti (Tran et al., 2018; Su et al., 2023; Su et al., 2020); (iv) arricchisce la letteratura che si è concentrata sull'analisi dei siti UNESCO (De Oliveira et al., 2022); (v) testa la relazione fra soddisfazione e comportamento di fedeltà nelle destinazioni culturali, arricchendo così la letteratura focalizzata sull'analisi degli **outcomes** della soddisfazione dei turisti (Vareiro et al., 2018); (vi) analizza il ruolo di moderazione delle variabili **on-site involvement** e **social media involvement**, cercando in questo modo di colmare un ulteriore gap emerso in letteratura e riguardante l'esiguo numero di studi che hanno analizzato il loro ruolo (Altunel e Erkurt, 2015).

A livello manageriale, invece, il presente lavoro offre importanti implicazioni ai diversi attori operanti sia nel comparto turistico in generale che in quello specificatamente legato alla dimensione culturale. In particolare, lo studio dimostra l'importanza per le destinazioni e le DMO di valorizzare, nelle politiche di branding, gli aspetti legati alla sostenibilità. Diventa fondamentale, quindi, iniziare a considerare il valore della dimensione culturale quale elemento chiave per attrarre e soddisfare i turisti. Inoltre, la formulazione delle strategie di marketing, in termini di segmentazione e di comunicazione, dovrebbe tenere conto della possibilità di identificare target di mercato con specifiche attitudini e sensibilità ai temi della sostenibilità. I siti UNESCO possono rappresentare dei luoghi privilegiati nello sfruttare questa dimensione comunicativa; tuttavia, non occorre trascurare le insidie che possono emergere da una comunicazione che valorizza gli aspetti legati alla sostenibilità culturale. Infatti, se da un lato le politiche di branding sostenibili sono in grado di attrarre turisti qualificati e più alto spendenti, dall'altro possono creare un'aspettativa molto elevata nei confronti dei visitatori, che, se non mantenuta, può incidere direttamente sui livelli di soddisfazione. Non è un caso che, durante il soggiorno presso la destinazione culturale, le attività di coinvolgimento on-site sostenibili (ambientali e culturali) incidano negativamente sulla soddisfazione dei turisti.

Nel complesso quindi le DMO e gli operatori del settore turistico (Del Chiappa e Presenza, 2013) dovrebbero porre maggiore attenzione al ruolo delle attività di coinvolgimento sostenibili on-site e on-line, per il significativo ruolo che possono svolgere nella soddisfazione dei turisti e di conseguenza nella possibilità che questi sviluppino atteggiamenti di fidelizzazione. In questa prospettiva le destinazioni devono rappresentare ecosistemi turistici sostenibili, caratterizzati da touchpoints fisici e virtuali (Barile et al., 2017), che consentono di coinvolgere il turista in attività esperienziali e sostenibili. Per quanto riguarda le attività di coinvolgimento social (Magno e Cassia, 2018), il presente studio sottolinea la rilevanza fondamentale di investimenti mirati in funzioni specifiche durante la vacanza del turista. Infatti, dato che i social media possono rappresentare uno strumento estremamente importante durante l'intero soggiorno di un turista, le organizzazioni turistiche potrebbero focalizzare la loro attenzione sull'utilità di tali piattaforme, non solo nella fase pre-vacanza ma anche e soprattutto quando il turista si trova in loco, stimolando anche processi di co-creazione del valore attraverso la realizzazione di contenuti digitali "real time" da parte dei turisti (Triunfo e Della Lucia, 2019).

In prospettiva è necessario che gli studiosi e i policy makers pongano maggiormente attenzione al tema della sostenibilità di medio e lungo periodo delle destinazioni culturali, per evitare che le attività turistiche possano trasformarsi in un fenomeno in grado di distruggere il valore dell'esperienza e della soddisfazione per i turisti.

Le linee di ricerca future potrebbero approfondire i temi trattati, tenendo conto anche delle specifiche caratteristiche dei turisti, come la provenienza geografica e culturale, che può incidere sulla percezione rispetto ai temi della sostenibilità (Campos-Soria et al., 2021). Inoltre, si rende necessario anche approfondire l'atteggiamento dei turisti nella destinazione attraverso metodologie di ricerca qualitative, mediante anche una possibile mappatura delle effettive attività sostenibili disponibili nella destinazione.

Originalità del paper. Il presente studio rappresenta un primo tentativo di misurare la reputazione sostenibile della destinazione attraverso la specifica dimensione culturale (Cultural Sustainable Reputation), cercando al contempo di approfondire il suo legame con la soddisfazione del turista. Inoltre, nonostante la letteratura esistente abbia evidenziato come il coinvolgimento dei turisti possa avere un effetto positivo sulla loro esperienza, sono pochi gli studi che si sono concentrati, da un lato, sull'analisi dell'influenza del coinvolgimento online, e dall'altro, sull'analisi congiunta delle attività on-site e on-line nell'ambito della sostenibilità culturale.

Entrepreneurial dynamics and behaviours within creative industries: Comparing artistic craftsmanship with hi-tech start-ups

ANGELO RIVIEZZO* MICHELA CESARINA MASON[•]
GIOELE ZAMPARO[▲] MARIA ROSARIA NAPOLITANO**

Framing of the research. *Creative industries embrace a wide range of different activities, such as advertising, design, film, music, photography, publishing, the performing arts, artistic craftsmanship, technological, and business process innovation (Garnham, 2005; de Klerk, 2015). The importance of creative industries has increased with the inclusion of information and communication technology in most of these activities (Garnham, 2005). Previous studies show that in the creative industries, the environment is particularly uncertain and resource-constrained (Hotho and Champion, 2011). Thus, most of the entrepreneurial initiatives in these industries, mainly made up of micro-sized and small businesses run by sole traders (Hartley et al., 2013), need to find original solutions to face the challenges of persistent resource scarcity (Daskalaki, 2010; de Klerk, 2015; Potts and Cunningham, 2008). Investigating the behaviour of creative entrepreneurs in acquiring the skills and resources required to manage and sustain their businesses is a key to understanding how they can survive and sometimes prosper in such a resource-constrained creative environment. This is why the lens of entrepreneurial bricolage has been proposed as particularly effective in analyzing the behaviour and performance of creative industry firms (de Klerk, 2015; Morris et al., 2015).*

The concept of 'bricolage' was first used by Levi-Strauss (1966), who described it as "making do with what is at hand" (p. 17). Later, this definition was successfully introduced in entrepreneurship and developed into the concept of entrepreneurial bricolage (EB), identified as a creative approach to resource application that helps new ventures survive and succeed (Baker and Nelson, 2005). In line with this concept, as new ventures typically lack the resources they need, EB may help them survive and even flourish through recombining and reusing resources. Indeed, extensive empirical evidence has highlighted that new ventures engaging in bricolage are better able to manage resource constraints and achieve superior performance (Baker and Nelson, 2005; Cunha et al., 2014; Senyard et al., 2014). However, even if creative work generally requires forms of experimentation with different combinations and processes, the perspective of entrepreneurial bricolage has been widely neglected in the context of creative industries (de Klerk, 2015).

