Moreover, the use of RSOs to test the effects of local banking development is new in the literature. Most prior papers in this field use firm data or aggregate economic data. The fact that an RSO can rely on the support of universities and research institutes during their incubation period provides an interesting setup to test the influence of the local banking institutions. In the extant literature, little attention has been paid to the role of banks, while have been regarded as important financiers of RSOs, as underlined by Prokop (2021). However, the same author argues that there is still to be discovered about which actors could affect RSOs success (Prokop et al., 2019). Banks could play a part in this game. Indeed, banks have strong tools to assess financial needs of firms and bank monitoring could be a solution to overcome creditworthiness problems (La Rocca et al. 2010), which are typical concerns of RSOs. Also Lekashvili and Bitsadze (2021) interestingly point out that a possible reason of unsuccessful spin-offs could be the lack of "access to financial resources, which integrates the finances of government, university, commercial and international institutions", for which here could come into play to study how banks support RSOs.

The findings aim to enrich both the literature on RSOs and the literature on banking development. In particular, we contribute to the RSO literature by studying an important determinant of corporate success that should be carefully considered both by academic researchers and decision makers. Moreover, we also contribute to the corporate finance literature by investigating a particular typology of firms for which, in the early stages of their life cycle, the role of the banking system as a credit provider is in competition with other sources of funding, namely public or university contributions.

Keywords: banks, local banking development, university spin-off, university, innovation, economic growth.

Main Model: 2SLS results concerning local banking development and RSO performance.

How the “vertical” and the “horizontal” heterogeneity affect academic spin-offs performance: an empirical analysis of life-science ventures

MAURO SCIARELLI* LORENZO TURRIZIANI* ANNA PRISCO*
VALERIO MUTO** IRENE RICCIARDI**

Framing of the research. *There is growing interest in how universities acquire more and more importance and relevance for the development of skills and innovations within our socio-economic system (Vesperi and Gagnidze, 2019). To commercially exploit this set of knowledge and skills in the best possible way, one of the most used mechanisms is the creation of Academic Spin-Offs (ASOs). ASOs are a new type of enterprise based on innovation and technology that arises from the transfer of resources and basic technologies developed within an academic or research university institution (Sciarelli et al., 2022). Fini et al. (2011) provides a rather comprehensive definition of a university spin-off; in fact, he argues that it is an enterprise within the university, and among the founding shareholders is at least one academic (full professor, associate professor, assistant professor, doctoral student, research fellow). Thus, two characteristics distinguish an ASO: the presence of at least one founder whom the university employed at the time of startup and the commercialization of a technology originally developed by academic research activity. In this sense, it has been amply demonstrated in the literature that this type of enterprise has become the potential engine for regional and national development, given that they are able to promote economic growth (Ben-Hafaied et al., 2021; Sciarelli et al., 2022), improve employment in science and research-based sectors (De Nicola et al., 2019) and bridge industry to science (Sciarelli et al., 2020). In addition, increasing the role of universities in local economic growth has been widely recognized as a strategy to involve stakeholders more closely in university technology transfer (Audretsch, 2014) and to create conditions for the economic exploitation of intellectual property, tacit knowledge, and academic research. Creating new entrepreneurial entities, in the form of academic spin-offs, is an effective way for universities to contribute to local development in response to their lack of financial resources by partnering with private enterprises.*

The literature related to ASOs has grown exponentially since 2010 and has mainly focused on human and social capital within different teams and how this capital is balanced to achieve better economic performance. Indeed, according to several scholars, the micro-foundations and success of academic entrepreneurship derive from the composition of the entrepreneurial Top Management Team (TMT) (Mathisen and Rasmussen, 2019), i.e. the "group of individuals primarily responsible for strategic decision-making" (Klotz et al., 2014).

Despite the body of literature on the subject, research has yet to find a definitive answer to the problem of team composition within ASOs. The problem arises because ASOs are companies with lower performance than traditional startups and, therefore, a decidedly riskier investment for those who decide to participate.

Little is known about the impact of vertical differences among members: heterogeneity of power, status, prestige, or privilege (Harrison and Klein, 2007). Strategic decision-making is a major responsibility of an entrepreneurial team (Knight et al., 2020). Decision-making power, reflected particularly by ownership, is therefore critical.

After extensively reviewing the literature on the subject, Bunderson and Van der Vegt (2018) state that most articles on team composition within ASOs are based on analysis of the degree of heterogeneity of team members, while few studies have yet questioned the effect of vertical differences between team members, namely diversity of status and power of different participants.

Purpose of the paper. *Our work aims precisely to fill this research gap and, therefore, to shed light on how to integrate the horizontal and vertical heterogeneity of the different teams and its effect on the economic performance of the ASOs.*

Therefore, our research aims to fill the gap by focusing on the relationship between Top Management Teams (TMT) and the economic performance of Academic Spin-Offs through the filter of the micro-foundational approach. In

particular, our goal is to understand what the right balance between academic and non-academic members is, the necessary skills and a background between the various members that is homogeneous or not, capable of positively influencing the economic performance of the ASO. Finally, our goal is to shed light on how members' vertical differences within teams (in terms of status and power as well as whether CEO Duality is present) can positively moderate the effects due to the creation of balanced and homogeneous teams and, therefore, to influence economic performance better

To carry out this research, we decided to adopt a micro-foundational approach (Barney and Felin, 2013), which allows us to focus on the roles of individuals, processes and structures of companies in the acquisition of skills and competitive advantage, creating the opportunity to shed light on which mechanisms and lower-level individual are able to influence the economic performance of the ASOs. The literature related to ASOs has grown exponentially since 2010 and has mainly focused on human and social capital within different teams and how this capital is balanced to achieve better economic performance. Indeed, according to several scholars, the micro-foundations and success of academic entrepreneurship derive from the composition of the entrepreneurial Top Management Team (TMT) (Knockaert et al., 2011; Wright, 2014; Taheri & Van Geenhuizen, 2016; Huynh et al., 2017; Nikiforou et al., 2018), i.e. the "group of individuals primarily responsible for strategic decision-making" (Klotz et al., 2014).

Despite the body of literature on the subject, research has yet to find a definitive answer to the problem of team composition within ASOs. The problem arises because ASOs are companies with lower performance than traditional startups and, therefore, a decidedly riskier investment for those who decide to participate.

Little is known about the impact of vertical differences among members: heterogeneity of power, status, prestige, or privilege (Harrison and Klein, 2007). Strategic decision-making is a major responsibility of an entrepreneurial team (Knight et al., 2020). Decision-making power, reflected particularly by ownership, is therefore critical.

After extensively reviewing the literature on the subject, Bunderson and Van der Vegt (2018) state that most articles on team composition within ASOs are based on analysis of the degree of heterogeneity of team members, while few studies have yet questioned the effect of vertical differences between team members, namely diversity of status and power of different participants.

Therefore, our research aims to fill the gap by focusing on the relationship between Top Management Teams (TMT) and the economic performance of Academic Spin-Offs through the filter of the micro-foundational approach. In particular, our goal is to understand what is the right balance between academic and non-academic members, the necessary skills and a background between the various members that is homogeneous or not, capable of positively influencing the economic performance of the ASO. Finally, our goal is to shed light on how members' vertical differences within teams (in terms of status and power as well as whether or not CEO Duality is present) can positively moderate the effects due to the creation of balanced and homogeneous teams and, therefore, to influence economic performance better.

We focused on Italian ASOs operating in the life-science sector which typically requires multiple business skills and competencies (Di Berardino, 2016). These USOs must be able to change their operations to follow the development of new scientific concepts and the transformation of technologies and prototypes into viable products or services. On this ground, high diversity in TMT backgrounds and competencies may promote a wider range of alternatives and solution which can contribute to preserve ASO's competitive advantage over time.

Prior literature and hypotheses development.

RELATIONSHIP BETWEEN ACADEMIC AND NON-ACADEMIC MEMBERS WITHIN ASOs TEAMS

According to some scholars, the objective underlying the establishment of the ASOs concerns the possibility of transforming scientific knowledge into products or services to be traded on the market (Zahra et al., 2007). This implies for the ASOs having to face both the uncertainties deriving from the market and the scientific-technological ones, relating to the academic and research world.

Indeed, despite their high scientific and research expertise, academics suffer from a lack of business and entrepreneurial experience, which implies the need to include non-academic outsiders in their teams, who can make up for these shortcomings and improve the market skills of the entire team (Vanaelst et al., 2006; Wright et al., 2007).

In addition, the role of academic entrepreneurs also emerges as critical at the level of team formation (Grandi and Grimaldi, 2003). Such composition also significantly improves ASOs' survival and growth performance by providing complementary human and social capital such as business management skills or market and technological knowledge, which are exactly what most ASOs lack but need (Ben-Hafaiedh et al., 2018).

Given these advances, according to various authors it is essential that academic members, at least in the initial phase of the entrepreneurial experience, are supported by real entrepreneurs, with the necessary skills and competences to move comfortably and efficiently in the corporate world. These business-skilled non-academics are defined in the literature as "surrogate entrepreneurs," (Franklin et al., 2001), and are essential for the development of the entrepreneurial idea in the initial phase of the project (Mustar et al., 2006), primarily for the ability to provide leadership, business experience, and market connections to academic members (Sciarelli et al., 2020).

Furthermore, a balanced composition of the team between academic and non-academic members allows for effective integration of scientific and commercial skills in order to positively impact the financial performance of the ASO (Sciarelli et al., 2020; Ben-Hafaiedh et al., 2021). In fact, according to several scholars (Visintin and Pittino, 2014; Dianez-Gonzalez and Camelo-Ordaz, 2016), creating balanced team structures in terms of research and

commercial skills brings significant advantages for ASOs due to the ability of non-academic members to act as mentors to facilitate the process of entrepreneurial learning and the development of professionalism and cognitive diversity within the team (Clarysse and Moray, 2004; Sciarelli et al., 2020; Sciarelli et al., 2022).

However, team diversity can also contribute to coordination and communication problems, making "variety" a double-edged sword (Harrison and Klein, 2007; Díaz-Fernández et al., 2020), the mix of these conflicting identities can create a fault line and thus a schism within the team that can have a negative impact on team performance (Thatcher and Patel, 2012). In the context of ASOs, Rasmussen (2011, p. 460) referred to the "inherent controversies between academic and business cultures" (2011, p. 460), and Nikiforou et al. (2018, p. 96) argued that "balancing these two very distinct but equally important mindsets can hinder knowledge sharing, create tensions in the team, and create problems in communication and collaboration" (p. 96). In fact, the commitment of academics can conflict with their entrepreneurial vision (Jain et al., 2009), particularly when research and business interests diverge (Visintin and Pittino, 2014). This leads to less effective communication within the group and a greater perceived risk in achieving commercial objectives (Li and Hambrick, 2005). The major differences between academic and non-academic members mainly concern the differences in culture, goals and orientation to the entrepreneurial world. In fact, the full-time commitment of non-academic members and the availability only part-time by researchers, could lead to conflicts due to lack of communication, common objectives and, therefore, lack of mutual trust between the two "factions" (Vohora et al., 2004; Visintin and Pittino, 2014; Nikiforou et al., 2018; De Nicola et al., 2019; Ben-Hafaiedh et al., 2021).

Then, we can formulate the following:

Hypothesis 1. Balancing a team structure between academic and non-academic members has a positive effect on the performance of ASOs.

TEAM SIZE IN ASOs

The relationship between academic and non-academic members and their balance within the team structure of ASOs is a thorny issue central to our study. In fact, this differentiation, when not controlled, can lead to harmful effects of separation (Shefer and Frenkel, 2005; Visintin and Pittino, 2014; Sciarelli et al., 2020).

In fact, according to the literature, smaller teams have fewer problems related to mutual communication and integration between the different subgroups of the team due to greater mutual understanding and the commonality of values and objectives within the same subgroups (Smith et al., 1994; Amason and Sapienza, 1997; Visintin and Pittino, 2014). In contrast, larger team sizes can reduce the motivation of various team members to participate as well as the efficiency of mutual monitoring. This means that group members will develop shallower interpersonal relationships and will be less likely to help each other (Kandel and Lazear, 1992; Carpenter, 2002; Backes-Gellner et al., 2006; Visintin and Pittino, 2014; Bunderson et al., 2016).

Therefore we can formulate the following:

Hypothesis 2. The size of the team negatively moderates the performance of the ASO.

SCIENTIFIC BACKGROUND HETEROGENEITY AND ASOs ECONOMIC PERFORMANCE

The ASOs literature focuses on the positive impact on the economic performance of the team with members with similar academic backgrounds (Ensley and Hmieleski, 2005; Talke et al., 2011). In fact, members with similar training are able to provide the team with a greater and more easily integrated set of skills (Williams and O'Reilly, 1998). The teams of the ASOs, so-called homogeneous, show a positive economic performance because they are able to fully benefit from the exploitation of shared scientific knowledge of team members and communication processes simplified by internal team processes, as well as the formation of a shared model of rules and routines, capable of forming commonly accepted values and behaviors among team members (Wuyts et al., 2005; Knockaert et al., 2011; Steffens et al., 2012; Visintin and Pittino, 2014; Sciarelli et al., 2020).

This leads to a series of critical issues which, if not managed properly, can create various communication problems between team members. As pointed out by Pfeffer (1998), in fact, the disparity of status among the different members of the group can negatively affect the performance of the lower level academic members, leading to situations of conformity and lack of participation in the performance of daily management activities.

There are several advantages relating to the homogeneity of the background of individual members of the group, including: it promotes the development of shared norms and values that facilitate communication; is able to improve mutual interaction; reduces categorizations among various members within ASOs teams (Tsui et al., 1992; Williams and O'Reilly, 1998; Beckman et al., 2007; Knockaert et al., 2011). Furthermore, greater homogeneity within groups can facilitate communication and effective mutual monitoring among team members (Zenger & Lawrence, 1989; Grandori, 2000; Clarysse & Moray 2004; Knockaert et al. 2011) and improve cooperation among the TMT members of an ASO (Williams and O'Reilly, 1998).

Accordingly, we tested the following hypothesis:

Hypothesis 3. Homogeneity in ASOs' teams scientific backgrounds positively affects (or moderates) ASOs' economic performance.

HOW VERTICAL DIVERSITY AFFECTS ECONOMIC PERFORMANCE IN ASOs TEAM

In the literature, in most cases, only the components able to influence the horizontal differences (differentiation of profiles within the team) rather than the vertical ones (disparity of status among the various team members) within the teams are analyzed. ASO team (Visentin and Pittino, 2014; Prencipe, 2016; Bunderson and Vejt, 2018). In fact, there is little knowledge in the literature regarding the impacts of vertical differences due to a large heterogeneity of team members in terms of power, status, prestige and privilege (Harrison and Klein, 2007).

Vertical heterogeneity, despite being almost always present within teams, has not attracted much interest from the literature. Vertical differences mainly emerge from highly formalized or informal hierarchies based on power or status. In most cases, vertical inequalities reflect the different degrees of power associated with team members. According to Finkelstein (1992), the sources of vertical inequality within teams in ASOs are of four types: structural; property; experts; prestige. In addition, Visintin and Pittino (2014) note that the disparity in members' academic status (vertical differences) mitigates the benefits of differentiating the group's profile (horizontal differences). If managed efficiently, vertical inequalities within teams may be able to clarify the results deriving from teams that are not very homogeneous and, therefore, with a high rate of horizontal differences (Ben-Hafaied et al., 2021).

Assuming that the distance between the subgroups in terms of norms increases when the group exhibits greater stratification of academic status, that is, when the subgroup of academics tends to replicate the same hierarchical distance that exists between members of the university and the research group to which they belong.

In particular, the disparity in status between the various members may favor conformity, silence and lack of participation as regards members of the lower level team (Pfeffer, 1998). The absence of a well-defined hierarchy between the various teams within the asos entails, for the members, a reduction in the tacit skills and coordination skills necessary for the survival and development of the enterprise (Sciarelli et al., 2020; Ben-Hafaied et al., 2021).

Based on the above, we propose the following hypothesis:

Hypothesis 4. Vertical differences, due to structural, ownership, expert and prestige heterogeneity, negatively affect the economic performance of ASOs

CEO DUALITY AND ECONOMIC PERFORMANCE IN ASOs TEAM

In the literature, studies relating to the benefits and advantages due to CEO Duality are inconclusive (Prencipe, 2016); according to scholars of the agency theory, the two roles should remain distinct and separated in order not to lead to imbalances between the subgroups composed of academic members and those composed of non-academic members (Tang, 2016), a less independent advice (Duru et al., 2016) and a lower efficiency of mutual monitoring among the members belonging to the various teams in the ASOs (Pugliese and Wenstøp, 2007). In any case, CEO Duality involves a strong imbalance in terms of powers within the different teams and, therefore, to a general worsening of the economic performance of the ASOs (Rashid and Lodh, 2011; Gabrielsson et al., 2014). Separate roles, on the other hand, have the effect of improving company services (Rashid and Lodh, 2011) and reducing ambiguity when it comes to having to assign crucial responsibilities during the decision-making process (Anderson and Anthony, 1986; Gabrielsson et al., 2014). So, the overlapping positions of CEO and president in ASOs imply less independence of the board, as well as less efficiency in supervising the activities of managers. As a result, the results related to the performance of managers are poor.

For Stewardship Theory theorists, on the other hand, concentrating the two roles in the hands of one person makes decision making more effective and efficient (Anderson and Anthony, 1986) and improves the CEO's ability to react more quickly and respond in a dynamic business environment and to secure resources critical to the success of the company. (Pfeffer and Salancik, 1978).

In particular, according to these scholars, CEO Duality involves more effective decision-making processes due to greater clarity on the hierarchical scale of the company and, therefore, a better definition of roles and positions (Finkelstein and D'Avanni, 1994; Sciarelli et al., 2020; Sciarelli et al., 2022).

Since it is still an understudied aspect, our goal is to analyze the impact of CEO Duality on the economic performance of the ASOs. In addition, in the presence of resource constraints, Boyd (1995) pointed out that CEO duality provides leverage to engage outside managers and increase the presence of female TMT and ASOs with economic performance on the board to improve stakeholder relations, decision-making, and integration of entrepreneurial members (Hillman et al., 2000).

Based on what has been said, we propose the following:

Hypothesis 5. A greater degree of concentration of power in the hands of a single subject (CEO Duality) negatively moderates the economic performance of the ASOs

Methodology. We employed data from the Netval directory to identify the entire population of Italian active ASOs as in previous studies (Algieri et al., 2013; Muscio et al., 2016; Ramaciotti and Rizzo, 2015). Then, we selected both pure and hybrid spin-offs operating in life-science sector that had at least one academic member on the TMT and were started in a university, excluding those spin-offs proposed by public research centers. Applying these conditions to our sample selection, we came to a spin-off population of 71 firms established from 1994 to 2015. We identified the academic position and the scientific background of academics members using the CINECA scientific platform, and for those academic members not listed in the CINECA platform, such as PhD students and research fellows, we checked the website of their university.

Because our research goal is to investigate the impact of certain entrepreneurial factors on ASO economic performance, we collected data on the governance structure and financial health of each spin-off from AIDA-Bureau Van Dijk).

Results. In line with some prior studies (Franklin et al., 2001, Wennberg et al. 2011; Visintin and Pittino, 2010; 2014), we predict that a balanced structure of ASO's TMT might favour the integration of scientific and business skills, improving the economic performance. This could be particularly relevant for ASOs operating in highly dynamic context such as the life-science sector which face highly uncertain tasks involving the application of new scientific concepts and the transformation of technologies and prototypes into viable products or services (Fontes, 2005, Knockaert et al., 2011).

However, in line with some previous studies (Knockaert et al., 2011; Visintin and Pittino, 2014), the profile differentiation should improve ASO performance even if its effect may be moderated by other features. This argument is consistent with recent theoretical reasoning on the topic (Knockaert et al., 2011) and may contribute also to reconcile the controversies in the literature on team heterogeneity and new venture performance (e.g. Amason et al., 2006).

Research limitations. Our study has some limitations according to different perspectives. First, one-year observation could be a rather short time-frame to assess the impact of individual features on company performance. Therefore, future developments along this line of research should monitor ASOs over longer periods of time and different stages of development. We can also extend this analysis to other sectors and/or countries, in order to provide more reliable empirical evidence. Additionally, we evaluate the heterogeneity of ASOs managers, regardless of whether they are shareholders. This might be relevant for assessing the relationship between academic shareholding and ASO strategic decisions.

Managerial implications. Our expected findings have several practical implications. First, the profile differentiation in TMT can accelerate ASOs' time to market, resulting in a better performance. This could be framed as a best practice for universities in fostering local economic development. Moreover, in academic technology transfer aimed at creating new entities from research, knowledge transfer managers should evaluate academic competences and capabilities in terms of scalability, thereby promoting a well-balanced governance model between academic and non-academic members, as supported by the literature.

The relevance of the profile differentiation between academics and non-academics has also relevant implications for the management and policy support of academic entrepreneurship programs. On this ground, Technology Transfer Offices (TTOs) should assess different strategies according to ASOs' peculiarities, distinguishing those having a pronounced market orientation from those aimed at enlarging and deepening researchers' scientific and technological competences (Colombo and Piva, 2012). Such contingency perspective would suggest that a heterogeneous team is better suited to the highly-dynamic life-science sector which requires strong market alliances and multiple business skills and competencies (Di Bernardino, 2016).

Originality of the paper. This ongoing work is part of the research field on academic business ventures, taking for the first time a micro-foundational perspective to analyze horizontal and vertical factors in TMTs that affect ASOs' performance. Particularly, this work tries to bridge a research gap in the ASO literature, shedding light on the relationship between TMT composition and new venture performance considering some important interactions between team members following a micro-foundational perspective (Barney and Felin, 2013). Our expected findings also contribute to the general literature on entrepreneurial teams in new ventures and suggest a mean to reconcile some inconsistent results of the literature on TMT heterogeneity and ASO performance.

Women entrepreneurship studies: which impulse from UN Agenda 2030? A Systematic Literature Review

MICHELA FLORIS* GIORGIA D'ALLURA*

Objectives. *Women's role in the larger entrepreneurship phenomenon and economic development is destined to change as a consequence of the UN Agenda 2030 (Bidegain Ponte and Enriquez, 2016. Accordingly, women entrepreneurship has attracted the attention of academics and practitioners with a large body of research studies in recent years, specifically systematic reviews of the literature. The goal of a systematic review of the literature is to describe and assess how research is organized and conducted in the field under investigation. Specifically, scholars from different fields of research highlighted the need to investigate various dimensions of women entrepreneurship to extend theoretical concepts to improve our understanding of women entrepreneurship as a topic of research inquiry (Al-Qahtani, Fekih Zgui, Al-Fagih, and Koc, 2022). Themes such as drivers, barriers, risks, and business outcomes have been mostly investigated by adopting various models and methods. However, there is a current call for more objective and technology-facilitated analytical methods. Previous studies, although they have led to different and sometimes contradictory results, agree on the fact that scholars have to spend their efforts to identify a theoretical framework to observe, analyze, and understand the phenomenon. In this perspective, there are still no studies on how literature has positioned itself after the strong impulse that the UN 2030 agenda has given to the development of women entrepreneurship. For this reason, a systematic review of the literature that includes the reference to the UN Agenda 2030 is essential to understand, also at an institutional and political level, what is changed from 2015 to now, and what actions can be taken to stimulate women entrepreneurship further, and remove the cultural, social, economic and financial barriers that still exist. Our study answers to the current call by providing a systematic literature review into the development of women entrepreneurship research including a new analysis on the impact of the Un Agenda 2030. With the aim to build a better understanding on how policies may turn in academic research (and vice versa), this paper attempts to present an overview of the field before and after the introduction of the Agenda2030 and highlight future research directions. In particular, this paper has two broad goals. The first goal is to highlight mainstream entrepreneurship journals by exploring the number of papers published on women entrepreneurship in these journals before the introduction of the Agenda 2030. The second objective of the paper is to review the growth of the field and present an analysis of the literature review papers published on women entrepreneurship till 2022.*

Regardless, there are at least two shortcomings in analyzing and mapping the women's entrepreneurship research field and the link with the UN Agenda 2030. The advent of the Agenda 2030 is powerful, including a goal for the global economy, with unprecedented such universal orientation on businesses. The GEM 2022 global report on the status and perceptions of entrepreneurship activities found that women still constitute a sizable portion of high-potential entrepreneurs: that is, those individuals starting some of the most promising new firms with high aspirations for growth and impact. New companies contribute to their local communities and economies in many ways, but most notably through job creation. While most companies start pretty small as solo endeavors or with 1–5 employees, women are typically much less likely to start companies with high numbers of employees. Thus, women should play a strategic role to meet the goal of AGENDA 2030, with different roles in different SDGs. The first shortcoming refers to the fact that previous studies have undervalued the relevance of women entrepreneurship in achieving sustainable development, which includes the effort to ensure current and future societal wellbeing, under the pressure of UN Agenda 2030. The second shortcoming refers to the fact that, to our knowledge, a limited number of studies have analyzed how women entrepreneurs can nurture sustainable solutions in line with the 17 UN Sustainable Development Goals, such as poverty, hunger, education, and inclusive communities.

Methodology. *This study adopts a Systematic Literature Review (SLR) because it provides a comprehensive overview of literature related to the aim of this study and synthesizes previous work to strengthen a particular topic's foundation of knowledge while adhering to the concepts of transparency and bias reduction (Pittway, 2008; Tranfield, Denyer, and Smart, 2003). Based on the combination of SCOPUS and Web of Science databases, which include a large number of leading journals, this study carries out an analysis of the articles from 2000 to 2023 (export date March, 7th) to verify the publication trend with a particular emphasis on the content of the articles published from 2015 to 2023, to*

deepen the knowledge on the role exerted by UN Agenda 2030 in terms of whether and how Sustainable Development Goals are stimulating the proliferation of studies on women entrepreneurship, suggesting new perspectives and research directions.

The search in SCOPUS and Web of science was made in three steps. In the first step, we used the following keywords and phrases in Title, Abstract, and Keywords: "Women entrepreneur*", "Female Entrepreneur*", "Gender Entrepreneur*", "Women-led firm*", "Women enterprise*", "Female firm*". We retrieved more than 4,000 documents. In the second step, we used "Agenda 2030" OR "Sustainable Development Goal*" OR SDG*, and the search returned more than 33,000 documents. In the third step, we combined the mentioned searches and retrieved 79 documents. Moreover, we included only English language articles published in academic journals and collected in the subject of Business, Management and Accounting. This step resulted in 43 selected articles, as shown in Table 1, that we proceeded to analyze.

Findings. *The study is currently in progress, thus the findings we show are preliminary in nature, even if interesting and intriguing because able to disentangle a complex nest of studies that both face interesting topics and polarize their attention towards well-defined trajectories.*

Preliminary results deriving from the first step uncovered that the studies focused on women entrepreneurship were carried out by facing the topic under the lens of entrepreneurial attitudes, entrepreneurial intentions, gender differences in managing successful firms, women entrepreneurship as a driver to women empowerment especially in poor countries, and the industry as a catalyzer of male or female interest. In a certain sense, some findings contributed to the enhancement of stereotypes, such as the gender division between high-income industries (male-dominated) and low-income industries (female-dominated). The analysis of women entrepreneurship studies from 2000 to 2022 showed that the field of research has increased in its relevance, and exponentially especially from 2015 to 2022. Our first impression was positive because we believed that the suggestions of UN Agenda 2030 stimulated this scholarly increasing attention.

During the second step, we noted an alarming bias due to the fact that UN Agenda 2030 is generally considered in terms of environmental sustainability, while the main contribution of the document is related to the comprehensive framework of sustainability definition.

The third step, which was characterized by the merging of the two searches - women entrepreneurship and UN Agenda 2030 - revealed an underdeveloped field of research. In fact, we found that the number of articles was not high, as we rather expected. Moreover, the selected articles have been published in a small number of specialist academic journals, which have been interesting since their foundation in publishing articles dealing with sustainability issues. In other words, among the selected articles, very few have been published in General Management or Entrepreneurship leading journals.

After reading the articles, however, findings show the main themes that scholars have deeply analyzed, and at the same time, those that deserve to be faced to contribute in unpacking the current and future women entrepreneurship studies.

We identified five main themes that consider, alternatively, UN Agenda 2030 as a driver to enhance women entrepreneurship and, women entrepreneurship as a driver to pursue several SDGs (especially SDG 1, SDG 5, SDG 7, and SDG 11):

- *women in service sectors and in social enterprises* (e.g. Alicia Mas-Tur, 2022; Fernández-Guadaño and Martín-López, 2023);
- *women entrepreneurship in emerging countries* (e.g. Quagraine, Adams, Kabalan, and Dankwa, 2021);
- *barriers and opportunities* (e.g. Pearl-Martinez, 2020);
- *technology as a driver to improve women entrepreneurship* (e.g. Ge, Abbas, Ullah, Abbas, Sadiq and Zhang, 2022);
- *female entrepreneurship education* (Pimpa, 2021).

In addition, the selected articles include several policy recommendations, with profound attention on government interventions and actions to promote women entrepreneurship. The suggested policies appear able to enhance women empowerment, and change the patriarchal culture, especially in well-defined geographical areas.

In sum, the preliminary results of this Systematic Literature Review, which aimed to deepen the knowledge of the role of UN Agenda in the studies of women entrepreneurship, underlined that UN Agenda does not act as a catalyst for women entrepreneurship field of research. Probably, the SDG5, which is related to gender inclusion, has stimulated the proliferation of other studies on women, such as women involvement in C-suite level, undervaluing the relevance of self-employment, and thus entrepreneurship, as a relevant way to ensure women empowerment, reduce gender divide, and contemporarily contribute to the achievement of the other SDGs..

Research limits. We consider two main limits of our study. The first refers to the extension of the data collection. Even though Scopus and Web of Science are very large databases, future research can combine additional databases to enrich the analysis, uncovering interesting further nuances that can help to delineate the trajectories of women entrepreneurship studies that in the last ten years have registered a heavy increase. The second limit that may be addressed to our criteria of data collection is the period of time. We choose to consider the period of timing before and after the introduction of the UN Agenda 2030. However, we also consider the opportunity to investigate the theme before the date of 2000 in order to extend the period of observation. Specifically, future researchers may consider different periods of timing also with the aim to build a history of the field.

Practical implications. Women represent half of the world's population and play a vital role in economic and social development. Our literature review offers a theoretical reflection and a research agenda on the basis of the results achieved. Through this work our aim is to provide a closer look on the impact of national and political policies on theoretical development of academic research on this topic. Further, our findings on existing research trends linking women entrepreneurship and the UN Agenda 2030 has been discussed under the SDG flags issues related to SDG 1, no poverty, SDG 5, gender equality, SDG 7, affordable and clean energy, and SDG 11, sustainable cities and communities. Nevertheless, there are 13 other SDGs, and more importantly, many of the SDGs are interconnected. Consequently, our study shed some light on the practical opportunity to undertake activities on other facets of sustainable development would be beneficial. For example, the potential impact that women entrepreneurs can have on SDG 8, decent work and economic growth action, or SDG 10, reducing inequalities seven, through their choice to start new businesses in specific sectors and by inspiring a new generation of women entrepreneurs (women empowerment).

Originality of the study. The phenomenon of women entrepreneurship is gaining increasing attention from scholars, especially in recent years due to the increase in women entrepreneurs worldwide. Recent studies argue that women play a significant role in entrepreneurship (Noguera et al., 2013), contributing to socio-economic development (Strawser et al., 2021), have positive impacts on poverty reduction and promote inclusion socially (Langowitz and Minniti, 2007).

However, women who decide to create an entrepreneurial activity are significantly less than their male colleagues (Elam et al., 2019)

Several scholars state that this difference, accentuated in some countries compared to others, could derive from stereotyped and male-dominated perspectives which would seem to discourage women from undertaking business activities (Langowitz and Morgan, 2003).

Other studies highlight other barriers, such as lack of education (Hansemark,1998), experience and training opportunities; spatial mobility and lack of family support; lack of institutional support; lack of entrepreneurial management; and problem acquiring financial resources (Raghuvanshi, J., Agrawal, R., & Ghosh, P. K., 2017).

The originality of the study relies on the focus on UN Agenda 2030, to understand if it represents a driver to enhance and stimulate women entrepreneurship. Contemporarily, this study tries to understand whether and how scholars have conjugated women entrepreneurship and UN Agenda 2030 in their studies. Compared to other studies, we produce new findings on the relationship between women entrepreneurship and the UN Sustainable Development Goals (SDG). We see a different relationship with SDG and we consider that future research should invest in the analysis of this difference to consider its impacts, first, on the development of the field and, second, on the practical side of the UN Agenda 2030. Based on our findings, we offer suggestions for future studies to investigate the impacts of Un Agenda 2030 to foster women's entrepreneurship, including a closer look at the evaluation of the various SDGs.

Harmonic Entrepreneur: a systematic literature review

MARIACARMELA PASSARELLI* GIUSEPPE BONGIORNO* PIERO VALENTINI[▲]
ALFIO CARIOLA** SEBASTIANO MASSARO**

Framing of the research. *How the world's most successful entrepreneurs manage their stress? Entrepreneurs put their reputations and often their investments (as well as their dreams) into the company, and in many cases, they are carrying on a reality that has existed for generations and must last for more generations, with an inevitable and solid personal identification (Dyer et al., 2014; Pittino et al., 2018; Parente and Kim, 2021). For these people often the balance between personal and working life is absolutely a mirage, as the company becomes life, the reason for its existence (Ezzedeen and Zikic, 2017). As one of the most high-powered CEOs in the world, Elon Musk only thinks that to suck up any stress he has and work with it. "If something's important enough, even if the odds are against you, you should still do it." He doesn't waste time self-pitying, and instead uses it to his advantage to help keep all of his ducks in a row – instead, he uses it as fuel to get ahead of the game and keep the money (and the business) coming in. "The ability to boil things down, to work on things that are things that really counts, to think through the basics.... It's a special form of genius". Bill Gates' approach is simple, but one that few actually follow through with; the simple task of stripping it back, and taking things one task at a time. Often when we are stressed, we get overwhelmed with the magnitude of the tasks that we have to achieve. But if we take things one step at a time, task after task, we're more likely to have a better performance and outcome. Jobs always took more of a spiritual approach to stress, focusing on mindfulness rather than getting distracted by the stresses of his incredibly busy life. Jobs appreciated just how much the mind can control our emotions and as a result, mean that we're not getting the most out of our day-to-day because we're becoming wrapped up in stress. Instead, try and focus your mind. "If you just sit and observe, you will see how restless your mind is. If you try and calm it, it only makes it worse, but over time, it does calm."*

Kevin N. Lawrence in his famous book on *Oxygen Mask First* (2017) refers to the famous phrase recited by the hostess in explaining the emergency procedure: "first put on your oxygen mask and then help others". This reference can be considered a metaphor to explain a strong dichotomy of entrepreneurship: a human and professional life experience, and yet one that, on the other hand, generates high stress and requires a constant dose of focus and energy. Entrepreneurs constantly test their limits, reckon with their own shadows, enjoy successes, weave relationships, through an up and down of emotions, positive and negative (Rojas et al., 2022).

Entrepreneurs have an enormous responsibility; they involve all their life into the companies so that they can generate value for society. All this represents a major daily emotional burden, which poorly managed, can lead to the 'burnout'.

Frequently the entrepreneur thinks that he/she literally has no time to take proper care of himself/herself, that these moments are not allowed because there are way too many responsibilities and things to do (Nikolaev et al., 2020). It thus enters a vicious circle of stress and malaise that inevitably generates negative relational and economic performance (Lerman et al., 2021). In recent years, partly because of the Covid-19 pandemic, people have begun to think about a more harmonic life able to give a balance among heart, body and mind (Wach et al., 2021). This is an interesting aspect to investigate.

Wellness is an integral part of living a fulfilling and flourishing life and is intimately related to people's ability to work, maintain positive relationships, and experience positive emotions (Ryff and Singer, 1998; Ryan and Deci, 2000; Diener et al., 2010; Seligman, 2012). Higher levels of wellbeing can recharge entrepreneurs' psychological resources such as optimism, resilience, and self-esteem and stimulate them to continue to persist in challenging tasks that others often consider impossible (Foo et al., 2009). This dynamic can become a force for positive change in society, which has positive effects on individual and social wellbeing (O'Neil and Ucbasaran, 2016). In recent years, entrepreneurship

and management scholars have been questioning the importance of the well-being of the *ENTREPRENEUR* as a person (Uy et al., 2013; Shir, 2015; Shepherd and Patzelt, 2017; Stephan, 2018; Shir et al., 2018; Wiklund et al., 2017). The entrepreneur is first and foremost a “person”, therefore both his existential and logical-formal aspects must be considered. In order to achieve as much, the whole human being must be examined.

Several studies show that happier people have more satisfying jobs (Erdogan et al., 2012), tend to have a more psychologically fulfilling life (Helliwell et al., 2013) and are more likely to live a longer and healthier life (Chida e Steptoe, 2008; Diener e Chan, 2011; Wiest et al., 2011). They also tend to be more creative and productive as well as staying more socially connected (De Neve et al., 2013; Lyubomirsky, 2008). These benefits, in turn, flow back into their families, workplaces, and communities, creating a virtuous circle of wellbeing (Helliwell et al., 2013).

Well-being, in fact, is a word that should be considered as a composed word of “well” and “being”; it explains two main concepts: “being well” and “existing well” is a state that involves all aspects of being human. The Treccani dictionary, in fact, defines wellness as one “a state of good health that characterizes an individual’s life in a positive sense or even a pleasant feeling of satisfaction, of mental and physical fulfilment. The word well-being, finally, can be used as an invariable adjective to indicate something that gives a state of health, of satisfaction”. The root of well-being is the word “well,” which indicates being as operationally effective and healthy.

Purpose of the paper. Coherently with the theoretical framework, the purpose of this work is to propose and explore an anthropocentric perspective of entrepreneurship (from Greek *ἄνθρωπος*, *Anthropos* as “human being” and *κέντρον*, *kentron* that means “center”), based on the concept of harmony. Stemming from Latin “*prahendere*” which means “to take upon oneself”, “to take charge of”, the term “self”, includes both a self-care perspective, a condition of respect, and solicitude for the other; it includes also reciprocity in emotional relationships and cooperation in social relationships.

All these elements explain a wellbeing perspective, where, the word “well”, invokes the word “harmony” as the relational logic that generates all levels of aggregation of matter in which human beings are shaped. Starting from the subatomic elements, the relationship of which forms the atoms, molecules are born from the relationship of the latter, and in turn, from these, relating, are created the organelles that give birth to the cell. From here the tissues, organs, apparatuses and finally an organism endowed with mind and heart: human being. So, human being is an immense harmony of relationships, and the phenomenon that has been described is our life, the life of human beings and also the life of the entrepreneur (Ryff, 2019).

Methodology. In order to answer the research questions, the methodological approach of systematic literature review (SLR) is used with the aim of analysing the state of the art on the topic under investigation (Secundo et al. 2020; Kraus et al. 2020). SLRs are reviews conducted in a systematic manner using an adopted procedure or protocol to guide data analysis, thus enabling transparent and replicable dissemination (Lim et al. 2022a; Kraus et al. 2020). According to Kraus et al. (2022), a SLR is a rigorous and relevant approach that produces knowledge, helps identify trends and research pathways, and potential future research. In more detail, according to Tranfield et al. (2003), this structured review method relies on filtering such that the process is replicable allowing bias in the results to be minimized. In this section, we summarize the main methodological steps suggested by previous studies (Dumay, 2010) with the aim of developing a systematic, transparent, and replicable 3D literature review methodology. Specifically, the first D requires the definition of the research questions, which, according to Massaro et al. (2016), is the preliminary step to conduct a SLR. In this study, some research questions were identified: what is the state of the art in the field of harmonic entrepreneurship? what are the main trends in the literature? what are the main themes on which to focus future research?

To answer these research questions, we move on to the second D, that is: Design a review protocol to determine the articles to be included and perform a comprehensive search of the material. For this work, the guidelines related to Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) (Moher et al., 2009) were followed in order to minimize errors in interpreting the results of the collected studies. Finally, going through the last D, a coding framework was developed. This approach was chosen to improve the value of the literature review results and minimize errors in interpretation (Fahimnia et al., 2015). The methodology chosen for the analysis is the bibliometric methodology (Kraus et al., 2022).

Documentary and bibliographic analysis was carried out using the Web of Science platform “a database of bibliographic citations from multidisciplinary areas, pertaining to journals in medical, scientific and social sciences, as well as humanities disciplines,” to retrieve all relevant documents on the topic (Identification). The material search phase was conducted in February 2023.

The first step consisted in searching for documents containing all the words needed to answer the search questions. In the query, the following keywords were entered for the Title section: “well*” and “Entrepreneur*” and in the Topic section the word “Harmonic.” The search returned 289,764 documents. The next step was to limit the analysis to the following categories: Business, Management, Psychology Multidisciplinary, Economics, Social Sciences Interdisciplinary. In the attempt to make the bibliometric analyses even clearer and refine the search, a series of filters were used. These made it possible to select only English-language papers, per journal of particular quality (example ABS 4*,4,3) without specifying a particular time interval. Key conditions for inclusion of a paper depended on whether it dealt with entrepreneurship and well-being or similar concepts. Using the above search criteria, 122 papers were extracted from the database.