Scholars agree on the importance of entrepreneurial orientation (EO) as a concept developed from strategy-making process literature that models firm-level entrepreneurship (Covin and Slevin, 1989, 1991). Academic research in this area is comprehensive and has grown into an established field in entrepreneurship (Ferreira et al., 2019). EO finds its roots in the work of Miller (1983), who defined an entrepreneurial firm as one that "engages in product-market innovation, undertakes somewhat risky ventures, and is first to come up with proactive innovations, beating competitors to the punch" (p. 771). This definition entails the core dimensions of EO: innovativeness, risk-taking and proactiveness (Covin and Slevin, 1989). Innovativeness relates to the extent that firms can innovate their business operations, engaging in new ideas, products and approaches to take advantage of consumers' changing tastes and desires. Risk-taking indicates the degree to which a firm can push its desire to take action even when the outcome is unknown and uncertain. Proactiveness refers to the firm's ability to anticipate customers' needs and act on them before competitors. According to Lumpkin and Dess (1996), who expanded the original conceptualization, EO "refers to processes, practices and decision-making activities that lead to new entry" (p. 137).

Over the last decades, much empirical evidence has been provided regarding the positive impact of EO on organizational performance and growth (Markin et al., 2018; Rauch and Frese, 2008) across a variety of industries, including small and medium enterprises (de Klerk, 2015; Riviezzo et al., 2013; Wiklund and Shepherd, 2003). However, the effect of EO on company performance is not always simple or direct (Hernández-Perlines et al., 2021). Previous studies show that EO is likely to "drive firm performance most strongly and positively when enacted in particular

‘congenial’ - environmental and organizational - contexts” (Hernández-Perlines et al., 2021, p. 198). It means that both external and internal conditions can enhance or diminish the impact of EO on firms’ performance (Covin and Miller, 2014).

In light of the above arguments, it seems particularly interesting to investigate how the impact of EO on creative businesses’ performance may be influenced by their entrepreneurial dynamics and behaviours in solving problems and exploiting opportunities despite environmental resource constraints. In other terms, it seems interesting to explore the interplay of EO and EB in affecting creative firms’ performance. At the same time, to consider also the potential impact of firms’ internal characteristics on this relationship, it is worth comparing different categories of creative firms. Indeed, creative industries represent a mixed reality, including firms that offer very different products with dissimilar strategy-making processes.

Purpose of the paper. Our study of 587 Italian creative firms aims to investigate how EO influences creative firms’ performance by introducing EB as a mediator and taking into proper consideration the heterogeneity of firms’ characteristics. To this aim, we compare more “traditional” vs more “innovative” creative firms. In particular, we included Italian artistic craftsmanship and hi-tech start-ups in our sample. By definition, these categories of creative firms are significantly constrained in terms of internal resources (Crowley, 2019; Davidsson et al., 2017). Thus, EO and EB seem particularly well-fitted to investigate their entrepreneurial behaviours and performance.

The proposed conceptual model of the study is depicted in Figure 1.

Fig. 1: Conceptual model

Methodology. Data were collected between the end of 2018 and 2020 with a company specializing in market research. The survey was first administered to 267 High-tech start-ups (HT) founded after 2005. After that, the dataset was expanded, adding 320 firms involved in artistic craftsmanship (AC). All interviews were collected following a CATI procedure. As a result, a total amount of 587 usable questionnaires were collected, and all statistical units included in the final sample were small or micro firms.

All the items used in this study relied on five-point Likert scales. The EB scale was a 4-item scale adapted from Davidsson et al. (2017). The extremes were anchored respectively to “never” and “always”. The EO scale was a 9-item scale adapted from Covin and Wales (2012). Each item was scored on a five-point Likert scale. In this case, extremes were anchored to two opposite statements. Details can be found in Table 1. As an independent variable, subjective performance was used. The subjective performance (SP) scale was a 2-item scale developed by the authors based on a five-point Likert scale, with the extremes anchored respectively to “not satisfied at all” and to “very satisfied”.

Confirmatory factor analysis using the maximum likelihood method was conducted to establish confidence in the measurement model. In the model, SP and EB were modelled as first-order constructs. Differently, EO was modeled as a second-order construct. The results ($\chi^2=136,38$; $df=84$; $RMSEA=0.033$; $CFI=0.977$ $TLI=0.971$; $NFI=0.942$) showed an acceptable fit. Internal consistency was assessed by inspecting Cronbach’s alpha and CR. Convergent and discriminant validity were verified by inspecting AVE values and constructs’ correlations. Of note, EB’s AVE was lower than the usually adopted threshold of 0.50 (Hair et al., 2018). More detail is available in Tables 1 and 2.

Tab. 1: Measurement model assessment: items, reliability, and convergent validity.

Measurement Items	SFL	A	CR	AVE
Entrepreneurial Orientation		0.752	0.849	0.63
EO: Innovativeness (First-order construct)	0.84			
In general, my firm favors a strong emphasis on the marketing of tried-and-true products or services.	0.43			
How many lines of products or services has your firm marketed in the past three years? no new lines of products or services.	0.75			
Changes in product or service lines have been mostly... of minor nature.	0.71			
EO: Risk-taking (First-order construct)	0.67			
In general, my firm has a strong proclivity for low-risk projects with normal and certain rates of return.	0.67			
In general, my firm believes that owing to the nature of environment, it is best to explore it gradually via cautious, incremental behavior.	0.59			
When confronted with decision-making situations involving uncertainty, my firm typically adopts a bold, aggressive posture in order to maximize the probability of exploiting potential opportunities.	0.65			
EO: Proactiveness (First-order construct)	0.83			
In dealing with its competitors, my firm... typically responds to action which competitors initiate.	0.60			
In dealing with its competitors, my firm... is very seldom the first business to introduce new products/services, administrative techniques, operating technologies, etc.	0.74			
In dealing with its competitors, my firm... typically seeks to avoid competitive clashes, preferring a "live-and-let-live" posture.	0.37			
Entrepreneurial Bricolage		0.783	0.757	0.439
We use any existing resource that seems useful to respond to a new problem or opportunity.	0.62			
When dealing with new problems or opportunities we take action by assuming that we will find a workable solution.	0.62			
By combining our existing resources, we take on a surprising variety of new challenges.	0.64			
When we face new challenges, we put together workable solutions from our existing resources.	0.70			
Subjective Performance		0.891	0.849	0.785
Subjective assessment of sales performance	0.83			
Subjective assessment of firm's growth	0.98			

Tab. 2: Discriminant validity: Fornell-Larcker Criterion and HTMT.

Theoretical Constructs	1	2	3
1. Entrepreneurial Bricolage	0.662	0.390	0.339
2. Entrepreneurial Orientation	0.432	0.808	0.249
3. Subjective Performance	0.344	0.278	0.886

Note 1: Diagonal and bold elements are the square roots of the AVE (average variance extracted). HTMT ratios above the diagonal.

The proposed model was estimated using Hayes, (2017) process macro for SPSS (Model 58; 5,000-bootstrap sample; 95% bias-corrected confidence intervals). As can be seen in Figure 1, the mediation between EO → EB → SP is moderated by the firm type (FT). FT is a categorical moderator: HT firms were coded with 0, and ACs with 1.

Results. The path analysis revealed the direct effect of both EO (Coeff. = 0.277; 95% C.I.: 0.131 to 0.423) and EB (Coeff. = 0.428; 95% C.I.: 0.306 to 0.550) on firm's performance was positive and significant. Similarly, also the direct effect of EO on EB was positive and significant (Coeff. = 0.385; 95% C.I.: 0.265 to 0.505). The indirect effect of EO on SP via EB was deemed positive and significant (Coeff. = 0.275; 95% C.I.: 0.175 to 0.379). Nevertheless, this effect varied across the different types of firms. It was stronger for AC firms (Coeff. = 0.443; 95% C.I.: 0.280 to 0.611), while weaker in HTs (Coeff. = 0.091; 95% C.I.: 0.027 to 0.158). Similar observations may be made for the moderating effects of FT in both the EO → EB and EB → SP paths. The former moderating effect was deemed as positive and significant (Coeff. = 0.459; 95% C.I.: 0.297 to 0.621). However, such moderating effect of FT on the EO → EB path was weaker for

HTs (Coeff. = 0.385; 95% C.I.: 0.265 to 0.505) when compared to the one for AC firms (Coeff. = 0.845; 95% C.I.: 0.736 to 0.953). The second moderating effect (i.e., EBxFT→SP) was also positive and significant (Coeff. = 0.287; 95% C.I.: 0.072 to 0.503). Additionally, similar patterns to the former moderating effects appeared for the interaction with FT. More details can be found in Table 3 and Figure 1.

In sum, the findings indicate that EO is positively associated with the performance of small firms and is mediated by EB. However, this association varies across firm types. Namely, it is stronger in the case of artistic-artisan micro firms.

Research limitations. The present study is not without limitations. First, the investigation is limited to a relatively small sample of firms belonging to just two specific categories within the broad creative industries. Second, the study was restricted to Italy, which is characterized by specific economic conditions. Therefore, caution needs to be exercised while generalizing the findings of this study to other countries. Interesting insights could derive from analyses extended

to different activities and national contexts. Another limitation is related to some variables' measurement validity. Since many firms under investigation are not required to file financial statements, we only relied on subjective performance measures. However, this measure may be imprecise, and future studies should put some effort into identifying objective data for the analysis.

Managerial implications. Due to creative firms' economic, social and cultural value, our study has relevant implications from a managerial perspective. Our study highlights that the performance of creative entrepreneurs can be enhanced if they innovate and develop strategic perspectives for running their businesses. Thus, by transiting from traditional approaches to processes and practices based on a high EO, creative entrepreneurs can also better exploit their creativity and convey their inspiration to identify workable solutions for emerging challenges. This is even more important for artisan micro firms. Today more than ever craftsmen operate in an uncertain and resource-constrained context, where being entrepreneurially oriented is essential to take full advantage of limited opportunities. These insights seem in line with a view of bricolage as a means to explore organizational creativity, especially within a time pressure and a crisis context (Le Loarne, 2005). With its long tradition, artistic craftsmanship comprises multiple production areas in which professional qualities, creativity, originality, ability to transform and business flexibility stand out. In a society that increasingly proposes the standardizing production and distribution model, the artisan workshop represents the best expression of individual creativity to be fostered through EB. Indeed, while retaining techniques typical of the traditional one, artistic craftsmanship stands out for the elaboration of new forms and original proposals of creativity and culture. A precise artistic meaning enriches the long tradition of manual dexterity, and today is increasingly influenced by the fruitful combination of local artisan cultures and new technologies.

Originality of the paper. Our study contributes to entrepreneurship research in several ways. First, the present study extends our understanding of the conditions under which an EO might be associated with performance. In fact, we establish a basic theoretical framework that incorporates EO, EB and subjective performance to explain the underlying mechanism of EO's influence on the outcomes of small and micro firms within creative industries. Despite the abundance of studies providing evidence about the relationship between EO and performance, as far as we know, this relationship has not been investigated in the specific research context of creative industries.

Second, while much empirical evidence has been provided on the effects of bricolage in the context of new ventures (Baker and Nelson, 2005), scant attention has been paid to its role in different types of firms. The present study aimed specifically to compare traditional and innovative firms.

Keywords: entrepreneurial orientation; entrepreneurial bricolage; artistic craftsmanship; high-tech start-ups; creative industries; small and micro firms.

Which growth process for deep tech startups? A stage-based model to cope with critical junctures

NICOLETTA BURATTI* FRANCESCO VITELLARO• MARIA COLURCIO▲ ANDREA PAGNIN**

Abstract

Deep tech start-ups (DTs) are a significant emerging managerial phenomenon. These ventures are at the forefront of facing the major challenges of our society and the fundamental problems of human beings by developing breakthrough technological innovations. Many DTs come from academia and research due to the high scientific knowledge required. Given the origin, intrinsic characteristics, and competitive setting, they experience highly challenging launch and growth patterns typical of research-based spin-offs. Despite their undeniable role in shaping future technological trends and innovation quantum leaps in several markets, the specific growth strategies of DTs have not been studied in academic literature yet. Therefore, this preliminary research aims to examine the principal stage-based models of research-based spin-offs debated by scholars. We identify the most suitable model to outline the main stages of growth and related junctures of DTs. The results set the ground for future empirical inductive research. The analysis of DTs and related growth processes is expected to provide significant managerial implications that can be also examined through the theoretical lens of the resource-based view.