Bibliometric analysis allows us to identify changes, both in number and content, within the research topic and provide useful data for assessing scholarly activity in a particular field through keyword analysis and the application of

statistical methods (Morris and Van der Veer Martens, 2008; Van eck and Waltman, 2010). Indeed, according to Cobo et al. (2011), scientific mapping, is an important research topic in the field of bibliometrics. The Bibliometrix package of R-studio software was chosen to carry out the analysis since it is an open-source tool that includes all major methods of bibliometric analysis and science mapping (Aria and Cuccurullo, 2017).

Results. To reach our purpose, it is important to visualize the structural and dynamic aspects of scientific research, made possible by certain types of bibliometric analysis (Börner et al., 2003; Noyons et al., 1999).

Among the most important of these the conceptual structure is included, which explains the main themes covered by a field by representing them in a well-defined scheme. However, we also find Co-citation (Small, 1973) and bibliographic coupling (Kessler, 1963) used to analyse the intellectual structure in a particular field of literature. For clarity, bibliographic coupling is a fixed and permanent relationship because it depends on the references contained in the paired documents, while co-citation varies over time (Jarneving, 2005). Starting with the conceptual structure, the relationship between concepts or words in a set of publications is analyzed. The thematic table was generated, which consists of 4 different quadrants, each of which refers to a particular theme that needs to be defined. To construct the table, two parameters were considered: Centrality (X-axis) and Density (Y-axis) (Callon et al., 1991). Motor Themes are characterized by high centrality and high density; these are the themes that have gradually become more prominent and are the “leading” research themes. Basic Themes are characterized by high centrality and low density. Emerging Themes have low density and low centrality, as they deal with underdeveloped and marginal topics. Finally, Niche Themes have high density (highly developed) and low centrality, due to the fact that they are very isolated themes. As research themes have evolved over the years, the entire time frame of analysis was divided into two, using 2019 as the “cutting year.”

Authors’ keywords were used as the discriminant of analysis and taking about 250 words as the order of analysis.

In the first period, until 2019, the “Motor” themes mainly concern the sphere of subjective well-being, happiness and psychological well-being (psychological well-being, well-being, subjective well-being, happiness, life satisfaction). The theme related to well-being in the “social” perspective is counted among the emerging themes (social entrepreneurship) while entrepreneurial success is niche (business success).

From 2000 onward, the motor themes concern various factors related to the emotional and personal sphere (family support, opportunity entrepreneurship, opportunity recognition, self-determination theory, social entrepreneurship, national well-being, social capital, job satisfaction, autonomy, entrepreneurial stressors). In this period, the aspect related to “prosocial” motivation (entrepreneurial exit intention, gender, prosocial motivation, poverty, women), becomes an emerging theme, highlighting how in the post covid period, issues related to well-being in its “social and ethical” meaning (Eudaimonic, subjective well-being, wellbeing, covid-19, psychological well-being) become established.

While, concerning the analyses on intellectual structure, they highlight the relationships between nodes, which can refer to articles, authors and sources. The Co-citation network related to the papers resulting from “Web of Science”, in order to create the different clusters, at least 6 citations were considered, for a total of 9310 citations. The analysis, developed returned three clusters, referring to different research topics:

- the first includes all contributions in the literature that analyze the emotional aspect and stress management (Cardon, 2009; Baron, 2011; Cardon, 2015);
- the second clusters the works that address issues related to the sphere of personality (Stephan, 2018; Diner, 1984; Ryff, 1989; Wiklund, 2019);
- the third the “Mental health” (Stephan 2018; Uy ma 2013; Ryan 2001).

Regarding the results of the Coupling analysis, (in which the selected papers had at least 6 citations and the clusters were composed by imposing 20 as the minimum number of papers contained in each of them). The analysis returned two main clusters, each referring to future research trends on which the literature is targeting. Specifically:

- The first cluster can be associated with papers that focus on the theme of “well-being,” from the perspective of “physical health and stress management” (Stephan, 2018; Wiklund, 2019);
- The second cluster fits with the theme of “social well-being” (O’Neil and Ucbasaran, 2016; Uy, 2012; 2013).

On the basis of results, it is possible to define a new construct, that is the “harmonic entrepreneur,” one who tends to a balance that involve mind-body relation and mind-heart relation, and operates with passion, to create social value.

Research limitations. This is a first contribution within a larger project, that is in progress. Thus, other keywords can be taken into account in the future and also possible challenges and empirical applications should be proposed.

Managerial implications. The entrepreneur must allow himself/herself to be humanly imperfect, to express how he/she feels, to simply be human, and to prioritize his/her psycho-emotional well-being. From one side the Entrepreneur should be careful of his mental and physical health and the literature is developing different contributes on this field (Cucino et al., 2021).

Exercise and physical activity improve physical and mental well-being. Distraction from stressful events produces important benefits to the individual. For instance, some studies have shown that physical activity reduces anxiety and improves a person’s state of mood (Petruzzello et al., 1991; Raglin & Morgan, 1985); exercise-induced mood improvement and anxiety reduction are linked to the release of β -endorphins, both at the central nervous system level and at the peripheral nervous system level. In addition, reasonable values of T and C improve well-being and even make the entrepreneur more alert to the recognition of opportunities.

From the other side the entrepreneur should “d well” in terms of ethical behaviours. However, we think that ethics must be endogenous to the harmonic-entrepreneur who in the relationship with himself and others establishes a healthy

relationship based on positive values: friendship, love, goodness, common sense, consistency, courage, education, loyalty, fraternity, kindness, gratitude, loyalty, honesty, wisdom, sincerity. We need to rediscover the deep meaning of Kantian thought. According to Kant, in fact, morality corresponds to the set of values of an individual, of a group, while ethics, besides sharing this set, also contains the speculative reflection of norms and values. The inner beauty of the entrepreneur is thus projected into the surrounding world, which is why we need to “take care” of the harmonic-entrepreneur and he in turn has a duty to protect nature and other living beings. Thus, “if we want to rebuild hope, we must abandon the languages, gestures and choices inspired by selfishness and learn the language of love, which is “taking care.” Caring is a new language that goes against these languages of selfishness. This is the commitment: to take care of our lives, our time, our souls; to care for creation and the environment in which we live; and, even more, to care for our fellowmen, those whom the Lord has placed next to us, as well as our brothers and sisters who are in need and call for our attention and compassion. Even of ourselves” (Pope Francis).

A proper balance between the mind-body perspective and the mind-heart perspective generates in the entrepreneur a harmony of life that is reflected in his or her business activities and life in general.

Originality of the paper. This paper, through a systematic literature review with bibliometric methodology, proposes a new entrepreneurial perspective, multidisciplinary in nature, which combines the concept of being well (healthy) with the concept of doing good. Therefore, being well in order to generate good, with passion, leads to a feeling of wellbeing and harmony and enables opportunities that generate paths of “rebirth,” from the crisis, leading to the true economic and social sustainability of the enterprise that should be cherished by all entrepreneurs. It is important to note, that to the limit of our knowledge, this work represents one of the first systematic literature reviews with bibliometric methodology on the topic of entrepreneurship that takes into consideration the entrepreneur, the mind-body well-being perspective and entrepreneurial activity.

Keywords: harmony; entrepreneurship, well-being, ethics, neuroscience

Capitale umano, sociale e finanziario e differenze di genere nelle decisioni di uscita imprenditoriale

NUNZIA PETACCA* NADIA DI PAOLA*

Inquadramento della ricerca. Nonostante sia stata trascurata fino a qualche tempo fa, l'uscita è una componente critica del processo imprenditoriale ed è uno dei domini distintivi della ricerca sull'imprenditorialità (DeTienne, 2010; DeTienne e Cardon, 2012; Wennberg et al., 2010). DeTienne definisce l'uscita imprenditoriale come il "processo mediante il quale i fondatori di aziende private lasciano le aziende che hanno contribuito a creare" (Cit De Tienne, 2010: 203).

Nella letteratura accademica, l'uscita imprenditoriale è un argomento indagato da parte dei ricercatori, i quali riconoscono in maniera sempre maggiore, che l'imprenditorialità è un processo continuo (DeTienne et al., 2012; Gimeno et al., 1997; Hessels et al., 2011; Ryan, e Power, 2012; Salvato et al., 2010; Wennberg et al., 2010). In questo senso, la decisione di uscita non è necessariamente una scelta permanente di cessazione dell'esperienza imprenditoriale, ma può preludere all'inizio di successive esperienze imprenditoriali (Stam et al., 2010). Inoltre, gli studi recenti sottolineano che gli imprenditori possono decidere di uscire dall'impresa per ragioni anche differenti e non necessariamente collegate alla performance di tipo economico-finanziario (DeTienne e Cardon, 2012; Mayer e Goldstein, 1961; McGrath, 2006; Ronstadt, 1986; Sarasvathy et al., 2013; Taylor, 1999). Una sintesi dei principali studi sull'uscita imprenditoriale è presentata in Tabella 1.

Tab.1: La letteratura sulle strategie di uscita dell'imprenditore

Autori	Titolo	Principali evidenze in letteratura
Chirico 2020	<i>The persistence of family firms: How does performance threshold affect family firm exit?</i>	Nelle imprese familiari, l'imprenditore è condizionato spesso da fattori quali l'attaccamento emotivo, l'orientamento al lungo termine e i forti legami familiari (Akhter et al., 2016; Chirico et al., 2020). Gli imprenditori delle imprese familiari, pur avendo soglie di performance più basse, sono meno propensi alla definizione di strategie di uscita imprenditoriale.
Delmar and Shane, 2004, Pe'er and Vertinsky, 2008	<i>Systematic Review of Research on Exit: a Bibliometric Analysis and Future Directions</i>	L'uscita può essere studiata a livello individuale (imprenditore), a livello di team e a livello aziendale. Gli imprenditori possono uscire dalle aziende che hanno fondato ma queste ultime continuano a operare. Le imprese possono cessare l'attività, ma i loro fondatori (imprenditori) possono continuare a svolgere la loro attività imprenditoriale fondando una nuova impresa
DeTienne 2010	<i>Exit Strategies in Family Firms: How Socioemotional Wealth Drives the Threshold of Performance</i>	L'uscita dall'impresa è il processo attraverso il quale i proprietari/imprenditori "lasciano le imprese che hanno contribuito a creare..." ed è necessario comprenderne le cause, poiché ha effetti sull'impresa, sulla famiglia, sul settore e sull'economia in generale
Gimeno 1997	<i>The fallacy of "only the strong survive": The effects of extrinsic motivation on the persistence decisions for under-performing firms.</i>	Teoria della soglia. L'imprenditore con una soglia di performance bassa potrebbe persistere, mentre un imprenditore con una soglia di performance alta tende a uscire
Petty1997	<i>Entrepreneurial exit as a critical component of the entrepreneurial process: Theoretical development</i>	La strategia di uscita è paragonabile all'acquisto di azioni quotate in borsa da parte di un investitore. Gli investitori acquistano azioni di una società e ne osservano l'aumento di valore nel tempo; solo quando le azioni vengono vendute, i profitti (o le perdite) vengono effettivamente riconosciuti
Rachida J., DeTienne, Sieger P. 2014	<i>Failure or voluntary exit? Reassessing the female underperformance hypothesis</i>	La strategia di uscita è associata alla sopravvivenza dell'impresa. Alcuni studi hanno rilevato che i tassi medi di sopravvivenza delle imprese di proprietà maschile sono superiori del 4-6% rispetto a quelli delle imprese di proprietà femminile. Le ragioni sono: mancanza di accesso a risorse come i finanziamenti, mancanza di esperienza manageriale precedente per le donne
Stam E. Thurik R. Van der Zwan P. 2010	<i>What do we really mean when we talk about "exit"? A critical review of research on entrepreneurial exit</i>	La strategia di uscita è "la decisione di lasciare una carriera imprenditoriale" e rappresenta un cambiamento importante nell'attività lavorativa e/o nell'identità lavorativa. Alcuni autori hanno osservato che sia l'ambiente competitivo che quello istituzionale influenzano l'uscita dall'impresa
Wennberg 2014	<i>Entrepreneurial Exit Strategies</i>	La strategia di uscita è il processo con cui l'imprenditore intende lasciare l'azienda e può essere legata alle motivazioni personali dell'imprenditore. Gli imprenditori escono sia da imprese finanziariamente in difficoltà (liquidazione e vendita) sia da imprese con buone performance
Wiklund 2003	<i>The impact of motivation and causation and effectuation approaches on exit strategies</i>	La strategia di uscita di un imprenditore dipende dalla sua motivazione. La motivazione è l'attivazione di un comportamento orientato agli obiettivi.

DeTienne et.al (2012) identificano tre strategie di uscita: *stewardship*, *raccolta finanziaria* e *cessazione volontaria*. Nel dettaglio una strategia di uscita basata sulla *stewardship* si riferisce ad una decisione guidata da un "senso continuo di obbligo o dovere verso gli altri" (Cit. Hernandez, 2012, p. 174) prevedendo continuità aziendale e cura dell'azienda, della famiglia e dei dipendenti (DeTienne et al.2012). La *successione familiare*, vale a dire, il processo attraverso il quale i proprietari della famiglia trasferiscono la proprietà della loro azienda a uno o più altri membri della famiglia, spesso i figli dei proprietari (Sharma, Chrisman e Chua, 2003) è una comune strategia di uscita basata sulla *stewardship* (DeTienne et al.2012).

Una strategia di uscita basata sulla *stewardship* fa sì, che coloro che la perseguono, sono disposti a sacrificare i guadagni finanziari personali al fine di promuovere la visione a lungo termine della famiglia e tutelare il benessere a lungo termine degli altri stakeholder (Miller, Le Breton-Miller e Scholnick, 2008.)

Una strategia di uscita basata sulla *ricompensa finanziaria* è una strategia basata sui massimi rendimenti potenziali per i proprietari (Babich e Sobel, 2004; DeTienne et al., 2012). Coloro che perseguono una strategia basata sulla *ricompensa finanziaria* tendono a favorire i ritorni finanziari personali rispetto ad altri obiettivi.

Per concludere una strategia di uscita basata sulla *cessazione volontaria* è quella che si riferisce ad un certo punto nel futuro allo scioglimento di un'impresa e alla liquidazione delle sue attività (DeTienne et al.2012).

Le prime ricerche sull'imprenditorialità tendevano a presumere che l'uscita fosse il risultato di scarsi risultati (Boden e Nucci, 2000; Caves, 1998). La letteratura che analizza le dinamiche di uscita imprenditoriale mostra, invece, che le ragioni alla base di tale scelta sono variegata. Il recupero dell'investimento iniziale (Watson e Everett, 1996); la riduzione del rischio in capo all'imprenditore (McGrath, 1999), la disponibilità di un'alternativa lavorativa interessante (Bates, 2005; Taylor, 1999), o anche le motivazioni personali (Harada, 2007) sono tra queste.

Gli studi sull'uscita imprenditoriale hanno individuato due principali categorie di ragioni che conducono all'uscita imprenditoriale sulla base della volontarietà della decisione.

L'uscita involontaria è essenzialmente dovuta ad una scarsa performance economico-finanziaria ed è un evento ampiamente affrontato nella letteratura (Ucbasaran et al., 2013). Essa comprende sia il fallimento in senso stretto, in cui l'impresa ha completato e registrato l'evento fallimentare (Ucbasaran et al., 2013; Balcaen et al., 2012; Taylor, 1999), sia tutte le fattispecie nelle quali la performance dell'impresa non soddisfa "una soglia minima di sostenibilità stabilita dall'imprenditore" (Ucbasaran et al., 2013, p. 175). L'uscita volontaria riguarda l'ipotesi in cui l'imprenditore deliberatamente decide di interrompere la sua esperienza imprenditoriale nell'impresa (Justo et al., 2015). In questo caso, le ragioni che lo spingono sono riconducibili all'ipotesi di uscita per motivi personali e di uscita per la possibilità di cogliere altre opportunità professionali/finanziarie (Justo et al., 2015). Questo gruppo di motivazioni tra l'altro appare alquanto eterogeneo. Esso comprende le scelte di natura professionale, ad esempio relative alle opportunità alternative di carriera (Justo et al., 2015).

Inoltre, esso comprende le scelte guidate da ragioni non lavorative, tra le quali il pensionamento (Harhoff et al., 1998); le questioni relative alla struttura familiare (es. matrimonio, divorzio, problemi di cura dei bambini, assistenza ai genitori che invecchiano) (Marlow e Swail, 2014); problemi di salute (Harada, 2007) o un cambiamento nella motivazione personale dell'imprenditore (Van Praag, 2003).

Tra le caratteristiche individuali dell'imprenditore, quella del genere in letteratura appare rilevante per spiegare molteplici aspetti e fasi dell'esperienza imprenditoriale (Justo et al., 2015; Marlow e Swail, 2015). Innanzitutto, la letteratura si sofferma su alcuni aspetti che limitano la probabilità che le donne intraprendano la carriera imprenditoriale. Gli studi dimostrano inoltre che le donne sono attente al bilanciamento del loro ruolo professionale con la vita privata (Boden, 1999; Bonet et al., 2013; Caputo e Dolinsky, 1998; Brush, 1992). Esse inoltre mostrano una diversa percezione delle opportunità (DeTienne e Chandler 2007), delle difficoltà (Langowitz e Minniti 2007) e persino del rischio associato all'esperienza professionale (Wagner 2007). Inoltre, le donne sembrano avere un diverso atteggiamento nei confronti dell'impegno imprenditoriale, tendendo ad assumere una visione più olistica dell'impresa e a non separare gli obiettivi economici da quelli collegati al benessere dei propri dipendenti o allo sviluppo della società (Hechavarria et al., 2012; Jennings e Brush, 2013; Carter et al., 2003; Cliff, 1998; Brush, 1992; Di Paola, 2021).

Infine, esse sovente percepiscono maggiori difficoltà nella capacità di gestire gli aspetti finanziari e contabili (Anna et al. 2000; Díaz-García e Jiménez- Moreno 2010; Wilson et al., 2007) e tendono ad ottenere minori dotazioni di risorse, sia finanziarie che sociali rispetto ai loro omologhi maschi (Powell e Eddleston, 2013).

Tutto questo scoraggia e limita l'avvio del percorso imprenditoriale per le donne.

Se il genere incide sui motivi per stabilire o avviare un'attività imprenditoriale, alcuni studiosi avanzano l'ipotesi che che questo aspetto possa influenzare anche le successive intenzioni o decisioni di uscita imprenditoriale (Marlow e Swail, 2015), meritando maggiori approfondimenti (Justo et al., 2015; Taylor, 1999; Yang e del Carmen Triana, 2019).

La letteratura si è concentrata sulla performance peggiore delle imprese guidate da donne rispetto a quelle guidate da uomini (Due Rietz e Henrekson (2000); Boden e Nucci, 2000), presumendo che le donne imprenditrici abbiano maggiori probabilità di fallire rispetto ai loro coetanei maschi. In questo modo si è rafforzata la dominante "ipotesi di sottoperformance femminile" nell'imprenditorialità (Du Rietz e Henrekson, 2000; Rosa et al., 1996). Tale ipotesi fa riferimento a una letteratura che, almeno a livello aggregato, ha rilevato che "le imprenditrici tendono a performare peggio rispetto alle loro controparti maschili" (Du Rietz e Henrekson, 2000, p. 1).

Le dinamiche di uscita imprenditoriale però sono state solo limitatamente affrontate in letteratura, sebbene gli studi fatti abbiano mostrato che alcune differenze rilevanti sussistono, ad esempio quando la donna imprenditrice intravede una opzione lavorativa alternativa o la possibilità di ottenere una remunerazione interessante (Justo et al., 2015), o

anche quando le condizioni personali a contorno rendono più difficoltosa la prosecuzione dell'esperienza, ad esempio per esigenze familiari o nel caso di conflitti con i cofondatori (Justo et al., 2015).

Obiettivo del paper

Gli studi sulle strategie d'uscita imprenditoriale hanno esplorato le connessioni tra la scelta del percorso di uscita e il capitale umano e sociale dell'imprenditore (DeTienne e Cardon, 2012; Kaciak et al., 2020; Van Teeffelen e Uhlaner, 2013), indagando sulle implicazioni finanziarie e psicologiche per l'imprenditore (Rubenson e Gupta, 1996).

L'attuale ricerca sull'uscita imprenditoriale tende ad esaminare le intenzioni di uscita con riferimento prevalente al capitale umano, considerando aspetti come quelli del genere, dello stato civile e del sentimento che tiene legato l'imprenditore alla sua azienda (DeTienne Cardon 2012; Gimeno et al. 1997; Justo e DeTienne 2008; Justo et al. 2015; Lee e Lee 2015; Wennberg et al. 2010; Williams et al. 2013).

Secondo Becker (1975), per capitale umano si fa riferimento alle conoscenze e alle abilità degli individui dal punto di vista dell'istruzione, dell'età o precedenti esperienze imprenditoriali che rappresentano un vantaggio in più. Il capitale sociale è definito come la capacità da parte degli individui di trarre vantaggi dalle strutture sociali, dalle reti e dai loro membri (Davidsson e Hong 2003). L'influenza di tali reti sociali è connaturata al capitale sociale, pertanto dovrebbe essere considerata nei modelli che hanno come obiettivo quello di esplorare e di prevedere le intenzioni di uscita imprenditoriali. (Kaciak et al., 2021).

Per concludere il capitale finanziario si riferisce alle risorse finanziarie a disposizione dell'impresa (Cooper et al., 1994). Per l'avvio di una nuova impresa, il capitale finanziario è un fattore chiave perché le imprese nella fase iniziale affrontano una grande incertezza (Cooper et al. 1994; Huang 2016), e scontano le liabilities of smallness e newness (Stinchcombe, 1965).

Il capitale umano, sociale e finanziario, dunque, sono stati descritti in letteratura come driver dell'uscita imprenditoriale in alcuni lavori indicati in tabella 2.

Alla luce della letteratura presentata, tuttavia si evidenzia che i capitali umano, sociale e finanziario raramente sono stati considerati simultaneamente dagli studiosi e difficilmente adottando una prospettiva di genere. Pertanto, il presente contributo ha lo scopo di indagare come il capitale umano, sociale e finanziario simultaneamente possano condizionare la possibile strategia di uscita imprenditoriale delle donne imprenditrici, come illustrato in figura 1.

Fig. 1: Framework concettuale

Metodologia. Lo studio è in corso di svolgimento e prevede il coinvolgimento di imprenditori e imprenditrici basati in Italia.

Nel contesto italiano gli imprenditori e le imprenditrici tendono ad essere rappresentati in modo opposto: gli imprenditori maschi si riferiscono a sé stessi privilegiando gli aspetti schumpeteriani ed il loro ruolo nelle reti finanziarie; le donne, al contrario privilegiano il punto di vista culturale ed etico (Castagnoli, 2007). Nel Rapporto "Imprenditoria femminile 2021" di Unioncamere, l'Industria della Moda è posizionata al 2° posto tra i settori a maggior densità imprenditoriale femminile, ed è quello su cui il presente studio si focalizza. Secondo le stime elaborate dal Centro Studi Confindustria, il 2022 è stato un anno positivo per il tessile made in Italy, che ha chiuso con un fatturato di circa 8,1 miliardi di euro (+32,4% sul 2021). Anche il raffronto con i livelli pre-pandemici indica un incremento: il fatturato settoriale risulta infatti superiore del +7,1% rispetto al livello raggiunto nel 2019.

La ricerca coinvolge gli imprenditori di imprese localizzate sul territorio italiano, identificate tramite il registro delle imprese della Camera di Commercio.

Per selezionare le imprese si sono presi in considerazione parametri come: l'età e la dimensione dell'impresa, poiché è stato dimostrato che questi due aspetti influiscono sulle performance e possono condizionare la strategia di uscita dell'imprenditore (DeTienne e Cardon, 2008).

Il numero di imprese selezionate per lo studio è pari a 30, ripartite per genere in modo da garantire il bilanciamento complessivo di genere tra gli intervistati.

Il primo contatto avviene via mail, e in caso di risposta affermativa il partecipante allo studio è invitato per un'intervista a distanza. La raccolta dei dati avviene mediante interviste semi-strutturate, condotte da uno o più degli autori. Le interviste sono registrate, al fine di procedere alla trascrizione sulla quale si basano le elaborazioni (Tesch, 1990). L'intervista consta di domande aperte e discussioni guidate dall'intervistatore. Le domande si concentrano su età, livello di istruzione, esperienza imprenditoriale, capitale iniziale investito, social network ed eventuale pianificazione della strategia di uscita.

Tab. 3: Tematiche esemplificative affrontate durante l'intervista

Tematiche	Antecedenti
Livello di istruzione ed eventuali corsi di imprenditorialità frequentati nel percorso di studi	Capitale Umano
Esperienze imprenditoriali pregresse	
Bilanciamento tra impegni imprenditoriali e familiari	Capitale Sociale
Influenza delle reti sociali	
Difficoltà nel reperimento delle fonti di finanziamento	Capitale Finanziario
Se l'uscita imprenditoriale viene presa in considerazione come possibile strategia	Uscita imprenditoriale
Che tipo di strategia d'uscita si intende perseguire

La ricerca ha natura qualitativa, e adotta un approccio deduttivo. L'elaborazione dei dati avviene attraverso analisi tematica. Essa è uno strumento utilizzato nella ricerca qualitativa, perché garantisce il rigore e l'affidabilità dei

risultati, grazie all'uso delle interviste che permettono di rispondere alla domanda di ricerca (Nowell et al., 2017). Braun e Clarke (2006) hanno delineato la procedura adottata in questo studio, che è basata sulla conoscenza approfondita dei dati raccolti, la codificazione degli stessi, in modo da avere un raggruppamento delle idee analizzate, un'eventuale revisione, con l'obiettivo di produrre un report finale che riporti le specificità di ciascun tema trattato.

Nel nostro studio consideriamo tre variabili del capitale umano che possono essere correlate ad una specifica strategia di uscita: esperienza imprenditoriale, età e istruzione (Wennberg et al., 2010). Alcuni studi hanno dimostrato che per le donne era meno probabile: ricevere un'istruzione adeguata (Belcourt et al., 1991; Hisrich e Brush, 1984; Watkins e Watkins, 1983) ed avere avuto un'esperienza manageriale, industriale e imprenditoriale rilevante (Belcourt et al., 1991; Hisrich e Brush, 1984; Watkins e Watkins, 1983).

Per il capitale sociale consideriamo le reti sociali in quanto si può presumere che l'imprenditore che decide di effettuare una strategia d'uscita presti attenzione e tragga vantaggio da tali reti (Kaciak et al., 2021). In tal senso le imprenditrici potrebbero potenzialmente ridimensionare il loro impegno imprenditoriale se la sfera familiare ed aziendale sono in conflitto (Jennings e McDougald, 2007; Marlow e Swail, 2015).

Per il capitale finanziario, abbiamo considerato il capitale inizialmente investito in quanto nella fase iniziale è il più difficile da raccogliere (Prisciotta e Weber 2005). Studi hanno confermato che le donne sono più propense degli uomini a utilizzare fonti di finanziamento interne, come risparmi personali (Bennet e Dann, 2000; Haynes e Haynes, 1999).

Risultati attesi

Il rapporto tra impresa e donne imprenditrici è studiato dagli anni '80, prendendo in considerazione il livello di istruzione (Brush 1992; Singh et al. 2001). Alcuni ricercatori sono giunti alla conclusione che le donne imprenditrici sono più istruite su argomenti che hanno poco a che fare con le loro funzioni e, soprattutto, sono poco formate in campo finanziario (Sexton e Bowman-Upton 1990; Jafari et al. 2011). Rispetto al capitale finanziario le donne ricevono un trattamento economico meno favorevole rispetto a quello degli imprenditori quando trattano con i finanziatori e altri fornitori di risorse (Belcourt et al., 1991; Goeffee & Scase, 1983; Hisrich et al., 1984; Humphreys et al., 1981; Stevenson, 1986). Alla stregua del capitale finanziario, anche nella sfera personale possiamo cogliere degli elementi di disparità di genere: il matrimonio aumenterebbe la probabilità che gli imprenditori escano dall'azienda per altre opportunità professionali/finanziarie mentre le donne imprenditrici per motivi personali, solitamente legati alla nascita dei figli, in quanto sono viste come custodi della famiglia (Blair Loy 2009; Ridgeway 2011).

Tab. 4: Gli antecedenti dell'uscita imprenditoriale in letteratura

Antecedenti	Impatto sull'uscita imprenditoriale
Capitale Umano	<p>Le donne imprenditrici sono complessivamente più istruite degli uomini (Brush 1992; Singh et al. 2001);</p> <p>Ipotesi sottoperformance femminile (Du Rietz e Henrekson, 2000);</p> <p>Le precedenti esperienze imprenditoriali diminuiscono la probabilità di uscita. (Taylor 1999)</p>
Capitale Sociale	<p>Il matrimonio fa sì che gli imprenditori escano dall'azienda per altre opportunità professionali/finanziarie mentre le imprenditrici per motivi personali, solitamente legati alla nascita dei figli. (Blair Loy 2009; Ridgeway 2011);</p> <p>Le imprenditrici potrebbero potenzialmente ridimensionare il loro impegno imprenditoriale se la sfera familiare ed aziendale sono in conflitto (Jennings e McDougald, 2007; Marlow e Swail, 2015);</p> <p>Le intenzioni di uscita di un imprenditore dall'azienda, possono essere influenzate da vari network, come quelli familiari, ma anche quelli legati ad amici, colleghi, collaboratori. (Lacap et al. (2018);</p> <p>Gli imprenditori che accettano il consiglio dei membri della famiglia probabilmente saranno più restii a uscire dall'impresa. (DeTienne 2010).</p>
Capitale Finanziario	<p>Le donne imprenditrici hanno meno probabilità di richiedere un prestito (Kon e Storey 2003);</p> <p>Una strategia attraverso la vendita è positivamente correlata alle risorse finanziarie o all'investimento iniziale totale (DeTienne, 2008).</p>

Limiti della ricerca. Come la maggior parte delle ricerche, anche la nostra presenta dei limiti, ognuno dei quali apre ad opportunità per la ricerca futura. Il primo limite riguarda il set di imprenditori considerati nello studio. Il numero è limitato, compatibilmente con uno studio di tipo qualitativo, ma per un'analisi quantitativa tale numerosità andrebbe necessariamente aumentata. Il secondo limite è geografico, considerando appunto esclusivamente il territorio

italiano. Un'espansione ad altri territori potrebbe consentire di rafforzare quanto emerso dall'analisi o di evidenziare differenze dovute a variabili di contesto. Inoltre, dal punto di vista metodologico, la ricerca impiega un'analisi tematica; tale metodo presenta alcuni svantaggi, tra i quali la flessibilità e soggettività del ricercatore nel condurre l'analisi (Holloway e Todres, 2003). L'utilizzo di metodologie alternative, anche di tipo misto o quantitativo, su un campione più vasto di imprenditori, potrebbe portare a un consolidamento dei risultati ottenuti con questo studio.

Implicazioni manageriali. Nonostante negli studi di imprenditorialità l'uscita imprenditoriale costituisca un argomento centrale, le prime ricerche hanno indicato che meno del 50% degli imprenditori avesse una strategia d'uscita (Dahl, 2005; Holmberg, 1991). Considerato che l'evento dell'uscita imprenditoriale si verifica in tutte le imprese (Perry, 1997), la mancanza di programmazione di questo tipo di decisione può fare danneggiare le imprese. È dunque rilevante indagare sulle ragioni che spingono solo una parte degli imprenditori a programmare l'uscita imprenditoriale in modo strategico. Una differenza potrebbe essere rivelata dalle motivazioni e dai diversi obiettivi posti dall'imprenditore al momento della fondazione (Stewart et al., 2003; Morris et al., 2006; Wiklund et al., 2003).

In questo contributo, contestualizzando lo studio alla strategia di uscita imprenditoriale, in primo luogo si risponde alla necessità di fare chiarezza su come questa pratica possa essere vista come opportunità per l'imprenditore, distinguendo l'uscita imprenditoriale come fenomeno involontario, dovuto ad una sottoperformance aziendale, dall'uscita vista come un'opportunità di tipo strategico.

In secondo luogo, in questa ricerca, sosteniamo che capitale umano, sociale e finanziario hanno un impatto importante sulla strategia di uscita delle donne imprenditrici, pertanto analizziamo come queste risorse influenzano la loro potenziale decisione di uscita.

Originalità del paper. Il nostro studio fornisce diversi contributi teorici ed empirici alla ricerca sull'imprenditorialità, soffermandosi in particolare sulle strategie di uscita imprenditoriale delle donne imprenditrici. Il presente lavoro mette in connessione diverse forme di capitale, nello specifico quello umano, finanziario e sociale con la definizione di una strategia di uscita imprenditoriale, adottando una prospettiva di genere, e dunque approfondendo le principali differenze di genere nel consolidamento di questa strategia.

Parole chiave: strategia d'uscita; capitale umano; capitale finanziario; capitale sociale; imprenditorialità; genere

La leadership imprenditoriale nel processo di cambiamento organizzativo delle start-up in un contesto di smart city

REBECCA TRIVELLI*

Inquadramento della ricerca. Negli ultimi anni, molte organizzazioni hanno dovuto adattarsi alle richieste provenienti dall'esterno (Callan, 2013), poiché il continuo dinamismo del loro ambiente richiede continui adattamenti (Errida and Lotfi, 2021). Il cambiamento nelle organizzazioni è generato dalla necessità di sopravvivenza e di mantenere il proprio successo (Al-Haddad and Kotmour, 2015; Bercovitz and Feldman, 2008), intraprendendo nuove iniziative strategiche (Bercovitz and Feldman, 2008). Il cambiamento organizzativo comporta in un'organizzazione la transizione dallo "stato di status quo a uno stato sconosciuto e desiderato" (Hussain et al., 2018, pp.123-124).

Nel corso degli anni sono stati sviluppati diversi modelli per spiegare le fasi del cambiamento organizzativo. Il modello alla base delle teorie sul cambiamento all'interno di un'organizzazione è quello di Lewin (Burnes, 2004), secondo il quale il cambiamento organizzativo avviene in tre fasi: scongelamento, transizione e ricongelamento. Lo scongelamento determina la fase del cambiamento, dallo status quo alla nuova fase; la transizione è la fase del cambiamento effettivo verso nuovi obiettivi e, infine, la fase di ricongelamento in cui si ritorna allo status quo ma con nuovi comportamenti. Molti autori sostengono che l'approccio pianificato di Lewin al cambiamento organizzativo è semplicistico e per un mondo in cui il cambiamento organizzativo è un processo continuo (Burnes, 2004).

Nel nostro studio, per comprendere il cambiamento organizzativo all'interno delle start-up, seguiamo la filosofia del modello di Kotter. Un modello con più fasi rispetto a quello di Lewin, ben 8 fasi: stabilire un senso di urgenza sulla necessità di realizzare il cambiamento, in questa prima fase è richiesta una buona leadership che sarà in grado di mettere in atto le azioni "necessarie, audaci e rischiose" (Appelbaum et al., 2012) p.766; creare una coalizione guida, dei buoni leader saranno in grado di generare una nuova visione e guidare il cambiamento; sviluppare una visione e una strategia; comunicare la visione del cambiamento; dare potere all'azione ad ampio raggio; generare vittorie a breve termine difatti sarà compito del leader a stabilire gli obiettivi da raggiungere e premiare le azioni che permettono il raggiungimento della nuova visione. Sarà sempre compito del leader determinare "gli standard da emulare per il resto dell'organizzazione" (Eisenbach et al., 1999, p. 773); consolidare i guadagni e produrre ulteriori cambiamenti, il leader dimostrerà con i risultati che "il nuovo modo funziona" ed infine sarà necessario ancorare i nuovi approcci nella cultura aziendale (Kotter, 1995, 1996; Appelbaum et al., 2012; Errida and Lotfi, 2021).

Un ruolo fondamentale durante il cambiamento organizzativo è quindi svolto dal leader che, secondo Kotter, deciderà la visione, comunicherà la direzione intrapresa in modo chiaro per consentire la comprensione della nuova visione, motiverà e ispirerà i membri dell'organizzazione a realizzare il cambiamento (Kotter, 1990).

Nella letteratura esistente si evidenzia il legame presente tra l'imprenditorialità e la leadership, attraverso lo studio della "leadership imprenditoriale", ci sarà un reciproco vantaggio con la combinazione delle aree di studio di leadership ed imprenditorialità (Leitch and Volery, 2017). Indagheremo quindi, come la figura del leader imprenditoriale condurrà il processo di cambiamento organizzativo all'interno start-up.

Il contesto in cui vogliamo indagare il cambiamento organizzativo è quello delle smart city, poiché gli aspetti istituzionali possono generare cambiamenti organizzativi (Zucker, 1987), come le iniziative per le smart city (Barba-Sánchez et al., 2019). La scelta di indagare il cambiamento organizzativo delle start-up è stata determinata da una lacuna nella letteratura, per di più in un contesto di smart city caratterizzato da un'elevata attività imprenditoriale (Barba-Sánchez et al., 2019) "dove si sviluppano ecosistemi di start-up con collaborazioni tra policymaker, amministratori di smart city, imprenditori, venture capitalist e vari stakeholder che ne beneficiano" (Mitra et al., 2022) p.3.

Negli ultimi anni, molti comuni si stanno concentrando sullo sviluppo delle smart city (Bosdriesz et al., 2018) in grado di generare benefici istituzionali e socioeconomici (Costales, 2021) all'ecosistema imprenditoriale (Mitra et al., 2022). La smart city ha il compito di incoraggiare l'imprenditorialità e di creare un ecosistema adeguato alle start-up (Mitra et al., 2022).

Le smart city sono considerate quelle città che impiegano varie tecnologie digitali ed elettroniche per trasformare gli ambienti di vita con le tecnologie dell'informazione e della comunicazione (ICT) per soddisfare le esigenze dei mercati (Christofi et al., 2021) o dei cittadini (Chamran et al., 2020; Lai et al., 2020).

Le smart city sono sostenute dalla digitalizzazione e dalle innovazioni tecnologiche che portano a futuri benefici

* Dottoranda di Ricerca – Università degli Studi di Chieti e Pescara
e-mail: rebecca.trivelli@unich.it

ambientali, sociali e finanziari (Bokolo, 2020). La digitalizzazione consiste in tecniche per migliorare i contesti sociali e istituzionali attraverso l'adozione o l'aumento dell'uso di tecnologie digitali o informatiche (Seth et al., 2020; Bokolo, 2021).

La digitalizzazione consente un ampio grado di interattività tra utenti e informazioni. Inoltre, il controllo delle informazioni ottenute attraverso la digitalizzazione è facilitato, poiché i dati possono essere trasferiti facilmente (Brennen and Kreiss, 2015). Il risultato della digitalizzazione nelle smart city può essere misurato attraverso l'aumento della qualità della vita dei cittadini, fornendo così un ritorno sugli investimenti (Serrano, 2018). Inoltre, la trasformazione digitale ha permesso alle smart city di acquisire conoscenza e comprensione delle criticità, ottenendo così un vantaggio competitivo rispetto alle città non digitalizzate.

Un ulteriore aspetto della smart city da considerare è la governance. Secondo la letteratura, la governance gioca un ruolo fondamentale nelle smart city, poiché “le preferenze divergenti dei cittadini si traducono in scelte politiche” (Kohler-Koch, 1999; Meijer, 2018) p. 2. All'interno delle smart city, il coinvolgimento dei cittadini è fondamentale (Savoldelli et al., 2014) per la creazione di valore pubblico e la sua gestione (Aversano et al., 2013; Castelnovo et al., 2016). Attraverso la governance, sarà possibile rispondere alle esigenze dei cittadini, che influenzeranno il processo decisionale delle istituzioni con l'obiettivo di allocare le risorse in modo efficiente (Castelnovo et al., 2016). Una governance inadeguata non permetterà la trasformazione di una città in una smart city (Manville et al., 2014).

Secondo la letteratura, “la teoria istituzionale in un contesto di Smart city postula che la governance sia un importante elemento costitutivo di una SC funzionante” (Ruhlandt, 2018, p.2). Per capire quale sia l'influenza della governance delle smart city sull'attività imprenditoriale, è necessario identificare le principali dimensioni che determinano la governance della città, un modello più comunemente indicato come “Smart Governance” (Bolívar, 2016). In letteratura si afferma che le dimensioni della Smart Governance sono gli stakeholder, le strutture e le organizzazioni, i processi, i ruoli e le responsabilità, la legislazione e le politiche, la tecnologia e i dati, e infine le modalità di scambio (Ruhlandt, 2018).

È quindi fondamentale capire come la digitalizzazione e gli aspetti della governance influenzino il cambiamento organizzativo, analizzando il ruolo della leadership imprenditoriale.

La digitalizzazione e le tecnologie adottate nelle smart city generano dati che aiutano le imprese a esplorare nuove opportunità (Kummitha, 2019). Il contesto della smart city permetterà l'utilizzo e la sperimentazione di nuove tecnologie (Hämäläinen and Tyrväinen, 2018; Sarma and Sunny, 2017; Hämäläinen, 2020). L'utilizzo di tecnologie all'interno di alcune aree d'impresa e la trasformazione digitale determinano importanti cambiamenti nelle attività aziendali (Bokolo, 2020). Attraverso la digitalizzazione le organizzazioni saranno in grado di ottenere maggiore accessibilità alle informazioni in maniera trasparente, determinando una modernità delle organizzazioni, permettendo inoltre una maggiore analisi della conoscenza interna dell'organizzazione (Kuusisto, 2017). La letteratura esistente mette in evidenza come la digitalizzazione all'interno delle smart city influenza la gestione delle necessità dei cittadini, non approfondendo come, l'aspetto della digitalizzazione delle smart city se possa e come possa influenzare il cambiamento all'interno delle organizzazioni.