Framing of the research. *The last decade has been characterized by the sharp growth of digital and high-tech companies. The impact of technological breakthroughs on our lives and economy is expected to be much more profound in the next years especially because of deep technologies that have been advancing at an accelerated pace (Bobier et al., 2022). Only in Europe, deep-tech companies worth €700 billion (Dealroom and Sifted, 2021). Many of these ventures have their roots in academia and research domain given the high technical skills required. The experts argue there is a lot more potential to be unlocked and the support of governments could be essential to stimulate new entrepreneurship in deep tech and rapidly transfer scientific knowledge to the market.*

Deep tech start-ups (DTs) are a significant emerging phenomenon. They are entrepreneurial initiatives based on breakthrough scientific and engineering knowledge aimed at developing innovative solutions within the realm of artificial intelligence, biotechnology, nanotechnology, robotics, and quantum physics domain that may have a high impact on people, society, and markets. DTs are committed to facing the major challenges of our society, such as sustainability and healthcare, and thus they usually benefit from government grants or other forms of financial support. Most DTs originate from universities and/or public research centres where they have developed emerging technologies. They exploit basic research carried out in laboratories to address fundamental human problems and use the new knowledge and inventions generated to propose innovative technological solutions. In this perspective, they show a problem-solving orientation toward innovation and technology management. In other terms, requested outcomes drive the deep technologies development and not conversely.

Due to their origin, intrinsic characteristics, and the competitive setting they are embedded in, DTs are called to cope with difficult challenges and specific junctures to launch and develop the venture. First, they typically face great market uncertainty, as the new inventions have often a wide array of potential applications. DTs are on the technological frontier and thus usually struggle to identify business opportunities. Therefore, commercial applications can be defined during the development process and/or after the first unsuccessful attempts. Second, DTs face competitive and strategic issues because of entering raising markets or creating non-existing ones. Third, DTs cope with extended time to market. The intrinsic need to push further the boundaries of science represents indeed a complex challenge since there are still unknown research areas that require time to be developed despite their tremendous potential. The complex nature of new products/services requires indeed the integration of sources from multiple technological domains. The development of an effective go-to-market strategy for their new products/services also

depends on the acquisition of new skills, knowledge, facilities, and infrastructures. Moreover, DTSSs are challenged to set up and develop a solid market reputation to overcome potential customers' scepticism, as well as potential partners' mistrust. Finally, consistent, and long-term financial support is essential to develop deep technological solutions. In this perspective, DTSSs are challenged to be able to attract "patient" investors and significant grants. The high capital-intensive nature derives from specific facilities and infrastructure needed to carry out basic research in the laboratories as well as to finance multiple proofs of concepts and prototypes. Therefore, they must be plugged into an interconnected ecosystem of actors, without which they cannot thrive.

Despite the undeniable role of DTSSs in shaping future technological trends and innovation quantum leaps in several markets, up to now, scholars have almost neglected to address this topic and thus the term "deep tech" has not substantially entered the language of managerial and entrepreneurial studies. More specifically, an in-depth analysis of growth strategies and stages of DTSSs is still lacking. To the best of our knowledge, no studies have disentangled how these ventures can overcome the obstacles and advance to the next stage of the development process yet. This paucity of studies is quite surprising, especially considering DTSSs have been already debated in the grey literature from the industry that has provided some managerial insights to boost the growth pathways.

Purpose of the paper. The growth processes of firms have been widely debated in the management literature (Parmentola and Ferretti, 2018). A stage-model approach is common among scholars when investigating the creation of new companies. In the early '80s, Galbraith (1982) proposed a five-stage process for the birth of new high-tech startups that begins with the identification of commercial opportunities of prototypes. This study was illuminating and inspired much further research in this domain to understand the growth strategies of these ventures.

More recently, the focus has been shifted to research-based spin-offs given their growing economic significance and importance for transferring cutting-edge technological solutions to the industry (Mathisen and Rasmussen, 2019). At the beginning of the 2000s, they have become a central theme in technology and innovation policies because they are considered an excellent tool for the commercial exploitation of knowledge generated within public research organizations (Wright et al., 2004).

These ventures are heterogeneous and developed under very different conditions. Therefore, several authors have investigated the growth path of university spin-offs and the obstacles they can encounter to succeed in the market (Wright et al., 2004; Rothaermel et al., 2007; Rasmussen, 2011, Van Geenhuizen and Soetanto, 2009; Wright et al., 2012). More specifically, the literature on stage-based models describes the organizational characteristics and aspects within each growth stage, suggesting the behaviours and practices these ventures must set up for moving to the next stage (Mathisen and Rasmussen, 2019).

However, to the best of our knowledge, no study has examined yet the growth stages and strategies of DTSSs nor if the previous models on research-based spin-offs can fit the case of DTSSs. Since their origin, strengths, and weaknesses, DTSSs demonstrate to have many similarities with research-based spin-offs. They both focus on research and the exploitation of scientific knowledge to create innovative and disruptive solutions that often address sustainability and societal issues. From this perspective, they require a high level of technical and technological expertise as well as expensive facilities and infrastructures to carry on research activities. Both research-based spin-offs and DTSSs tend to experience challenging launch and growth patterns because of the time and funds needed to develop inventions and go to market. Indeed, the recognition of commercial opportunities for their products/services represents a critical stage of their growth process.

Notwithstanding, DTSSs are called to cope with specific obstacles that might widely differ from other kinds of research-based spin-offs. They are much more exposed to the lack of or poor social capital, networks, financial resources, infrastructures, managerial capabilities, and external support. Therefore, a better understanding of the stages and junctures of their growth process is required to lay the foundation for a comprehensive specific model for DTSSs.

Given the above, this preliminary study aims to examine the principal stage-based models in the academic literature on research-based spin-offs to identify the most suitable for the case of DTSSs. This model is expected to outline the main stages of growth and related junctures of these emerging ventures.

Methodology. We applied the snowball sampling technique (Biernacki and Waldorf, 1981) to perform our literature review. This procedure is widely used by scholars to identify the most important and influential academic papers on a specific topic.

First, we consulted prior literature reviews about academic entrepreneurship to define an initial sample of papers addressing the growth processes of research-based spin-offs (Rothaermel et al., 2007; O'Shea et al., 2008; Hayter et al. 2018; Mathisen and Rasmussen, 2019; Hossinger et al., 2020). These papers were selected using alternative keywords referring to "academic entrepreneurship", "research-based spin-offs", "growth process", and "literature review" on the search engine Scopus Elsevier. Second, we looked at the references cited in those papers to identify important contributions; then, we looked at the references in the new ones to recognize even more significant papers addressing the specific topic of stage-based models. We repeated this process until we reached a comprehensive sample of the most relevant papers in the field of our research. Finally, we evaluated each selected paper according to its relevance to our research, the quality of the results and its impact. More specifically, all the Authors were involved to select only the papers that describe a stage-based model for research-based spin-offs. As a result, the final sample is reported in Table 1. The literature review is presented and debated in the following section where, after an in-depth analysis, we indicate the most suitable model for our scope.

Source: Authors' elaboration

Results. Roberts and Malone (1996) provided one of the first contributions to the growth processes of research-based spin-offs. They do not describe a specific stage-based model and related implications but rather explore the policies and structures necessary to create new ventures spinning out from universities and, in general, R&D organisations. Indeed, after an initial phase of basic research in laboratories, the research results may enter the public domain through publications in scientific journals or research teams may decide to exploit their invention by licensing technological intellectual property or creating a new venture. In these cases, the technology transfer office (TTO) is essential to support the teams by assisting in the patent process, administrative procedures, fundraising, incubation, and business development. Roberts and Malone (1996) provide five alternative scenarios to describe the sequence of interactions between the main actors involved in the growth process of spin-offs and related objectives. Notwithstanding the significant contribution to the literature, the Authors mainly focus on the role of TTO and the definition of an effective commercialization policy for facilitating the formation of spin-offs. Therefore, this contribution partially addresses how these ventures face obstacles and evolve to move to the next stages of the growth path. Thus, it cannot be completely useful for our scope.

Ndonzuau et al. (2002) developed a conceptual model on research-based spinoff evolution emerging from the analysis of 15 university spin-offs in several countries worldwide. It consists of four consecutive stages: the emergence of the business idea; the rise of the entrepreneurial project; the birth of the new spin-off firm; and the generation of economic value. The research results and technological knowledge (whether tacit or not) are the starting point of research-based spin-offs and what distinguishes them from most other start-ups. The Authors recognize the first stage as critical. Commercial opportunities resulting from research must be identified and the support of the TTO or external advisor is often essential to access the second step given the lack of entrepreneurial insight of the founders. Indeed, many brilliant inventions reveal as non-feasible business ideas and cannot be translated into venture projects. The model elaborated by Ndonzuau et al. (2002) is a useful contribution to understanding the evolution of spin-offs. However, what they did not consider is that some phases may overlap and co-exist, especially in the case of DTS where, given the high uncertainty of the technological innovations, the growth process is dotted with failures and successes that affect its linearity. For instance, the opportunity recognition and the new venture project may occur simultaneously

or even in reverse order. Indeed, the core technology and product portfolio can be developed after the foundation. This stresses the need for a more dynamic model with feedback loops among the different stages. Moreover, the process described by the Authors appears too rigid and it does not cover peripheral aspects. For example, some projects can be launched without any external investor, using the personal savings of the founders, and financing the growth of the spin-off via the turnover. Finally, the model of Ndonzuau et al. (2002) fails to include the possibility that the ultimate objective of a spin-off is not only the creation of economic value but also social or environmental goals. This is another reason because the framework Ndonzuau et al. (2002) is not suitable for DTSs since they try to solve fundamental problems of human behaviours and society that may represent their first purpose.

Another significant stage-based model is provided by Hindle and Yencken (2004). The Authors represent a linear growth process that actually is highly interactive and sometimes chaotic. In this perspective, they bridge the gaps of previous models by adding peripheral aspects (i.e., entrepreneurial capacities and external resource inputs) that affect each stage of the core linear path. Although this model is a valid depiction of reality, it reveals some weaknesses. First, the sequence starts from research and leads to technology development, proof-of-concept or prototype in the final stages that constitute the foremost exit point, when, typically, a venture capitalist (VC) could be interested. However, most DTS need to attract VCs just in the early phases to finance further highly expensive research and development activities. Therefore, the entrance of VCs may be necessary for the evolution stages, where the DTS still has a long way to go. Second, as the previous model of Ndonzuau et al. (2002), Hindle and Yencken (2004) almost neglect the overlaps of various stages. Although they include peripheral aspects, the core linear succession of stages remains problematic because it does not consider alternative scenarios. Finally, the model gives little attention to business development and strategies to go to market. Conversely, this activity is pivotal for DTS since the mismatch between the novelty of the technology and market readiness to adopt it.

Clarysse and Moray (2004) propose an analysis of how the entrepreneurial teams of research-based spin-offs evolve during the early stages and how it affects the investment decisions of VCs. The Authors identify four distinct stages of development that are linked to the changes of the entrepreneurial team (i.e., idea, pre-start-up, start-up, and post-start-up). Although this model is not suitable to investigate the overall growth process of DTS, it provides significant insights into hindrances related to the team compositions and skills requirements that appear useful for our study. The Authors argue the initial knowledge of the founding team is not sufficient to sustain the growth, especially for the lack of managerial expertise. As research-based spin-offs, DTS tend to be founded mostly by researchers and scientists. Therefore, the experiential learning processes that take place when external factors induce a shift in the organisational structure are thus crucial. This could be also a test bench for DTS to understand if they were able to acquire the competencies needed to develop the business venture. When the lack of these competencies persists, VCs tend to take measures. Clarysse and Moray (2004) argue VCs may request a drastic change in the founding team and nominate an external CEO before investing or they may not invest at all. However, this solution may generate internal tensions because the newcomers do not often have the technical skills to manage a team of highly qualified and independent researchers. Therefore, the major lesson learnt from the model of Clarysse and Moray (2004) is that spin-offs as well as DTS can evolve only when the founding team has sufficient time and foresight to understand the respective role of each component. Once everyone accepts and agrees with the structure, the venture is ready for a capital injection and advances to the final stages.