L'adozione delle ICT negli aspetti di governance ha portato alla costituzione dell'e-governance creando una maggiore interazione tra governo, imprese e cittadini, con l'obiettivo di semplificare e migliorare gli aspetti democratici, commerciali e governativi (Backus, 2001).

L'interazione tra il governo ed enti con organizzazioni private è facilitata grazie all'e-governance, dove le organizzazioni private possono avere accesso a regolamenti, leggi, requisiti per la loro attività imprenditoriale, inoltre è possibile creare una partnership tra governo industria per iniziative ad hoc oppure collaborazioni tra aziende per portare a termine progetti ed attività (Gil et al., 2018). L'obiettivo è di investigare se e come l'e-governance ha determinato cambiamenti organizzativi all'interno delle start-up attraverso le possibili partnership che la piattaforma e-governance permette di incontrare, ed in che modo le stesse organizzazioni si adattano all'utilizzo dell'ITC nei servizi di e-governance.

Ulteriori fattori da tenere in considerazione per il cambiamento organizzativo nelle start up, sono le iniziative intraprese dalle smart city, combinando condizioni e contesti locali, generando un impatto su aspetti di governance, persone, comunità, economia, ambiente e infrastrutture, con l'obiettivo di creare progetti per rendere una città intelligente (Griffith, 2001). Si è riscontrato un cambiamento nella cultura organizzativa attraverso studi empirici rivolti a quattro smart city nel Nord America relativi all'influenza delle iniziative intraprese dalle smart city (Alawadhi et al., 2012). Sarebbe opportuno quindi approfondire ed investigare come le iniziative intraprese dalle smart city in relazione alle organizzazioni, come le start-up, possono apportare cambiamenti.

L'obiettivo della ricerca è di investigare come in contesto di smart city ed aspetti di digitalizzazione e di governance, influenzano il cambiamento organizzativo condotto dall'imprenditore leader, sarà necessario quindi comprendere in che modo l'imprenditore leader riesca a rispondere alle necessità esterne, per poter adattare la start-up, nel contesto in cui opera.

Attraverso l'analisi della letteratura è stato possibile creare il seguente modello analitico. (Fig.1)

Fig.1: Modello analitico

Obiettivo del paper. L'obiettivo del presente lavoro è investigare in che modo viene condotto il cambiamento organizzativo all'interno delle start-up considerando il ruolo della leadership imprenditoriale. Basandoci sulla letteratura e di conseguenza sul modello analitico creato, presentiamo le seguenti preposizioni:

P1: La smart city ha una relazione positiva con la leadership imprenditoriale.

P2: La smart city ha una relazione positiva con il cambiamento organizzativo.

P3: I leader imprenditoriali hanno una relazione positiva con il cambiamento organizzativo.

Metodologia. Nel nostro lavoro è stata condotta un'accurata revisione della letteratura, che consente di raccogliere e sintetizzare le ricerche precedenti (Baumeister and Leary, 1997; Tranfield et al., 2003), permettendo così di individuare un'eventuale lacuna all'interno della letteratura o di giustificarne l'espansione e l'approfondimento (Snyder, 2019). Analisi della letteratura relativa alle smart city, con particolare attenzione alla digitalizzazione e alla governance, al cambiamento organizzativo, alla teoria istituzionale, agli imprenditori e alle start-up.

La revisione della letteratura è stata condotta utilizzando Google Scholar, in quanto possiede un numero enorme di articoli che supera i database di letteratura scientifica di altri motori di ricerca come Web of Sciences o Scopus, nonostante la possibile perdita di qualità dovuta all'elevato numero di articoli presenti (Halevi et al., 2017).

La strategia di ricerca seguita consisteva in due fasi. In primo luogo, abbiamo identificato parole chiave appropriate per la ricerca nel database online (ad esempio, cambiamento organizzativo, start-up, leadership imprenditoriale, smart city, digitalizzazione, governance), estraendo così un ampio insieme di documenti, tra cui riviste, libri e conferenze, senza porre alcun limite al database per la ricerca. In secondo luogo, sulla base dello studio di Meier (Meier, 2011), abbiamo individuato tre criteri per selezionare i documenti da inserire nella nostra revisione della letteratura: (i) abbiamo incluso solo articoli in lingua inglese; (ii) abbiamo incluso tutti i documenti pubblicati negli ultimi 60 anni; (iii) tutti gli articoli dovevano essere pubblicati su riviste peer-reviewed con il più alto impact factor del settore. Dopo aver esaminato attentamente i documenti (leggendo abstract, metodologia, conclusioni e implicazioni pratiche), abbiamo selezionato i documenti da libri e articoli. Sulla base della revisione della letteratura, sono state avanzate alcune proposte, discusse in precedenza nell'articolo.

Risultati. Questo studio contribuisce alla letteratura esistente sugli imprenditori, concentrandosi sul cambiamento organizzativo in un contesto di smart city. Un contributo teorico primario di questo articolo è quello di considerare il cambiamento organizzativo all'interno delle start-up. In secondo luogo, contribuiamo alla letteratura esistente sulla smart city, evidenziando come fattori quali la digitalizzazione e la governance possano influenzare il cambiamento organizzativo nelle start-up. Infine, l'obiettivo è creare un ponte tra le tre letterature: cambiamento organizzativo, smart city e leader imprenditoriali. Inoltre, il nostro studio ha anche implicazioni pratiche per i politici e gli educatori.

In terzo luogo, con questo articolo possiamo contribuire con una futura analisi empirica al dibattito esistente sulla teoria istituzionale, sul fatto che la teoria porti dei cambiamenti, sul fatto che le organizzazioni possano essere considerate tutte uguali o che ci siano delle differenze.

Limiti della ricerca. Il principale limite del paper è che è costituito da una analisi teorica. Il secondo limite è l'utilizzo di un unico database; la revisione della letteratura è stata condotta utilizzando Google Scholar, in quanto possiede un grande numero di articoli che supera i database di letteratura scientifica di altri motori di ricerca come Web of Sciences o Scopus, nonostante la possibile perdita di qualità dovuta all'elevato numero di articoli presenti (Halevi et al., 2017).

Implicazioni manageriali. La nostra ricerca offre diverse implicazioni manageriali. Analizzare in che modo avviene il cambiamento organizzativo all'interno delle start-up grazie alle capacità della leadership imprenditoriali permetterebbe di creare delle linee guida generali in grado di definire che modo si potrebbe operare all'interno delle organizzazioni, ovviamente considerando che ogni organizzazione è diversa dall'altra, rimarcando così la necessità di maggiori studi empirici a riguardo.

La ricerca, inoltre, può fornire maggiore consapevolezza ai policymaker delle smart city in quanto è possibile comprendere attraverso l'analisi empirica gli effetti che le loro scelte hanno effettivamente sulle organizzazioni

influenzandole ed in che modo ciascuna di esse reagisce, potendo così comprendere quali iniziative possono essere amplificate e quali no.

Sarà quindi possibile comprendere per i policy maker in che modo incentivare l'imprenditorialità, influenzare il modo in cui gli individui lavorano e migliorando l'allocazione delle risorse in modo efficiente.

Originalità del paper. *I risultati della nostra revisione della letteratura evidenzia un gap esistente nell'investigare il cambiamento organizzativo all'interno delle start up, potendo quindi fornire spunti per ulteriori studi.*

Questo studio contribuisce alla letteratura esistente sulla leadership imprenditoriale, fornendo un'espansione della letteratura in organizzazioni piccole e nuove (Miller and Friesen, 1984; Jensen and Luthans, 2006) come le start-up, concentrandosi, inoltre, sul cambiamento organizzativo in un contesto di smart city.

Parole chiave: *cambiamento organizzativo; leadership imprenditoriale; start-up; smart city; governance, digitalizzazione.*

L'influenza della religiosità locale sul finanziamento dei progetti di crowdfunding orientati al sociale

FRANCESCA DI PIETRO* FRANCESCA MASCIARELLI*

Inquadramento della ricerca. Il crowdfunding è emerso come una nuova forma di raccolta fondi tramite Internet, in cui un gruppo di persone forniscono contributi individuali per sostenere un'idea imprenditoriale specifica (Mollick 2014;). Questa fonte alternativa di finanziamento è particolarmente rilevante per i progetti imprenditoriali orientati al sociale, dove le opzioni di finanziamento sono limitate (Tosatto, Cox e Nguyen 2019). Il finanziamento dei progetti imprenditoriali orientati al sociale ha ricevuto l'attenzione di alcuni studiosi nel corso del tempo (Di Pietro, Spagnoletti e Prencipe 2019). Il crowdfunding aumenta la legittimità delle nuove imprese e le imprese sociali potrebbero trarne particolare beneficio in quanto il crowdfunding potrebbe portare ad altre opportunità di investimento (Braund e Schwittay 2016; Deephouse e Suchman 2008; Zheng 2018). Studi hanno anche indagato come l'orientamento sociale delle imprese possa influire sull'esito della campagna di crowdfunding, dimostrando che la missione di sostenibilità ha un'influenza positiva sul successo del finanziamento (Calic e Mosakowski 2016), così come la creatività del progetto, le approvazioni di terze parti (Calic, 2017), e l'uso dei social media (Goodman e Polycarpou, 2013). Nonostante la letteratura esistente fornisca importanti spunti sui fattori che influenzano la raccolta fondi dei progetti imprenditoriali orientati al sociale, il ruolo del contesto locale, che esercita un'importante influenza nel facilitare l'accesso alle risorse finanziarie (Agrawal, Catalini e Goldfarb 2015; Dana 2011; Giudici, Guerini e Rossi-Lamastra 2018; Di Pietro e Masciarelli 2021), è stato finora trascurato. Ad esempio, il livello di altruismo locale dell'area geografica in cui le persone risiedono influenza positivamente il sostegno ai progetti di crowdfunding (Giudici, Guerini e Rossi-Lamastra 2018). Inoltre, Di Pietro e Masciarelli (2021) dimostrano che la religione gioca un ruolo nell'influenzare il trasferimento di risorse di finanziamento tra regioni, favorendo quindi le transazioni di crowdfunding transfrontaliere.

Nonostante il valore di questi contributi, la letteratura esistente non ha considerato come le condizioni ambientali locali, tra cui la religiosità locale, possano contribuire al sostegno dei progetti di crowdfunding orientati al sociale per i quali i sostenitori non si aspettano necessariamente un ritorno finanziario.

Obiettivo del paper. Lo scopo di questo studio è quello di investigare se e come la religiosità locale e le affiliazioni religiose influenzano gli investimenti in progetti di crowdfunding orientati al sociale. La religione è infatti una variabile culturale locale che svolge un ruolo fondamentale nella vita della maggior parte delle persone (Guiso, Sapienza e Zingales 2003) in quanto promuove determinati comportamenti e censura altri, con importanti ripercussioni sui risultati economici (Van Buren, Syed e Mir 2020; Dana 2011; Guiso, Sapienza e Zingales 2003; Kumar et al. 2022; Shu, Sulaeman e Yeung 2012). La religiosità locale, definita come "credenze, attività e istituzioni basate sulla fede in forze soprannaturali" (Iannaccone 1998, p. 1466; La Porta et al. 1999; Siegel, Licht e Schwartz 2011), promuove le relazioni sociali (Glaeser e Sacerdote 2008) e l'imprenditorialità (Dana 2011; Farmaki et al. 2020; Kumar et al. 2022) e, aumentando la fiducia verso gli altri e il senso di comunità (Guiso, Sapienza e Zingales 2003) e la propensione al rischio (Shu, Sulaeman e Yeung 2012), favorisce il finanziamento imprenditoriale tramite crowdfunding (Di Pietro e Masciarelli 2021).

Questo lavoro si concentra sul ruolo svolto dalla religiosità locale e dalle affiliazioni religiose nell'influenzare il sostegno di progetti orientati al sociale attraverso il crowdfunding in Svizzera. La Svizzera è un paese omogeneo per le sue condizioni economiche generali, ma presenta una diversità culturale intra-nazionale importante in termini di religiosità e demografia; quindi, rappresenta un contesto ideale per il nostro studio. Le sue peculiari formazioni storiche e religiose hanno portato i cantoni svizzeri ad ospitare varie combinazioni di minoranze e maggioranze cattoliche e protestanti, che persistono nel tempo.

La religione ha un impatto sui comportamenti di responsabilità sociale e sostenibilità. Studi hanno rivelato che le imprese situate in paesi con una elevata concentrazione di abitanti religiosi sono più propense a partecipare a iniziative di responsabilità sociale d'impresa e, di conseguenza, godono di rapido sviluppo economico (Brammer, Williams e Zinkin 2007; El Jurdi, Batat e Jafari 2017). Studi hanno inoltre mostrato come la religione favorisca l'imprenditorialità delle imprese familiari (Astrachan et al. 2020), l'imprenditorialità sociale e sostenibile (Chandra 2017; Khurana, Ghura e Dutta 2021) e l'imprenditorialità femminile (Wu, Li e Zhang 2019). Pertanto, la religiosità

• Associato di *Economia e Gestione delle Imprese* - Università "G. d'Annunzio" di Chieti-Pescara
e-mail: francesca.masciarelli@unich.it

locale può esercitare un impatto positivo sulla propensione individuale a sostenere progetti di crowdfunding orientati al sociale. Pertanto, ci aspettiamo che:

Ipotesi 1: La religiosità locale della regione in cui investitori risiedono, influisce positivamente sul successo dei progetti orientati al sociale tramite piattaforme di crowdfunding.

Tra le diverse religioni, le religioni cristiane sono associate positivamente ad atteggiamenti favorevoli alla crescita economica (Guiso, Sapienza e Zingales 2003). Inoltre, all'interno delle religioni cristiane, il protestantesimo e il cattolicesimo mostrano importanti differenze nei livelli di collettivismo (Cohen e Hill 2007; Shu, Sulaeman e Yeung 2012) che potrebbero influire sul sostegno ai progetti di crowdfunding orientati al sociale. I cattolici considerano le relazioni sociali come parte integrante della loro vita religiosa e ritengono che le affiliazioni di gruppo siano importanti poiché le persone sono viste come fondamentalmente connesse tra loro e alla loro comunità religiosa (Cohen e Hill 2007). Pertanto, le persone che vivono in regioni cattoliche sono probabilmente inclini a formare legami sociali basati sulla partecipazione ai servizi religiosi (Glaeser e Sacerdote 2008), il che può essere vantaggioso per il trasferimento di risorse, conoscenze e informazioni sulle opportunità di investimento (Laursen, Masciarelli e Prencipe 2012). Date le differenze sopra menzionate tra i cattolici e altre affiliazioni religiose come i protestanti, ci aspettiamo che le diverse affiliazioni religiose predominanti nelle regioni in cui risiedono gli investitori influenzeranno in modo diverso il sostegno ai progetti di crowdfunding orientati al sociale. Pertanto, ipotizziamo che:

Ipotesi 2: L'orientamento cattolico della regione influenza positivamente il successo dei progetti orientati al sociale attraverso le piattaforme di crowdfunding.

Metodologia. I dati sono stati raccolti in due fasi. La prima fase di raccolta dati è avvenuta da luglio a dicembre 2016, mentre la seconda fase da novembre 2018 a febbraio 2019, su tre piattaforme di crowdfunding svizzere. Per costruire il nostro campione di progetti orientati al sociale, abbiamo selezionato dai tre siti web progetti appartenenti alle categorie "umanitarie", "sociali" e "comunitarie", come indicato dalle piattaforme, disponibili durante il nostro periodo di raccolta dati. Abbiamo selezionato 76 progetti orientati al sociale, di successo e non, e abbiamo raccolto dati sugli investitori di questi progetti. Il nostro dataset contiene 2.431 osservazioni che rappresentano gli investimenti individuali nei nostri progetti campione. I 76 progetti di crowdfunding selezionati appartengono alle tre diverse piattaforme: 28 progetti dalla piattaforma I care for you (rappresentando il 37% delle nostre osservazioni), 25 progetti dalla piattaforma I believe in you (rappresentando il 33% delle nostre osservazioni), 23 progetti dalla piattaforma Wemake it (rappresentando il 30% delle nostre osservazioni). Dei 76 progetti, 66 sono stati di successo (87%), il che significa che hanno raggiunto l'importo target, mentre 10 progetti (13%) non hanno raggiunto l'importo target alla fine della campagna e quindi non hanno ricevuto fondi. L'importo medio raccolto dagli iniziatori di progetto è di 12.537 franchi svizzeri (CHF) da un numero medio di 86 investitori. Gli investitori dei 76 progetti risiedono in 25 diverse regioni svizzere. I promotori dei progetti risiedono in 19 diverse regioni svizzere, principalmente nelle regioni di Zurigo, Berna e Lucerna, mentre 8 progetti sono stati avviati da persone residenti al di fuori della Svizzera. Dei 2.431 investitori nel nostro campione, il 49,6% sono maschi e il 50,4% sono femmine.

Utilizzando i siti web delle piattaforme di crowdfunding, abbiamo raccolto dati sugli (i) investitori nei progetti, come l'importo investito, la città, la regione di provenienza, il genere e la serialità; (ii) il progetto di crowdfunding, compresi il numero di investitori, l'importo richiesto e i fondi raccolti. Per ciascun progetto di crowdfunding, siamo stati in grado di includere nella nostra selezione solo gli investitori che hanno divulgato il loro nome e la loro città di provenienza. Abbiamo escluso gli investitori che non hanno divulgato il loro nome completo (ad esempio, utenti anonimi) o che hanno utilizzato pseudonimi e quelli che non hanno riportato la loro città di provenienza.

Per integrare il nostro database con le variabili a livello regionale (corrispondenti al livello NUTS3), abbiamo consultato i database ufficiali di statistica svizzeri, come l'Ufficio federale di statistica svizzero e l'USTAT e l'ufficio di statistica del canton Ticino, per raccogliere dati sulla religiosità e la religione primaria in ogni regione svizzera e informazioni macroeconomiche, ad esempio il reddito pro capite (in CHF), la cultura digitale, il numero di nuove aziende create negli anni di interesse e la lingua primaria parlata nella regione.

Variabile dipendente. La nostra variabile dipendente, Successo (Success), è una variabile continua misurata come la differenza tra l'importo raccolto (in CHF) dai promotori del progetto attraverso la campagna di crowdfunding e l'importo obiettivo (in CHF) stabilito all'inizio della campagna. La variabile assume valori negativi se il progetto non è riuscito a raccogliere fondi.

Variabili indipendenti. La religiosità locale (Local religiosity) è la principale variabile indipendente. Indica la percentuale di persone religiose che vivono nella regione dell'investitore e viene calcolata come 1 meno la percentuale di persone in ogni regione che non hanno affiliazioni religiose, ovvero non religiose. Abbiamo raccolto i dati dal sito web dell'Ufficio federale di statistica svizzero e ci riferiamo all'anno 2016 per la popolazione svizzera di età superiore ai 15 anni che vive in una casa privata e che ha indicato un'adesione religiosa tra protestante, cattolica, altre affiliazioni cattoliche, islamica, ebraica, altre affiliazioni religiose e nessuna affiliazione religiosa.

La variabile regione orientata al cattolicesimo (Catholic-oriented regions) è una variabile dummy che assume il valore 1 se la religione cattolica è predominante nella regione in cui risiede l'investitore; 0 altrimenti. Una regione viene classificata come orientata al cattolicesimo se la quota di persone appartenenti all'affiliazione cattolica è

superiore alla quota di persone appartenenti alle altre affiliazioni religiose o nessuna affiliazione religiosa nella regione. Ad esempio, la regione svizzera del Canton Friburgo che riporta il 61,3% di cattolici, l'11,1% di protestanti, il 17,7% di atei e il 9,9% di membri di affiliazioni religiose minori è classificata come orientata al cattolicesimo. I cattolici costituiscono il gruppo religioso più grande in Svizzera (il 37,25% della popolazione è cattolica), il 25% è protestante e altri gruppi religiosi come l'islam e gli ebrei sono rappresentati da una piccola parte della popolazione (circa il 14%).

Variabili di controllo. Includiamo variabili di controllo relative alle caratteristiche della campagna di crowdfunding, dell'investitore e della regione dell'investitore, che potrebbero influenzare la propensione a sostenere una campagna di crowdfunding orientata al sociale.

Risultati. Abbiamo analizzato se la religiosità locale - ovvero la percentuale di persone appartenenti a un'affiliazione religiosa nella regione in cui risiedono gli investitori - influisca sul sostegno ai progetti orientati al sociale tramite il crowdfunding. Abbiamo utilizzato il modello di stima Ordinary Least Squares (OLS) (Wooldridge 2002) per testare empiricamente le nostre ipotesi. La tabella 1 riportata sotto illustra il modello OLS.

Tab. 1: Risultati del modello di Ordinary Least Squares (OLS) per il Successo

DV: Success	Model I		Model II	
	Coef.	SE	Coef.	SE
Local religiosity			9551.481 ***	(695.71)

R-squared	29%		35%	

Il Modello I della Tabella 1 riporta l'effetto delle variabili di controllo, tra cui Number of investors, Platform, Investor Gender, Investor Seriality, Income Per-capita, Digital literacy, New companies, e Language match, sulla variabile dipendente Success. Guardando alle variabili a livello di progetto, troviamo un effetto diretto significativo per Number of Investors e Platform su Success. Osserviamo inoltre che l'Income Per-capita è positivamente associato a Success. Non abbiamo trovato alcuna associazione significativa tra l'uso di internet (Digital literacy), il genere dell'investitore e la serialità dell'investitore sulla nostra variabile dipendente. D'altra parte, troviamo un'associazione negativa tra il tasso di imprenditorialità locale (New companies) e il Success dei progetti di crowdfunding orientati al sociale. Questo è un risultato controintuitivo che potrebbe essere spiegato dal fatto che le imprese orientate al profitto possono essere considerate più attraenti dagli investitori e potenzialmente attirare risorse di finanziamento dai progetti orientati al sociale. Inoltre, troviamo che la condivisione di una lingua comune influenza positivamente il successo dei progetti di crowdfunding orientati al sociale. Questo controllo è estremamente importante poiché, controllando la corrispondenza linguistica tra la regione del promotore del progetto e quella degli investitori, possiamo in parte escludere la possibilità che l'influenza dei flussi di risorse sia principalmente determinata dalla condivisione di una lingua comune.

Passando alle principali variabili esplicative, i risultati del Modello II nella tabella 1 sono coerenti con la nostra H1 (la religiosità locale della regione degli investitori influenza positivamente il successo dei progetti orientati al sociale tramite piattaforme di crowdfunding). Ci aspettavamo che la religiosità locale fosse positivamente associata all'investimento in progetti orientati al sociale tramite crowdfunding. In linea con le nostre aspettative, troviamo un'associazione positiva e significativa tra la religiosità locale e il successo dei progetti orientati al sociale tramite crowdfunding ($p = 0,000$, $b = 9,551$). Ciò implica che le persone che vivono in regioni caratterizzate da un elevato livello di religiosità sono più inclini a sostenere i progetti imprenditoriali orientati al sociale.

La religiosità può quindi essere considerata una variabile culturale strategica all'interno del paese che svolge un ruolo significativo nell'influenzare il finanziamento dei progetti di crowdfunding orientati al sociale.

Successivamente, per testare l'influenza dell'orientamento religioso della regione degli investitori sull'investimento in crowdfunding orientati al sociale, includiamo nel Modello III (Tabella 1) la variabile Catholic-oriented regions.

In linea con le nostre congetture (H2: L'orientamento cattolico della regione influenza positivamente il successo dei progetti orientati al sociale attraverso le piattaforme di crowdfunding), la variabile Catholic-oriented regions ha un impatto positivo sul successo ($p = 0,000$, $b = 1,137$). In particolare, troviamo che i progetti di crowdfunding orientati

al sociale beneficiano degli investitori che vivono in una regione in cui il cattolicesimo è la religione predominante. Sugeriamo che ciò sia dovuto alla personalità collettivista dominante tra i cattolici, che attraverso lo sviluppo di connessioni sociali (Cohen e Hill 2007), aiuta nell'acquisizione di informazioni e conoscenze preziose sulle opportunità che beneficiamo la società. Un senso di comunità e fiducia sono ingredienti fondamentali del crowdfunding dei progetti imprenditoriali orientati al sociale (Butticè e Colombo 2020), valori che sono radicati nel cattolicesimo (Glaeser e Sacerdote 2008).

Limiti della ricerca. Questa ricerca ha alcune limitazioni. In primo luogo, ci siamo concentrati su un singolo paese; le nostre analisi potrebbero essere ripetute considerando un campione di paesi diversi. Inoltre, la maggior parte della popolazione svizzera aderisce al gruppo religioso cattolico. Studi futuri potrebbero replicare il nostro studio in paesi in cui altre affiliazioni religiose, come protestanti, ebrei, musulmani, ecc., sono meglio rappresentate.

In secondo luogo, ci siamo concentrati solo sul supporto di progetti orientati al sociale tramite il crowdfunding. Tuttavia, la diversità religiosa intra-paese potrebbe influenzare anche altre forme di investimenti finanziari; in particolare, potrebbe essere interessante esaminare gli investimenti di venture capital o di business angels (Chircop, Johan e Tarsalewska 2020). Inoltre, abbiamo testato la nostra ipotesi su progetti orientati al sociale non motivati dal profitto, in piattaforme basate su ricompense e donazioni (reward e donation crowdfunding). Potrebbe essere interessante ampliare questo studio su un campione di aziende che ricorrono a piattaforme di crowdfunding azionario o di prestito peer-to-peer (equity e lending crowdfunding). Infine, altre forme di diversità intra-paese, ad esempio la lingua, possono essere esplorate. Essendo un mezzo principale per la trasmissione della conoscenza e alle credenze degli altri, la lingua è probabilmente in grado di influenzare la propensione agli investimenti di crowdfunding.

Implicazioni manageriali. La nostra ricerca ha anche implicazioni pratiche. In primo luogo, capire le caratteristiche del contesto locale nell'influenzare il sostegno ai progetti di crowdfunding orientati al sociale può fornire informazioni utili per lo sviluppo di politiche volte a promuovere contributi a iniziative non profit. In secondo luogo, sottolineando l'importanza della religione e delle affiliazioni religiose per influenzare il comportamento degli investitori tramite il crowdfunding, il nostro studio può aiutare gli imprenditori a decidere dove è più favorevole lanciare la propria iniziativa sociale.

Originalità del paper. La nostra ricerca offre contributi alla letteratura che collega religione ed imprenditoria, fornendo una maggiore comprensione del ruolo dell'ambiente locale nell'influenzare il sostegno a progetti di crowdfunding orientati al sociale e fornendo evidenze dell'associazione tra religiosità e investimenti di crowdfunding online. In questo modo, la nostra ricerca contribuisce ad una migliore comprensione di come religione e tecnologia influenzino l'imprenditoria e il cambiamento sociale con ripercussioni positive sulla società.

In secondo luogo, esplorando l'impatto della religiosità locale sull'investimento di crowdfunding, aggiungiamo alla crescente letteratura sulla diversità dei valori culturali intra-nazionali. Esiste un consenso crescente sulla necessità di comprendere come le variabili culturali intra-nazionali, come la religiosità, influiscano sul coinvolgimento degli individui in attività sociali che possono avere importanti ripercussioni sull'economia, ma i contributi finora sono stati limitati dalla disponibilità di dati. Pertanto, la Svizzera, che include la coesistenza di diverse affiliazioni religiose, rappresenta un unico scenario empirico.

In terzo luogo, contribuiamo anche alla letteratura sulla finanza imprenditoriale fornendo una spiegazione interdisciplinare importante su come la religiosità locale e le diverse religioni influenzino gli investimenti in fase iniziale. L'accesso al finanziamento è una sfida per tutte le nuove imprese a causa della novità dei loro prodotti e dell'incertezza corrispondente, questo è particolarmente il caso delle imprese sociali dove il ritorno finanziario non è tipicamente il loro obiettivo principale. Pertanto, poiché il crowdfunding rappresenta uno strumento di finanziamento importante per i progetti orientati al sociale, è cruciale identificare i principali fattori che incoraggiano e ostacolano il loro sostegno.

Keywords: Crowdfunding; religiosità; tecnologia; progetti orientati al sociale.

Trasformazione delle città ed ambiente economico: videnze empiriche sulla relazione esistente tra ambiente urbano e imprenditorialità femminile nelle città contemporanee

FILIPPO MARCHESANI* FRANCESCA MASCIARELLI*

Inquadramento della ricerca. Negli ultimi anni, le città hanno modificato le loro traiettorie urbane, passando da un ambiente locale e statico ad un contesto più dinamico in grado di fornire un ambiente tecnologico, sostenibile ed efficiente inglobato all'intero dei progetti di smart city (Albino et al., 2015; Caragliu et al., 2011; Vanolo, 2014). Nello specifico, le smart city possono essere definite come città avanzate e ad alta intensità tecnologica con l'obiettivo di collegare persone, informazioni ed elementi della città utilizzando le nuove tecnologie per creare e trasformare le attuali città in contesti più sostenibili, più verdi, competitivo e ed innovativi influenzando di conseguenza la qualità della vita di utenti interni (cittadini) ed esterni (lavoratori, turisti, visitatori) (Bakici et al., 2013).

Questa trasformazione apre una nuova visione della città che si muove verso un contesto urbano più vivibile e umano che coinvolge diverse aree che possono essere classificate nelle sei dimensioni dello sviluppo delle città intelligenti (Smart Environment, Smart People, Smart Living, Smart Governance, Smart Economy and Smart Mobility) (Appio, Lima e Paroutis, 2019; Caragliu e Del Bo, 2021; Christofi, 2021; Vanolo, 2014). In questa evoluzione, la tecnologia è un driver primario ma non essenziale nello sviluppo delle città e consente a queste dimensioni, considerate pilastri nel concetto di smart city, di essere collegate tra loro all'interno del contesto urbano e di influenzare di conseguenza la relazione della città stessa con cittadini ed utenti (Christofi et al., 2021; Ibrahim et al., 2018; Ooms et al., 2020). Pertanto, andando oltre lo sviluppo meramente tecnologico, la città deve essere costruita intorno agli utenti, adattandosi e, contemporaneamente, facendo evolvere l'ambiente urbano in una prospettiva centrata sull'utente (Appio et al., 2019; Neirotti et al., 2014; Vanolo, 2014). In questo contesto, la dimensione "smart living", definita come la dimensione della città che si relaziona con la qualità della vita, immaginata e misurata in termini di disponibilità di servizi culturali ed educativi, attrazioni turistiche, coesione sociale e sicurezza personale (Vanolo, 2014, p. 887), ha assunto un ruolo dicotomico che manca di una concettualizzazione accademica e pratica attuale. Anche se, da un lato, è essenziale creare un ambiente sociale vivibile, sicuro, inclusivo e avanzato, dall'altro è difficile valutare sia il costruito di questo contesto che il relativo impatto sul territorio (Abid et al., 2022; Vanolo, 2014).

In oltre, in questa evoluzione, la spinta delle politiche locali e dell'Unione Europea ha assunto un ruolo centrale nella trasformazione delle città (Paskaleva, 2011). Nello specifico, il rapporto tra investimenti pubblici nelle città e lo sviluppo di progetti di smart cities è un aspetto importante da considerare per comprendere la loro attuale evoluzione. Gli investimenti in ricerca e sviluppo (R&S) da parte dei governi centrali sono sempre più presenti nelle politiche locali, ma rimangono al centro del dibattito per l'incertezza degli esiti e la mancanza di obiettivi ben definiti (Lanahan et al., 2021; Laursen et al., 2012). Tuttavia, basandoci sulla letteratura di riferimento (Betz et al., 2016; Lee et al., 2013; Marchesani et al., 2023), ci sono evidenze teoriche ed empiriche sull'impatto positivo degli investimenti in R&S da parte delle città. Questi investimenti possono contribuire alla creazione di posti di lavoro, lo sviluppo tecnologico della città, l'avanzamento di servizi digitali e ad altri effetti positivi sulla qualità della vita, diventando un fattore di sviluppo fondamentale per le città del futuro.

Seguendo il dibattito accademico attuale, sappiamo le pratiche di "smart living" nelle città contemporanee contribuiscono direttamente all'ambiente delle città influenzando lo sviluppo urbano e la crescita economica (Florida et al., 2017; Neirotti et al., 2014). Sulla base di questo dibattito ed in accordo con l'attuale contestualizzazione delle smart city in relazione all'ambiente imprenditoriale (Kummitha, 2018; Marchesani et al., 2022), questo lavoro si propone di investigare la relazione tra le pratiche smart living e la promozione dell'imprenditorialità femminile in città.

L'imprenditorialità femminile svolge un ruolo significativo nello sviluppo socio-economico (Rosca et al., 2020) ed è direttamente influenzata dal contesto urbano (Allen e Bartlett, 2022; Kimbu e Ngoasong, 2016). In particolare, nella relazione tra la dimensione "smart living" della città e l'ambiente economico, recenti studi accademici hanno evidenziato il legame tra la vivibilità urbana e l'imprenditoria femminile, identificata come gli attori più sensibili alla dimensione abitativa della città (Collins e Low, 2010; Nguyen et al., 2022; Poggesi et al., 2016). Inoltre, l'influenza

della dimensione relativa alla vivibilità della città “smart living” emerge anche nella letteratura urbana, assumendo che le donne siano più disposte ad avanzare l'attività imprenditoriale in un ambiente sicuro e avanzato (Martínez-Rodríguez et al., 2022; Nesti, 2019; Rosca et al., 2020). Oggi, sebbene la ricerca sull'imprenditoria femminile sia un argomento recente e ampiamente discusso (Estrin e Mickiewicz, 2011; Kogut e Mejri, 2022; Rosenthal e Strange, 2012), vi è una comprensione relativamente scarsa dell'interazione tra le smart city, la vivibilità e l'imprenditoria femminile nel contesto urbano. Questa lacuna è evidenziata dal fatto che (i) la connessione tra le traiettorie delle smart city e l'ambiente imprenditoriale nelle città è ancora poco studiata (Kummitha e Crutzen, 2017; Marchesani et al., 2022), (ii) la dimensione della “smart living” manca di risultati specifici correlati al contesto imprenditoriale (Liu, 2012) e (iii) c'è la necessità di elevare l'ambiente urbano ed economico delle città in una nuova e completa comprensione basata sull'uomo piuttosto che sulla tecnologia (Caragliu e Del Bo, 2021; Shelton et al., 2015; Vanolo, 2014).

Basandoci su questo stato dell'arte, ci concentriamo sull'intersezione tra le pratiche di “smart living” e l'imprenditoria femminile considerando l'influenza degli investimenti pubblici in R&S per fornire analisi approfondite dei contributi che l'innovazione e la vivibilità nelle attuali traiettorie delle smart city possono fornire all'imprenditoria femminile.

Obiettivo del paper. Questo studio mira a investigare la relazione tra l'ambiente economico e la dimensione di smart living incorporata nelle attuali iniziative di smart city, focalizzandosi sul ruolo dell'imprenditoria femminile nelle città contemporanee. Questa interazione è poco investigata e controversa in quanto comprende pratiche urbane che permettono agli utenti e ai cittadini di sviluppare il proprio potenziale e vivere in un ambiente costruito intorno al cittadino, influenzando di conseguenza gli esiti imprenditoriali ed economici.

Questo studio si pone l'obiettivo di offrire contributi empirici al dibattito accademico preliminare sullo sviluppo delle imprese e l'attuale implementazione di progetti di smart city analizzando la relazione corrente tra la dimensione della vivibilità della città “smart living” e l'imprenditoria femminile. I risultati forniranno preziose informazioni sulla promozione dell'imprenditoria femminile nel contesto delle smart city e mirano a far avanzare la discussione teorica su (i) l'intenzione imprenditoriale nell'imprenditoria femminile, (ii) l'avanzamento delle smart city (come contesto), e (iii) la dimensione di smart living (come driver), offrendo importanti spunti per i decisori politici e la governance.

Metodologia. Questo lavoro utilizza il metodo Generalized Methods of Moments (GMM) per investigare il fenomeno in esame. L'adozione di questo metodo è basata su due caratteristiche distintive del nostro campione di analisi, come (i) le caratteristiche intrinseche del nostro spatial-panel-dataset (ii) la specifica dinamica che considera che le pratiche passate delle città possono influire sugli esiti economici attuali. In particolare, i panel dati utilizzato è caratterizzato da una vasta sezione trasversale (30 città) e un periodo di tempo relativamente breve (12 anni) che, includendo entrambi gli effetti fissi temporali e delle città, si adatta al metodo utilizzato (Roodman, 2009). Ci concentriamo sul contesto italiano in quanto è considerato al centro del dibattito accademico e politico sulle traiettorie delle smart city (Abid et al., 2022; Vanolo, 2014), costituendo un importante focus empirico per i dibattiti sullo sviluppo urbano in Europa (Christofi et al., 2021, p. 961). Per garantire l'alta eterogeneità del campione, le 30 città italiane sono state selezionate utilizzando il campionamento proporzionale alla dimensione in ciascuno livello (Localizzazione, sviluppo economico, popolazione) delle città medie e grandi per garantire una altra rappresentatività ed eterogeneità del campione su tutto il territorio Italiano (Levy e Lemeshow, 2011).

Le variabili presenti all'interno del modello considerano “imprenditorialità femminile” come variabile dipendente, “smart living” come variabile indipendente e “R&D investment” come moderatore. In particolare, la variabile dipendente “imprenditorialità femminile” è stata costruita sulla base dei dati presenti nella Camera di Commercio di ogni città, prendendo in esame il numero di imprese fondate da donne e registrate ogni anno nel corso dei 12 anni analizzati. Basandoci su questi dati, abbiamo operazionalizzato la variabile utilizzando il logaritmo naturale della variabile rispetto al numero totale di imprese nella città. Questa procedura ci consente di comprendere lo sviluppo delle attività imprenditoriali femminili di ogni città in relazione a ogni contesto economico e geografico.

La variabile indipendente “smart living” è stata costruita attraverso un indice basato sulle pratiche inclusive, integrate e sociali di ogni città. Questa variabile è strettamente legata alla dimensione della vivibilità urbana e comprende un set di i variabili che considerano i servizi inclusivi, integrativi e sociali basati sulla persona nello sviluppo della smart city (Sharma e Manocha, 2021). Nello specifico, questo indice è basato su diversi indicatori come l'assistenza sanitaria e i servizi sanitari, l'assistenza all'infanzia e agli anziani, l'istruzione, l'ospitalità, l'integrazione lavorativa e i servizi lavorativi.

Inoltre, il nostro modello include come moderatore la variabile relativa agli investimenti in R&S da parte delle città, misurata dal totale degli investimenti del settore pubblico in R&S nella città sulla popolazione annuale. Questa variabile è universalmente associata all'avanzamento digitale e, nel contesto delle città, fornisce un'adeguata leva per diffondere le innovazioni e guidare i progetti di smart city influenzando non solo la creazione di servizi digitali ma migliorando anche la percezione e la qualità della vita (Harrison et al., 2010; Simmons et al., 2018). Infine, partendo dalla dicotomia che lo sviluppo delle città può essere influenzato da diversi fattori, abbiamo incluso un insieme di caratteristiche delle città come la dimensione, gli indicatori economici, lo sviluppo delle aziende, gli investimenti della città e gli effetti temporali per servire come variabili di controllo

Risultati. Risultati preliminari trovano supporto empirico per evidenziare una relazione diretta tra lo sviluppo della dimensione “smart living” della città e la promozione dell'imprenditoria femminile. Le caratteristiche della città in termini di qualità della vita, misurata in termini di disponibilità di servizi culturali ed educativi, coesione sociale, ambiente, e sicurezza influenzano la creazione di impresa e promuovono l'imprenditoria femminile, che tende ad essere

più attiva in una città con un alto livello di pratiche “smart living” nel corso degli anni. Questa relazione è guidata dall'avanzamento del processo di transizione da città a smart city, che crea molteplici opportunità per utenti, cittadini ed imprenditori che trovano un ambiente adatto per lo sviluppo della propria vita e della propria attività imprenditoriale. Inoltre, risultati preliminari evidenziano che gli investimenti delle città in R&S hanno un effetto moderatore nella relazione tra le pratiche smart living e l'imprenditorialità femminile. Questi risultati sono in linea con la letteratura attuale che conferma che l'imprenditoria femminile è direttamente influenzata dal contesto urbano e che le donne sono gli attori più sensibili rispetto alla qualità della vita, ai servizi educativi, alla salute e alla sicurezza in città (Rosenthal e Strange, 2012; Solesvik et al., 2019; Xie e Wu, 2022).

Limiti della ricerca. Questo studio ha alcune limitazioni legate alla natura quantitativa della ricerca. Innanzitutto, lo studio si concentra su un solo paese. Questa è una limitazione comune alla maggior parte degli studi quantitativi legati alla smart city a causa del tipo di dataset, delle misurazioni e delle politiche intraprese nei vari paesi. Tuttavia, l'Italia è considerata un contesto adeguato per indagare la relazione tra smart city ed ambiente economico grazie alla considerevole variazione e distribuzione del campione su livelli geografici ed economici. In secondo luogo, anche se abbiamo verificato lo sviluppo dell'ambiente economico nella relazione, questo potrebbe influenzare lo sviluppo dell'imprenditoria femminile. In terzo luogo, la comprensione attuale della dimensione della smart living non è ancora sufficientemente avanzata, quindi ci siamo basati sulla letteratura di riferimento per costruire la nostra variabile. Sulla base di queste limitazioni (e di altre insite nella natura del lavoro), studi futuri potrebbero approfondire lo sviluppo della dimensione “smart living”, investigandone l'intersezione con con l'ambiente locale (cittadini) ed economico (aziende e imprenditoria).