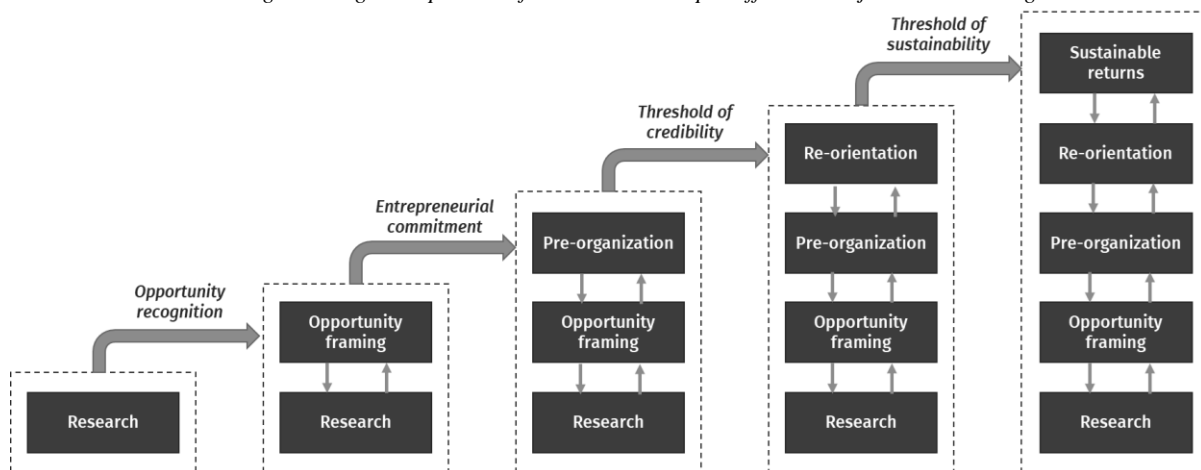

Gübeli and Doloreux (2005) divide the growth process of research-based spin-offs into three stages: “pre-founding”, which refers to the period before the formation of the new company; “founding of firm”, which occurs when the venture is formed; and “post-founding” in correspondence with the birth of the spin-off. The study explores the implications for networking between the spin-offs, the originating institutions, and the local environment throughout the three stages. According to the Authors, the university (i.e., the parental organization) covers a pivotal role during the first stage of the incubation and development of the business idea by providing infrastructure and expertise in a specific field of mentorship. Then, the spin-off needs to acquire external competencies in both the technological and management area. Therefore, outside contacts become crucial determinants in the growth process because they support the new spin-off by acquiring information and knowledge that the host university cannot provide. Gübeli and Doloreux (2005) stress the importance of management and marketing skills along with technical and engineering ones. However, this contribution mainly focuses on the importance of collaborations for the development of research-based spin-offs and does not describe an articulated model with a clear distinction between the growth stages and related junctures.

Based on previous academic work, De Cleyn and Braet (2010) propose a model consisting of six stages. After the first “research stage”, the next one is the “pre-incubation”, in which researchers are called to shift from basic research to applied research and develop a prototype to evaluate the commercial opportunities of the new products/services. In the following “incubation stage”, the products/services are tested on the market and if the results are encouraging, the venture moves to the “early stage”, in which they are definitively launched on the market. During the “growth stage,” there is a consistent injection of funding and development of the business strategy. The Authors argue in many cases the process concludes with an IPO or acquisition by a third party in the final “maturity stage” or company is purchased by a third party. The model developed by De Cleyn and Braet (2010) is particularly interesting for our scope because it provides an integrated framework that links both the business and financial evolution of a research-based spin-off to the content of the evolution of a venture. The Authors also report the types of financial resources that the spin-off can access during each stage. This aspect appears particularly intriguing for the case of DTSs since they need consistent and long-term funding from the early stages to develop new technological solutions. Finally, De Cleyn and Braet (2010) argue the succession of stages is purely indicative and overlaps often occur

according to the different forms of ventures and situations as happens for DTSSs. However, the proposed model suffers from some relevant weaknesses. First, it seems almost exclusively addressed to product-oriented spin-offs because of the focus on intellectual property rights, and product and technology development. Conversely, DTSSs may also develop advanced services and solutions, including diagnosis, monitoring and treatment of diseases as well as algorithms for analysing data to increase the efficiency, productivity, and safety of industrial processes. Furthermore, this integrated model fails in integrating the feedback loops between the different evolution stages that, as stated before, are relevant for DTSSs due to the different trials and errors characterizing their growth process. This framework has the merit of proposing an overview of the principal critical junctures and the important aspects related to the evolution of research-based spin-offs. However, it seems a “utopic and constrained path” because it does not consider alternative exit solutions or shorter successful processes.

Vohora et al. (2004) use an inductive approach on a sample of nine academic spin-offs in the UK to understand how these ventures evolve and which are the main challenges they are called to face. The five-stage model and related critical junctures are reported in Figure 1.

Fig. 1: The growth process of research-based spin-offs: critical junctures and stages.

Source: Authors' elaboration on Vohora et al. 2004

In the first stage, spin-offs focus on research activities to generate significant intellectual property and breakthrough technological innovations. After having tested the validity and performance of the new inventions, in the “opportunity framing” several attempts are made to turn them into commercial opportunities. Thus, spin-offs are called to identify alternative markets and potential applications of their products/services according to customers' profiling and expectations. During the “pre-organisation” stage, a strategic plan is developed to outline the skills and resources needed to structure and evolve the venture. Funding (e.g., seed finance) is a critical resource without which the transition to the following stage is prevented. The “re-orientation” stage concerns the efforts addressed to generate returns through the offer of a consistent value proposition to customers. Thus, the entrepreneurial team is wholly committed to an iterative process of continuously identifying, acquiring, and integrating resources and then subsequently re-configure them. The fifth and final stage is characterized by the achievement of sustainable returns.

The contribution of Vohora et al. (2004) is not limited to defining the main stages of growth but it also describes the critical junctures the spin-offs are challenged to cope with to move to the following stage. Compared to previous academic work, especially De Cleyn and Braet (2010), these junctures, as the proposed stages, are more conceptual. In other terms, they do not reflect specific obstacles and actions to overcome them. Conversely, they describe complex problems that may occur at a point along the growth process of spin-offs and prevent them from achieving the transition from one stage to the following. They are fundamental impediments originating from the inherent limits of research-based spin-offs as well as evolution paths. To summarise, the critical junctures identified by Vohora et al. (2004) are four and they occur between the five stages reported in Figure 1:

- “opportunity recognition”, identification of potential applications of innovations developed during the research stage to satisfy unfulfilled market needs;
- “entrepreneurial commitment”, the transition from the initial academic vision of the founders to a more entrepreneurial business idea;
- “threshold of credibility”, strengthening venture credibility to facilitate the acquisition of key resources and customers;
- “threshold of sustainability”, acquisition of the ability to continuously re-configure resources to generate sustainable returns.

The more abstract and conceptual approach of Vohora et al. (2004) particularly appears suitable for our purpose since it can be tailored to the specific context of DTSSs. Indeed, the model describes a non-linear path that consists of five iterative stages that fit with the characteristics and dynamics of DTSSs. It captures the essence of these ventures that

usually face great market uncertainty and unsuccessful attempts that continuously require to re-orient resources and strategies. Moreover, the framework includes in both stages and junctures different aspects that can widely affect the growth of DTSs. First, management and marketing competencies which the founding team usually lacks. Second, the importance of collaborations beyond the relationships with the parent institution and academic network because they favour the acquisition of key information, resources, and competencies. Third, funding can be injected at different stages and is not strictly related to a specific moment.