Implicazioni manageriali. Le smart city stanno contribuendo attivamente al cambiamento sociale ed economico del nostro tempo e questa influenza è positivamente correlata all'aumento alla promozione e allo sviluppo dell'intero contesto economico locale. In particolare, focalizzandoci sui risultati emersi da questo lavoro, l'avanzamento di pratiche “smart living” in una città è cruciale per lo sviluppo urbano e non deve essere considerato meno importante rispetto ad altre dimensioni delle smart cities come la mobilità, la governance, l'ambiente, l'economia e le persone. Dal punto di vista manageriale, questi risultati suggeriscono che le politiche locali dovrebbero concentrarsi sull'incremento del benessere e della qualità della vita, in quanto ciò favorisce l'imprenditoria femminile e l'attività imprenditoriale in generale (Almirall et al., 2016; Camboim et al., 2019).

Inoltre, le città dovrebbero investire nell'innovazione e nella ricerca e sviluppo pubblico per migliorare ulteriormente l'ambiente imprenditoriale. Infine, gli amministratori delle città dovrebbero bilanciare lo sviluppo tecnologico con le esigenze umane e sociali, per evitare che le innovazioni tecnologiche siano sviluppate senza considerare le reali esigenze degli utenti (Vanolo, 2014).

Originalità del paper. L'interesse verso la trasformazione smart nelle attuali politiche urbane ha spinto molte città nel mondo a perseguire iniziative di smart city. Tuttavia, in questa trasformazione da città a smart city, gran parte della ricerca si è concentrata principalmente sulla tecnologia e sull'avanzamento digitale nella città come motore di questa trasformazione, perdendo il senso intrinseco che le città dovrebbero essere incentrate sull'uomo piuttosto che sulla tecnologia o sul capitale. In questo articolo, ci proponiamo di indagare la relazione tra l'ambiente economico e le attuali traiettorie delle smart city, concentrandoci sulla dimensione del smart living. Questa dimensione è poco studiata e controversa in quanto include le pratiche delle città che consentono agli utenti e ai cittadini di sviluppare il proprio potenziale e costruire la propria vita in un ambiente adeguato. Sulla base di questo stato dell'arte, lo studio si propone di indagare come le pratiche di smart living integrate nelle dimensioni delle smart city influenzino l'ambiente economico nel promuovere l'imprenditorialità femminile nelle città. In particolare, questo studio è uno dei primi che cerca di misurare quantitativamente e di affrontare l'importanza della dimensione del smart living nelle traiettorie delle città, considerando le pratiche incentrate sull'uomo, come l'istruzione, la salute, la sicurezza, la coesione e l'inclusione nelle città, che influiscono sulle attività imprenditoriali.

The potential role of gamified solutions on sustainable choices

GIUSEPPE FRANZESE* CHIARA CANNAVALE*

Framing of the research. *Despite the relevance that sustainability has assumed in the current historical period, many companies still struggle to find the right balance between the pursuit of sustainable behavior on the one hand and utilitarian goals on the other. Although there are still companies today that fail to identify this trade-off, many other companies have made sustainability a focal point of their development. In fact, being sustainable nowadays allows companies not only to benefit from many facilities arranged by governments (Sharma and Henriques, 2005), but at the same time to make themselves more attractive to customers and investors (Danciu, 2013).*

The term sustainability has been used in several fields and in a variety of contexts, spanning from the concept of environmental sustainability to the vision of a sustainable society with a stable economy (Loorbach et al., 2017). In this paper, we consider only some of the definitions that are associated with the term. For example, the management of resources to maximise their continuous production, maintaining a constantly renewable stock (Xu et al., 2021). Or a situation - sustained indefinitely - in which the members of a society enjoy maximum satisfaction (Higgins-Desbiolles, 2018). Or, finally, a development whose decisions - taken at a given time - do not damage the prospects of maintaining or improving living standards in the future (Romasheva and Dmitrieva, 2021). However, the environmental and economic complexities of each concrete situation make it almost certain that the realisation of such a concept is not possible (Demers and Gond, 2020). It is clear from these definitions that the phenomenon has gained importance in a wide variety of fields, but above all that at the basis of sustainability are attitudes and choices made by the various players in the environment (Farjam et al., 2019). In fact, applying sustainable choices requires a radical change in individuals (Bogdanov et al., 2019). This is only possible if the involvement of people is very high (Holmberg and Sandbrook, 2019). If we consider companies - as profit-oriented organisations - applying these changes becomes even more problematic as it is not always easy to achieve sustainable goals without having repercussions in economic terms (Luzzani et al., 2021). For these reasons, managers and companies that wish to pursue sustainable goals that bring benefits are constantly looking for new and creative approaches that can improve user engagement (Gerards et al., 2018) and guide them towards certain behaviours without losing the utilitarian purpose of the company (Hsu and Chen, 2018).

Among the phenomena that can improve user engagement, there is gamification (Xiao et al., 2022). Gamification is an umbrella term in which the use of mechanics, design and other game elements are applied in non-game contexts (Ashaari, 2018). Gamification is a tool that - by exploiting people's primal desires for success, competition, and self-fulfilment - organisations use to guide the behaviour of employees and customers (Aghdaie et al., 2022). Considering that gamification is not limited solely to satisfying hedonistic elements but provides utilitarian benefits to the users (Anim and Omar, 2021), it emerges as a valuable tool useful in increasing employee productivity, improving customer engagement, and even speeding up the production processes of new products or services (Nacke and Deterding, 2017). Among the various areas where the potential of gamification has been applied is sustainability (Günther et al., 2020; Guillen et al., 2021). Gamification applied to sustainability goes by the name of Eco gamification or green gamification, and although the concept emerged a decade ago (Owen, 2013), it is only in recent years that there has been work that has taken this phenomenon into account. For this reason, there are still some gaps on how gamified solutions can be used to guide individuals toward sustainable behaviors and even more so on what steps companies have taken to successfully implement gamification to achieve certain outcomes. Understanding the role that gamification can play in sustainable choice within the company and in customer relationships is essential when considering the actual importance of sustainability. Furthermore, understanding "the steps" that some companies have taken in designing and implementing gamified experiences could be useful for those who wish to achieve sustainability-related goals without affecting the utilitarian nature of the company.

Purpose of the paper. *The aim of this article is to understand how, by using gamified solutions, some companies have succeeded in driving individuals - both internal and external to the company - towards sustainable behaviour, while at the same time managing to maintain utilitarian objectives. Indeed, understanding this relationship may prove highly important in providing - to those companies that have not yet found this trade-off - guidance and suggestions on how to best exploit the potential of gamification as a novel and creative approach that can influence individuals*

(Gimenez et al., 2021). Even though in the literature, gamification has become increasingly important to the point of influencing a wide variety of fields (Xi and Hamari, 2019; López et al., 2021; Breur et al., 2022), including those related to sustainability (Karoleva and Novack, 2020) there are still many gaps on the relationship between the phenomena considered. Indeed, despite the fact that some scholars have attempted to explain whether and how the use of gamification as a tool can bring about radical changes within organisations (Alhammad and Moreno, 2020), there is still no clear vision of how this occurs, especially when considering the use of Gamification as a tool aimed at guiding individuals towards sustainable choices that do not negatively affect the company's bottom line.

The purpose of this article, first, is to study and understand how and in what ways some companies have been able to take full advantage of the potential of gamification to make improvements, in terms of sustainability, in their organizational set-up without having an impact on profits, indeed, increasing them in some cases (Gatti et al., 2019). Second, the goal is to develop, prepare and suggest a set of practices and behaviors that can be implemented by any company that is unsuccessfully addressing sustainability-related challenges.

Methodology. To achieve the objective of the research and thus put in place practices that harness the potential of gamified solutions to drive sustainable behaviors that can create value not only for individuals but also for the enterprise, we conducted a multiple case study analysis because we are dealing with a topic that is still at an exploratory stage (Yin, 2003). Using multiple cases allows for a more detailed analysis in terms of accuracy and generalizability. In addition, replicability of the results is also facilitated in this way (Bordeleau et al., 2020). In addition, several semi-structured interviews were conducted, which are useful in those cases where despite the use of predefined questions, one still wants to leave room for any unanticipated emergent phenomena (Roulston and Choi, 2018). Each interviewee was asked the same set of questions, developed from sources already used and validated in the literature (Ball, 2019). The advantage of relying on already validated sources increases the possibility of obtaining a reliable and valid questionnaire (Sürücü and Maslakçi, 2020).

The reference sample consists of 3 companies that use gamification and strive to meet a variety of sustainability criteria. Two of the companies analyzed deal with information systems and have implemented gamification first in some services offered to clients and then within their own staff. The third company is in the food & beverage and has implemented some applications aimed at guiding consumers toward sustainable choices. In addition, just as with the others, this company also uses gamified solutions with its employees.

Primary data were collected through interviews and were supplemented with secondary data from literature, company websites, social media, online interviews, and blogs. In this way, we were able to triangulate the data (Stake, 1995). Transcription and analysis were done with the help of NVivo, a computer-assisted qualitative data analysis software. NVivo improves the effectiveness and transparency of qualitative research through efficient coding and retrieval (Sinkovics & Alfoldi, 2012).

To fulfil the study objectives, an abductive method (Dubois and Gadde, 2002) was used, which systematically blends the deductive approach, which entails generating theories from existing literature, and the inductive approach, which aims to create a universal law from specific situations. On the one hand, this work is based on a broad and well-known body of literature on sustainability. On the other hand, the phenomena of gamification have yet to be properly investigated.

Results. Gamification, due to its ability to leverage on the natural needs of the individual (Rigby, 2015), appears to be an excellent tool for guiding user behaviour (Wood and Reiners, 2015). Through our analysis, it is possible to confirm that gamification is not only a socially useful tool, as it provides learning services with innovative and engaging mechanics to multiple individuals by enticing them to make certain choices, but also confirms that through the implementation of gamified solutions in their workforce, companies can derive numerous benefits towards their employees and customers. In addition, it is clear which practices are most used by companies, their purpose and how they are implemented. In the first part of the analysis, primary and secondary data were transcribed and analysed using CAQDAS NVivo. The use of this software can improve the systematisation, reliability, effectiveness, and transparency of qualitative research by following formalised procedures and making the analysis more rigorous (Tate et al., 2015). NVivo helps to establish a chain of evidence by organising and coding data in a systematic way (Wong, 2008). Through coding, it has been possible to identify key nodes where gamification and sustainability-related concepts seem to have a correlation. However, the analysis is still ongoing, and no more data will be entered only when theoretical saturation has been reached, i.e. when no new themes emerge by adding information (Alam, 2021).

Even more interesting are the results obtained from the interviews and the analysis of the individual case studies. Indeed, according to the managers, gamified solutions can play a crucial role in driving behaviour inside and outside the company, including sustainable behaviour. However, certain factors must be considered when designing and planning a gamified experience. Moreover, some techniques may prove more useful than others.

Two of the analysed companies belong to the IT sector and had no difficulties in implementing gamified solutions in their staff and services. The third company is positioned in the food & beverage sector and had some problems interfacing with gamification, so much so that it outsourced the planning and implementation of the experience to an external company. Despite these difficulties for all companies, the steps that were taken were similar: (1) first, the gamified experience was proposed to customers, implementing gamification techniques on already existing products/services offered to the public; (2) then the gamified solutions were introduced within the company, considering the characteristics of the individuals for whom they were intended and the surrounding environment. At this stage, it was necessary to consider the abilities of the subjects and to find the right balance between task difficulty and reward obtained. In fact, the designers had to make several attempts before understanding how to 'activate' the

players' hedonistic desires to increase their involvement; (3) simultaneous with the previous phase was the selection of techniques to be used, sometimes creating a unique gamified experience in which several techniques are combined to maximise user involvement. Through merging these steps, the case company were able to direct both customers and employees towards sustainable choices, and in some cases, as a result of special events launched by the companies and aimed at consumers, employees, and institutions, it was possible to realise projects aimed at creating an ecosystem in which sustainable goals could be achieved through the use of gamified solutions.

Research limitations. Even though the findings may give additional information regarding the use of gamified solutions inside companies and how they may lead consumers towards more sustainable behaviours, the study has significant limitations. First, despite the inclusion of multiple case studies, the use of data from semi-structured interviews and the use of a variety of secondary funds, some information may have been unintentionally left out, which could diminish the credibility of the study. Second, the participants in this study represent only a small sample of the companies that use - or have tried to use - gamification to achieve certain goals and therefore the generalization of the research results to a wider population is limited. Finally, there might have been additional contextual elements that were overlooked and could have influenced the study's findings.

However, this exploratory case study provided insights for future research aimed at investigating (1) the relationship between the use of gamified solutions and the choice of sustainable behaviours; (2) the existence of gamification techniques that are more useful for achieving certain goals; (3) the existence of variables, such as culture, that may influence the techniques used; (4) the importance of gamified experience design for a company and the users of the experience. Furthermore, this study also provided practical implications for managers interested in applying gamified solutions to address the increasing demand for sustainable practices. Future research is needed to explore the relationship between the use and implementation of gamified solutions to guide individuals towards value-creating behaviours, for the company and society. Finally, future research could explore how to implement gamification strategies in companies that have not yet approached them.

Managerial implications. Gamification can be introduced into technological systems to enhance utilitarian goals by providing hedonistic experiences (Hamari and Koivisto, 2015). Considering individuals' desires regarding success and power, it is possible to push them towards certain behaviours. Considering this, our research contributes to the literature in two ways. On the one hand, it provides new information to understand how gamification experiences can guide individuals towards sustainable behaviours and how through a reinforcement system (Macdonald and Brewster, 2019) it is possible to push individuals to repeat such choices over time. On the other hand, this article shows that through the use and implementation of gamified solutions it is possible to generate value for the company and society. This result is in line with the value-behaviour perspective proposed by Whittaker et al. (2020).

Beyond the theoretical implications, this work also presents practical contributions. In the first role, it becomes clear that not all gamification techniques lead to the same results. Therefore, it is necessary to analyze the context in which a gamified solution is implemented and to construct the experience based on the identified characteristics as well as the desired results. Secondly, linked to the design and implementation of the experience, the subjects the experience is intended for must also be considered. In fact, using techniques that require skills not possessed by the users or the imposition of utopian objectives will only lead to the failure of the experience. In fact, it should be kept in mind that while the playful nature of gamification and the desire to achieve a goal are an important incentive for the accomplishment of certain actions, failure in failing to achieve a given goal may lead to a series of negative feelings in those involved (Ouariachi et al., 2020). For this reason, we suggest that managers who act as designers in gamified experiences analyze all the characteristics linked to the context of reference, the surrounding environment, and the culture of the subjects for whom the experience is intended. In this way it will be possible to understand the level of the participants and the objectives that will best capture their involvement.

Originality of the paper. Considering the growing importance of sustainability-related phenomena, the goals set by the 2030 agenda and possible solutions to overcome critical situations, our research demonstrates how through the design and implementation of a gamified experience employees and customers can be guided towards the adoption of sustainable behaviours, capable of being repeated over time thanks to reinforcement systems linked to the intrinsic desires of individuals. In fact, through rewards, linked to the completion of certain tasks in gamified solutions, it is possible to increase - in consumers and employees - the perception of personal value linked to sustainable actions. This research contributes to understanding the effectiveness of gamification for sustainability. The topic is relatively new and still little discussed in the literature (Douglas and Brauer, 2021; Oliveira et al., 2021) and, for these reasons, suffers from some shortcomings. The analysis was developed on the information obtained from the three companies examined and provided several practical and theoretical insights into the future course of the research. From a purely theoretical point of view, this study allows us to better understand the relationship between gamification and sustainability and especially on how to design - and the factors to be considered - in the construction and implementation of a gamified experience aimed at pushing subjects towards sustainable behaviour. Now, the research is still in an embryonic stage, so obtaining information from further sources and considering more companies could add more validity to this work.

Finally, it would be interesting for further future research to conduct a large-scale analysis and set up a quantitative study to determine how gamification may affect the choice of sustainable behaviour and the factors that determine this choice.

Keywords: Gamified solutions; sustainability; user engagement; innovations.

European R&D grants: assessing the impact of SME Instrument on Technology Transfer activity

SAVERIO BARABUFFI* VALENTINA CUCINO* ALBERTO DI MININ* ANDREA PICCALUGA**

Framing of the research. *The utilization of European funding to promote corporate research and development (R&D) is a widely accepted solution to tackle the issue of private underinvestment in R&D (Nelson, 1959; Arrow, 1972). R&D grants have been suggested to be more effective in influencing the direction of technological change and addressing specific societal challenges, in comparison to other policy measures such as R&D tax credits (Azoulay and Li, 2020 Van Reenen, 2020). The impact of these market failures is primarily felt by innovative SMEs, with financial resource constraints being a significant obstacle to R&D activities, especially with regards to technology transfer (Bukvic and Barlett, 2008). Hence, European funding can play a vital role in stimulating R&D and bridging the financing gap for small and medium-sized enterprises (SMEs) (Cincera et al., 2016; Mina et al., 2021).*

However, despite a tendency to report positive results, empirical evidence has not provided a conclusive answer on the effectiveness of R&D subsidies, as noted by Dimos and Pugh (2016) and Bloom et al. (2019). While R&D grants have the potential to encourage firms to increase their investment in R&D activities, the ultimate impact of such policies may depend on various factors, such as the design of the subsidy program and the characteristics of the firms that receive the subsidies. Furthermore, R&D subsidies may have unintended consequences, such as encouraging firms to engage in rent-seeking behavior or skewing their R&D efforts towards short-term goals rather than long-term breakthrough innovations.

Despite the potential limitations of R&D grants, they remain a crucial tool for policymakers seeking to promote technological progress and economic growth of SMEs. As such, continued research into the effectiveness of these policies is essential in order to develop grant programs that can maximize their benefits while minimizing potential drawbacks. As shown by several studies, European funding can play a crucial role in stimulating R&D and closing the funding gap for SMEs (Cincera et al., 2016; Mina et al., 2021). The support of European funding can enable SMEs to access the necessary resources and expertise to develop new technologies and innovations, thereby promoting economic growth and competitiveness. Indeed, several studies have demonstrated the positive impact of grants on the survival of small and medium-sized enterprises, as well as on their ability to maintain employment levels, invest in tangible assets, and increase sales or turnover (Dvouletý et al., 2021; Pergelova and Angulo-Ruiz, 2014). More concretely, grants are a form of financial assistance that can provide a boost to SMEs struggling to stay afloat or expand their operations. Studies have shown that grants can have a range of positive outcomes, including helping SMEs weather financial challenges and avoid bankruptcy, retaining or even increasing their workforce, investing in new equipment or facilities, and boosting sales or revenue.

Furthermore, European funding can also provide SMEs with access to international networks and markets, facilitating their integration into the global economy (Mulier and Samarin, 2021). This is particularly important for SMEs, which often lack the resources and capabilities to compete globally on their own (Gabrielsson et al., 2004).

By promoting innovation and competitiveness among SMEs, European funding can contribute to the overall economic growth and development of the European Union. As the European Commission notes, "The EU's future growth and jobs depend on its ability to support the creation of new companies and the growth of existing ones, particularly small and medium-sized enterprises" (European Commission, 2021).

Given the importance of European financing in promoting R&D and economic growth of SMEs, the present study aims to investigate its role in fostering innovation and competitiveness among SMEs.

Purpose of the paper. *The SME Instrument (SMEi) is a well-established funding program within Horizon 2020 that was introduced in 2014. Its primary objective is to support high-potential innovation and consolidate the EU's policy efforts to promote European competitiveness in advanced technologies, matching its excellence in science. The program*

provides funding for SMEs to develop and bring new products, services, and processes to market as well as to access new markets. Moreover, the SMEi has facilitated technology transfer activity through patents activity. Within the framework of the SMEi instrument, businesses participate in a grant competition where the amount of funding can vary from as little as €0.5 million to as much as €2.5 million. Research and development activities that are eligible for funding include prototyping, testing, design, performance evaluation, monitoring, demonstrating, piloting, validating for market duplication, scaling, and application development. Grants cover 70% of all eligible costs associated with the proposed project for a period of 12 to 24 months. The intended outcome of the project is a market-ready product, process, or service (Di Minin et al., 2016).

The SMEi has two types of winners. The first type receives economic compensation while the second type is awarded a Seal of Excellence. The Seal of Excellence is a quality label granted to project proposals submitted under a Horizon Europe call for proposals that meet a predefined quality threshold but were not funded due to budget constraints (European Commission, 2023). More concretely, the Commission awards this seal to recognize the value of project proposals and encourage other funding organizations to benefit from Horizon Europe's high-quality evaluation process.

The aim of this paper is to determine whether SMEi contributes to fueling technology transfer activities, specifically in terms of new patent activity. In other words, this paper investigates whether SMEs improve their technology transfer performance, as measured by the numbers of patents, in the two years following their financing period. Thus, the analysis relies on SMEs that applied for funding to the Horizon 2020 SME Instrument (SMEi) program Phase 2, during the period 2014 to 2020. We have selected this stage because Phase 2 fundings focuses on sustaining innovation projects underpinned by a strategic business plan and a feasibility assessment. During this period, SMEs are requested to reach the market with a new idea (product, process, service) or to develop a business innovation plan which includes a detailed commercialization strategy and a plan on how to attract private investors.

Methodology. To evaluate the impact of the SMEi on technology transfer, we use propensity score matching (PSM) and difference in differences (DID) models to compare innovation performances (patent stock and patent applications) of SMEs that received the SMEi fundings with the correspondent performances experienced by a counterfactual group of SMEs that was awarded with the Seal of Excellence.

We retrieved the information on 3810 SMEi Phase 2 applicants that have achieved the qualification score in the evaluation cycle from eCORDA proposal database. The dataset contains applicants' data and project data for the evaluated project (both funded and not funded) that apply to the SMEi. To analyze the effect on technological transfer of SMEi, we further combined patent information over the period 2013-2021 obtained from Bureau van Dijk Orbis Intellectual Property database. By matching the two datasets, we obtain an unbalanced panel of 2039 firms.

To identify the causal effect of SMEi, we need to control for those elements that might have driven the acknowledgment of the "Main list" status. We need to make sure that our analysis rules out any significant difference between "Main list" and "Below available budget" SMEs in terms of these characteristics. Hence, we run a k-nearest PSM by using a set of variables related to the SMEi proposal (proposal duration, total cost of the project, requested EU contribution, coordinator country, and year of application). After the application of the PSM, the final sample comprises 1152 SMEs. Then, we specify a DID model by introducing both individual and time fixed effect and by clustering at firm level the standard errors.

Results. In Table 1, we report the preliminary results of the DID model to evaluate the impact of the SMEi on technology transfer. We present the results of being funded by the SMEi on the stock of patents and the applications of new patents. In both cases, the impact is positive and statistically significant, meaning that being funded by the SMEi lead to higher technological transfer with respect to the SMEs not funded.

The estimate of DID is higher in column 1 rather than column 2, but this result could be biased by potential acquisition of patents by SMEs. By focusing on the estimated coefficient of DID in column 2, we can isolate the effect of the policy on knowledge production of SMEs by both reflecting the inventive performance of the firm and having a close link to the invention (OECD, 2015).

This preliminary analysis confirms the positive effect of EU public policy in the short term by fostering technology transfer and the innovative performances of SMEs. These preliminary results show that the policy promotes the SMEs involvement in the commercialization of knowledge, hence generating and fostering competitiveness and growth. These early findings demonstrate that the policy encourages SMEs to participate in the commercialization of knowledge, thereby promoting competitiveness and growth. Moreover, the policy has fostered a culture of innovation and entrepreneurship among SMEs, leading to the creation of new products and services and the expansion of existing markets. Overall, the positive effects of the EU public policy on SMEs highlight the importance of continued investment in technology and innovation for economic growth and development.

Finally, our results are in line with the findings of empirical analysis of the U.S. Small Business Innovation Research (SBIR) program, a U.S. program that inspired the SMEi policy design. Studies of the SBIR program have highlighted the policy relevance of technology and knowledge transfers from publicly funded research to SMEs (Hayter and Link, 2021; Link, 2020). These studies have shown that policies that support innovation and technology transfer are effective in promoting the growth and competitiveness of SMEs (Berger et al., 1992). Our findings similarly suggest that the EU public policy has been successful in promoting technology transfer and innovation among SMEs, which has contributed to the growth and development of these businesses. Continued support for these policies will be important for the sustained success of SMEs in the EU.

Tab. 1: Results of the DID model

	Patent stock	Patent applications
DID	0.1467*** (0.02714)	0.1022*** (0.0205)
Observations	8092	8092
N of Firms	1152	1152
Firm FE	Yes	Yes
Year FE	Yes	Yes
Note: Clustered standard errors (in parentheses). *p<0.1; **p<0.05; ***p<0.01		

Research limitations. This study has certain limitations that serve as potential avenues for future research. Firstly, the analysis is limited to a specific time frame, as the effects of the European grant are assessed only within the two years following its allocation. Therefore, future studies could explore a wider time span to fully comprehend the longer-term impacts of the grant. Secondly, while some research highlights the importance of the intangible aspects of technology transfer (Campbell et al., 2020; Cucino et al., 2022), our analysis solely focuses on the tangible benefits, such as patent applications. Future research could adopt a qualitative approach and examine a sample of case studies to investigate the social and reputational benefits of the European grant that are not quantifiable through a quantitative analysis alone. By doing so, we can obtain a more holistic understanding of the impact of the European grant beyond the scope of patents. Moreover, we need to overcome the selection bias and loss of information arising from the presence of missing data in the ORBIS IP database by using the multiple imputation technique developed by Honaker and King (2010), drawn from the statistics literature, to generate a balanced panel and solving the problem of selection bias and randomly missing data

Managerial implications. The findings of this study have important managerial and policy implications. Firstly, companies that intend to participate in the European funding policy for research and development should pay particular attention to the protection of their intellectual property. Since the quality of the proposal is a fundamental criterion for obtaining funding, companies should focus on designing an ambitious and high-risk research and development plan that also has strong commercial potential. In this sense, the European funding policy for research and development can be seen as a sort of catalyst for the adoption of open innovation practices, which improve resource management and awareness of intellectual property (Spithoven et al., 2013; Van De Vrande et al., 2020).

Secondly, the R&D managers of companies that have obtained European funding should design and implement open innovation strategies in order to maximize the impact of the funding. The adoption of open innovation practices can increase companies' ability to transfer the knowledge acquired during the research and development project to other contexts and sectors, thus creating additional business opportunities. Furthermore, collaboration with other companies and research institutions can accelerate the process of commercializing the acquired knowledge.

In summary, our conclusions suggest that companies that intend to participate in the European funding policy for research and development should pay attention to the protection of their intellectual property and design open innovation strategies to maximize the impact of the funding.

From a policy perspective, the SMEi aims to create a unique and specialized group of companies that drive EU competitiveness and growth. Policymakers should consider these findings to optimize the allocation of resources for SMEs seeking European grants. By providing SMEs with the necessary support and tools, policymakers can drive innovation, economic growth, and job creation.

Moreover, this study provides valuable information for managers and policymakers to make informed decisions regarding the allocation of resources for SMEs seeking European grants. It is recommended that managers adopt open innovation practices to maximize the impact of the grant, while policymakers develop ad hoc tools to incentivize the best SMEs to apply for the seal of excellence qualification. Moreover, the study's findings are consistent with the empirical analysis of the U.S. Small Business Innovation Research (SBIR) program. Studies of the SBIR program have shown that policies supporting innovation and technology transfer are effective in promoting the growth and competitiveness of SMEs (Chowdhury et al., 2022; Leyden and Link, 2015; Link and Scott, 2010). Our findings similarly suggest that the EU public policy has been successful in promoting technology transfer and innovation among SMEs. Policymakers can continue to learn from and leverage the experiences and successes of programs like the SBIR to further improve the effectiveness of EU policies aimed at supporting SMEs.

In conclusion, our study highlights the importance of EU public policy in promoting innovation and technology transfer among SMEs. Policymakers must continue to invest in programs like the SMEi to support SMEs in their efforts to commercialize knowledge, generate growth, and remain competitive in today's global economy.

Originality of the paper. The role of European funding in promoting R&D among SMEs is critical, as it can help bridge the financing gap and stimulate innovation, as highlighted by previous studies (Cincera et al., 2016; Mina et al., 2021). One program that supports such innovative projects is the SMEi, which rewards high-risk and ambitious innovation proposals with the potential to disrupt the European market. The program encourages combining market-close innovation with market-oriented approaches to enhance competitiveness (Padilla et al., 2018).

Despite the importance of public support in promoting innovation among SMEs, questions remain regarding the impact of the SMEi instrument on technology transfer activities of SMEs. Therefore, this study aims to investigate

whether the SMEi has supported the patenting capacity of SMEs. While previous studies have focused on the financial performance of SMEs that have received European funding, this study aims to analyze the technology transfer activities of SMEs that have received funding and those that have received the seal of excellence qualification.

The findings of this study can be valuable for policymakers and SMEs seeking to design effective strategies to promote innovation and enhance technology transfer activities. By identifying the impact of the SMEi on the patenting capacity of SMEs, policymakers can optimize the allocation of resources to support SMEs in developing their intellectual property and drive innovation and economic growth. Moreover, SMEs can utilize the findings to enhance their patenting capacity and develop effective strategies for technology transfer activities.

Overall, the study sheds light on the potential impact of the SMEi on technology transfer activities of SMEs and highlights the importance of designing effective policies and strategies to support SMEs in promoting innovation and enhancing competitiveness in the European market.

Technology transfer through Open Innovation practices: a qualitative study on public and private Proof-of-Concept (PoC) programs

GIOVANNI TOLIN* ANDREA PICCALUGA*

Framing of the research. *Open Innovation (OI) is a well-diffused topic in business studies (Bigliardi et al., 2020), with relevant implications for organisations that deal with knowledge and technology management (Scuotto et al., 2020). OI has been analysed from a process perspective (Chesbrough, 2017) identifying three main archetypes of knowledge and technology flows, namely inside-out, outside-in and coupled OI practices (Enkel et al., 2009).*

Even if the original OI model developed by Chesbrough (2003) mainly addresses private companies (Leckel et al., 2020; Livieratos et al., 2022), the role of Public Research Organisations is fully acknowledged in knowledge and technology transfer (Perkmann et al., 2013; Munari et al., 2016). However, as argued by Schillo and Kinder (2017), OI practices are implemented differently in the public and private sectors. OI practices in the public and private sectors are mostly addressed separately (Bommert, 2010; Huizingh, 2011), and therefore we argue that there might be a lack of discussion about how these practices take place in the two domains (Almirall et al., 2014; Bogers et al., 2018), particularly in the field of technology management and valorisation (Mergel and Desouza, 2013).

We address this issue by analysing a tool that is often used in OI practices, both in the public and the private sector: Proof-of-Concept (PoC) programs (Passarelli et al., 2020). These programs act as enablers for external collaborations to stimulate and develop innovation in the public and private sectors (Bradley et al., 2013; Munari et al., 2017; Battaglia et al., 2021b). More precisely, this work aims to answer the following research question: How do different PoC programs in the public and private sectors facilitate OI practices toward technology valorisation? To pursue the aim of our research, we carried out a qualitative study based on 26 interviews with professionals working in 12 PoC programs and experts in the field of open innovation, technology transfer, and VC funds within the Italian context.

Purpose of the paper. *Several studies addressed OI from a process view, investigating a wide number of dimensions to cover different OI models both from a theoretical and a practical perspective (Chesbrough, 2017). Drawing on Enkel et al. (2009), researchers mainly identify three archetypes of knowledge flows that underpin OI processes in public and private organisations. First, there is the inside-out practice, where organisations transfer ideas to the external environment by bringing ideas to the market, often valorising their technologies or IP. Second, there is the outside-in practice in which organisations enrich their value chain by integrating innovation and technology externally developed. Third, the coupled OI practice combines the two previous ones and refers to value co-creation by collaborating and cooperating with partners. The process leads organisations to jointly develop innovations, gain external knowledge, and bring ideas to the market.*

Traditionally, OI studies have been related to the private sector (Leckel et al., 2020; Livieratos et al., 2022). However, public organisations have also entailed OI practices with their external stakeholders generating value and impact on society (Wang et al., 2012; Uribe-Echeberria et al., 2019). Within this framework, Schillo and Kinder (2017) pointed out that organisations in the public and the private sector tend to differ in OI practices, participating in different ways in those kinds of collaborative dynamics. In fact, when we consider these two sectors, OI practices are mostly addressed separately in terms of interactions with the stakeholders, innovation tangibility (Bommert, 2010), and innovation outcome (Huizingh, 2011). However, we observed a general lack of comparison on how OI mechanisms differ between the public and private domain (Almirall et al., 2014; Bogers et al., 2018), in particular, regarding the field of technology management and valorisation (Mergel and Desouza, 2013).

Within their OI strategies, several organisations started to equip themselves with specific tools and instruments to manage internal and external knowledge flows (Mount and Martinez, 2014). Among those solutions, PoC programs enhance technology co-development in OI contexts (Passarelli et al., 2020). PoCs support organisations in forming open networks in which different actors work together to valorise technologies (Passarelli et al., 2018; Battaglia et al., 2021b). More precisely, PoC programs are pre-seed instruments designed to decrease the technological uncertainty of research-based inventions in their early stages and to support the process of technology valorisation (Rasmussen and Sorheim, 2012; Munari et al., 2016). They aim to transform knowledge into industrial applications (Battaglia et al., 2021a; Munari and Toschi, 2021).

In recent times, researchers have paid growing attention to the role of PoC programs in facilitating the process of technology transfer, with regard to the activities of public research organisations (Munari et al., 2016; Battaglia et al., 2021b). PoC programs are relevant not only from the perspective of technology commercialisation but also because they support the valorisation process through the enhancement of co-development and networking activities outside the organisations (Maia and Claro, 2013; Passarelli et al., 2018). They have been structured to enable inventors' entrepreneurial capabilities and generate interactions among different internal and external stakeholders both in the public and the private sector but, in the knowledge and technology transfer literature, there is almost no evidence of how those programs differ across these two domains (Bradley et al., 2013; Munari et al., 2017), allowing further discussion on this topic.

Methodology. *The difference in OI practices between the public and the private sectors represents an issue that still needs to be addressed (Almirall et al., 2014; Bogers et al., 2018) and for this reason, the aim of our investigation is mainly explorative. To inductively provide new pieces of evidence and better address the research question, we analysed a set of PoC programs launched in Italy by different kinds of actors (Passarelli et al., 2020).*

We adopted an inductive research method to let the emergence of knowledge through direct observations. By collecting interviews and analysing their content, we recognise specific patterns among the different observations. Based on the grounded theory explorative approach (Strauss and Corbin, 1998), we abstracted the knowledge into a general framework to facilitate the description of this phenomenon and its exploration.

We considered a set of 12 PoC programs launched by 12 different organisations operating in the public and private sectors. We selected the four most common types of organisations operating in the technology transfer domain within the Italian scenario according to measures of research and technology transfer in Italy (Villani et al., 2017). The private sector is represented by three large firms (FF) and three VC funds (VC), while the public sector is represented by three universities (UU) and three national research centres (RC). We considered these four different organisations' typologies to better explore the phenomenon from a wider point of view. The 12 programs are related to specific characteristics that reflect the different contexts in which those organisations operate.

The 12 PoC programs differ in focus, average funding, typology of support provided, and average starting TRL. This is mainly because these instruments assume different characteristics according to the context in which they are applied (Maia and Claro, 2013). Several of the PoC programs are rather general, while others are more targeted to a specific field that has strategic relevance for a certain institution. As will be further discussed in the next sections, the programs also differ in terms of the average starting TRL of the invention considered and the type of support provided in combination with the grant.

According to the so-called Gioia Methodology (Gioia et al., 2013), we based our primary data collection on semi-structured interviews with professionals involved in designing and managing 12 PoC programs in Italy, both in the public and the private sectors. As a matter of fact, these professionals represented the unit of analysis of our study.

To better observe the dynamics that underpin PoC programs, we considered managers of the organisations, administrative staff responsible for the programs' development and management, but also a small panel of experts (EE) in the public and private fields of knowledge and technology transfer to get additional insights on those kinds of solutions. Overall, we made 26 interviews which have been recorded and transcribed. We collected our data between October 2021 and May 2022 through 15 online calls that lasted from 60 to 90 minutes each. The whole process took place on the Microsoft Teams platform.

We considered the grounded theory approach (Strauss and Corbin, 1998) and other more recent methodologies used in qualitative management research (Gioia et al., 2013) to inductively code the interviews' transcripts. To reduce any presence of retrospective data collection bias, we constantly updated our work through a continuous triangulation of data with the other secondary sources previously described (Eisenhardt and Graebner, 2007).

Considering the approach of Corley and Gioia (2004), we schematised the data analysis process according to the different organisations considered: universities (Figure 1), firms (Figure 2), national research centres, and VC Funds (Figure 3). The schemes include representative quotes from the interviewees associated with their specific IDs, first-order concepts, second-order themes, and, finally, four aggregated dimensions.

Fig. 1: Representative quotes from universities.

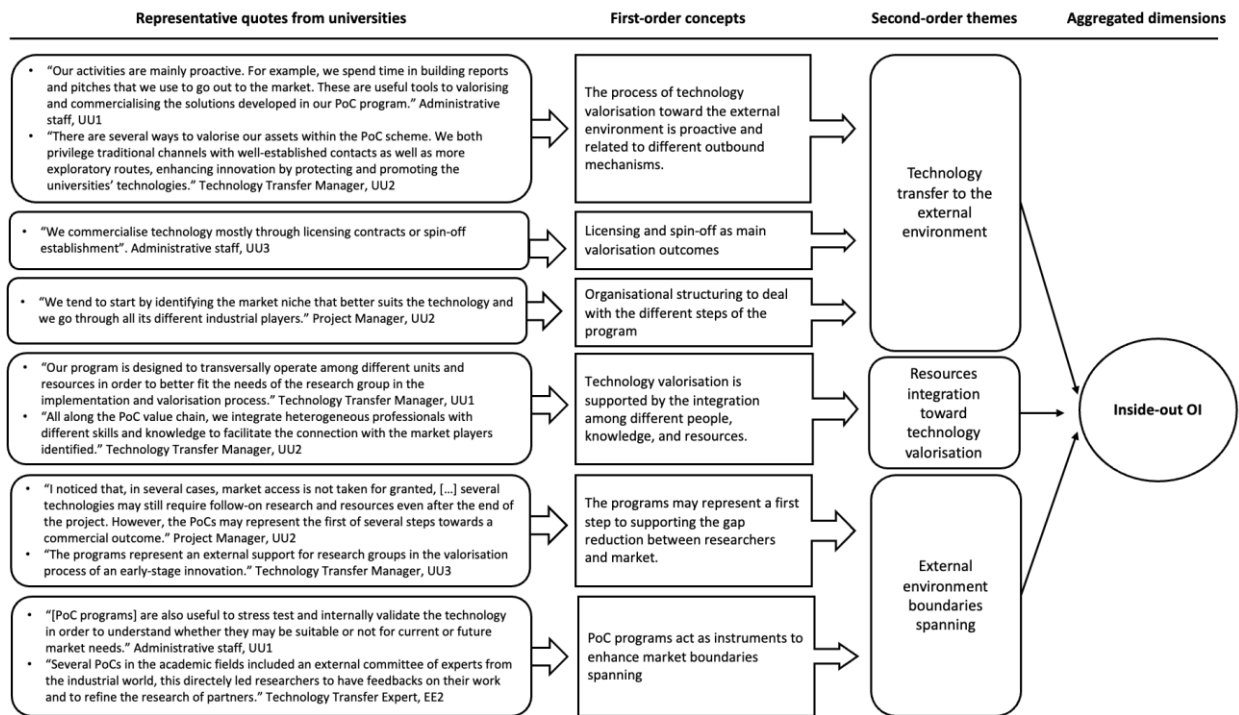

Fig. 2: Representative quotes from large firms.