For these reasons, we believe this stage-based model is the most appropriate to explore the growth processes of DTSs.

Research limitations. The snowball sampling technique has inherent weaknesses. Indeed, it may not have drawn a comprehensive sample, including all the academic papers on stage-based models for research-based spin-offs. Although we have scrutinized multiple sources and databases, a traditional systematic literature review may provide a wider sample. However, it does not guarantee better results because the selected keyword may miss some relevant contributions.

Finally, the choice of selecting the model of Vohora et al. (2004) as the most suitable for the case of DTSs must be confirmed by empirical studies. For this reason, we are planning to use an inductive approach based on multiple cases stemming from Italian universities and research centres.

Managerial implications. The analysis of DTSs and related growth processes provides significant managerial implications that can be examined through stage-based models emerging from the literature on research-based spin-offs and the theoretical lens of the resource-based view (RBV).

Compared to research-based spin-offs, DTSs may suffer most from the lack of or poor social capital, resources, and internal managerial capabilities. According to RBV theory, the founders of new ventures are called to take a step forward by identifying, acquiring, and integrating new resources to create strategic assets and enhance internal capabilities. This is in sharp contrast to the context of DTSs where basic research competencies and capabilities are predominant, and a silent internal resistance exists to combine social capital and entrepreneurial resources to evolve the venture towards profitability. The analysis also emphasises the managerial weaknesses of DTSs and the junctures they are challenged to cope with for growing, especially concerning identifying market opportunities, defining the business model, elaborating the market strategy, acquiring the necessary capital for development, and finally building the reputation needed to support growth.

Originality of the paper. To the best of our knowledge, this preliminary study is the first that addresses the growth processes of DTSs. Deep technologies and related new startups from the research domain represent an emerging and relevant topic that calls for greater attention of scholars given its significance for managerial and societal implications. Therefore, this paper takes the first step towards this research field by identifying a suitable framework to explore stages and junctures in the development of DTSs.

Can a banking relationship with strong local roots influence the entrepreneurship of spinoffs?

Abstract

This paper studies an important driver of academic spin-offs' success, i.e., the institutional banking context in which they operate. We find that the development of the banking institutions does not affect academic spin-offs' performance at the time of incubation, when the main source of funding to finance R&D activities comes from public contributions. Conversely, there is a significant positive and growing influence of banking institutions when academic spin-offs enter the market and become independent of public resources. The findings suggest that governments and banking institutions should develop new financial instruments to support academic spin-offs' R&D investments, especially during the early stages of their life cycle. Academic spin-offs should consider bank debt as a complementary source of funding that allows them to encounter the vital growth opportunities emerging during the incubation phase.

Framing of the research. *Universities and research institutes are protagonists of economic growth and transfers knowledge and technology from the academic environment to the market (Passarelli et al., 2020 Clarysse et al., 2005; Chiesa and Piccaluga, 2000), A large number of products and processes existing on the market could not have been developed without the support of academic research (Mansfield, 1995)- Universities and research institutes enact different exploitation strategies and academic/research spin-offs (RSOs) are considered a special tool to promote the technology transfer. Shane (2004) defines an academic spin-off as "those high-tech companies whose core business is based on the commercial valorisation of results of a scientific and technological research", Thus, RSOs create knowledge and generate innovation through new product development (Bellini et al., 2002; Atasu et al., 2009), Moreover, they create new industries and also new employment for both academics and graduates (Rizzo, 2015; Shane, 2004), The importance of spin-offs for economic development has also been highlighted by different authors (De Marco et al. (2020), according to whom RSOs have a key role in the European SME Instrument project¹. Considering the large involvement in economic and social development of RSOs, Miranda et al. (2018) propose a review of the literature on spin-offs by identifying internal and external drivers that boost the success of such companies. Among the external drivers that influence RSO value, the institutional context, the financial incentives, the support and the advice structures at the local/university level all play a vital important role. In this framework, the relevance of banking institutions is a new and interesting driver to investigate, as access to external financial resources is important to RSO growth (Ortín et al., 2007; Patzelt and Shepherd, 2009; Trinugroho et al., 2021), The effectiveness of investors is also fundamental for RSOs in their advancement from the technology development phase to commercialisation (Keuschnigg and Nielsen, 2004; Wright et al., 2006), This is because during the development phase that precedes commercialisation (the incubation period), RSOs need capital to finance their technological activities and to prototype and engineer their innovations (Fernández-Alles et al., 2015; Munari et al., 2016; Ayoub et al., 2017), During early stages it is crucial for RSOs to keep their survival and, in doing so, the availability of entrepreneurial finance is crucial (Vedula and Kim, 2019), This capital can be found through internal or external resources. However, RSOs in the early stages of their life cycle are small and young firms, meaning they are not able to internally generate enough cash (Fasano and Deloof, 2021) and have difficult access to financial markets (Berger et al., 2001), As a result, RSOs could face asymmetric information problems in debt contract negotiations, because financiers have scarce information about their operating activities. However, RSOs, in contrast to other young and small firms, can rely on non-refundable resources that the*

¹ The European SME Instrument is a funding tool launched by the European Commission whose purpose is to foster SMEs' innovation

government makes available to them to conduct scientific research in the technology development phase. These external resources reduce RSOs' financial needs at their incubation stage. However, when the RSOs are no longer dependent on public contributions, i.e., at the time of their entrance in the product market, the banking institutions could become relevant. Indeed, well-developed banking systems where the bank and the firm are geographically close (La Rocca et al., 2010) could better meet the credit needs of RSOs looking for financial resources to face market competition. This is because the bank-firm proximity allows to acquire soft information, alleviating asymmetric information problems and thereby increasing the use of bank debt (La Rocca et al., 2010). The mitigation of bank-firm information asymmetries is the essence of the banking relationship (Greenbaum et al., 2019) and it bases its foundations on the ability of banks to acquire soft information. Thus, when RSOs after the incubation period are in search of financial resources, the closeness of bank branches could become relevant.

Purpose of the paper. This paper studies an important driver of academic spin-offs' success, i.e., the institutional banking context in which they operate. The paper tries to answer the following research question: does local banking development affect the performance of RSOs both at the time of incubation and after the incubation period? As RSOs in the early stages of their life cycle are small and young firms, they could face asymmetric information problems in debt contract negotiations, because financiers have scarce information about their operating activities. However, RSOs, in contrast to other young and small firms, can rely on non-refundable resources that the government makes available to them at their incubation stage. But when the RSOs do not depend on public contributions any more during their entrance in the product market, the banking institutions could become relevant. In this context, this work empirically investigates whether and how the local banking development affects the performance of RSOs during the incubation period and after the market entry of the product. We want to more comprehensively understand whether and how during the RSO life cycle a well-developed banking system shapes corporate performance. The present contribution aims to bridge an important gap in the RSO literature, exploring the role of a critical institutional factor, the banking system, as a crucial driver to boost RSOs' performance.