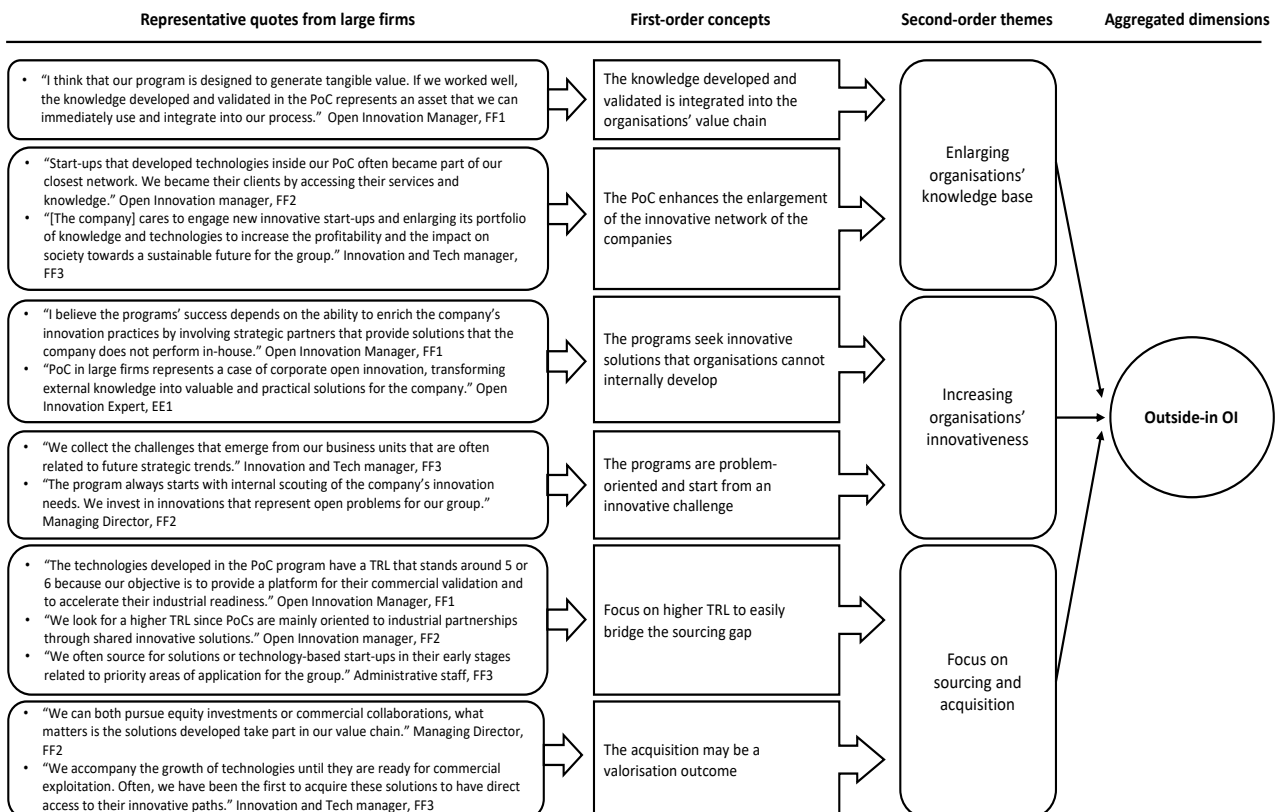

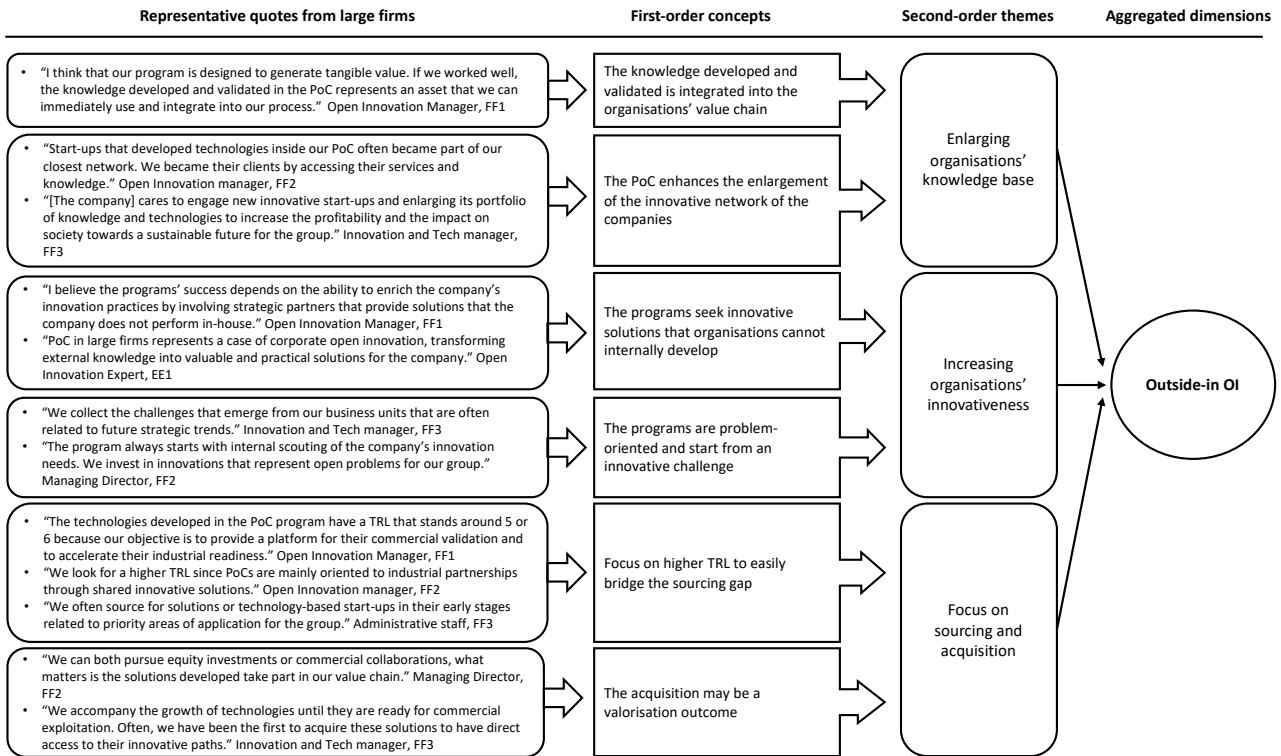

Fig. 3: Representative quotes from Research centres and VC funds.

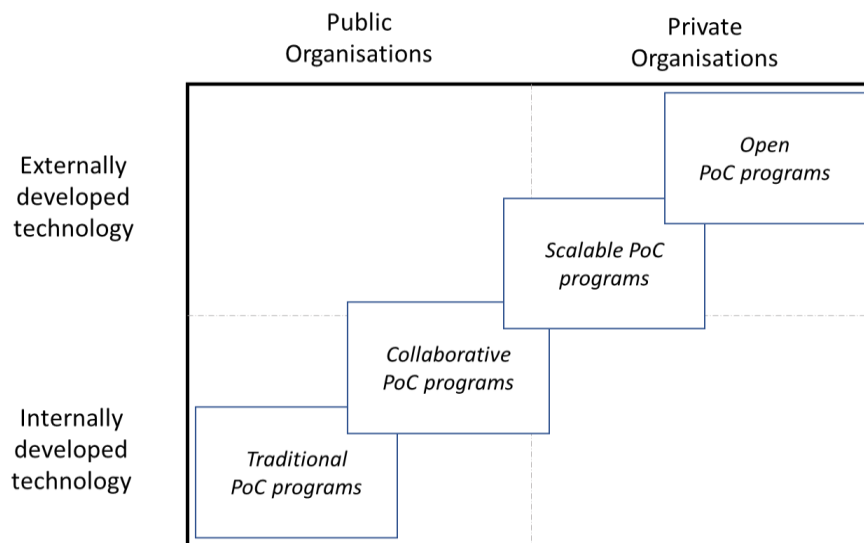

Results.

4.1. PoC programs in the public and the private sector

Interviewing the professionals who deal with PoC programs and analysing the data collected, we observed that four different PoC models emerge when we distinguish between the public and the private sector. The general scheme we developed by answering the first research question has been framed in Figure 4, organising the models according to the sector (public or private) of the organisation that managed and invested in the PoC, as much as on the external or internal technology development.

Fig. 4: PoC models in the public and the private sector.

4.1.1. Traditional PoC Programs

This model reflects the PoCs discussed in academic literature, mainly related to public organisations and technologies that are internally developed (Munari et al., 2017). We observed the emergence of these programs mostly in universities. In these cases, PoCs act horizontally, being oriented to valorise the vast set of knowledge developed inside the laboratories of large public research organisations. Within this frame, even if technology transfer

professionals seek licensing and spin-off as the main valorisation outcomes, it emerged that these programs may be also useful since they represent a first step to supporting the gap reduction between researchers and the market. They act as instruments to enhance market boundaries spanning, supporting public organisations in the path of internally testing and validating the technologies to understand whether they are ready or not to start the process of commercialisation.

4.1.2. Collaborative PoC programs

This is the model that we mostly observed in National Research Centres. Even in this case, we are referring to public organisations that rely on internally developed technologies. This model is specifically designed to create a match between researchers and the industry. In this PoC, a collaboration with industrial players promoted by public research organisations emerged. To enhance this interaction, we observed several cases in which the funding structure is shared between the public and the private sector and so it is the risk. The effort of each partner and the valorisation outcome are often pre-determined at the beginning of the program. Again, in this case, the program leads to the establishment of licensing contracts and spin-offs with an equity split among the parts involved.

4.1.3. Scalable PoC programs

The third model is the “scalable PoC program”. We refer to private organisations that rely on externally developed technologies. These are programs organised and managed by VC funds and are often very vertical around specific high-impact topics according to which the partners work together toward an innovation target. It is not the traditional VC funding scheme in which an investor puts money into a start-up or spin-off. In fact, they tend to invest only in an invention within pre-seed mechanisms with the idea to increase its technology and investment readiness levels toward the creation of a spin-off or start-up ready to go through a seed funding round and to be scaled up.

The programs require complementarity of knowledge and constant interactions to support strategic alignment among the different partners to both develop the technology and the business. We observed that the managing directors and partners of the VC fund have also a scientific background. With their knowledge, they can act inside a mentorship scheme supporting researchers all over the program’s value chain.

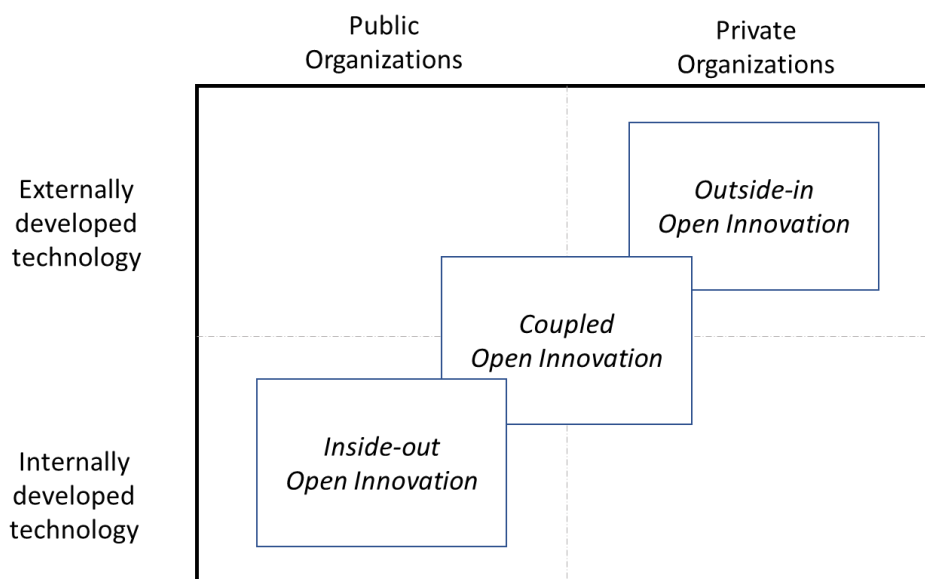

4.1.4. Open PoC programs

The last model is the “open PoC program”. Even in this case, we refer to private organisations, especially large firms, that rely on externally developed technologies. These programs seek innovative solutions that organisations cannot internally develop, they are problem oriented and they always start from an innovative challenge that emerged from an internal scout of the business units’ needs. To better address these innovation calls, firms tend to involve in the program’s technologies with higher TRL with respect to more traditional PoC to easily bridge the sourcing gap. Firms finance technologies that are already at the centre of constituted start-ups in their early stages. Even if it emerged that acquisition may be a valorisation outcome, the programs’ objective is not mainly to acquire those companies but that the knowledge developed and validated is integrated into the organisations’ value chain.

4.2. OI practices in the public and the private sector

Having presented how PoC programs differ in the public and the private sector, we now turn to the OI mechanisms that underpin these programs to observe how PoC programs between these two different domains facilitate OI practices toward technology valorisation. In fact, considering the interviews and the specific case of PoC programs as OI instruments, we observed the emergence of different “shades of openness” (Marullo et al., 2021) when moving from the public to the private sector. Figure 5 provides a visual representation of the three different OI practices that emerged in our study according to the different sectors (public or private) and the external or internal technology development of the organisations that managed and invested in the PoC programs.

Fig. 5: OI practices in the public and the private sector.

4.2.1. Inside-out Open Innovation practices

The first OI practice we observed is the so-called inside-out OI that results to be an aggregated dimension that emerged from our data analysis. When we consider PoC programs as OI instruments (Passarelli et al., 2020), we observed that public organisations such as universities, tend to facilitate OI practices by valorising technologies internally developed via mechanisms of technology transfer to the external environment (e.g., licensing, spin-off).

In this perspective, universities organise and manage those programs to facilitate open innovation by proactively promoting their technologies and involving external partners. As discussed in Battaglia et al. (2021a), all along the technology value chain, universities transversally integrate a set of “heterogeneous professionals with different skills and knowledge” (Technology Transfer Manager, UU2) to work together with academic researchers in increasing the technology and the investment readiness levels.

By transferring ideas and bringing value to the market, universities directly deal with external environment boundaries spanning, impacting, and accelerating the innovation process in an open and diffuse innovative ecosystem promoted by universities and enriched by a vast set of complementary actors.

4.2.2. Outside-in Open Innovation practices

Another OI practice that emerged as an aggregated dimension of our study is the so-called outside-in OI. This kind of OI practice is mainly facilitated by PoC programs in large firms that have the capacity of resources to invest in innovation to solve an internal or societal innovation challenge. In this case, the OI practice is managed by a private actor and relies on a technology externally developed. Concerning other OI practices, the technologies here involved have higher TRL and, as previously discussed, may already be the centre of a start-up or spin-off.

We observe that these OI practices are always problem-oriented and related to enlarging organisations' knowledge base and increasing organisations' innovativeness. By addressing open challenges, companies integrate their value chains with external technologies and knowledge, participating in an OI scheme first supporting the technology and business development of the invention and then adopting those solutions among their standard processes. Within this framework, the integration may take place both with a focus on sourcing and acquisition. However, even if the acquisition emerged as a possible outcome of this OI practice, from the interviews it emerged that the aim is to reach industrial partnerships with these start-ups or spin-offs to solve problems by collaboratively developing and adopting innovation.

4.2.3. Coupled Open Innovation practices

In conclusion, the last OI practice that emerged is the so-called coupled OI. We observed this practice both in public and private organisations (national research centres and VC funds) and both with internally and externally developed technologies. It is positioned in-between the two previous practices discussed and it is characterised by a set of elements that stands as a mixture of inbound and outbound OI mechanisms.

Within the schemes of PoC programs, these practices appeared to be facilitated by an inflow and outflow combination of knowledge that contributes both to technology and market development. In this frame, research centres' TTOs and VC funds experts actively work to “bridge the need for funding of researchers and the need for innovation of companies” (EE3). The combined integration among knowledge inflows and outflows leads to collaborative development and implementation of research-based innovations, valorising the technologies towards specific innovation targets. In particular, OI practices developed in the context of PoC programs in national research centres tend to generate joint start-ups or spin-offs with industries, while VC funds are more oriented towards their scale-up and acquisition on the global market.

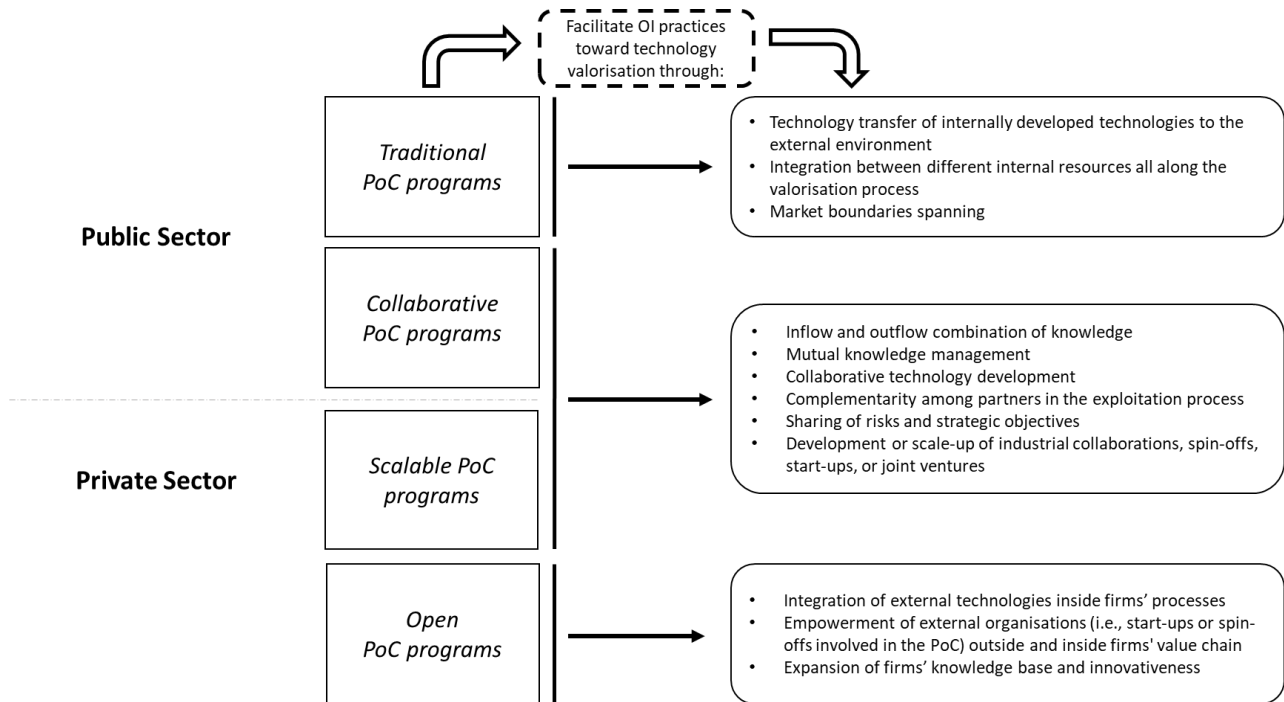

These OI practices are particularly facilitated by the need for constantly sharing risks and strategic objectives, working side by side, and, often, sharing the spaces. This approach is specifically designed to stimulate interactions to strategically align the partners and the complementary support that they can give not only in the implementation but also in the exploitation process.

Research limitations. However, our work is not free from limitations that we hope other researchers may consider as a starting point for future investigations. Our qualitative study may not be broadly generalisable to different national contexts or other kinds of public and private organisations. However, the aim of our research is mainly explorative and represents a first preliminary attempt to extend and develop the theory on OI practices in the public and private sectors. Even if the degree of generalisability remains to be determined, we believe our findings may inform future theoretical and empirical studies in this field toward the definition of a more extended and refined framework.

Managerial implications. Our work explored how different PoC programs in the public and private sectors facilitate OI toward technology valorisation. We schematised the general framework that directly addresses our research question in Figure 6. The exploratory study offers novel theoretical insights and practical implications on the role that those programs have within the OI framework as much as on the mechanisms that facilitate an open valorisation of technologies.

We noticed that PoC programs organised in the public sector mostly rely on the valorisation of internally developed technologies to the external environment, while PoCs organised in the private sector on the integration of externally developed technologies within their value chain. In particular, PoC programs in public organisations tend to spin out the technology by interacting with private partners, while programs in private organisations tend to integrate technology by interacting both with public and private partners.

Fig. 6: General framework

It emerged that PoC programs in the public sector, especially when we consider the case of universities, mainly facilitate inside-out OI practices toward technology valorisation, enabling the transfer of their internally developed technology to the external environment, the integration between different internal resources to boost the valorisation process, and the boundaries spanning with the market. While, PoC programs in the private sector, represented by large firms, mainly facilitate outside-in OI practices toward technology valorisation. In this sector, PoC programs enhance the integration of external technologies inside their processes and support spin-offs or start-ups in which they invest to implement innovation to become their suppliers or to be acquired. By facilitating these OI practices, these PoC programs expand the knowledge base and increase the innovativeness of those organisations.

In conclusion, we observed other PoC programs that facilitate coupled OI practices. It is the case of national research centres in the public sector that deal with internally developed technologies and VC funds in the private sector that deal with externally developed technologies. Here, PoC programs facilitate OI practices toward technology valorisation through an inflow and outflow combination of knowledge. PoCs stimulate OI within collaborative and co-development schemes oriented to manage knowledge, risks, and strategies among complementary partners toward the development or the scale-up of industrial collaborations, spin-offs, start-ups, or joint ventures to valorise technology in the market.

Originality of the paper. Our work provides further insights into the literature on OI in the public and private sectors. Even if previous research identified and investigated three main archetypes of OI practices (Enkel et al., 2009; Chesbrough, 2017), existing studies are fragmented among the processes that underpin these different mechanisms, particularly when it comes to considering their differences in the public and the private sectors (Almirall et al., 2014; Schillo and Kinder, 2017). The academic debate is mainly focused on understanding the emergence of these OI practices but considering these two separately (Wang et al., 2012). For this reason, we still lack a framework able to draw connections between the two sectors, especially concerning the field of technology management and valorisation (Mergel and Desouza, 2013; Bogers et al., 2018).

Drawing on previous literature that identifies PoC programs as instruments to implement OI (Passarelli et al., 2020) and technology valorisation (Battaglia et al., 2021b; Munari and Toschi, 2021), we provide a link between research on OI practices across the public and private sectors (Almirall et al., 2014; Bogers et al., 2018) and on technology transfer through gap funding instruments (Bradley et al., 2013; Munari et al., 2017). As far as we know, no prior investigation has dealt with this interaction before.

Our findings extend existing studies by exploring the role that PoC programs play in facilitating OI practices toward technology valorisation in the public and private sectors. More specifically, we identify how different ways of managing technology (internally or externally developed) as much as different kinds of public and private organisations facilitate technology valorisation. According to the findings, this process takes place through four typologies of PoC programs that facilitate three OI practices characterised by a different range of "openness" (Marullo et al., 2021). In developing this framework, we believe that our work offers some theoretical contributions, as much as some managerial and policy implications.

First, adding insights to the research of Uribe-Echeberria et al. (2019) on how to implement OI practices in research and technology organisations across different sectors, our study pointed out which are the key elements that

facilitate the emergence of OI practices, providing an in-depth look at programs specifically designed to implement these dynamics in the process of technology valorisation. Considering the case of PoCs, the emergence of OI practices appears to be mostly facilitated by the way through which public and private organisations manage knowledge and technology, their relationships with the external environment, their ability to integrate resources all along the innovation pipeline, and how their exploitation process is structured under a strategic and operative path. As argued by Wang et al. (2012), at the basis of the development of OI practices there is a strong presence of “forging ties” among several players between the public and the private sector. Even if this kind of linkage is not always easy to reach, our findings identify how these processes can be facilitated under an inside-out, outside-in, and coupled perspective.

Second, our findings contribute to shedding light on the definition of PoC programs as “relational enablers” first discussed in Battaglia et al. (2021b). We investigated the relational side of these programs within the OI framework, describing how multi-stakeholder partnerships oriented to innovation are managed and how they differ across four different kinds of organisations. We complement the vision discussed in Maia and Claro (2012), which sees these programs as “connectors” within an innovative ecosystem, bridging people, ideas, and resources toward technology valorisation. We observed how public organisations such as universities tend to operate with an outbound relational strategy, managing interactions oriented to an external valorisation of technologies internally developed, while private organisations as large firms tend to operate with an inbound relational strategy, through interactions oriented to an internal valorisation of technologies externally developed. Moreover, we observed a mixed relational strategy in other organisations operating across the two sectors such as research centres and VC funds.

Open innovation in agricultural sector: an empirical analysis

GIUSEPPE BONGIORNO* MARIACARMELA PASSARELLI* PIERO VALENTINI[▲] ALFIO CARIOLA**

Framing of the research. *Entrepreneurs in general, but especially agricultural entrepreneurs, are faced with several challenges related to their daily business: environmental sustainability, food security, meeting the growing and very diverse needs of consumers and increasing competitiveness (Altobelli et al., 2017; Cavallo et al., 2014; Bigliardi and Filippelli, 2022). In this context, innovation is considered crucial to address present and future challenges (Jha, 2022). The growing importance of innovation in the agricultural sector is due, on the one hand, to the recent changes the sector has faced with the advent of new disruptive technologies (such as the Internet of Things (IoT), blockchain, big data, etc.) (Gardezi et al., 2022; Pillai and Sivathanu, 2020; Sharma, et al., 2022). Technological innovations and an 'open innovation' approach play an important role, not only in the simple growth of agricultural productivity, but in all aspects of this sector (Roberts and Geels, 2019; Touzard et al., 2015; Bronson, 2018). For example, innovation is crucial in improving business performance (Fitz-Koch et al., 2018), product quality (Haji et al., 2020) but also the impact on the environment (Bigliardi and Filippelli, 2022). Indeed, for these reasons and many others not listed, the concept of innovation in agriculture is being increasingly studied, especially in relation to what influences technology adoption or more generally the 'open innovation' approach (Mugge, et al., 2020; Goto, 2019).*

Having said that, it is important to explore, within this topic, the relationship between open innovation and agricultural entrepreneurs (Petruzzelli et al., 2022; Maalouf et al., 2022). Our study was based on two different literature frameworks: on the one hand we based this research on the concept of open innovation and, in particular, on its relationship with the agriculture firms referring to entrepreneur, on the other hand, we assumed that the decision to engage in a certain behaviour, to adopt an open innovation approach.

Chesbrough (2003a) suggests that many innovative firms have shifted to an 'open innovation' model, using a wide range of external actors and sources to help them achieve and sustain innovation. According to Laursen et al. (2006), "the focus on openness and interaction in studies of innovation reflects a wider trend in studies of firm behaviour that suggest that the network of relationships between the firm and its external environment can play an important role in shaping performance".

Open innovations become all the more essential during tough economic times, in particular, for the agricultural sector. The many difficult challenges faced by agricultural entrepreneurs in the transition to more sustainable agricultural systems are often related to resources (water, energy, biodiversity, land), socio-economic concerns (rural development, development of agricultural methodologies and reference to emerging markets), human health and environmental integrity (ecosystem health, environmental justice, climate change) (Bennett et al., 2014; Elzen et al., 2012; FAO, 2014; 2016).

In addition, in recent years, with the advent of the covid-19 pandemic, additional challenges and problems have arisen. The COVID-19 pandemic has affected markets, companies, entrepreneurs, sectors and also technological developments worldwide (Breier et al., 2021). Companies have been forced to adapt in a very rapid and agile manner to survive in an era of great change (Passarelli et al., 2023b). The pandemic has revolutionised many aspects and will influence many more in the coming years and decades. Therefore, it is crucial for companies to adapt and create conditions that require them to rethink business models (Piccolo et al., 2022). Business model innovations often involve digital transformation processes, while digital technologies are used to create or capture new forms of value (Bresciani et al., 2021).

Empirical investigations show that open innovation is mainly driven by larger companies and so, firm' size impacts on the extent of both technology exploitation and exploration (Lichtenthaler and Ernst, 2009) for this reason we investigated if even the small firms included in the sample could have an open innovation approach. Starting from an analysis of the literature on behavioural adoption in agriculture, the contribution proposes a conceptual extension of the theoretical model of the Theory of Planned Behaviour (TPB) (Ajzen, 1991).

Purpose of the paper. *This study aims to answer two research questions: the first aims to understand which factors influence the entrepreneurs' intention or planification to adopt an open innovation approach in the Covid-19 period; secondly, we conducted an empirical quantitative analysis, referred to a sample composed by agricultural entrepreneurs in two distinct sub-periods: the first characterised by severe restrictions and uncertainty, that we labelled: "strong pandemic period" (referred to the period of 2020) and the other called "Transition pandemic period" (according to the OMS it is referred to the 2022) ". The aim was to understand if there are any differences in the results, considering the two aforementioned periods. We conducted an analysis of the literature on the use of open innovation in agricultural sector and, given the lack of studies in the literature, we investigate the farmers' intention to adopt an open innovation approach (Passarelli et al., 2023a).*

Methodology. *For our purpose, it is necessary to understand in which way the variables included in the analysis may influence the probability (for the farmers) to adopt an open innovation approach, intended as the intention to develop innovation, in collaboration with actors that operate outside the boundaries of the firm. To do so, it is necessary to verify the existence of significant causal relationships between the different independent variables and with two dependent variables called "intention to adopt" and "planification to adopt", using the binary logistic model (Gujarati and Porter, 2008). The dependent variables assume value zero in the case of no intention to adopt an open innovation approach and value 1 in the case of intention to adopt this type of approach. Thus, in this case, a binary logistic model is the most appropriate econometric tool for the analysis. Specifically, the variable "intention to adopt" refers to the intention of the entrepreneur to develop innovation, in the short run, in collaboration with actors that operate outside the boundaries of the firm, while "planification to adopt", refers to the intention of the entrepreneur to develop innovation, in the long run, in collaboration with actors that operate outside the boundaries of the firm.*

In our research project, we use the extended theory of planned behaviour (TPB) that considers (Ajzen, 1991; Fishbein and Ajzen, 2011), added to the original TPB, two more variables: the first is the Access to external financial resources (Sapbamrer e Thammachai, 2021) and the other is Sustainability (Bigliardi and Filippelli, 2022).

To understand which factors, affect the dependent variables, we began our study starting from the creation of a questionnaire composed by two macro sections. The first wants to collect information about the sample, the second part aims to analyse the factors that could influence the dependent variables. The first dependent variable that we considered was the "Intention to adopt an open innovation approach", intended as farmers' probability to adopt this type of approach in the near future; the second dependent variable was called "Planification to adopt an open innovation approach" and it is different from the previous one because in this case we considered a larger timespan in terms of future adoption.

This questionnaire was administered to the same sample of 106 agricultural entrepreneurs (based in Calabria) in two different periods: in the "strong pandemic period" and in the "Transition pandemic period". From the sample, we can note that almost half of the farmers are under 45 years; there is a predominance of the male gender, with 94 male farmers out of a total of 106. From the answers obtained from the questionnaire, we can note that 35 respondents obtained a degree, and most of the firms included in the analysis (58 out of the total of 106) are characterised by the use of internal and external workforce. Finally, almost half of entrepreneurs have already adopted technologies in the past years.

The estimates of the variables, except for the dependent variables and other control variables since they were valued with the dichotomous questions (0=No; 1=Yes), were measured through different 7-point Likert scales. The second section of the questionnaire returns a set of variables measured through different items. We decided to reduce the complexity of the data with an Explorative factor analysis (EFA), a statistical technique able to reduce data to a smaller set of variables and to explore the underlying theoretical structure of the phenomena. The aim is to find out how each of the elementary indicators changes in relation to all the others and how much they are associated one another. Factor analysis is developed using the principal components analytical method: a smaller number of principal components are extracted from the original N variables, that are able to account for a considerable proportion of the variance of the original variables. Subsequently, it is necessary to evaluate the coefficients by the two indicators: Kaiser-Meyer-Olkin index (KMO) and Bartlett's test of sphericity. KMO is constructed by comparing the correlation coefficients with those of partial correlation, with variation between 0 and 1, suggesting the potential inadequacy of factor analysis, since the correlations between pairs of variables cannot be explained by the variance shared by the set of variables, which means that common factors cannot be identified. In these cases, we obtained a KMO index of 0.848 for the post pandemic period and of 0.787 for the strong pandemic period; furthermore, as regards the Bartlett's test of sphericity, used to verify the hypothesis that the correlation matrix is an identity matrix, we obtained for both cases that there are correlations that are sufficiently high not to be comparable to zero. Subsequently, it was evaluated in the analysis of communality, which allows to purify the input variables in order to eliminate from the model those variables that present extracted saturation lower than 0.40. From the analysis on the reference sample, there is a good level of explanation of the variance, for both periods, deriving from the excellent saturation of the chosen variables.

Through factor analysis it is appropriate to lose the least amount of information, therefore, the objective is to select those factors that, cumulatively, are able to explain at least half of the variance. In the present cases, after the explorative factor analyses, four factors emerged; the results for the Transition pandemic, explain about 68,39% of the cumulative variance, while for the Strong pandemic period, we have a cumulative variance of 74,28%. The four factors emerged from the EFA were the following:

- "Attitude to Economic and Sustainability" (ATES) is related to variables that measure the attitude of agricultural entrepreneurs to adopt new technologies with a positive economic effect on the firm and also on the environment;

- “Perceived Behavioural Control” (PBC) is the entrepreneur's perception of controlling external events and corporate resources (Lefcourt, 1991; Abay et al., 2017);
- “Subjective Norm” (SN) is a measure of the approval that the entrepreneur perceives from all the subjects that belong to the ecosystem in which he/she operates (Ajzen, 2012; Hall and Rhoades, 2010);
- “Access to external financial resources” (AER) which refers to subsidies, incentives and credit market products for agriculture (Abate et al., 2016; Pannell and Claassen, 2020).

We used the same approach for both periods of analysis; using the factors coming from the explorative factor analysis, we did two logistic regressions, considering the different dependent variables.

The aim was to understand if there were differences between the factors that influence the dependent variables in the two periods and to identify four different profiles for farmers, based on different factors affecting the probability to adopt an open innovation approach. Multicollinearity was checked between continuous and categorical variables before they were added to the logit model and, after some test, used to understand how the logit model fits the data, we analysed which factors affected the two dependent variables in the different period.

Results. This approach offered different results. The Omnibus test of the maximum likelihood ratio with chi-square was evaluated comparing the model containing only the dependent variable with the model containing all the predictors and, for both analyses, the test is significant with p -value < 0.05 . To understand how well the logit models fit the data, Cox-Snell R-square and Nagelkerke R-square were tested and we obtained good results for each model, in particular the values obtained are respectively 0.335 and 0.474 (for the post pandemic period's model), and 0.495 and 0.736 for the strong pandemic period. Finally, the correct classification of cases into different groups concerns the number of correctly and incorrectly assigned cases based on the probability of occurrence of an event; we obtained a correctness rate of about 80,2% of the cases for the post pandemic period and a correctness rate of about 89,6% for the strong pandemic period. Results from the different logistic regressions, gave us the following results.

- During the strong pandemic period we obtained that the variables that have a positive effect on both the dependent variables (Intention to adopt and planification to adopt) are: the PBC (with a p -value lower than 0.05 in both cases) and the ATER (with a p -value lower than 0.10 in both cases); furthermore, when we consider as dependent variable the “Intention to adopt”, also the Age is significant (with a p -value lower than 0.10) and have an impact on the Intention to adopt an open innovation approach soon.
- During the transition period, if we consider as dependent variable the Intention to adopt, different results come out. Specifically, all the independent variables are significant (PBC with a p value lower than 0.05 while the other four variables with a p value lower than 0.10) with a positive effect on the dependent variable. When the dependent variable is the planification to adopt an open innovation approach, we can note how, again, PBC, and also ATER are significant (with a positive effect) with a significance level lower than 0.05, while SN shows a p value of 0.10.

After these preliminary analyses, results of logistic regressions were discussed. Findings from the strong pandemic period for both dependent variables, gave similar results. In both cases, in fact, the significant variables that have an impact on the dependent variables are PBC and ATER but, given that the adoption timespan is different for each dependent variable, we define in different farmers' typologies. Considering as dependent variable “Intention to open innovation”, led us to define this type of farmer as “Dreamer”, that because in this uncertain period we have an entrepreneur that is influenced (in the adoption of an open innovation approach in a brief period), among others, by his attitude to economy and environmental sustainability and not by external financial support. Farmers in the same period but, considering as dependent variable the “Planification to adopt an open innovation approach”, were identified as “Optimistic” thanks to the fact that the same significant variables, considering as adoption timespan a larger period, are typical of a more concrete entrepreneur that want to deeply understand which is the evolution of this difficult period. The transition pandemic period is probably considered, by the farmers, as a period characterised by a lowest level of perceived risk related to the probability to adopt an open innovation approach. Even in this case, the timespan is different for the two periods, in fact, considering as dependent variable the intention to adopt (and so a brief period in terms of adoption of an open innovation approach) all the independent variables are significant and have a positive impact on the dependent variable; we called this farmer “Pragmatic” thanks to the fact that, even if this period is considered less risky, the probability to adopt an open innovation approach is influenced by the external financial support.

Research limitations. This study is not without limitations. The first one is related to the sample's dimension, we could expand, in the future, our analysis on a larger number of entrepreneurs. The second limitation is related to the fact that we considered the particular case of agricultural sector and we cannot extend our results to other sectors. Furthermore, we could have used different methodologies to understand if entrepreneurs are interested in the adoption of an open innovation approach.

Managerial implications. Our study offers different implications. We can suppose that during the strong pandemic period, entrepreneurs used many resources to keep their firms alive and now, if they want to invest (in a relatively short time horizon) in different technologies and partnership, they need help. Considering a larger adoption timespan, and so the dependent variable called “planification to adopt an open innovation approach”, three independent variables out of the total of four, remain significant; just the variable related to the external financial support becomes not significant. This could be justified by the fact that after a period of adjustment, where the financial support is necessary for all entrepreneurs, farmers are influenced in the probability of adoption, just by variables related to “less concrete aspects” and for this reason, we called this farmer “Ethical”. The identification of farmers' profiles can offer to the

entrepreneurs and to the policy makers, some opportunities to think about financial opportunities and innovation strategies.

Originality of the paper. In literature there are many studies related to open innovation and, in particular, to the relationship between the open innovation and the firms. However, there aren't articles that investigate if farmers entrepreneurs are interested in the adoption of an Open innovation approach, intended as: investments in technologies and collaboration with different types of external partners (e.g. universities, partners, customers etc.). In addition, several studies considered Open innovation as an independent variable, analysing its effect on the dependent one; on the contrary, in this study, we considered the open innovation as a dependent variable and we splitted it into two different ones. Finally, we conducted our analysis in two different periods in order to compare the results and to understand how farmers' propensity to adopt an open innovation approach has changed during these difficult years.

Open Innovation for Local Development: The Role of University and Its Stakeholders

NUNZIA CAPOBIANCO * SILVIA COSIMATO • NADIA DI PAOLA ^
OLIMPIA MEGLIO ** ROBERTO VONA **

Framing the research. *Innovation is widely considered an important means for addressing the “grand challenges” of contemporary society, and this explains the extensive interest received from different disciplinary domains and settings (Acar et al., 2019). Even though the literature provides many different definitions of innovation, one of the seminal ones describes it as the creative response of a company, an industry, or an economic system to emerging problems/needs (Schumpeter, 1934).*

Innovation has also been approached as a key source of competitive advantage (Henry and Pinch, 2000) not only for business organizations but also for specific geographical or regional areas (Mas-Verdu et al., 2010). More recently, scholars have increasingly focused on the inner relationship between innovation and regional development (Harmaakorpi, 2006; Mitra, 2019; Afrifa et al., 2022). This relationship has been also recognized by the OECD that underlines the impact of innovation policies on regions’ performance (OECD, 2014). Several regional areas or even cities have further exploited this top-down approach, putting innovation at the core of their “local (bottom-up) development strategies” (Shearmur, 2016, p.440), focusing on the contribution that institutional elements, including intermediary organizations and the related services, can offer to innovation-based initiatives. This bottom-up approach is based on new forms of collaboration between local government, research institutions, universities, companies, and even citizens involved in open innovation processes (Komninou et al., 2013).

The concept of open innovation has grown in prominence over the last decades as a powerful path for stimulating innovation by connecting organizations with outside knowledge sources (Bogers et al., 2017). With the help of digitalization, this is also possible on a global scale through a process called “distant search” (Laursen et al., 2012; Lopez-Vega et al., 2016). Distant search makes it simpler for organizations to identify and collaborate with other organizations in developing new products and services because it gives them access to external knowledge sources regardless of where they are in the world. However, working with diverse partners often with different mindsets can negatively affect the overall trust of the interacting actors (Hannen et al., 2019). To address this issue, a novel approach known as “local open innovation” has been proposed.

Local open innovation is a combination of open innovation and local collaboration, based on a network approach and on the presence of intermediaries (Deutsch, 2013). The goal of this type of innovation is to boost collaborative problem-solving in a particular geographic region (Leckel et al., 2020). Local open innovation makes organizations able to access effective novel inputs, even if they are not the best available worldwide. In addition, local open innovation can benefit small and medium-sized enterprises (SMEs) that may be hesitant in engaging in open innovation due to their local embeddedness (Leckel et al., 2022). Thus, this innovation can assist SMEs in gaining access to external knowledge and resources even though they aren’t engaged in traditional open innovation processes. Local open innovation can be also crucial for the growth of new businesses, as the local economic environment plays a great influence on their success (Jonek-Kowalska et al., 2021). Due to its networked nature, local open innovation may foster the creation of a regional innovation ecosystem and regional development by nurturing an innovation-based collaboration between firms, professionals, research bodies, and institutions (Leckel et al., 2020).

The implementation of local open innovation strategies boosts the improvement of different actors’ expertise, including solution-seeking companies, problem-solvers, and network promoters (Leckel et al., 2020). The latter ones are considered intermediaries of innovation processes because they facilitate the collaboration between two or more

parties at different stages of the innovation process (De Silva et al., 2018). Recent research on the use of workshops to promote local collaboration in the pharmaceutical industry (Kratzig et al., 2018) demonstrates that research institutions play a vital role in intermediating and promoting local open innovation processes. It appears that these actors have the knowledge, skills, and several trusted relationships essential to engage several other local actors (or stakeholders) in open innovation processes (Leckel et al., 2020).

We suggest that the Triple Helix Model (Leydesdorff and Etzkowitz, 1998), based on networking activities, knowledge transfer, and human capital development, can be a fruitful framework to advance the research on local open innovation. Indeed, it contributes to a better understanding of the dynamics at the core of the interactions occurring between three actors placed in each single helix (government, university, and industry) at different stages of the innovation process (Etzkowitz, 1996; Cai and Etzkowitz, 2020). This is due to this model's ability to involve different local actors in non-linear innovation processes by exploring, exploiting, and expanding the available knowledge (Lichtenthaler, 2011; Kerry and Danson, 2016). The triple helix model is inherently based on an open innovation approach because even if each helix acts according to an internal development logic, at the same time they are also involved in knowledge, products, and services exchange with external actors or stakeholders (Khan and Park, 2012; Yun and Liu, 2019).