Methodology. The study is based in Italy as a perfect background of analysis, as the banking development significantly differs across local contexts (Italian provinces). Such differences allow to capture the effect of different levels of banking development on RSOs performance. Moreover, the detailed information available for this country allows us to investigate the influence of the banking systems on RSO performance by including exogenous determinants of local banking development, following the methodological approach of noteworthy contributions (Guiso et al., 2004; Deloof and La Rocca, 2015; Deloof et al., 2019). The sample is based on an unbalanced panel dataset of 1,879 RSOs from the Italian universities (public and private) and public research institutes listed in the Ministry of Education². We selected only active RSOs during the sample period, which was from 2012 to 2019. Financial and ownership information come from the Amadeus database of the Bureau van Dijk. We investigate the hypotheses first using the ordinary least squares (OLS) technique based on standard errors clustered at the firm and province level. This approach is essential because it facilitates control in observations that are correlated under the provincial dimension. Then, we use the two stage least squares (2SLS) technique with instrumental variables (IV) since omitted factors and simultaneous causality relationship could influence the effect of local banking development on RSO performance. We use the same IV as in Guiso et al. (2004) and Deloof and La Rocca (2015), and others who measured local banking structures in 1936. As Guiso et al. (2004) state, "to deal with the potential endogeneity" it is important to use an instrument that "describe the regional characteristics of the banking system as of 1936". This is because the 1936 banking law has been in force for about 50 years and, as a result, the local (provincial) differences that existed then persist to today.

Results. The Table at the end of the present short paper shows our empirical results. From a statistical point of view, the outcome of the analysis is valid and robust. For the 2SLS regressions, the F-test statistic of the first stage regression shows that the instruments are jointly significant when estimating the local banking development. The p-values of the instruments, based on heteroscedastic robust standard errors, are statistically significant.

We find that the development of the banking institutions does not affect academic spin-offs' performance at the time of incubation, when the main source of funding to finance R&D activities comes from public contributions and when non-operating revenues outnumber sales. It seems that in the early stages of their life cycle, RSOs largely rely on public or university contributions and, consequently, their performance is not influenced by the state of development of the banking system. Thus, when their major source of revenue comes from non-operating revenues, the role of local banking development is meaningless.

Conversely, there is a significant positive and growing influence of banking institutions when academic spin-offs enter the market and become independent of public resources. Once RSOs have started selling their products or services, their dependence on non-operational earnings decreases and their relationship with banks becomes fundamental. At this time, RSOs deal with market competitors and are in search of funds to finance their investments. Here, the role of the banking system comes into play, which is crucial to RSO growth and performance. It seems that the proximity between the RSOs and a loan office enhances personal contacts and accelerates the acquisition of soft information, for which RSOs can more easily obtain external finance. This reduces RSOs' financial constraints and bank debt can be used to obtain valuable business opportunities and face market challenges.

² When information about RSOs was not directly available on the website, we contacted (by email or telephone) each university to obtain a list of RSOs.

When RSOs enter the market, they are more in need of external funds, for which the banking sector interestingly becomes strongly relevant, thus affecting their performance.

Research limitations. The work also has some limitations, as we use only one proxy of local banking developments, i.e., bank branch density. Indeed, to confirm our findings it would be useful to also consider, as a proxy of local banking development, the total amount of credit banks extend to firms as a percentage of GDP. However, this work underscores the need for more research on financial policies in very early stage RSOs, encouraging future researchers to further study their debt policies.

Managerial implications. The findings suggest that governments and banking institutions should develop new financial instruments to support academic spin-offs' R&D investments, especially during the early stages of their life cycle. Academic spin-offs should consider bank debt as a complementary source of funding that allows them to encounter the vital growth opportunities emerging during the incubation phase.

A key implication of the findings is that policy makers should stimulate technology-based entrepreneurship from universities not only via public funds, but also by improving the banking systems through specific banking solutions dedicated to RSOs. Moreover, banks should not ignore RSOs during the engineering phases and, at the same time, RSOs should increasingly look for bank funding. Another crucial implication of the findings is that banks and RSOs should try to better meet each other's needs. They can no longer overlook each other throughout the critical prototyping phases, during which the success of the idea could significantly depend on the availability of financial resources. At the same time, policy makers should ensure the necessary attention is paid to the banking sector, recognising that it acts as a force that boosts the growth of spin-offs. Governments should develop banking instruments that support the business of RSOs. Additionally, policy makers should recognise that a close relationship between an RSO and a bank branch presents the possibility to obtain successful growth opportunities. Thus, policy makers should increase the availability of debt financing for RSOs in those provincial banking contexts with few branches. With this regard, bank promoters could explore and deepen the credit need of RSOs and reduce their financial constraints.

Moreover, banking institutions should support the consolidation of innovative RSOs not only during the maturity stages, but also throughout the early phases of their life cycle.

Additionally, banks could allocate dedicated funds to RSOs, such as financial incentives for specific academic projects. This because the banking sector has a key role in reducing the uncertainty of future cash flows, which is a major concern for RSOs.

From a firm-level point of view, managers of RSOs should try to reduce the informational gap between their company and the money lenders. Too often, banks have no idea of the high income potential from valuable projects. The initial location of an RSO could mitigate such a problem. RSOs could try to reduce the physical and informational distance from their nearest bank branches in order to facilitate debt financing. Moreover, RSO managers should not ignore the possibility of relying on bank loans and could establish production facilities as close as possible to high bank branch density areas.

Countries cannot afford to miss the opportunity to commercialise the results of public research, as it contributes to economic and social welfare. In light of this, this contribution hopes to increase the understanding of the mechanisms through which the application of new ideas, technologies, and scientific knowledge generates economic development and job creation.

Originality of the paper. The importance of the academic entrepreneurship to the growth of a country is of particular interest in the research context (O'Shea et al., 2008). In this field of research, investigating how RSOs interact with banking institutions is a relevant topic that enriches the understanding of RSO success. Indeed, if access to the banking markets is a major concern for firms, this especially applies to innovative firms, such as RSO, whose activities are expensive and require well-developed financial systems (Sharma, 2007; Ayyagari et al., 2007). Considering this peculiarity, it is of academic and practical interest to study the role of the banking system on the activities of RSOs during their life cycle.