The extant literature also underlines the pivotal role that universities and other knowledge-producing organizations play in promoting innovation. Thus, according to some scholars (Etzkowitz and Leydesdorff, 1995; Perkmann and Walsh, 2007), universities are no longer passively focused on the private creation and dissemination of scientific knowledge, rather they are proactively engaged in open innovation networks and in interactive local-based innovation processes. This implies that due to their proactivity and ability in encouraging interaction among stakeholders, universities can act as focal organizations in local innovation networks (Foss et al., 2011).

Purpose of the paper. Drawing on previous research on local open innovation (Deutsch, 2013; Smulders, 2013; Leckel et al., 2020; 2022), this study aims at contributing to the relatively scant literature on the topic, examining the close relationship existing between regional/local development and open innovation processes occurring in “urban settings or clusters, which generate local buzz and allow access to external actors” (Shearmur and Doloreux, 2016). Starting from the crucial role that universities play in innovation dynamics, we assume that they typically serve as “place leaders” and orchestrators of the stakeholders participating in innovation network activities, in addition to their conventional teaching and research roles (Thomas et al., 2021). Orchestration refers to the collaborative practices involved in the creation and development of networks (Dhanaraj and Parkhe, 2006). Through their leadership, universities may act as orchestrators promoting cooperation and information sharing essential for open innovation development (Majava, 2016). More in detail, universities’ orchestration tasks mainly consist of (especially during a network development phase) identifying the reference context and the participants in innovation processes. Against this background, the main goal of this study is to delve deeper into the focal role of universities in boosting the network dynamics among the local actors involved - at different stages and with different roles - in open innovation processes.

For a better understanding of university orchestration tasks, a stakeholder analysis and mapping have been conducted (Parmar et al., 2010) assuming the Triple Helix model perspective (Leydesdorff and Etzkowitz, 1998; Helman, 2020; Baturina, 2022). Stakeholder analysis and mapping are powerful tools for acknowledging stakeholders, i.e., individuals and groups able to influence an organization's goals (Morgan and Taschereau, 1996). In general, stakeholder analysis points to recognizing their influence, power, and interests. This technique will support this analysis, identifying and prioritizing stakeholders’ interests based on their relevance for the achievement of an innovative project (Morgan and Taschereau, 1996; Brugha and Varvasovszky, 2000). In this sense, it is vital to highlight that the institutional framework in which stakeholders operate shapes their power, influence, and interests.

Methodology. This study aims at contributing to the call for further research on local open innovation and provides evidence from a qualitative case study analysis¹. This method is particularly suitable for understanding emerging phenomena “when how and why questions are being posed when the investigator has little control over events, and when the focus is on a contemporary phenomenon within some real-life context, especially when the boundaries between phenomenon and context are not clearly evident” (Yin, 2003, p. 50).

The innovation processes have been investigated according to the perspective of the case organization (a public university based in Italy), intended as a focal local actor able to promote and attract the interest of its stakeholders around innovative initiatives and projects. In doing so, the network approach to stakeholder theory (Cots, 2011; Marcon Nora et al., 2023) and the Triple Helix model (Leydesdorff and Etzkowitz, 1998) - which is built upon the role that the University can have in the generation, transfer, and application of new knowledge (Ranga and Etzkowitz, 2013) - inspired the definition of the focal actor. We collected a mix of primary and secondary data. After the identification of 48 key informants, we conducted interviews through a digital platform between December 2022 and January 2023. We then triangulated primary data with information retrieved from different secondary sources (e.g., official documents and reports, corporate websites, news articles, research reports, etc.) to improve their reliability (Fush et al., 2018).

Our study involved a two-step analysis: 1) stakeholders identification, and 2) stakeholders prioritizing in a power/interest matrix.

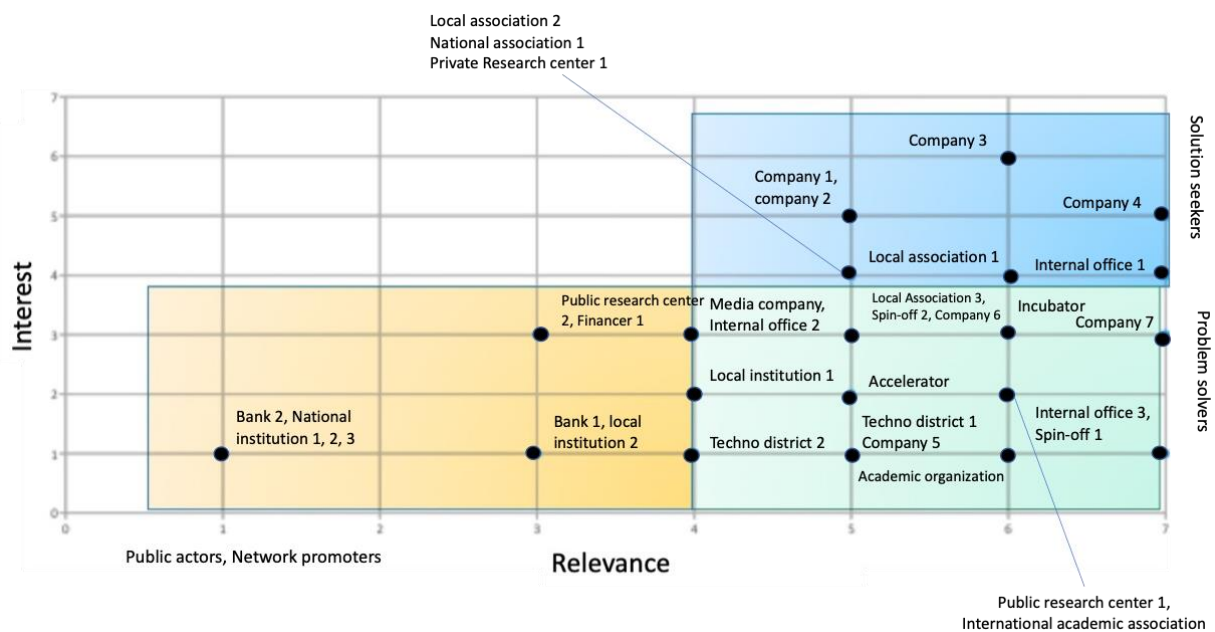

During the first step, stakeholders were identified and, according to the Triple Helix model perspective (Leydesdorff and Etzkowitz, 1998): as a result, we categorized them as Government, University, and Industry actors, according to

¹ It is worth noting that this analysis is part of a wider and multi-year European-based project on entrepreneurial education for the development of local innovation ecosystems.

their macro domain and their core activities. During the second step, a power/interest matrix was developed for mapping and defining stakeholders' interests in and relevance for local innovative projects and activities (Bronke and Winch, 2002; Bryson, 2004). This also led to proposing some appropriate engagement strategies and actions. The matrix was developed according to the information collected by performing semi-structured interviews with stakeholders' key informants. 48 stakeholders were identified and invited to participate in the study but just 36 of them participated in the interview process.

Results. Based on the analysis of primary and secondary data as described above, and after having h coded the interview responses, we developed a relevance/interest matrix. More in detail, relevance refers to the perceived stakeholders' importance for the success of innovative projects (Heugens et al., 2002), while interest refers to their willingness to be engaged within innovative projects (Freeman et al., 2017). The matrix depicts 36 stakeholders (those who agreed the interview protocol) located and grouped according to their relevance for and influence in innovative projects/activities in which also the focal actor is involved (Fig.1). We also attempted to combine stakeholder classification with the one we found in the local open innovation literature. More specifically, following Leckel et al. (2020), we categorized the 36 stakeholders into the following categories 1) Solution seekers or those stakeholders who get benefits from innovation programs (10), Problem solvers or those stakeholders who are open to collaborate for finding new solutions to local problems (18), Public actors or those stakeholders who have the interest and the means to engage others in innovative projects (4), and Network promoters or those those stakeholders (e.g., public or industry agencies, banks, etc.) who support innovation projects within their economic realm (4). Figure 1 represents a provisional attempt to combine two different classifications.

Fig. 1: Stakeholder mapping.

Source: authors' elaboration.

Respondents have been labeled using a generic notation related to their core activity to ensure their anonymity.

The map suggests that most of the stakeholders are relevant to the innovation activities in which the focal organization is involved; thus, they are placed on the right side, even though they have demonstrated a different interest in, and a different relevance for these activities. This suggests that a strategic effort is needed for stimulating the interest, and therefore, the engagement of less interested but relevant stakeholders (problem solvers) for the common purpose of activating value-creation processes essential for innovation. It is worth noting that the number of stakeholders defined as "solution seekers", which have a high relevance and a high interest, is not that high (10) especially if compared with "problem solvers" (18). Therefore, if the solution seekers can be also defined as "partners forever" because are constantly and directly interested in innovation projects/activities, problem solvers can be defined as "work needed" because they need further engagement and better communication strategies aimed at increasing their interest (e.g., through periodic consulting to better focus project activities also on their scope and goals).

Finally, a few stakeholders - mainly public actors (4) and network promoters (4) - are placed at the bottom left of the map; therefore, low relevance and low interest characterize them. Due to their different position in the low-relevance low-interest quadrant, the focal organization cannot ignore them, but it should rather monitor them to plan, design, and develop specific communication strategies to keep them informed about innovative projects.

Even though a good number of case organization stakeholders are interested and engaged at different levels in innovative projects/activities, it is worth noting that institutions (e.g., national, and local ministries and agencies) demonstrated less interest and relevance.

This is an interesting finding because even though the literature approaches them as a group that calls for a minimal strategic effort (Scholes et al., 2001), Todeva and Etzkowitz (2013) maintain that the focal actor cannot ignore them because the activation of triple helix innovative dynamics calls for the engagement and the close interaction between all the three core actors. In this sense, Todeva and Ketikidis (2017) maintain that policy mismatches can negatively affect the proper innovative capacity as well as the decentralization from national innovation systems to regional ones. This implies that the university should act as a “local hub” able to counteract the negative attitude or the low interest of institutional stakeholders toward local innovative projects/activities (Demir et al., 2015) enacting more intensive engagement strategies. This will also boost the participation of these actors in local open innovation activities, activating an effective triple helix constellation and the related innovative dynamics among each helix.

Research limitations. This study is not free from limitations that may inform future investigation. First, it offers evidence from a case study of a mega and public university based in Italy. This limits the generalizability of our findings to different contextual conditions, including for instance, small or private universities. Future studies may remedy this flaw by pursuing empirical studies based on large samples. Relatedly, another important boundary condition is that our study refers to an Italian university and is therefore affected by Italian institutional conditions. To remedy this flaw, future studies could pursue a multi-country comparison of the role played by HEIs in favoring local open innovation.

An additional limitation refers to the unit of analysis/perspective under investigation. As a local open innovation system benefits from the contribution of multiple stakeholders, analyzing different actors (from their perspectives) would provide a more comprehensive account of the phenomenon. Moreover, our study provides a static view of the relationships between the university under analysis and the engaged stakeholders. As their engagement may evolve over time, a processual investigation of how the relationships of stakeholders change over time and under what circumstance may further advance our understanding of how universities enact local open innovation processes and orchestrate innovative resources.

Managerial implications. The managerial implication is that universities should map their stakeholders and identify the best engagement strategies on a regular basis as a part of their strategic planning process. Moreover, as orchestrators, universities can mobilize stakeholders to participate in those transformative processes essential to address societal challenges with local open innovation policies. To this end, the networked interaction between the university, industry, and government at a local level is essential for creating a viable innovation system based on localized trust forms (Meissner, 2017) able to increase the competitiveness and socio-economic growth of a specific area.

Our findings also have important policy implications. Thus, local institutions may benefit from the ability of universities to orchestrate resources and competencies from a plethora of stakeholders and should identify the most effective and suitable mechanisms to favor such a role. Moreover, findings emphasize the importance of informal ties among stakeholders that institutions could leverage upon generating local knowledge bases, and intensifying local interactions in remote areas may be ill-advised: they attempt to generate processes that are inherently urban or cluster related in places where no cities or clusters exist. This opens to the importance of private-public collaboration, which - according to a co-creative logic - can “democratize” innovation and in doing so enhance its beneficial influence for a specific community (Leckel et al., 2020).

Originality of the paper. The literature on local open innovation is still in its infancy and this paper enriches existing studies with an Italian experience based on primary data. Moreover, the empirical study focuses on the role of universities as orchestrators of stakeholders’ activities towards knowledge co-creation for the development and socio-economic growth of a local community. From a theoretical standpoint our work builds upon different research streams by integrating open local innovation with the triple helix logic. In addition, our work introduces the idea of mapping and engaging stakeholders as important tools to nurture local open innovation.

Keywords: Local development; local open innovation; triple helix model; stakeholder engagement; stakeholder mapping.

Food labelling: l'effetto della blockchain sulle intenzioni di acquisto dei consumatori

CHIARA ACCIARINI* FRANCESCO CAPPA* VIVIANA D'ANGELO* STEFANO FRANCO**

Inquadramento della ricerca. Nel 2020, il mercato alimentare globale ha generato entrate per oltre 8 trilioni di dollari USA e si prevede che raggiungerà circa 9,1 trilioni di dollari USA nel 2025 (Statista, 2022a). Al momento, tale industria sta affrontando enormi pressioni e sfide come l'applicazione dei divieti sull'utilizzo di plastica, la presenza pervasiva dell'e-commerce e l'adozione di tecnologie digitali avanzate. Infatti, una crescente attenzione ai Grand Challenges, ovvero i pressanti problemi ambientali e sociali che affliggono la società come il cambiamento climatico (Cappa, 2022; Cappa et al., 2022d; Centobelli et al., 2020; Sakshi et al., 2020) ha portato i consumatori a diventare più favorevoli alle questioni relative alla sostenibilità. Secondo un recente sondaggio condotto da Deloitte (Hammond, 2021), l'85% dei consumatori sta facendo scelte di vita più sostenibili e un terzo (34%) preferisce brand con forti credenziali di sostenibilità. Inoltre, poiché i consumatori sono più consapevoli delle preoccupazioni sociali, tendono a concentrarsi sulla qualità piuttosto che sulla quantità (Nasir e Karakaya, 2014). Ad esempio, il mercato è sempre più attento alla presenza di antiossidanti nella frutta e nella verdura fresca (Żakowska-Biemans, 2011) e controlla se i prodotti acquistati sono noti per causare inquinamento o altri problemi ambientali (Nasir e Karakaya, 2014). Inoltre, l'adozione delle tecnologie digitali costituisce una tendenza trasformativa che interessa l'industria alimentare. Un esempio è l'Internet of Things, che ha il potenziale per ridurre gli sprechi alimentari (Secondi et al., 2020) dell'1%-4% grazie all'aumento della trasparenza e della tracciabilità della catena di approvvigionamento in tempo reale (World Economic Forum, 2019). L'opportunità di migliorare la tracciabilità del prodotto e la sicurezza delle informazioni sfruttando gli strumenti digitali può produrre benefici lungo tutta la catena di fornitura. La tecnologia blockchain, in particolare, può aiutare a raggiungere questi obiettivi rimodellando la catena di approvvigionamento e il comportamento di consumo. Dall'avvento della digitalizzazione, gli individui e le organizzazioni hanno adattato le loro pratiche commerciali alle nuove tecnologie digitali (Ardito et al., 2019; Bohnsack et al., 2019; Cappa et al., 2022; Hanelt et al., 2020; Visconti e Morea, 2019). Tra le tecnologie digitali emergenti, le blockchain hanno un ruolo primario nella trasformazione delle imprese. Una blockchain è un registro distribuito basato su sistemi web peer-to-peer per registrare informazioni (Chen, 2018; Tapscott e Tapscott, 2017). A differenza dei sistemi basati su registri centralizzati, dove la fiducia nella qualità delle informazioni archiviate dipende dalla reputazione di un'autorità centrale che gestisce i registri, le blockchain consentono di registrare e verificare le transazioni attraverso una rete di individui collegati attraverso il web, senza la presenza di alcuna autorità centrale. Tutti nella rete hanno la propria copia identica del libro mastro e l'informazione è attendibile se una certa percentuale dei nodi nella rete ha la stessa copia di informazioni, memorizzata in blocchi. L'attendibilità dei dati è determinata dalla presenza dello stesso blocco in numerosi nodi della rete, che rende più difficile la vita agli attacchi informatici rispetto a quando ci si concentra su un'unica autorità centrale, e dai componenti crittografici che assicurano la non modificabilità delle informazioni (Chen, 2018; Javaid et al., 2021; Rakshit et al., 2022; Tapscott e Tapscott, 2017). Nel complesso, l'uso della blockchain incoraggia la tracciabilità e la registrazione delle informazioni, nonché l'automazione della catena di approvvigionamento (Javaid et al., 2021).

La blockchain è tipicamente associata all'industria finanziaria all'interno del vasto fenomeno del fintech (Cappa et al., 2022; Fasano e Cappa, 2022), dove questo strumento tecnologico consente di monitorare, verificare lo scambio di attività finanziarie tra i vari stakeholder, e facilitare transazioni finanziarie complesse (Beck et al., 2017). Tuttavia, è anche di grande importanza nei settori caratterizzati da transazioni di beni materiali (Friedman e Ormiston, 2022; Krzyzanowski Guerra e Boys, 2022; Nofer et al., 2017). Attualmente, la tecnologia blockchain ha effettivamente ridotto gli oneri del settore finanziario ed è stata applicata in molti altri contesti come l'industria musicale, dove la documentazione sui diritti d'autore utilizza questa tecnologia per costruire database che forniscono informazioni sulla

proprietà del copyright (Chalmers et al., 2021). Inoltre, viene utilizzata dai notai per verificare l'autenticità dei documenti (Crosby et al., 2016). Infine, i benefici apportati dalle blockchain stanno iniziando ad essere analizzati anche in altri contesti, come le industrie manifatturiere e agricole (Belhadi et al., 2020; Kamble et al., 2021, 2020; Lohmer e Lasch, 2020).

Le blockchain hanno anche il potenziale per influenzare profondamente l'industria alimentare. Da un lato, la maggior parte degli studi sul tema ha sottolineato i diversi vantaggi associati all'utilizzo di questa tecnologia nel settore. Utilizzando le blockchain potrebbe essere possibile tracciare l'origine e il flusso dei prodotti attraverso le reti della catena di approvvigionamento, prevedere la domanda, ridurre i rischi di contraffazione e frode e ridurre le conseguenze negative per l'ambiente (Dujak e Sajter, 2019). Quando le informazioni vengono raccolte e trasferite in un formato digitale, le blockchain possono consentire la verifica e l'immutabilità grazie a un sistema di registro distribuito, che viene verificato in tempo reale. Pertanto, le informazioni condivise tramite blockchain sono affidabili, sicure, autentiche e verificate solo dai membri della rete di approvvigionamento che sono autorizzati a fornirle (Dujak e Sajter, 2019). Grazie ai sistemi di tracciabilità blockchain, tutte le informazioni prodotte lungo una filiera sono verificabili in tempo reale, con dettagli sui prodotti (Galvez et al., 2018). Di conseguenza, le aziende possono migliorare la loro reputazione e attrarre più clienti (Pizzuti e Mirabelli, 2015). Secondo Kayikci e colleghi (2022), tutti gli attori che partecipano a una blockchain hanno la responsabilità di distribuire informazioni corrette lungo la catena di approvvigionamento, che inizia con le materie prime e termina con i prodotti finiti. D'altra parte, alcuni studi si sono concentrati anche sulle potenziali criticità delle blockchain (Alharby e Moorsel, 2018; Kamilaris et al., 2019; Li et al., 2021; Reyna et al., 2018; Zheng et al., 2018). Ad esempio, secondo Kamilaris et al. (2019), possono sorgere sfide normative a causa della mancanza di politiche e regole specifiche, mentre Paech (2017) ha discusso sul fatto che le questioni relative alla proprietà e alla gestione dei dati non siano ancora state stabilite. Inoltre, con l'uso della blockchain l'integrazione tra i vari partecipanti alla catena di approvvigionamento può essere più complessa (Zheng et al., 2018) e l'accessibilità dei dati può risultare più difficile da implementare (Reyna et al., 2018). Gli studi precedenti hanno quindi esplorato sia i benefici che i costi associati all'adozione della blockchain nel settore alimentare, mentre c'è ancora la necessità di esplorare il suo impatto sull'intenzione di acquisto dei clienti. L'imballaggio dei prodotti e le etichette nutrizionali forniscono informazioni utili sul contenuto nutrizionale di ogni alimento confezionato (Ni Mhurchu et al., 2018). Ad esempio, vengono utilizzati per indicare i valori energetici e la quantità di proteine, grassi, carboidrati, fibre alimentari, sodio, vitamine e sali minerali. Inoltre, le etichette vengono utilizzate per trovare dettagli importanti sull'origine di ingredienti e prodotti.

Il monitoraggio e l'autenticazione della filiera alimentare sono essenziali per creare comunicazioni coerenti e condividere i dati in modo trasparente in ogni fase, evidenziando l'attenzione per la qualità e la sicurezza degli alimenti (Galvez et al., 2018). Secondo Chen e Huang (2013), la trasparenza dei dati nell'industria alimentare è fondamentale per costruire la fiducia dei consumatori, in modo che possano percepire che i produttori non si comportano in modo opportunistico. Pertanto, la trasparenza aumenta il senso di coinvolgimento dei clienti, che è alla base delle intenzioni di acquisto (Chen e Huang, 2013), e può anche portare a differenziare un produttore da un altro (Chen e Huang, 2013). In questo modo, la trasparenza delle informazioni aumenta la credibilità dei marchi, portando i clienti ad acquistare più facilmente da produttori caratterizzati da un più alto grado di divulgazione delle informazioni nonché a preferire produttori che rivelano maggiori dettagli (es. ingredienti e processi) rispetto ad altri (Walters e Lunga, 2012). La tecnologia blockchain, grazie al suo sistema di registro distribuito e alla crittografia, può consentire di raggiungere questi obiettivi di sicurezza e trasparenza delle informazioni. Pertanto, basando il nostro studio sulla signaling theory, che sostiene che la trasmissione di segnali evidenti e facili ai clienti è vantaggiosa in contesti caratterizzati da incertezza (Connelly et al., 2010; Tiwana e Bush, 2014), sosteniamo che l'uso della tecnologia blockchain segnali ai clienti una fondata affidabilità e la sicurezza dei dati nella catena di fornitura. Questo processo favorisce la qualità e la sicurezza dei prodotti immessi sul mercato e di conseguenza anche le intenzioni di acquisto dei clienti. Di conseguenza, ipotizziamo che:

Le informazioni fornite ai clienti del settore alimentare attraverso la tecnologia blockchain influenzano positivamente le loro intenzioni di acquisto.

Obiettivo del paper. La considerazione di quali sono i vantaggi e gli svantaggi è stata utile per chiarire il ruolo che la blockchain può avere nel settore alimentare. Ciò che, tuttavia, è stato finora trascurato è se l'uso di blockchain possa attirare positivamente i clienti nel settore alimentare. In particolare, non è ancora chiaro se l'uso delle blockchain nelle filiere del settore alimentare possa avere un impatto positivo sugli acquisti, che è di primario interesse per le imprese. In questo studio, ci concentriamo sugli effetti causati dall'adozione di blockchain nelle filiere alimentari sulle intenzioni di acquisto, che è un efficace proxy per acquisti efficaci (Cappa et al., 2022c; Nov et al., 2014). Pertanto, la domanda di ricerca affrontata in questo studio è la seguente: la presenza di una indicazione dell'utilizzo della tecnologia blockchain sulle etichette dei prodotti per proteggere le informazioni influenza positivamente le intenzioni di acquisto dei clienti nel settore alimentare?

Metodologia. Per studiare l'effetto che l'uso della tecnologia blockchain ha sulle intenzioni di acquisto, abbiamo somministrato un sondaggio. Più in dettaglio abbiamo adottato un disegno sperimentale per testare un concreto interesse e applicazione di questa tecnologia nel settore alimentare confrontando due diverse situazioni, una che sfrutta la blockchain e una no. Tale progettazione di esperimenti tra soggetti (between-subjects experiment) consente di concentrarsi su un trattamento specifico (Cappa et al., 2022); in questo caso, l'uso della blockchain nel settore alimentare. Abbiamo contattato potenziali consumatori in merito a un prodotto alimentare specifico, ad esempio una tavoletta di cioccolato. La scelta del prodotto alimentare di uso generale per un'ampia porzione di individui e che è in

continua crescita nei consumi all'interno del settore alimentare (Statista, 2022b) mira alla generalizzabilità dei risultati. Abbiamo eseguito un esperimento randomizzato su un totale di 50 individui per stimare gli effetti causali con due diverse condizioni, ovvero una in cui sono fornite informazioni sull'uso della tecnologia blockchain e una in cui non lo sono. Il campione, sebbene limitato, soddisfa la soglia di 10 osservazioni per variabile, considerando quelle utilizzate in questo studio come dettagliato nella seguente sottosezione, per condurre una regressione Ordinary Least Square (OLS) (Cappa et al., 2022, 2021). A un gruppo, sono state offerte semplici informazioni sull'etichetta del prodotto. All'altro gruppo, abbiamo indicato la presenza della tecnologia blockchain per proteggere le informazioni dell'etichetta aggiungendo un marchio visibile accanto all'etichetta rispetto allo scenario precedente. Per entrambi gli scenari è stato utilizzato un prodotto di cioccolato fittizio e ad ogni partecipante è stato proposto un solo scenario, dopodiché è stata registrata la loro intenzione di acquistare il prodotto. I partecipanti sono stati assegnati a uno dei due gruppi in modo casuale e sono state registrate solo le risposte complete al sondaggio. Abbiamo amministrato il sondaggio online tramite Qualtrics, una piattaforma affidabile per creare e gestire questionari. Il link per accedere al sondaggio è stato distribuito tra i contatti degli autori attraverso vari social network per ottenere la variabilità nelle caratteristiche degli intervistati che rispecchia una rappresentazione diffusa di possibili clienti. Il nostro campione è composto da intervistati di età compresa tra i 18 e i 70 anni che vivevano in diversi Paesi europei. La variabile di interesse, ovvero la variabile dipendente, in questo studio, è l'intenzione di acquisto del cliente valutata attraverso una scala Likert (da 1 "Per niente" a 7 "Molto probabile"). La variabile indipendente nel nostro modello è la presenza della tecnologia blockchain che garantisce le informazioni contenute nell'etichetta, una variabile binaria pari a 0 o 1 a seconda della sua assenza o presenza. Il modello completo include anche cinque diverse variabili di controllo. Abbiamo controllato per genere, età, dimensione della città (in termini di abitanti) e livello di qualificazione accademica degli intervistati. Il genere è una variabile dummy che vale 1 se "femmina" e 0 se "maschio". Per la terza opzione, "Preferisco non dirlo", non abbiamo ricevuto risposte. L'età è stata classificata in quattro opzioni, ovvero tra 18 e 30 anni codificati come 1, tra 31 e 50 anni codificati come 2, tra 51 e 65 anni codificati come 3, e più di 65 codificati come 4. Anche il titolo di studio è una variabile di controllo categorica compresa tra 1 e 3 indicante un titolo di studio liceale, di laurea triennale o di laurea magistrale.

Risultati. I nostri risultati mostrano che le informazioni fornite ai clienti sull'uso della tecnologia blockchain influenzano positivamente le intenzioni di acquisto nel settore alimentare (Tabella 1). La blockchain può fungere da base affidabile per garantire che l'accesso alle informazioni sia controllato e che i rischi per la sicurezza e la qualità siano ridotti. Inoltre, i clienti potenzialmente interessati all'acquisto di un prodotto specifico possono verificarne facilmente i dati, come provenienza e ingredienti, e le blockchain potrebbero collegare vari clienti con venditori certificati. In tal modo, forniamo diversi contributi per studiosi, manager e responsabili politici, come dettagliato nelle sottosezioni seguenti.

Limiti della ricerca. Questo studio non è esente da limitazioni, ma queste aprono anche la strada a future vie di ricerca. In primo luogo, sebbene lo studio soddisfi la dimensione del campione necessaria per eseguire le analisi, studi futuri potrebbero ampliare il numero di osservazioni per supportare ulteriormente i risultati di questa ricerca. Inoltre, ulteriori controlli potrebbero essere presi in considerazione da studi futuri. Ad esempio, possono essere considerate variabili istituzionali e culturali, con l'obiettivo di controllare la complessità delle istituzioni che potrebbero rinviare o favorire la decisione di utilizzare blockchain come tecnologia alimentare e della differenza culturale che può influenzare l'intenzione di acquisto. Inoltre, il nostro studio si occupa delle intenzioni di acquisto, che si sono dimostrate efficaci proxy del comportamento (Cappa et al., 2022; Nov et al., 2014), ma studi futuri potrebbero cercare di misurare direttamente gli acquisti effettivi. Inoltre, poiché le blockchain richiedono costi di implementazione elevati (Vu et al., 2021), studi futuri potrebbero valutare il punto in cui i benefici generati in termini di intenzioni di acquisto, e di conseguenza gli acquisti effettivi, supereranno i costi complessivi per l'implementazione della blockchain. Poiché questa ricerca è focalizzata su un singolo tipo di prodotto nel settore alimentare (ad esempio, tavolette di cioccolato), studi futuri potrebbero anche esplorare come diversi tipi di prodotti possono influenzare l'impatto dell'uso della tecnologia blockchain nel settore alimentare. Infine, questo studio si è concentrato sul settore alimentare, come contesto rilevante in cui studiare i benefici che la tecnologia blockchain può produrre, in termini di maggiore affidabilità e affidabilità delle informazioni, ma studi futuri potrebbero considerare anche altri settori per esplorare se ci sono differenze o se si possono ottenere risultati simili.

Implicazioni manageriali. I nostri risultati sono rilevanti anche per i manager. Nell'attuale scenario dell'industria alimentare, i manager si stanno impegnando per realizzare una catena di approvvigionamento solida ed efficace, poiché i consumatori stanno rapidamente cambiando il loro comportamento di acquisto. I clienti, infatti, stanno diventando sempre più sensibili alla sicurezza e alla qualità dei prodotti. Questo studio rafforza ulteriormente la comprensione della tecnologia blockchain nel settore alimentare mostrando empiricamente come questa possa essere uno strumento utile per incrementare le vendite. Infatti, grazie all'adozione delle blockchain, tutte le informazioni prodotte lungo le filiere sono verificabili con dettagli in tempo reale, verificando la tracciabilità e l'attendibilità di tali informazioni. Tale maggiore trasparenza e affidabilità migliorano l'immagine e la reputazione di un'azienda, con impatti positivi sulle intenzioni di acquisto dei clienti. I risultati di questa ricerca forniscono quindi ulteriori motivi per i manager per investire nella tecnologia blockchain, poiché ha un effetto positivo sulle intenzioni di acquisto, oltre ai vantaggi forniti in termini di una migliore gestione delle informazioni lungo la catena di fornitura. I risultati della nostra ricerca portano anche implicazioni di policy making. I policy maker stanno infatti incoraggiando gli sforzi del settore per una catena di approvvigionamento sicura e di alta qualità. In questa direzione, iniziative pubbliche come Horizon Europe 2027 nell'Unione Europea o sforzi nazionali come il fondo italiano per lo sviluppo di tecnologie e applicazioni di Intelligenza Artificiale, blockchain e Internet of Things hanno rispecchiato questa volontà di destinare risorse finanziarie a persone e organizzazioni e costruire infrastrutture digitali affidabili anche nel settore alimentare. I risultati di questo studio supportano ulteriormente i policy maker nel favorire l'adozione della blockchain per una catena di approvvigionamento migliore e più sicura nel settore alimentare, dimostrando che influisce positivamente anche sugli acquisti, portando benefici a tutte le parti interessate.

Originalità del paper. Il nostro studio contribuisce a formare una migliore comprensione dell'effetto della blockchain sul favorire l'attendibilità delle informazioni e sull'influenzare l'intenzione di acquisto dei clienti nel settore alimentare. Inoltre, le nostre intuizioni sono rilevanti anche per manager e policy maker perché evidenziano i vantaggi che possono essere ottenuti adottando la tecnologia blockchain nel settore alimentare. Le aziende, infatti, possono diventare più consapevoli degli atteggiamenti che i clienti hanno nel settore alimentare. In questo senso, possono salvaguardare sia la qualità dei loro prodotti che la veridicità delle informazioni fornite, utilizzando blockchain e beneficiando anche degli acquisti. Allo stesso modo, i policy maker possono lavorare su iniziative pubbliche per supportare lo sviluppo di blockchain e incoraggiare l'adozione di questa tecnologia attraverso le catene di approvvigionamento alimentare per favorire lo sviluppo delle aziende che operano nel settore.

Parole chiave: blockchain; intenzioni di acquisto; industria alimentare

Knowledge-innovation loops as a smart city driver: Exploring the circular interplay between talents attraction and local and economics innovation in contemporary cities

FILIPPO MARCHESANI* FRANCESCO MASCIARELLI* HUNG QUANG DOAN[♠]

Framing of the research. *The rise of smart cities has become crucial in economic and local policies in recent years, as technological innovations have enabled more efficient and sustainable management of urban resources. As a result, smart cities have gained increasing importance in the social environment, economy, and innovation (Vanolo, 2014). Today, smart cities play a central role in promoting economic growth, innovation, and sustainable development by providing a supportive environment for creating and implementing new technologies and services (Christofi, 2021). In this context, understanding the relationship between local innovation and developing an innovative economic environment in smart cities has become a crucial research topic.*

This study aims to contribute to this field by examining the interplay between local innovation, the development of an innovative economic environment, and talent attractiveness in current smart cities (Caragliu & Del Bo, 2019; Marchesani, 2022). The study aims to evaluate how current smart cities create a circuit where local innovation influences the development of innovative companies and consequently attracts talent, triggering a self-sustaining loop. The circular relationship reveals the indissoluble source of an innovative local and economic environment and talent acquisition and highlights how increasing one of these factors contributes to elevating the entire cycle towards a more innovative context.

The main objective of this research is to demonstrate how smart cities are becoming a current innovation hub, generating not only a competitive advantage for cities over rural and less advanced areas but also fostering competition among future cities to attract and retain key factors that fuel this loop, such as innovative firms, talent, knowledge, and local innovation in terms of digital and policy innovation.

Purpose of the paper. *Over history, we have seen a continuous interaction between innovative- and economic drivers and the urban environment. This interaction has contributed to the cities' transition to the current "smart" city perspective in the last century. This transition started in the early 1900s and was characterized by financial-intensive capitalism, in which cities such as New York, London, and Tokyo have played a central role (Beaverstock et al., 2000, p. 125) and still maintain their dominant position (Sassen, 2013). However, over the years, the financial-intensive need has met another perspective by considering the innovation and knowledge-intensive need. The city transformation has led to a more comprehensive view of knowledge-based capitalism in cities and regions, representing the key organizing unit for innovative activities, bringing together the firms, talent, and other regional institutions necessary for them (Florida et al., 2017; Jacobs, 1961). This more comprehensive view in the early 70th years opened up a new vision of the urban context and led to the creation of an innovative environment that attracts, retains, and promotes knowledge, financial capital, and innovation as an engine for highly innovative and technological companies. In this case, Silicon Valley in the USA is the best-known example of such concentration (Chandler and Saxenian, 1995; Saxenian, 2002). However, today this evolution is changing again in the second millennium, driven by globalization, the change of habits, the spread of digital and technology in society, and the new and different needs of all actors such as businesses, companies, workers, and people (Christofi, 2021). In doing this, we meet new visions of the regions and 'good cities' in which companies, entrepreneurs, and users interact in the management of urban development (Vanolo, 2014, p. 883), creating a virtuous cycle in which smart cities affect private investment, companies, and knowledge feed to the development of a whole local and advanced ecosystem (Valdez et al., 2018, p. 3398).*

To meet the current users' needs and urban trends, cities are becoming a hub and crucial center of the new world, aiming to manage to provide an ecosystem where innovation, knowledge, and technology are connected to create a new, competitive, and advanced context (Caragliu and Del Bo, 2019; Hollands, 2008; Kummitha, 2019). In this evolution, the adaptive cities' transformation merges with the technological pattern. Hence, economic growth, in combination with internal and external actors' needs and practices, generates an adaptive ecosystem capable of self-

generation based on 3 pillars such as (i) local innovation, (i) innovative economic environment, and (i) attraction and knowledge creation.

Building on the literature, the relationship between knowledge, local innovation, and innovative and entrepreneurial activities is at the center of a current debate (Abid et al., 2022; Adler and Florida, 2021; Caragliu and Del Bo, 2021; Kummitha & Crutzen, 2017). However, there is a lack of current understanding regarding who influences whom and how. What is certain is that the presence of these 3 factors affects the development of cities and that smart cities are the container that allows these factors to interact together. For example, we know that innovation and entrepreneurship do not simply take place in but require cities (Florida et al., 2017, p. 93). This perspective led to a bidirectional relationship between entrepreneurship and smart cities as (i) entrepreneurs initiates technological interventions that help cities undergo socio-technical transitions and become smart cities (Kummitha, 2019, p. 1), at the same time, (ii) the technologies being adopted in cities generate data which then helps enterprises to explore new opportunities (Kummitha, 2018, p. 330). The role of knowledge also fits into this relationship. Specifically, while we know that innovative and entrepreneurial activities influence the knowledge inflow and entrepreneurship in cities positively affects this relationship (Marchesani et al., 2022, p. 1), it is also true the reverse as cities advance innovation and innovative entrepreneurial activities that impact and promote the development of the host places in attracting knowledge and high-skilled human capital (Faggian et al., 2007; Parrilli et al., 2019, p. 1; Saxenian, 2002). This debate is intrinsic to the current city trajectories, and the direction of those relationships is hardly extricable. However, what is certain is that cities are the container of this transition, as the current smart cities vision helps us understand the interaction between technology, innovation, and knowledge. Building on this state-of-the-art and in line with the economic agglomeration and smart city debate, we posit the following research questions:

RQ1: “There is a direct and circular relationship between local innovation, innovative economic environment, and talent attractiveness in the development of smart cities?”

RQ2: “Which of the three factors mainly influences this relationship, and how do they relate to each other?”

To answer these questions, this paper empirically investigates the interplay between urban innovation, innovative economic environment, and talent attractiveness in the city to advance a theoretical model and empirical research to explain the impact of the relationship between city and innovation in current smart cities trajectories.

Methodology. This research is based on 30 Italian cities for a 13-year period (2009-2021). To ensure high heterogeneity in the sample, we selected the cities on an equal basis within the country’s territory, and the final sample was determined based on several constructs. Firstly, we ensured the homogeneity of the variables included in our model to guarantee uniformity in our approach. Secondly, the sample was constructed based on the reference context, characterized by cities of different sizes with populations ranging from 67,200 to 2,852,000. Finally, we applied probability-proportional-to-size sampling in each stratum of medium and large cities to ensure the robustness of our sample (Levy and Lemeshow, 2011). Our model also used this distinction between large and medium-sized cities as a control variable. The final analysis sample included 30 equally distributed cities within the country to ensure heterogeneity in our analysis.

This empirical investigation focuses on the current state of Italy, which is at the center of academic and political debates on smart city transformation, social and economic policies, and sustainable development trends, and constitutes a prominent empirical focus for sustainable development debates in Europe (Ferraris, 2015; Vanolo, 2014, Christofi, 2021). City-level variables were used, and data were collected from databases at the national (ANPR, AGCOM, ISTAT, GreenItaly, GSE, OECD, MIUR CoC, and IBS) and international (EUROSTAT and OECD) levels. The variables considered are related to urban innovation, the innovative economic environment, and talent attractiveness. Urban innovation is measured through an index that includes 9 variables representative of cities’ smart transition from a digital perspective (i.e., Wi-fi, Home banking diffusion, Online Services, Open Data, and Social Media) in accordance with the literature (Abid et al., 2022; Hampton and Gupta, 2008; Kummitha and Crutzen, 2017; Marchesani, 2022). The innovative economic environment is measured through an index that considers 5 variables related to the economic environment (startups, innovative companies, spin-offs, private R&D investment, and the number of workers in private sector research and development). Finally, the talent attractiveness variable is measured through student inflows into the city from (i) other cities in the same region, (ii) other regions, and (iii) other countries. Due to the intrinsic characteristics of our sample, which is based on a panel dataset comprising cities located in the same region and neighboring each other, producing spillover effects, we use spatial panel models based on Lee and Yu (2010) and Elhorst (2010) in our paper to estimate the effects of local innovation and the innovative economic environment on talent attraction, and how these factors shape the trajectories of smart cities. To confirm the suitability of spatial econometrics, we perform the Moran test for spatial dependence. Thus, we estimate our model using both fixed effects (FE) and random effects (RE) specifications in the spatial panel data models. To interpret the results, we use the Mundlak approach to select the appropriate FE or RE models. This approach is designed for small samples and is considered more robust compared to the Hausman test for this sample of analysis (Debarsy, 2012).

Results. This research examines the links between local innovation, an innovative economic environment, and talent attraction to assess their respective roles in shaping the trajectories of smart cities. Preliminary results confirm the interplay between these factors and demonstrate their central role in the current smart city transformation. Furthermore, these results will allow us to weigh the impact of individual variables on the smart city ecosystem, providing a practical and significant picture of the current theoretical framework conceptualized in the literature. Thus, our objective will be to propose a conceptual framework that relates the ecosystem of the city to the entrepreneurial ecosystem, highlighting the central role of knowledge and talent acquisition in current perspectives of urban

development. This framework will allow us to have a comprehensive understanding of the interplay between various factors and stakeholders involved in the development of a smart city. It will serve as a valuable tool for policymakers and urban planners and contribute to the smart city literature. Specifically, these findings empirically support the current academic debate on smart cities, which emphasizes (i) the impact of an innovative local environment on the creation of an innovative economic environment (Marchesani, 2023; Florida et al., 2017) and the attraction of talent (Kummitha and Crutzen, 2019); (ii) the role of an innovative entrepreneurial ecosystem in driving the smart transition of cities (De Jager et al., 2017; Kummitha, 2018) and the connection between talent and urban areas cities (Marchesani, 2020; Marchesani, 2022); and (iii) the central importance of talent in intercepting local innovation and promoting an innovative economic environment (Kummitha and Crutzen, 2019). Thus, these preliminary results strengthen the current theoretical debate and provide new insights into the role of innovation and knowledge in the urban ecosystem.

Research limitations. Our approach has limitations intrinsic to the empirical nature of the approach. Firstly, our research sample consisted of 30 Italian cities that have initiated smart city projects over a 13-year period, which provides a significant starting point for the Italian national fabric. However, future research could improve the sample and explore connections with other important cities worldwide. Secondly, our analysis covered the years 2009-2021, a period during which economic growth was affected by the 2008 crisis and rapid changes in innovation and technology. Moreover, current global issues, such as the COVID-19 pandemic and ongoing geopolitical conflicts, may have an impact on the current smart city trajectories and accelerate (or slow down) the process of urban development and attractiveness. Therefore, it is crucial for future research to consider the dynamic nature of these factors and their potential influence on the relationship between attractiveness, economic and technological environments, and urban development.

Additionally, given the direct influence of the economic and technological environment on major cities, the relationship with attractiveness may be impacted. Although we tried to reduce this effect by considering a local and spatial context and controlling for variables, this limitation must be acknowledged. Finally, our variables were constructed based on the reference literature on smart cities and theoretical constructs since no absolute variables can evaluate the three factors considered in the model. Future research could expand the model to include internal factors, such as infrastructures and services, economic factors related to companies' innovation, and talent-related factors, like high-skilled workers and researchers.

Managerial implications. Managerial implications can be drawn from our result to advance the current smart city policies and should serve policymakers, governance, and urban planning to construct current and future policies. Specifically, smart city managers can leverage these findings to develop various factors and create a competitive advantage for their cities. By promoting, attracting, and retaining innovation and talent, they can strategically drive smart city implementation in local and international ecosystems. Consequently, smart city managers can design targeted interventions to achieve a higher level of implementation and secure an advantage in terms of innovation and attractiveness.

Furthermore, our findings shed light on the still-emerging debate about the intersection between the smart city and the entrepreneurial environment. Our preliminary results support the argument that the smart city and entrepreneurial ecosystems have an existing and indissoluble relationship. This offers managers a practical vision of the current state of the art, moving from an exploratory and theoretical context to a practical implementation on which to base policies and urban planning. Finally, to create synergy between the entrepreneurial environment, technological development, and incoming talents, universities, and the private sector must collaborate with each other to promote and stimulate the development of this loop (Kummitha and Crutzen, 2017). Thus, we encourage policymakers to adopt a more comprehensive vision of the city that includes stakeholders and interested parties with the ultimate goal of creating an integrated ecosystem between universities, the entrepreneurial environment, and the city to advance the city towards a new, competitive, and advanced concept of a smart city.

Originality of the paper. This study is one of the first to empirically evaluate the intersection between local innovation, an innovative economic environment, and talent attractiveness in current smart city trajectories. In Italy and the broader European Union, there is widespread rhetoric of smartness, which risks building public consensus without empirical evaluation, particularly regarding energy efficiency, digitization, and sustainability. Despite the debates on the smart city concept from various perspectives, such as urban environment, sustainability, information system, and economic agglomeration, the empirical evidence on the actual outcomes of this transformation and the role of various factors in the ecosystem are still unclear. Therefore, this study aims to evaluate how current smart cities create a circuit where local innovation influences the development of innovative companies and subsequently attracts talent, creating a self-sustaining loop. The research aims to demonstrate how smart cities are becoming innovation hubs, generating not only a competitive advantage for cities over rural and less advanced areas but also fostering competition among future cities to attract and retain key factors that fuel this loop, such as innovative firms, talent, knowledge, and local innovation in terms of digital and policy innovation. These findings contribute to the current theoretical and conceptual debate (Christofi et al., 2021; Kummitha, 2019; Marchesani et al., 2022; Vanolo, 2014).

Does founders' local pre-founding experience influence SMEs' innovativeness

GIANLUCA VAGNANI*

Objectives. *Small and Medium-sized Enterprises (SMEs) are separately owned firms that are not dominant in their field of business (D'Amboise and Muldowney, 1988; Baldassarre et al., 2022; Zamani, 2022). Given their resource poverty (Welsh and White, 1981; Miklian and Hoelscher, 2022), literature acknowledged that founders – individuals involved in the setup of a firm and who initially had an equity investment in the same firm –matter for SMEs innovation and success (Colombo and Grilli, 2005; Kato et al., 2015; Barroso-Castro et al., 2022). In the spirit of the upper echelon theory (Mason and Hambrick, 1984; Pongelli et al., 2023), founders' contribution to firms' performance is shaped by their influence on structure and process (Golinelli, 1974; Baccarani, 2015). Moreover, there is an underlying assumption in the upper-echelon theory that measurable and observable leaders' characteristics, like demography and past experiences, are proxies of their beliefs and endowments (Busenitz and Barney, 1997; Denzau and North, 2000; Bryant, 2007; Popli et al., 2022); and, given the imprinting effect (Marquis and Tilcsik, 2013), founders' beliefs and resource endowments are to shape the organizational structure and process, which are essential to SMEs innovation and success. An extensive number of researches have focused on founders' contexts of related areas of experience before founding (Van de Ven, 2004; Niittymies, 2020), like industries, firms, and organizational functions (Roberts et al., 2011; Hashai and Zahra, 2021). However, given the same area of experience, founders can develop it in a context that is local/non-local compared to the SMEs location (Mauro, 2009; Accetturo et al., 2011). Therefore, we proposed that such dimension matters for SMEs innovativeness, as measured by their innovation outcomes.*

Concerning the geographic areas, by distinguishing between local versus nonlocal sources of experience (Simons and Roberts, 2008; Liu and Guenther, 2022), scholars theoretically discussed the negative effect of greater levels of locally developed experience on firms' innovation outputs. Such negative effect is explained by the knowledge-based view and specifically by the mono-cultural, less diverse knowledge exposure and acquisition which limit search strategies for new knowledge and the ability to combine different chunks of knowledge (Un, 2016; Un and Rodríguez, 2018; Almodóvar and Nguyen, 2022). In this vein, scholars empirically observed that founders with greater local experience levels will harm firms in entering new international markets (De Cock et al., 2021) and adopting new organizational forms in entering such new markets (Simons and Roberts, 2008). It has also only theoretically advanced that lower levels of local prior-founding experience, as in the case of immigrant founders, will enhance firms' innovations in terms of new products and services (Bajaba et al., 2021). In our study, we tested the main effect of founder local prior-funding experience on SMEs innovation in Italy. In addition, we contribute to the literature by considering how and under what conditions such a main effect will be produced and whether its sign will remain negative.

Given the relevance of the inter-organizational relationships in small firms (Lorenzoni, 1990; Vurro et al., 2014), in the local prior-founding experience-SMEs innovation association, we argue that greater levels of founders' local experience will induce more positive attitudes and perceived behavioral controls toward the conditions at the local environment, which, given the founder imprinting effect (Marquis and Tilcsik, 2013), in turn, will induce a local stamp to their firms, at both intra- and inter-organizational levels. Such an effect is augmented by the founders' endowment locally developed over time. As personal ties, collaboration, and commercial commitments are developed by founders in local contexts (Milanov and Fernhaber, 2009), they make easier for founders themselves to leverage such local relationships than more distant ones, thus reinforcing their firms' local stamp, particularly in the inter-organizational relationships (Johnson, 2007; Bryant, 2014). Moreover, it has been observed that relational embeddedness facilitates tie stability (Polidoro Jr et al., 2011). Founders' resource endowment developed via locally related experiences favor social relationships embedded in local contexts (Marchington and Vincent, 2004; Barden and Mitchell, 2007), which induces greater levels of stability in local relationships of a given SME with its task environment. Accordingly, founders prior-founding local experiences will influence the localness and the stability of inter-organizational relationships, and, in turn, such inter-organizational relationships will influence SMEs' innovation. As for the latter association, building on the knowledge-based view of the firm, within contexts of firms attempting to innovate by entering new markets (Simons and Roberts, 2008) or by introducing new products in foreign countries (Un, 2016), scholars introduced two main mechanisms that may affect firms innovation: cultural diversity and conformity Given the two suggesting

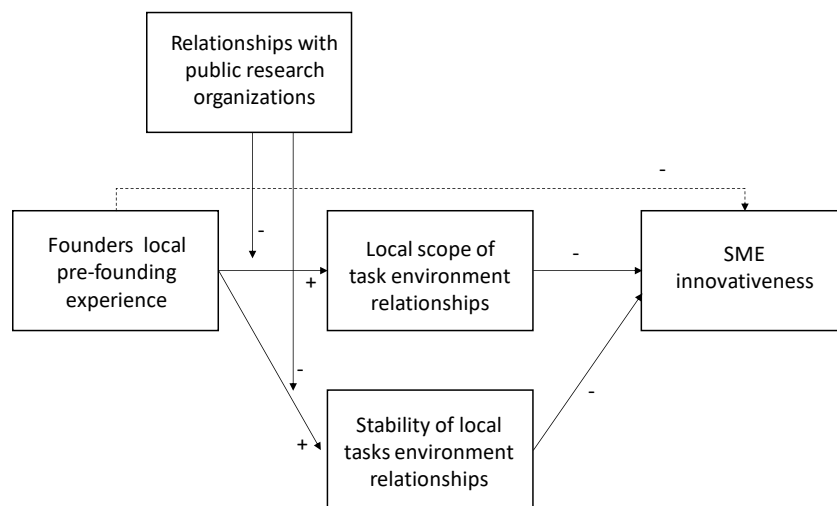

* Full professor of Business Management - Sapienza University of Roma
e-mail: gianluca.vagnani@uniroma1.it

mechanisms, we add that greater levels of local-stable relationships between SMEs and their task environment will both limit cultural diversity and increase conformity to the local environment, which, in turn, reducing diversity and variety of available knowledge, limiting knowledge recombination, all essential ingredients for SMEs innovation (Varaldo and Ferrucci, 1996; Guckenbiehl et al., 2021; Hervas-Oliver et al., 2021).

We advanced that, given the broader, general scientific scope of knowledge developed and accumulated by public research centers (Masiello et al., 2015), established relationships with local public research centers to partially offset the founders' local prior-founding experience-SMEs local scope and Stable task environment relationships association, which in turn will benefit SMEs innovation. Public research organizations are defined as universities and other public research centers. These organizations are vital since, as noted by early research, many technological changes could not have been introduced without organizations collaborating with public research organizations, particularly with universities (Mansfield, 1991). Moreover, collaboration with universities in innovation can bring organizations overall enhancement in competitive advantages (Leckel et al., 2020). Public research organizations offer unique opportunities to firms to acquire external, highly diverse sources of knowledge, which is crucial for generating new technologies (Cohen et al., 2002). In addition, publications, seminars, workshops, and conference meetings are additional channels that technological collaboration with public research organizations makes available to firms to share and exchange more distant, diverse knowledge (Meyer-Krahmer and Schmoch, 1998). Thus, SMEs collaborating with public research organizations offer opportunities for establishing more diverse, non-local collaborations and, at the same time, to reduce the stability of existing task environments, by injecting varieties of knowledge and variability of opportunities for collaboration. Therefore, we expected that established relationships between SMEs and public research organizations will negatively moderate the Founders' local pre-founding experience association with the Local scope and Stability of task environment relationships.

The main concepts and their association are included in Fig 1. The dotted line represents the main effect, while solid lines the indirect effects.

Fig. 1 Our theoretical framework

Methodology. The associations included in our theoretical framework were tested on a random sample of 350 founder-lead SMEs located in Southern Italy. Data was collected through a survey, with a direct personal interview with founders. To reduce the mono-responded bias, we asked interview founders to indicate three other individuals to whom address the same interview, except for the founders' local pre-founding experience. For each sampled SME, we calculated the inter-interviewed agreement whose average score is equal to .98. When we observed inter-interviewed scores lower than .95, we organized a joint meeting with the interviewed subjects to resolve salient differences through discussion. Then, we averaged responses from the different interviews for each of the sampled SMEs.

The independent variable is the founders' local pre-founding experience. In particular, we asked each interviewed founder about the city in which he/she studied and the city in which he/she had the last professional experience before founding the current firm. Accordingly, we calculated the geographic distance between the coordinates of the city in which her/his SME operates and the coordinates of the other cities in which each founder studied and/or had professional experience. The resulting distance was then normalized to range between 1 (full local pre-founding experience) and 0 (full nonlocal pre-founding experience).

Concerning the local scope of a firm's task environment, we asked interviewees to list the main suppliers and their geographic locations. Accordingly, we calculated the geographic distance between the coordinates of the City in which the SME operates and the coordinates of the city in which each SME's supplier operates. As before, the distance was then normalized to range between 1 (full local scope of an SME's task environment) and 0 (full nonlocal scope of an SME's task environment). We also asked interviewees to indicate the turnover of SME relationships with its suppliers. In particular, we asked for the share of input costs from new suppliers used in the last five years. For robustness, we

requested interviewees to provide us with evidence through accounting data. We also asked interviewees to list the established relationships with public research organizations (e.g., universities or public laboratories) in the last five years. We also asked about the nature of such relationships (e.g., joint research projects, Ph.D. grants) and independently check the accuracy of interviewed responses.

As for the dependent variable, organizational innovativeness, we asked the interviewed the number of innovations introduced in the last five years. These figures were checked by a team of three experts in the industry to which each SME belongs. A majority rule was then introduced to select the number of innovations to be considered. In other words, innovation was considered true if at least two out of three experts confirmed its nature.

As control variables, we considered, at the SME level, the average R&D expenditures over sales in the last three years, age, number of employees, and number of family-related individuals involved in the firm. At the founder level, we instead controlled for his/her age, highest degree, and tenure in years. To control for additional heterogeneity, industry dummies were also considered.

Findings. We tested the main effect of founder' local pre-founding experience on SMEs innovativeness, with included control variables ($R\text{-squared} = .15$; Oster (2019) $\Delta = 11$). The association was negative and significant ($\text{Beta} = -.04$, $p < .05$). Such association is also robust to the selection of unobservable, given that the Δ value is greater than one. Among control variable, the extent of R&D investment has a significant positive effect on SME innovativeness ($\text{Beta} = .01$, $p < .01$). Concerning our mediating variables, the founders' local pre-founding experience has a positive and significant effect on the local scope of SMEs' task environment ($\text{Beta} = .10$, $p < .01$). In addition, SMEs relationships with public research centers has a negative and significant effect ($\text{Beta} = -.19$, $p < .01$). Among control variables, R&D expenditures have a negative and a significant effect on the considered mediating variable ($\text{Beta} = -.01$, $p < .01$). As for the stability of local task environment relationships, we observed that founders local pre-founding experience has a positive and significant effect on the considered variable ($\text{Beta} = .03$, $p < .01$), while SMEs' relationships with public research centers have a negative significant effect ($\text{Beta} = -.06$, $p < .01$). Among controls, R&D expenditures have negative significant effect ($\text{Beta} = -.01$, $p < .01$). Finally, considering the effect of mediators on SMEs' innovativeness, we noted that both the local scope of the task environment ($\text{Beta} = -.25$, $p < .01$) and the stability of the local task environment relationships ($\text{Beta} = -.07$, $p < .05$) have a negative and a significant effect on SME's innovativeness. Finally, the two considered mediators account for 41% of effect of founders' local pre-founding experience on SME innovativeness.

Research limits. Our study has several limitations. We focused on SMEs located in selected areas of Italy. Although we limit unexplained heterogeneity, considering homogenous geographic areas, replicating the current study in different areas or regions may contribute to the generalizability of our results. We measured the dependent variable with a single measure captured via interviews with key SME representatives. Using additional measures, such as the number of patent applications, could have contributed to further triangulating our results. However, holding our sampled firms, very few SMEs had patent applications. Thus, we excluded this possible additional measure of innovation outcome. We measured the local nature of the pre-founding experience referring to the location in which such an experience was developed. We did not measure, instead, the local content of such an experience. However, such a measure would have required us to understand founders' experience content, separating its local vs non-local components, and accordingly, measure its degree of localness.

Practical implications. Our study has implications for practice. It suggests prospective founders broaden their pre-founding experience, well beyond their local contexts. Such a non-local experience could expose prospective founders to a diverse, new source of knowledge that once combined with local knowledge, could inject into their SMEs more opportunities to introduce innovations. Those founders that have already developed local pre-founding experience, may find opportunities to interact with public research organizations, which will provide broader, more diverse knowledge to complement the more specific, homogenous knowledge derived from a founder's local pre-founding experience. Finally, founders with local pre-founding experience can also foster the development of relationships with more distant suppliers. At the same time, they can foster changes in such local relationships, which in turn will mitigate the negative effect of founders' local pre-founding experience on SMEs' innovativeness.

Originality of the study. Our study delves into the concept of liability of localness, which initially referred to the competition between local companies and multinational companies' subsidiaries, and extends to SMEs and, specifically to their founders' experience and knowledge acquired during their study periods. We argued that Founders' local pre-founding experience is transmitted to their SMEs via the imprinting effect. We further introduced two additional theoretical variables able to capture two channel mechanisms through which represent how the imprinting effect will produce its effect on SMEs. These two mechanisms, namely the local scope and the stability of task environment relationships, reflect the founders' local pre-founding experience, and induce a liability to SMEs, by making their knowledge less diverse and more homogeneous, thus less able to contribute to innovation outcomes. We also advanced that such an iron cage, produced by founders' local pre-founding experience on SMEs' task environment, is partially unleashed for SMEs that established relationships with local public research organizations. These organizations are to inject new partnership opportunities, new contacts, and new, diverse knowledge, which in turn will reduce the effect of founders' local pre-founding experience on SMEs' local scope and stability of task environment relationships. In other words, SMEs' collaboration with public research organizations is a moderating variable to partially offset founders' local prior experience negative effect on SMEs' innovation. We developed a theoretical framework and tested it on a sample of Italian SMEs. To the best of our knowledge, we are not aware of empirical studies on the same issue. From our empirical analysis, we also provided evidence that did not disconfirm our theoretical associations. Our study

contributes to the debate around the effect of founders' backgrounds and experience on their firms' performance. While scholars focused more on the breadth and depth of theoretical vs practical experiences, industry-specific or industry non-specific, we advanced that locations in which such experiences and knowledge have been developed are relevant, particularly in SMEs located in areas of low research and innovation intensities. Founders with local pre-founding experience may well understand local contexts and main players. However, may miss the broader picture, and the opportunities available in more diverse, more distant contexts. Our study attempts to contribute to the debate between the local and global scope of SMEs. We advanced that founders' local or non-local scope of their pre-founding experience matters too. We also discussed and empirically observed that an SME can hold its local scope, but to sustain its innovation performance the firm must build more distant diverse relationships. In this vein, relationships with public research organizations do matter.

Key words: SMEs innovativeness; Local pre-founding experience; Public research organizations; Localness and stability of SMEs' task environment

“How Matter Matters”: “Translations”, Boundary Objects, and Digital Innovation in the Public Reforms[♦]

FRANCESCO CRISCI^{*} RUBINA ROMANELLO[♦]

Framing of the research. *This paper illustrates a research program on the processes of organizational change and institutional learning in the Italian administration of the justice and in the trajectories of courts technology development. It is argued that objects, artifact and materiality should be included in theoretical accounts of organizational phenomena connected with (digital) innovation and change (Carlile et al. 2013). Drawing on the “socio-technical-systems” (STS) (Law 1986; Mol 2002; Latour 2005, 2009; Bijker et al. 2012; Pickering 1995; Nimmo 2016), we argue that it is possible to understand the process of reform in the Italian judiciary: (i) by combining two theoretical dimension, between “institutions & materiality” and “materiality & change”; (ii) conceptualizing the relation between technology, work and organizations as “enacted in practice” (Orlikowski, Scott 2008); (iii) and analyzing the introduction of accountability mechanisms, and digital technologies in terms of “sociomaterial practices” (Power 1997; Gherardi, Lippi 2000).*

The theoretical premises of this work are based on the interpretation of:

- a) *the change in the governance structure of the Italian judicial system as one of the expression of the technology of accountability (Power 1997), considering how the “transformative/performative” process in which this technology is used makes the administration of justice truly more “accountable” than before;*
- b) *the administration of justice as a set of “situated and emerging practices” (Suchman 1987; Gherardi 2012), in which the practice-based perspective has the interpretive advantage of eliminating the organizational boundaries of a phenomenon articulated at different organizational levels, between center and periphery (Council of the Judiciary, Ministry of Justice, Courts of Appeal on one hand, courts on the other), showing forms of decoupling between means and ends and policy and practice (Bromley, Powell 2012);*
- c) *institutional learning and organizational change as participation in social practice that produces and circulates knowledge situated in contexts of interaction and mediated by technological artifacts (digital archive as artifacts, “digital evolution of archiving practices” as “memory practices”, and processes of “digital infrastructure” within the courts as “technologically dense environments”, i.e., Suchman 1997; Bowker, Star 1999; Mol 2002; Pickering 1995; Bowker 2005);*
- d) *the reform as a process of “translation-into-practice” by an “actor-network” capable of triggering institutional learning in the judicial system and organizational change in the courts (Czarniawska, Sevón 1996; Gherardi, Lippi 2000; Nimmo 2016), rather than an “implementation” of a policy (i.e., a model of rational and temporally linear decision) or “diffusion” of an innovation (i.e., recalling the absence of “agency” and logics of “replication”, or “institutional isomorphism”).*

Purpose of the paper/Evidence. *Since the mid 1990s, the reforms of the European judicial systems have addressed the issue of improving efficiency, quality, and accountability mechanisms, in line with the “new public management” (NPM) approach intended as “an assortment of ideas and orientation driving the reform of public administration” (Power 1997: p. 92; Miller, Power 2013).*

As can be seen in the following abbreviated episodes, the interdependence between the two dimensions of the phenomenon, namely 1) the introduction of digital technologies and 2) the performance evaluation mechanisms, is taken for granted (CEPEJ 2022), while our theoretical perspective considers this as a matter of concern:

[1] «Courts are first considered as legal entities, i.e. institutions responsible for settling disputes submitted to them by citizens. [...] In addition to their character of legal entities, courts can also be defined by their geographic location, i.e. by the premises in which judicial activities take place» (p. 79)

«The good development and proper use of ICT is an important element of the good functioning of judicial systems as it contributes to increased transparency, efficiency, access and quality of the services delivered. ICT is no longer a novelty in European judicial systems. Judicial systems whose traditional activities and work organization were based on paper (legal texts, case files, court registers, etc.) are increasingly replacing the old tools with the digital one. The courts are being transformed to accommodate new options and move on-line. Some hearings are taking place via videoconferencing, electronic evidence is regularly presented, while case files and court decisions are becoming digital objects with their content tagged to ease search, analysis and legal reasoning. ICT innovation in the European judicial systems has evolved through different paths because of tensions between different elements, which have led to different results in various national contexts. Examples of these are tensions between local versus centralized solutions, between the development of specialised tools versus more global and generic systems, data security versus external access by users and the public, competences between the executive power in this area and judicial power. Furthermore, institutional settings may differ, depending on the national specificities in the organisation of the judiciary» (p. 95).

[2] «The efficiency of courts and public prosecution services is one of the vital factors for upholding the rule of law and a critical component of a fair trial. It facilitates good governance, promotes the fight against corruption and builds confidence in institutions. Efficient courts and public prosecution services enable individuals to enjoy their economic and social rights and freedoms. They improve the business climate, fosters innovation, attracts foreign investment and secures stable state revenues. [This chapter] demonstrates the main trends and tendencies, while also promoting the best practices among member States, entities and observers. It also provides basic facts and figures on the performance of courts and public prosecution services. It treats all jurisdictions equally and compares them without any intention of ranking them or promoting any particular type of justice system. Its approach is inspired by the fundamental principle enshrined in Article 6 of the European Convention on Human Rights – the right to a fair trial.

The CEPEJ has developed two performance indicators to assess court efficiency at the European level. Clearance Rate (CR) and Disposition Time (DT) present an overall picture of the judicial efficiency in a particular judicial system. An analysis of their evolution provides a clear picture of efforts of the judicial system to maintain or improve its efficiency. The CR is the ration obtained by dividing the number of resolved cases by the number of incoming cases in a given period, expressed as a percentage. CR shows how the court or the judicial system is coping with the in-flow of cases and allows comparison between systems regardless of their differences and particularities. DT is the theoretical time necessary for a pending case to be resolved, taking into consideration the current pace of work. The resulting indicator should not be taken as an actual calculation of the average value. Actual average times needed for case resolution would need to derive from judicial case management ICT systems. [...] This indicator offers valuable information on the estimated length of the proceedings» (p. 107).

Figure 1 describes the research context of this paper, by illustrating on the left the three waves of the recent Italian judicial reforms. In addition, it proposes a matrix based on two descriptive dimensions, namely professional control and administrative accountability, within which some episodes are situated. Below the matrix, the multidimensionality of the concepts of accountability in the field of judicial governance are described. These aspects will be discussed in detail in the following paragraphs.

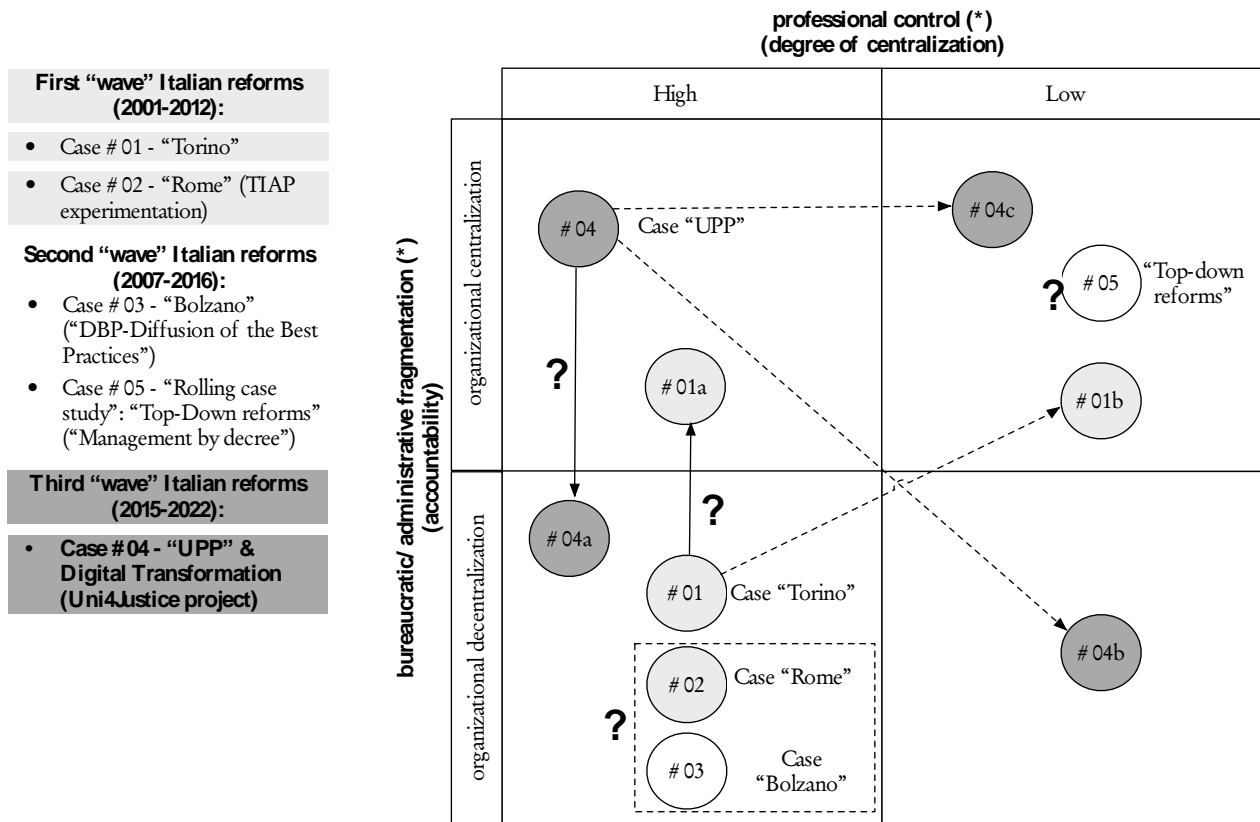

The three “waves”, also overlapping, of the Italian judicial system are the following (Sciacca et al. 2013; Piana 2016, 2017; Vercelloni 2020): 1) a “quality-of-justice-oriented” agenda (2001-2012); 2) the judicial offices “in-search-of-best-practices” (2007-2016); 3) and the “management-by-decree” and “digital transformation” reforms (from 2015) (CEPEJ, 2020). This work mainly focuses on this last stage, in relation to the NextGenerationEU – “UNI4Justice” project.

The intent of the reforms largely responds to the need to introduce European standards into the Italian judicial system (CEPEJ 2020, 2021a, 2021b). In 2002, the European Commission for the Efficiency of Justice (CEPEJ) was created within the framework of the Council of Europe, inspired by a user-oriented and a results-oriented viewpoint and by a coherent agenda of macro themes (Piana 2017, p. 187): “access to justice and the proper and efficient functioning of courts; the status and roles of legal professionals; administration of justice and the management of courts; use of information and communication technologies (IT)”. Although the States are not under the supervision of the CEPEJ, the spread of rationalizing trends in the international language of the reform process of bureaucratic administration was pervasive: “ruling issued within reasonable amounts of time; judicial decisions executed in conditions of certainty and reliability; transparency of budgetary policies; transparency and accessibility of legal proceedings and legal texts” (Guarnieri, Pederzoli 2002, 2020; Piana 2016). The “dual” Italian system of judicial governance is founded on the balance of power between the executive branch (the Ministry of Justice ensure the availability of resources and their management) and the High Judicial Council (responsible for judicial appointments and promotions). In this “resource/goals oriented” approach (Piana 2010, 2017), the “appropriateness of the quality-of-justice mainstream has been perceived for years as being very low, [and] any policy touching upon the institutional and the organizational setting of the court system has since the early 1990s encountered a high level of conflict” (Piana 2017, p. 191). The most notable example of escalation of conflict between the judicial branch and the political elite in the important actions against corruption can be seen in the “Clean Hands” affair.

Since 2001, the first wave encouraged the Italian public policy debate to explicitly take in consideration the quality of justice: a constitutional provision entrenches the principle of “fair trials” and by means introduces the conditions for a number of legal measures, among which the most significant is the law on the damage suffered because of unreasonable delays in proceedings (“Law Pinto”). The Government presented a decree law which aimed to digitize civil proceedings: Civil Trial Online (or “Processo Civile Telematico-PCT”) is the digital procedure for civil cases in

the Italian judiciary (Zan 2002, 2004): it is expected to reduce delays in the courts, and to reduce the costs of the justice system, and its use became compulsory in 2014.

Figure 1 - Professional control and accountability in the Italian judiciary reform

(*) (An assemblage of) Norms and standards of quality of justice (in the “language” of European Commission and Council of Europe) (Piana 2010, p. 59):

(1) Legal accountability:

- Centralised control of constitutionality; judicial review handled by specialised bodies (i.e. constitutional courts)
- Coherence with arts. 5 and 6 of the European Convention for Human Rights
- Respect of the timeframe standards of a fair trial in due time
- Artt. 5 and 6 of the European Convention for Human Rights
- Every citizen should be ensured about the availability of a legal representative in case she can't afford the costs of legal representation
- Organization of systematic and comprehensive programmes of training in law

(2) Institutional accountability:

- The Judicial Council's board should be composed by a majority of judges (but not all of the members should be judges)
- The Judicial Council has representative and administrative functions
- The Judicial Council is entitled to handle all the mechanisms of recruitment and promotion
- HJC prepares the budget; the court manager is managerially accountable to the HJC
- Creation of a judicial school, centralised, providing programmes of initial and in-service training; the State should provide for the budget for training; the School is accountable to the Judicial Council for the programmes and for the management

(3) Professional accountability:

- Legal training
- Judges and prosecutors (courses of ICT by experts of public administration)
- Adoptions of National and Supranational Codes

(4) Managerial accountability:

- Court manager; system of e-filing
- Non judicial staff
- Performance assessment for judges and clerks at the court level
- ICT tools for judges & ICT tools for clerks; data set of case law and doctrine

(5) Social accountability:

- front office system of e-filing
- web sites of judicial institutions; broad and free availability of information about rights of citizens
- information about the development of judicial procedures
- statistics and survey available to public

A second “wave” of judicial policies is marked by 2006 and 2011’s interventions (Sciacca et al. 2013; Piana 2016; Verzelli 2020). The first attempt to reform the judicial branch leads to reconsider the mechanisms of performance evaluation “whereby the confirmation in office of chief justices and chief prosecutors was made subject to the outcome of performance evaluations in their first four years office – with a consequential increase in their organizational entrepreneurship” (Piana 2017, p. 191). The reform has taken several years to be fully implemented effectively, mainly for the weakness of central institutions (both the executive and judicial branches). As a result, “in 2011 [Mario Monti forms a new government], the level of conflict between the judicial and the executive branches decreased. [...] Since 2013, a large number of measures [...] designed to improve the management and organization of judicial offices have

been introduced” (Piana 2017, p. 194). This introduces an organizational change to harness skills, competences and leadership in the courts based on a logic of “management-by-decree” (Panozzo 2000; Miller, Power 2013), marked by incisive change at the ministry of Justice.

The first two waves of reforms have been characterized by (Piana 2016; 2017; Contini, Lanzara 2009; 2014):

(a) initiatives taken by a number of chief justices to digitize civil proceedings, relying on the collaboration of the local bar association and the availability of technical expertise with pilot projects in Bologna, Milan and Florence (Piana 2010; Sciacca et al 2013);

(b) initiatives taken by a number of chief justices and chief prosecutors to improve the accountability of the offices in the quality-of-justice mainstream, with pilot projects in Turin, Bolzano, Rome (Piana 2010, 2017);

(c) initiatives to incorporate into regional planning programs the projects of organizational innovation praised by the EU and financially supported by the structural funds, with pilot projects in Bolzano and “DBP” (Sciacca et al., 2013; Castelli et al. 2014);

(d) initiatives driven by the general policy regarding IT, trying to regain control and centrality of the digitization processes to ensure homogeneous implementation patterns in the judicial districts (i.e. e-justice platforms for civil and criminal trials; the introduction of the “Ufficio per il Processo” (UPP), “Office for Proceedings”, within the PNRR).

The evidence on the judicial policies between 2001 and 2016 reflects three features (Piana 2017: p. 194): 1) in policy formulation the “local level” predominates; 2) the lack of leadership in the central judicial institutions – the High Judicial Council and the Ministry of Justice – has obstructed the governance of the results achieved by the projects; 3) the long wave of local initiatives taken to improve the quality of justice has had unintended consequences both at the micro and macro levels.

The third “wave” of reform starts from and develops the digitization processes, in line with the highlights above.

The analysis of the evolutions in the governance and reforms of the judiciary system in Italy leads to identify the two dimensions, which give rise to the matrix proposed in figure 1 (Piana 2010, 2016, 2017; Sciacca et al. 2013; Castelli et al. 2014; Verzelloni 2020): the level of centralization of professional control connected to the judicial independence, and the degree of institutional fragmentation among different organizational levels considered as an initial approximation of the dimension of judicial accountability.

Research Design/Method. This work uses the language of the “sociology of translation”, or Actor-Network Theory (ANT) (Latour 2005; Czarniawska 2017) to make sense of the reforms concerning the introduction of digital technologies and accountability mechanisms in the administration of justice (Gherardi, Lippi 2000). The “actors” who enter into action in a space of social action (an “action net”: Callon 1984; Law 1986, 2009) can be considered as translators who, in attributing and negotiating the meaning of what they do, also build the collective subject who implements the process of translation (Gherardi, Lippi 2000). In the ANT language, the actors of a translation process (Callon, Latour 1981; Latour 2005) form a space of relationships that involves (Gherardi, Lippi 2000): those who produce and codify/share expert knowledge (universities, legal training, consultants); regulators and laws that impose themselves as obligatory passage points, the movements and detours that must be accepted as well as the alliances that must be forged (Law 1986, 2009; Latour 2005) (the ministry of Justice, the High Judicial Council, the CEPEJ, the reform decrees, internal rules); the “territorial” actors who in turn produce knowledge, imitate, copy, adopt what a “transfer center” imposes or disseminates as a model, such as courts that “resist” the process of translation or promote it as forms of “representation” or as a “community of practice”; intermediaries, anything that circulate between actors and defines their relationships (Law 1986; Latour 2005), who can be humans (i.e. chief justices and chief prosecutors), technological (i.e. software or performance indicators) and, in general, texts, documents, exchange of information in various forms (i.e. conferences or meetings, legal training classes, slides in power point).

The courts constitute a local translation center in which the intermediaries, starting with the judicial file as an artifact (a digital archive) converge, stabilizing the meaning of digital technologies and accountability mechanisms in an actor-network that will act as an “actor of the translation” (Callon 1984; Law 1986, 2009; Latour 2005, 2009).

In the cases of Turin (#01, #01a and #01b) and Bolzano (#03), chief justices and chief prosecutors are facing with the construction of relationships between “discourses”, bodies/work practices, texts, machines, infrastructure/architectures in an attempt to make sense of reforms that have by object technologies and forms of accountability (digital innovation, quality-of-the-justice, performance indicators). The case of Turin is based on the idea of reducing the time of justice by extending the experience of the chief justice of the “civil section” to the entire court when the magistrate becomes president (Sciacca et al. 2013; Piana 2016, 2017). The court adopts the “Strasbourg programme”, a series of organizational practices based on a large collaboration in the classifying pending files by “seniority”, based on the “risk factor”: the risk the file could generate a proceeding in the European Court of Human Rights (ECHR) in Strasbourg and, by analogy, the risk of falling under the “Law Pinto”. The “inventory” of pending judgments requires the identification of different “social group” in the court which relates to the artifact (the inventory), redefines the nature of the problem and produces some alternative solutions, for example, sharing the importance of enhancing internal court monitoring mechanisms. The judicial offices agree on the elaboration of two statistics a year which become the “communication standard” used by the Courts of Appeal (i.e., in the inauguration of the judicial year). In 2001, the court added two more statistics on the disposal of pending judgments “by seniority”, sharing the information with the entire organization. In 2009, 98% of the pending cases were outside the “Pinto risk” and the “Strasbourg risk” (Piana 2016).

Table 1 - Boundary objects, centers of coordination and “translation” in the Italian reform of judicial system (***)

CENTERS OF COORDINATION (**)	
Centers of coordination (**): are representative of a set of situations which have to do with ‘working together’ [the world of humans interacting with the world of non-humans and with ICTs which support distance work]. These places [...] make it possible to revise categories of analysis like cooperation and individual/collective work, as well as organizing understand as an activity situated in practice (Gherardi 2012)	
BOUNDARY OBJECTS (**)	
Boundary objects: they are a major method of solving heterogeneous problems. BOs are objects that are both plastic enough to adapt to local needs and constraints of the several parties employing them, yet robust enough to maintain a common identity across sites. They are weakly structured in common use, and become strongly structured in individual-site use. [...] A BO “sits in the middle” of a group of actors with divergent viewpoints. <i>Translation: The world of the BOs depends on the practices of the heterogeneous domains to which they are translated</i> (Bowker et al 2015, p. 251).	
(A) Repositories (**)	<ul style="list-style-type: none"> • there are ordered “piles” of objects which are indexed in a standardized fashion. • Repositories are built to deal with particular devices, but in generally structured courses of action involving the assembly of heterogeneous devices into a working information system (2) Reading a scene: how competency in these settings involves learning how to read scene, through the juxtaposition and interpretation of verbal reports, visual images, and various forms of text, in real time; into provisional assessments of an emerging situation (3) (Re)producing a normal order: how, through their management of everyday contingencies, workers are able to maintain an accountable space/temporal order (4) Structures of participation: how participants in a multi-activity settings structure their focus of attention and engagement, from moment-to-moment (5) Constituting workspaces: how workspaces are dynamically configured through interactions across visible and invisible boundaries (6) Acquiring competency: how the identity of competent practitioners is acquired through progressive rounds of increasingly demanding work, supported in <i>study</i> by experienced co-workers (7) Authoritative knowledge: relations between participants’ access to technologies and the distribution of knowledge taken to be consequential for the work at hand (8) Designing for change: implications of the relations between professional design and design-in-use
(B) Ideal type (*)	<ul style="list-style-type: none"> • this is an object such as a diagram, atlas or other description which in fact does not accurately describe the details of any one locality or in the presence of different means of communication across dispersed work groups. Because the natural history work took place at highly distributed sites by a number of different people, standardized methods were essential. In the case of the amateur collectors, they were provided with a form of fill out while cooperating partners share a common referent. • An example of an ideal type is the fact described non specimen, which incorporated both concrete and theoretical data and which served as a means of communication across both worlds. Ideal types arise with differences in degree of abstraction. They result in the deletion of local contingencies from the common object and have the advantage of adaptability
(C) Coincident boundaries (*)	<ul style="list-style-type: none"> • these are common objects which have the same boundaries but different internal contents. They arise as methods of common communication across dispersed work groups. Because the natural history work took place at highly distributed sites by a number of different people, standardized methods were essential. In the case of the amateur collectors, they were provided with a form of fill out when they obtained an animal, standardized in the information it collected. • The results of this type of boundary object are standardized indexes and what Latour would call ‘immutable mobiles’ (objects which can be transported over a long distance and convey unchanging information). • The advantage of such objects are that local uncertainties (for instance, in the collecting of animal species) are deleted.
(D) Standardized forms (*)	<ul style="list-style-type: none"> • these are common objects which have the same boundaries but different internal contents. They arise as methods of common communication across dispersed work groups. Because the natural history work took place at highly distributed sites by a number of different people, standardized methods were essential. In the case of the amateur collectors, they were provided with a form of fill out when they obtained an animal, standardized in the information it collected. • The results of this type of boundary object are standardized indexes and what Latour would call ‘immutable mobiles’ (objects which can be transported over a long distance and convey unchanging information). • The advantage of such objects are that local uncertainties (for instance, in the collecting of animal species) are deleted.

Definitions (***) - Memory practices: acts of committing to record (such as writing a scientific paper) do not occur in isolation; they are embedded within a range of practices (technical, formal, social) that collectively I define as memory practices. Taken as a loosely articulated whole, these practices allow (to some extent) useful/interesting descriptions of the past to be carried forward into the future» (Bowker 2005: p. 7). Four moments of Translation (***) - problematization in which translators attempt to define as issue and offer an obligatory passage point drawing an initial set of actors together to solve it; **‘invention’** in which translators determine and fix the interests of key actors so that they are willing to sign with an emerging project; **enrolment** in which representatives of main groups of actors are assigned roles and drawn together to build an alliance; **mobilization** in which the actor-network is extended beyond an initial group» (Lawrence, Suddaby 2006, p. 243)

In 2004, in Bolzano the new chief prosecutor proposed a program for the “rationalisation, monitoring and quality certification of the office” (Piana 2016): revision of the forms, revision of the “operation management” of the judicial files, attention to the time and costs of the procedures. In 2006, the “Bolzano case” was extended to all Italian judicial offices (ministry of Justice as a promoter). Since 2007, the European Commission has included this experience in the program for the implementation of “best practices” in judicial offices funded with the European Social Fund, within the National Operational Plan PON 2007-2013. The DBP program acts on the organization of the work of the administrative staff, without the direct involvement of the magistrates (Piana 2016): it is possible to change the organization of the courts without changing the law; the chief justices and chief prosecutors can play a decisive role in the organizational change; the DBP program has at least introduced the idea that the courts can report and adopt goal-oriented strategies (CEPEJ 2020, 2021b, 2022). The PON Governance and Institutional Capacity 2014-2020 program, which includes the Uni4Justice project, and the funding from the NextGenerationEU start from these foundations.

The evidence proposed in figure 1 brings out a common feature that allows us to justify the choice of the court as the empirical context for this research (Piana 2017).

Findings. In the context of the third wave of reform, the Italian National project “Uni4Justice” aims at investigating digitalization and the introduction of “Ufficio Per il Processo” (UPP), within courts, in consequence of a recent legislative reform. “Uni4Justice” is a complex project involving a consortium of universities coordinated by the Alma Mater - University of Bologna. This research project promotes organizational, technological, and professional change in the courts on the basis of objective and verifiable knowledge of work practices, methods in using the resources, and monitoring tools. This interdisciplinary project, funded under the PON Governance and Institutional Capacity 2014-2022, involves socio-legal experts, legal informatics, and management scholars and fits into the third wave of Italian judiciary reforms (figure 1: case #04 and case #05). In 2012 (with Law Decree 179/2012), the UPP was introduced in courts and Courts of Appeal as an “urgent measure” meant to reduce the length of trials: in these offices were employed even students in internship or on-training staff, auxiliary judges at the Courts of Appeal and honorary judges at the courts, with the purpose of supporting full-qualified judges in their routine duties (e.g., writing minutes of the hearings and drafts of the decisions: CSM 2019, 2021). Adapting similar legal initiatives enacted in other Countries (e.g., UK, USA, Spain and France) in 2021 (with Law Decree 80/2021), additional personnel was recruited in order to increase the efficiency of the UPP as an extraordinary measure included in the programs financed by the Next Generation EU Plan. Those resources, called “Addetti all’Ufficio del Processo” were aimed at supporting the legal workflow performing complementary tasks (e.g., organising files, planning hearings, and facilitating the imminent process of digitalization: CSM 2019, 2021). The combination of said pieces of legislation (figure 1: cases #04b and #04c: UPP & Digital Transformation; case #05: “management-by-decree” or “top-down” reforms), both justified by urgency and necessity brought further confusion, bringing uncertainty in procedures, and establishing overlapping competences (Zan 2002, 2004; Sciacca et al. 2013).

The organizational work in the reform of the Italian judicial system is heterogenous, requiring different actors and viewpoints (Contini, Lanzara 2009, 2014; Verzelloni 2020). Table 1 presents a scheme in which actors managed this tension in “the making of law”. In a practice-based perspective (Gherardi 2012), we argue that: (i) if the process of “translation-into-practice” of the reform of the judicial system in Italy involves the adoption of digital technologies and the introduction of the UPPs; (ii) we will investigate the evolution of this process in the court, considering “the judicial file” as the “unit of analysis”; (iii) considering digital archives as artifacts (boundary objects: Star, Griesemer 1989); (iv) the digital evolution of archiving practices (memory practices: Bowker 2005) as “infrastructure processes” (Bowker, Star 1999; Berg, Bowker 1997); (iv) and, as well as, the UPP as a “center of coordination” (Suchman 1987, 1997: forms of “situated work”, a “technologically dense” workplace and a “technology in use”; case #04a). The episodes that intersect in the scheme and populate this analytical framework emerge from our research process: “having identified the relevant social groups for a certain [digital] artifact, we are especially interested in the problems each group has with respect to that artifact. Around each problem, several variants of solution can be identified” (Bijker et al. 2012, p. 28).

Research limitations. The research project considers the problem of how the “adventures” of a “requested reform” in the Italian judicial system are marked by the general need for “facilitating a comprehensive introduction of managerial vocabulary and knowledge into the public domain” (Panozzo 2000, p. 357). However, since managerial notions of accountability and performance, of organizational change and digital transformation are enacted by law (“management by decree”, Panozzo 2000), “they enter into a terrain governed by legal framework and terminology” (p. 347). The rhetoric of change and “management by decree” constitute a paradox in the reform of the Italian judiciary (i.e.: figure 1, case #4b and #04b; case #05). From an institutional learning perspective, when the relationship between means and ends is opaque, some consequences emerge from our analysis of this form of “decoupling” (Powell 1997; Bromley, Powell 2012; Miller, Power 2013): (i) internal organizational structures become increasingly complex, (ii) organization persist in a state of perpetual reform, and (iii) resources are often diverted away from core goals.

Theoretical and managerial implications. According to Star and Griesemer (1989), we identify four types of BOs: repositories, ideal types, coincident boundaries, standardized forms. Based on the Suchman’s study of an air traffic control tower (1997), we consider eight themes for research and analysis. Through the language of the “sociology of translation” (Callon 1984; Czarniawska, Sevón 1996; Callon, Latour 1991; Nimmo 2016) and the concepts of actor-network (Latour 2005; Law 2009; Nimmo 2016; Czarniawska 2017), heterogenous engineering (Law 1986; Bijker et al 2012; Law 2009; Nimmo 2016), sociomateriality (Orlikowski, Scott 2008; Carlile et al. 2013), we have combined the

notions of boundary objects and center of coordination with the aim of bringing out a type of organizational environment (the UPP: figure 1, case #04a) that allow us to define technology (both the digital and the accountability) as a social practice. John Law suggested that “heterogeneous engineers seek to associate entities that range from people, through skills, to artifacts and natural phenomena. This is successful if the consequent heterogeneous networks are able to maintain some degree of stability in the face of the attempts of other entities or systems to dissociate them into their component parts” (Bijker et al. 2012: p. 123).

Managerial implications concern the multidimensionality of the concept of (public) accountability in the same semantic field of judicial governance, as listed in figure 1 (Bovens 2009; Piana 2010; Castelli et al. 2014; Verzelloni 2020).

Originality of the paper. In contrast to traditional models, the metaphor of “translation-into-practice” of justice reform should produce (Gherardi 2012): (i) “technologically dense environments”, (ii) in which “working implies expert practices” and specific “technological know-how”, (iii) in which “human and technology work together”, (iv) and interaction is made possible by technologies (i.e. space-time is “reconfigured on the basis of such interactions and technologies”).

Keywords: materiality; organizational change; judiciary reform; digital innovation; accountability; actor-network theory

The role of business networks into the energy transition: a study on companies belonging to different sector creating ties to foster hydrogen economy

VITTORIO MARIA GARIBBO* ELEONORA ANNUNZIATA* FRANCESCO RIZZI[▲] MARCO FREY**

Framing of the research: *The sustainability challenge in business environment is not anymore considered a passing trend but it represents the new frontier with which companies must deal with. The complexity of these challenges requires the collaborations with a set of multiple stakeholders (Albino, 2012). The specific focus of this study concerns interorganizational relationships between multiple companies belonging to different sectors or value chain steps. We seek to understand how such relationships allow the development of environmental innovation as well as a widespread adoption of new technologies or business models.*

In the broader context of sustainable transition, this study, falls within the scope of energy transition, with a specific focus on green hydrogen (H2). There are several reasons why we consider particularly relevant to study green hydrogen and the strategies that can enable a widespread adoption in the market (IEA, 2022): (1) it allows a deeper penetration of renewable energy sources by stocking electricity when there is an overproduction; (2) it enhances energy security by balancing the energy mix; (3) it decarbonizes many hard to abate sectors where the electrification is not an available option (i.e., steel making industry, heavy transportation, chemical, refinery, heating, etc...). For the reasons above the growth of green H2 solutions is expected in coming years but the scale-up of business models H2 based is still challenging. The main barriers (IPCC, 2022) lie on: (i) high costs of green H2 comparing with fossil fuel solution; (ii) slow development of production capacity and delivery infrastructures; (iii) lack of clear regulatory framework; (iv) lack of a clear incentives; (v) wrong perception of danger by the population. Through the theoretical lens of Relational View (Dyer and Singh, 1998) and alliance management capabilities, we will analyse how the attributes of these streams of literature interacts together into H2 based projects to overcome the barriers and to generate environmental innovation. To the best of our knowledge there is a significant gap into this field since only few studies (Donbesuur et al., 2021; De Almeida et al., 2021) investigated the relation between the post-formation alliance capabilities (Schreiner et al., 2009) and the complementary roles of certain RV constructs in generating environmental innovations. This study will complement the current knowledge by using a mixed method approach able to catch, through a series of interviews a more nuanced picture of these topic.

Theoretical Background:

The Schumpeterian concept of Innovation lies on the combinations of the following: (i) new materials and components, (ii) the introduction of new processes, (iii) the opening of new markets, (iv) the introduction of new organisational forms. This vision of innovation highlights the two intertwined dimensions of the innovations which are the technical world and the business world (Tao et al., 2010).

The environmental innovation (EI) according to Kemp and Pearson (2007), is a step forward into the conceptualization of innovation. EI include the production of a product, service or the exploitation of a business method which will have to result in a reduction of “environmental risk, pollution, and other negative impacts of resource use (including energy use) compared to relevant alternatives.

Sometimes companies need to implement strategic alliances to pursue EI. These alliances involve mutual agreements between two or more partners to exchange resources or to collaborate on developing knowledge (Rizzi et al., 2013). By forming alliances with external partners, companies can gain access to new environmental knowledge that increases their understanding of sustainability issues and fosters environmental innovation.

The academic interest in business interconnections has deep roots in socio-managerial studies. The Relational View (RV) (Dyer and Singh 1998; Dyer et al., 2018) systematizes the multiple theoretical contributions related on

partnerships and alliances and it proposes an interorganizational theory that explain the competitive advantage of partner companies by using as unit of analysis the relationships between companies.

The theory indeed suggests that exchange relationship between partners companies lead to relational rent, which is defined as supernormal profit jointly generated by partners that cannot be generated by either firm in isolation. The determinants of relational rent are organized in four pillars: relation-specific assets, knowledge-sharing routines, complementary resources and capabilities, and effective governance mechanisms (Dyer and Singh, 1998).

Research has successfully studied the effectiveness of the RV to demonstrate the rent generating effect of the networks or dyads (Dyer, 2006; Kale et al., 2001). Similarly, the positive interaction between environmental innovation and interorganizational relationship has been extensively reviewed. As a matter of fact, it's been demonstrated that collaborations between different players could enhance the environmental performance (Albino, 2012). Moreover, it has emerged that green innovation is influenced by the ability of a company to create networks of collaborations (Dangelico, 2016; Melander, 2017; Pereira et al., 2020).

Although there is a rather extensive literature on the topic, the overall potential of horizontal collaborations between multiple actors in green innovation networks is considered a research direction still underexplored (Melander, 2022) and most of all, the RV model has been weakly analysed (Gölgeci et al., 2019; Juo and Wang, 2022) in conjunction with sustainable transition topics.

Indeed, we believe that a more comprehensive analysis of the potential of cross-sector collaboration should include, in addition to the structural components of partnership that are well highlighted by the RV, the role played by the skills, abilities and specific attitudes of the companies involved in the partnership itself.

The alliance management capabilities literature is a vast research stream where it's been deeply examined the role of alliances in enhancing economic performance as well as firms' innovative output. Standing on the framework proposed by Wang & Rajagopalan (2015) the capabilities of managing alliances can be classified into three different levels of analysis: firstly, the individual-alliance capabilities which emphasize a company's skills in initiating, managing, and concluding individual alliances (Schreiner et al., 2009); secondly, the alliance-portfolio capabilities which focus on a company's abilities in developing and coordinating a portfolio of alliances (Sarkar et al., 2009); and thirdly, the dyad-specific alliance capabilities which represent the relational capability of a dyad (Dyer and Singh, 1998; Zollo et al., 2002). In addition, the three levels mentioned can be categorized into two temporal segments: (i) pre-formation alliance capabilities, which emphasizes ability to select partners and negotiate terms and structures of an alliance agreement with partners, and (ii) post-formation alliance capabilities, which refers to characteristics helping firms to create and capture value from the partnership (Anand and Khanna, 2000) such as coordination, communication (Schreiner et al., 2009), and interorganizational learning (Schilke and Goerzen, 2010; Kale and Singh, 2007).

In line with Kohtamäki (2018) we recognise significant gap related to the interaction between different post-formation alliance capabilities, so the question on how different capabilities impact the key partnership attributes (Robson et al., 2019) remains unexplored.

This study, drawing from the RV theory and from the alliance capabilities literature, examines the combination of structural and relational factors affecting the environmental innovation in the energy transition field. Thus, it will investigate the role played by companies' network in allowing the achievement of energy transition through hydrogen solutions.

Purpose of the paper: This study arises from the need to understand the factors that companies can leverage, and the resulting strategies implemented, to enable hydrogen-based business models to establish themselves in the market and overcome the afore-mentioned barriers. Therefore, the paper addresses the following research question: which interactions among which firms' alliance capabilities and relational view constructs affect the successful development of hydrogen development projects?

Building upon the theoretical introduction presented above, the objective of this study is to identify how the alliance capabilities of a focal firm relate to the structural components of the alliance (RV constructs) to generate value in the form of environmental innovation. The coexistence of alliance capabilities and the RV is harmonious, indeed the literature on alliance capabilities, as highlighted by Wang and Rajagopalan (2015), draws heavily from the RV to introduce dyad-specific alliance capabilities. Similarly, there are a many studies that focus on how a company's partnerships or alliance capabilities can foster the development of EI. On the contrary, we believe that a joint analysis of how alliance capabilities and RV impact EI is basically missing or underexplored.

We have selected a specific set of alliance capabilities and determinants of the RV since they are theoretically linked to EI and recent studies have tried to understand how they these constructs are related (Donbesuur et al., 2021).

Coordination Dimension: coordination in alliance is the extent of routines to coordinate activities and resources with the alliance partner (Gulati et al., 2005). So, it describes the attitude of the firm to efficiently manage tasks, responsibilities, interdependences and to flexibility adapt partners' agreements (Schilke, 2014; Schreiner et al., 2009). We emphasized that alliance coordination expresses the ability to manage and enhance interdependence among partners. This aspect is in fact of crucial importance as the interdependences among partners and their resources plays a triggering role in the alliance creation (Dyer, 2018); furthermore, the level of interdependence denotes the speed of value generation. Huang and Li (2017) have demonstrated that the coordination capability, by simplifying the co-engagement between separate functions, has a positive impact on green product innovation. Moreover, the interactive effect of interorganizational coordination and environmental innovation in partnering companies was empirically demonstrate by Donbesuur et al. (2021) making use of the mediating role of environmental in-learning.

Communication Dimension: The communication capability refers to the formal and informal sharing of significant and timely information between partners (Schreiner, 2009). Effective communication involves the use of various modes and media among alliance partners, and if properly utilized, can improve knowledge acquisition, learning, and it can foster greater understanding of complex issues among partners. Frequent exchange between firms and the use of multiple channels are essential to structuring a decision-making process that is shared among partners and expressive of their mutual wills and intentions (Schilke and Lumineau, 2018). It also enables members of the company to pool opportunities and risks associated with joint activity or project (Dhaundiyal and Coughlan, 2022). The interconnection with the innovation processes is highlighted in the literature (Huang and Li, 2017) since the effective communication is presented as fruitful for the collaboration among people from different functional areas and these interactions are likely to induce innovation patterns. Moreover, this individual alliance capability resulted positive related to environmental innovations (Donbesuur, et al., 2021) when it is mediated by environmental in-learning.

Interorganizational learning: In line with the RV theory, the capacity of dyads to produce relational rent is contingent on the presence of knowledge sharing routines. These routines are patterns of inter-firm interactions that facilitate the transfer, recombination, and creation of specialized knowledge. This concept not only pertains to the exchange of knowledge between partners, but it also concerns the recipient's ability to internalize and utilize the knowledge shared. According to Dyer and Singh (1998), the recipient's ability to leverage the knowledge shared by a partner is directly proportional to their "absorptive capacity," which is influenced by the extent of overlapping knowledge bases between partners and the routines of interaction established between the firms. Interorganizational learning capabilities, which refers to the ability to transfer knowledge across organizational boundaries, serves as an appropriate proxy for this concept (Dyer and Nobeoka, 2000). Von Hippel (1988) argues that a network characterized by high level interorganizational learning mechanisms among partners will be able to "out-innovate" itself and Dyer and Singh (1998) agreed that firm's alliance partners are the most important source of new ideas and information that result enhanced innovation level.

Transaction-Specific Assets: The Relational View framework posits that a firm which engages in developing specialized assets in collaboration with its partners can generate a competitive advantage that is not easily replicable by rivals. Indeed, the specialization of assets can generate greater trust and improved coordination in partnering companies (Dyer et al., 2018) which are qualities of a relationship that are difficult to replicate. This construct is contingent upon the duration of the partners' agreement, with longer safeguard periods resulting in reduced risks of opportunistic behaviour (Dyer and Singh, 1998). Furthermore, the presence of a transaction specific asset is likely to increase transactions volume between partners leading to enhanced operational efficiency and specialization. Dyer and Singh (1998) stated that transaction specific assets can lower the value chain costs and enhancing product differentiation, fewer defects, and faster product development cycles (Dyer and Hatch 2006).

Methodology: To address our research question, we have chosen to utilize the Qualitative Comparative Analysis (QCA) methodology. Unlike inferential statistical methods, this methodology is not used to establish and confirm the existence of a causal relationship between variables. Rather, it helps to identify recurring patterns among variables that are useful in supporting and enriching knowledge about causal relationships (Schneider and Wagemann, 2010). In other words, this method helps us to understand how certain variables relate to each other when a particular outcome of interest is achieved. However, the use of QCA resulted from a multi-step process of the collection of data: selection of cases, semi-structured interviews, and questionnaire survey, which is summarized below.

Empirical context and selection of cases:

To identify the key actors involved in the development of the hydrogen supply chain in Italy, we employed various channels and strategies. First, we used the IEA Hydrogen Projects Database, which showcase projects that have been commissioned since 2000 (last updated in October 2022) to produce, distribute, and use hydrogen. Additionally, we identified actors who are part of independent associations that promote the progress of technologies related to hydrogen use. Among these associations, we highlight the H2IT and the European Clean Hydrogen Alliance. From this initial screening, we obtained a list of 64 companies. Some of these companies didn't have ongoing project since they participate to the associations just to voice their interests or concerns regarding market and regulatory developments or to actively monitor market trends. Through further investigation based on the analysis of websites and documents published by companies, we arrived at a list of 37 companies actively involved in hydrogen supply chain development projects in Italy.

Finally, we contacted the companies to ensure that the projects they were conducting adhered to the following principles: (i) projects that were ongoing or completed within 2022 (to ensure the utmost relevance of the study); (ii) projects conducted in partnership with other actors; (iii) projects involving the production, distribution, or usage of green hydrogen.

Considering these constraints and the companies' willingness to participate in the study, we arrived at a final sample of 18 projects.

The projects we analysed are distributed along the value chain as in illustrated Table 1.

Table 1: Projects

H2 Value Chain Steps	Project sector	Type of Project	N. of Project
R&D Testing	Energy	Development of an Industrial Technology Testing Hub	1
	Steel Making Industry	Usage of H2 & Natural Gas Blending	1
		Usage of H2 in a DRI process	1
	Engineering and Manufacturing	Optimisation of Value chain steps	1
H2 Production	Energy	H2 Valley Development	2
H2 Distribution	Energy Infrastructures	Definition of blending % in national pipelines	1
H2 Technology Providing	Engineering and Manufacturing	Electrolysers Production	1
H2 Usage	Steel Making Industry	Upgrade to Hydrogen DRI process	3
	Refinery	Substitution of grey H2	2
	Mobility	Hydrogen Train	1
		Refilling stations	1
		Hydrogen Busses	1
Trucks mobility	2		

Variables and data collection:

The data collection process was structured in two phases consisting of a series of interviews with the leading company of the project and a questionnaire to the project managers involved in the project development activities.

Semi-structure interviews:

The interview sessions were conducted with focal company' informants (i.e., the company that triggered the project and mainly responsible for the proper integration of the various players contribution) involved in strategic decision-making processes and in the supervision of the selected projects. The positions of the interviewees fall into the categories of company's CEO, director of innovation, project manager. The semi-structured interviews lasted around 1 hour and were conducted using a protocol with the main objective of understanding the project itself, the relationship between partners, and the mechanisms by which such partnerships are managed. To this end, we have deepened and mapped for each project the existence and the further implementation of the four pillars of the Relational View using the Nvivo software.

Questionnaire survey:

The questionnaire was developed to limit interpretational issues with some of the interview questions and to obtain more nuanced insights into the theoretical constructs that we aimed to investigate. The data will be collected through an online questionnaire spread among persons involved in the supervision of the selected projects. The items used to measure the constructs of relational view and alliance capabilities were based on prior literature and were measured using a 6-point Likert scale with 1 = strongly disagree....6 = strongly agree. Table 2 summarize the single variables and related references.

Table 2: Questionnaire' Items

Items	Reference
Coordination Dimension	Adapted from M. Schreiner and P. Kale's (2008) (Donbesuur et al., 2021; Dhaundiyal et al., 2022)
Communication Dimension	Adapted from Schreiner and Kale's (2008) (Paulraj et al., 2008; Donbesuur et al., 2021).
Interorganizational Learning	Adapted from Schilke and Goerzen's (2010) (Inigo et al., 2020)
Transaction-Specific Assets	Adapted from Wu et al. (2017) (Donbesuur et al., 2021)

The environmental innovation of our ongoing projects was measured through the projects' evolution (the green component is embedded in each of selected projects since they all aim at launching green H2 technologies or business model) over a certain temporal interval.

The measure of the progress of a project, requires the contextual consideration of multiple dimensions to determine whether the project is evidently moving towards commercialization. For these reasons, we chose to use the balanced readiness assessment tool (Vik et al., 2021; Kobos et al., 2018) to evaluate the multiple dimensions that characterize the evolution of these technologies or business models.

The methodology expands the well-known Technology Readiness Level (TRL) assessments, with a method for assessing TRL as well as Market Readiness Level (MRL), Regulatory Readiness Level (RRL), Acceptance Readiness Level (ARL), and Organizational Readiness Level (ORL) in concert (Vik et al., 2021). Each of these dimensions, consists of 9 scalar levels that express from an early stage of project evolution (level 1) to ready for scale commercialization (level 9) the readiness level.

The questionnaire asks to evaluate for each of these 5 dimensions:

- the project's state one year prior to the questionnaire,
- the current project's state

The difference between (a) and (b) allows us to identify, for each dimension of the balanced readiness level, the evolution targeted by the project over one year. Therefore, the average of the 5 gaps becomes the value of the project's evolution able to indicate the project scale-up.

QCA:

QCA method is useful to unravel the causal complexity relations and it is worthy when the goal is to observe how different attributes of the cases interplay to produce a certain outcome (Parente, 2019). The study aims to identify the combinations of causal conditions (RV pillars and Alliance Capabilities) for the occurrence of the environmental innovations (project scale-up). QCA bridges the gap between qualitative and quantitative analysis and provides a mechanism to research a small-to-medium number of cases (Ragin, 2008).

The analysis will adopt a Crisp Set for the calibration of conditions which it use a dichotomous approach that entails assigning binary values of 0 or 1 to denote absence or presence of the attribute. The values 0 or 1 of each variable is determined by the average of the answer to each theoretical construct. This sample-based calibration is adopted in circumstances where there is no existing theoretical knowledge that can be used for calibration thresholds (Greckhamer, 2016). The collected questionnaires will be used to build the truth table by adopting the logic of necessity and sufficiency (Ragin, 2008). Then, it will be identified the configurations that consistently will produce the outcome of interest i.e., the evolution of the project.

Preliminary results: This paper provides the preliminary results of a still ongoing research. To date, we have collected data on 15 out of 18 projects by interviewing their respective focal companies. We therefore have a total of approximately 30 hours of interviews (i.e., 2 hours per project) that have been transcribed and coded with Nvivo to identify recurring patterns and modes of implementation of the afore-mentioned projects.

The questionnaire survey has not yet been finalized with companies, thus we do not yet have the results that will emerge from the QCA. Only after running the QCA model, we expect to identify the necessary and sufficient conditions for the evolution of H₂-based projects, and therefore the interaction between the various components of the RV and the Alliance Capabilities.

Research limitations. The present research is affected by a series of limitations that might, in turn, represent a starting point for future explorations.

The first and most important limitation regards the limited size of the sample, indeed, a larger sample might offer a more comprehensive and exhaustive analysis.

Second, further studies, by using a larger sample, might include more variable into the research, thus they could explore the interaction between more alliance capabilities in relation to the environmental innovation.

Third, the study is limited to Italy, this highlight the necessity for further explorations where the results will be checked also in other countries.

Managerial implications. We believe that this study can be helpful for companies entering the hydrogen market with pioneering projects aimed at the development of new business models. The evidence emerging from these projects can be valuable lessons learned for other managers. The definition of the most performing business approaches to the new technology scale-up will shed light on the role of the business network in the energy transition and will demonstrate how to pursue environmental result and business opportunities into the hydrogen market. By defining the attributes that the networks present when the projects evolve successfully is a worthy insight for the companies that enter this market. The leading company of future projects could accordingly with our results, structure the alliances and invest in the capabilities that lead to the best outcome.

Originality of the paper. To the best of our knowledge, there are no studies that focus on the development of environmental innovations such as green hydrogen solutions, by analysing the perspectives of multiple actors distributed across all the various steps of the value chain. As such, we have a series of actors who are at the starting line and are vigorously preparing themselves to tackle the challenge of participating in the development of the hydrogen economy.

This study is one of the few to adopt a project perspective in order to understand how individual initiatives are evolving and therefore to grasp how they may contribute to the development of a widespread adoption of hydrogen-based technologies.

Furthermore, our study benefits from the contribution of first-rate corporate partners, including energy companies, steelworks, refineries, EPC contractors, etc., who hold a leading position at the global level. The understanding of the barriers and challenges that these companies face in responding to the political and social needs of launching a hydrogen economy is expression of the voice of the market. Therefore, analysing the best strategies and the structures they implement to overcome these obstacles and to guide an energy transition, allows us to better understand what can be done on a global scale and what is still missing for widespread sustainable transition.

Keywords: relational view; environmental collaboration; alliance management capabilities; environmental innovation; hydrogen economy; innovation scale-up

Product sustainability and willingness to buy: a parallel mediation model of product traceability and consumers' environmental concerns

VERONICA MAROZZO* ALESSANDRA COSTA* TINDARA ABBATE* ANTONIO CRUPI**

Abstract

This study examines the relationship between product sustainability and consumers' willingness to buy, as well as the mediating effects of product traceability and environmental concerns. Through a survey involving 239 participants, the study showed that product sustainability positively influences consumers' willingness to buy, and that product traceability and environmental concerns partially mediate this relationship. The findings have important implications for businesses seeking to promote product sustainability and increase consumers' willingness to buy sustainable products. Specifically, businesses should focus on improving product traceability to increase consumers' confidence in the sustainability of the products they purchase. Additionally, businesses should seek to educate consumers about the environmental benefits of their products to increase their environmental concerns and willingness to buy sustainable products.

Framing of the research. *The growing demand for eco-friendly or sustainable products (Teoh and Gaur, 2019; Konuk, 2019), driven by pollution and environmental concerns, has prompted organizations to shift towards sustainable and environmentally friendly products like organic food, to remain competitive in the global arena and to satisfy consumers' needs. Consumers' demand is not only more environmentally conscious but also socially conscious: more consumers are aware of the environmental, social, and economic impact of their choices (Joshi and Rahman, 2016) and are directing their consumption behavior towards sustainable purchasing due to their increased awareness of detrimental impacts of nongreen purchase (Dagher and Itani, 2014). Accordingly, consumers have increased their demand for organic food (Eyinade et al., 2021) because perceived as healthy, safe, environmentally and animal-respectful (Dangi et al., 2020; Janssen, 2018; Lea and Worsley, 2005) as well as for its sustainable, authentic and natural characteristics (Mazzacano D'Amato and Falzon, 2015) and for motives that go beyond health and often include hedonic characteristics (Brantsæter et al., 2017). Therefore, health and environment have become important parameters for consumers in purchases, even if not always this interest in sustainable and environment-friendly products translates into their purchases (Sultan et al., 2020), due to the well-known intentions-behavior gap (Boulstridge and Carrigan, 2000). Even though environmental protection and animal welfare attributes have been shown to have a strong influence on consumer willingness to buy organic food (Ghali, 2020), purchase intentions are also influenced by functional values related to personal gratification mechanisms: consumers are likely to experience pleasure and gratification because they believe that their purchase behavior contributes to the well-being of environment and animals (Giffors and Sussman, 2015; Padel and Foster, 2005). Likewise, consumers are likely to experience pleasure because they believe that buying organic food is synonymous of high quality, integrity, safety and transparency (Trienekens and Zuurbier, 2008): product traceability effectively acts as a boost for consumers' confidence through assisting food quality and safety assessment, thus affecting their health consciousness (Wu et al., 2021; Chang et al., 2013). Therefore, since organic food has become popular among consumers for both its health and environmental benefits, there is a growing interest in understanding organic food consumption as parallel of those in sustainable food and health-oriented lifestyles and as it is believed that health and environmental consciousness drive consumers to purchase pure and chemical-free food (Parashar et al., 2019). Those arguments make this topic relevant for decision-makers, given that consumers have become more familiar with and attribute a different value to organic food, thus changing their behavior in the wake of increasing environmental concerns. Therefore, identifying factors that*

may, directly and indirectly, influence consumers' purchase behavior toward organic food could be useful for producers, marketers, and researchers.

Purpose of the paper. From the consumers' perspective, previous studies focusing on organic food consumption have examined willingness to buy (Ghali, 2021; Aschemann-Witzel and Zielke, 2017; Bartels and Onwezen, 2014; Hoffmann and Schlicht, 2013; Onyango et al., 2007; Padel and Foster, 2005), as a surrogate of purchase intention and a predictor of actual consumers' purchase behavior (Lio and Hsieh, 2013). Willingness to buy (WTB) consists of consumers' likelihood to shop, purchase, and recommend stores to others (Ghali, 2019) and it has been correlated to a positive attitude toward an environmentally friendly product (Malik and Singhal, 2017). Among the multiple motives to purchase organic food products (Eberlet et al., 2022; Lee et al., 2020; Bartels and Onwezen, 2014; Voon et al., 2011; Ahmad and Juhdi, 2010), this study focuses on the mediating role of environmental concerns and the importance of product traceability in the relationship between product sustainability and WTB. Sustainable products are those with positive environmental and ethical attributes (Luchs et al., 2010) and that contribute to one or a combination of the economic, social, and environmental dimensions of sustainability (Reheul et al., 2001). Product sustainability has been found to positively affect consumers' WTB due to its social and ecological impact (Nie et al., 2021; Kaczorowska et al., 2019). Following Konuk (2019), who tested the impact of mediating variables on consumers' WTB and willingness to pay for fair trade food, when examining consumers' purchase behavior towards organic food, the literature suggests considering conditional values that contribute to the overall product features or attribute perception (Lin and Huang, 2012), thus affecting their WTB through the impact on consumers' environment-friendly identity. In this spirit, since consumers tend to self-obligate themselves to act in ways that can protect the environment, some authors recognize their positive impact on consumption behavior (Johnstone and Tan, 2015; Chen and Chang, 2012). In particular, by defining environmental concerns as individuals' awareness of the environmental problem and their willingness to be part of the problem solution (Chan and Lau, 2000; Maloney and Ward, 1973), previous research individuated environmental concerns as a component of pro-environmental/green self-identity (Confente et al., 2020), being associated to an increased frequency of buying organic food (Kushwah et al., 2019; Paul et al., 2016; Kim and Choi, 2005). Other studies have demonstrated that environmental concerns mediate the relationship between values and behavior (Confente et al., 2020; Whitmarsh and O'Neil, 2010; Smith and Paladino, 2010; Schultz, 2002). Confente et al. (2020), by differentiating between values (as the set of personal convictions and beliefs that individuals have about themselves) and perceived values (as the collection of qualities the consumers have about products) demonstrated the positive impact of pro-environmental self-identity on perceived values. In the same direction, Smith and Paladino (2010) evidenced a positive impact of environmental concerns on consumers' organic values and attitudes. On the contrary, in their study about consumers' intentions to purchase organic food in the context of the theory of planned behavior (TPB), Yadav and Pathak (2016) did not find any significant effect of environmental concerns. Among variables impacting on WTB, also product traceability importance has been shown to orient consumers' purchase choices (Haleem et al., 2019; Chen and Huang, 2013). As defined by the European Commission Act (178/2002), traceability is the ability to track the production of food, forage, livestock and feeding raw materials in all stages of production, processing, and circulation, thus enhancing food supply chain safety and food quality (Marozzo et al., 2022; Adam et al., 2016), and with a direct effect on the hedonic and utilitarian dimensions of consumers' behavior, through their increasing health consciousness.

Hence, it seems necessary to incorporate the critical factors mentioned above to develop a more comprehensive model and a better understanding of organic food purchase behavior, by examining the role of environmental concerns and the importance of product traceability as mediators in the relationship between product sustainability and WTB organic food. In particular, going beyond the direct relationships among single constructs, environmental concerns and product traceability importance, through their effect on both utilitarian and hedonic attitudes, impact consumers' purchase intentions. Therefore, we argue that since organic food consumption has a lower environmental impact, buying organic food contributes to the consumers' psychological well-being (Manning et al., 2019; Bartels and Onwezen, 2014) as well as organic food chains impact consumers' well-being and their purchase behavior (Esteki et al., 2019), through their capabilities of going above and beyond their safety criteria to shape consumers' values (Liu et al., 2013). Consequently, they are able to shape the relationship between product sustainability and WTB. Based on previous findings in the literature (Cavite et al., 2022; Amin and Tarun, 2021; Lee and Yun, 2015; Chen and Huang, 2013; Smith and Paladino, 2010), we hypothesized the following hypotheses (see Figure 1 for the proposed conceptual framework):

H₁. Product traceability's importance mediated the relationship between product sustainability and consumers' willingness to buy.

H₂. Consumers' environmental concerns mediated the relationship between product sustainability and consumers' willingness to buy.

H₃. Product traceability's importance and consumers' environmental concerns parallelly mediated the relationship between product sustainability and consumers' willingness to buy.

Fig. 1: Proposed conceptual framework

Methodology. Quantitative data were collected from a sample of the Italian population (N=239) with an online survey built on the Qualtrics software platform. Participants' age ranged from 18 to over 65, with the median category falling into the 45-54years range. 50.6% of the respondents were female, 82% of the sample had at least a bachelor's degree, and 46.9% were employed. The survey was advertised through a convenience sample (Taherdoost, 2016), which is a kind of nonrandom sampling in which members of the target population are selected for the purpose of the study if they meet certain practical criteria, such as geographical proximity, availability at a certain time, easy accessibility, or the willingness to volunteer (Dörnyei, 2007).

The questionnaire was constructed using established and adapted scales with 7-point Likert items, asking participants to indicate the extent to which they agree or disagree (1=strongly disagree, 7=strongly agree) with the proposed statements. The concept of product sustainability was measured using three items scale (e.g., Carter, 2014; Marozzo et al., 2020), while the concept of willingness to buy was measured using three items scale adopted from Mugge et al. (2017). The concept of the product traceability importance was captured by two semantically different items (adopted from Verbeke and Ward (2006) by asking "To what extent do you pay attention to the traceability of the product when buying an organic product?" (ranging from 1=very low attention to 7=a lot of attention); and "To what extent is the traceability of the product important to you when you buy an organic product?" (ranging from 1=totally unimportant, to 7=extremely important). Finally, the concept of consumer environmental concerns was captured using three items scale adapted from Lin & Huang (2012).

Then, descriptive statistics and Pearson correlation analysis on the average score of the constructs were performed to test the relationships among measured variables. Finally, the parallel mediation analysis was performed. In particular, the parallel mediation assumes that both constructs of product traceability importance and consumer environmental concerns mediate the relationship between product sustainability and consumers' willingness to buy in a comparable manner. To test the proposed model, willingness to buy was entered as the outcome variable, product sustainability as the predictor variable, and product traceability importance and consumer environmental concerns as mediators. Additionally, four variables were controlled in this study, which are education, occupation, gender, and age added as covariates in the model. Then, the parallel mediation analysis was performed through the PROCESS macro (model 4) of SPSS developed by Hayes (2017) which uses the resampling method of bootstrapping, which gives an estimate of the indirect effect based on 5000 bootstrap samples, to avoid classical Type 1 errors that may arise from non-normal distributions of an indirect effect. In this study, 95% CI was employed, which was deemed significant when the 95% CI did not contain zero.

Results. Data were entered into IBM SPSS Statistics (version 25, SPSS Inc., Chicago, IL, USA), and data accuracy was checked throughout the process. Firstly, all the used scales were evaluated for reliability. Specifically, the concept of product sustainability showed a Cronbach alpha (α) of .82 and all corrected Item-Total Correlations were $>.65$; WT showed an $\alpha=.92$ and all corrected Item-Total Correlation $>.82$; for the product traceability importance, an $\alpha=.84$, and a corrected Item-Total Correlation equal to $.74$; finally, the concept of consumers' environmental concerns showed an $\alpha=.81$ and all corrected Item-Total Correlations $>.60$ the For each of the above-mentioned constructs (product sustainability, willingness to buy, importance of product traceability, and environmental concerns), an average score was computed.

Descriptive statistics and correlations for the constructs were provided in Table 1. Product sustainability was found to be positively and significantly correlated with product traceability importance ($r=.346, p<.01$) and environmental concerns ($r=.416, p<.01$). Likewise, willingness to buy was found to have significant positive relationships with product sustainability ($r=.595, p<.01$), product traceability importance ($r=.433, p<.01$), and environmental concerns ($r=.519, p<.01$).

Tab. 1: Descriptive statistics and correlations between variables (N=239)

Variable	M	SD	Product sustainability	Product traceability importance	Environmental concerns	Willingness to buy
Product sustainability	5.7197	1.23366	-			
Product traceability importance	5.8661	1.37232	.346*	-		
Environmental concerns	5.2008	1.36024	.416*	.468*	-	
Willingness to buy	5.5872	1.24411	.595*	.433*	.519*	-

* $p < .001$

Then, we conducted the parallel mediation analysis by using PROCESS macro (model 4) for SPSS. Table 2 and Figure 2 showed the results of the regression analysis by controlling for the covariates. The results indicated that product sustainability positively predicted product traceability importance ($\beta=.36, p < .001$) and environmental concerns ($\beta=.44, p < .001$). In addition, it was found that product sustainability, product traceability importance, and environmental concerns significantly predicted willingness to buy ($\beta=.43, p < .001, \beta=.15, p < .001, \text{ and } \beta=.24, p < .001$, respectively).

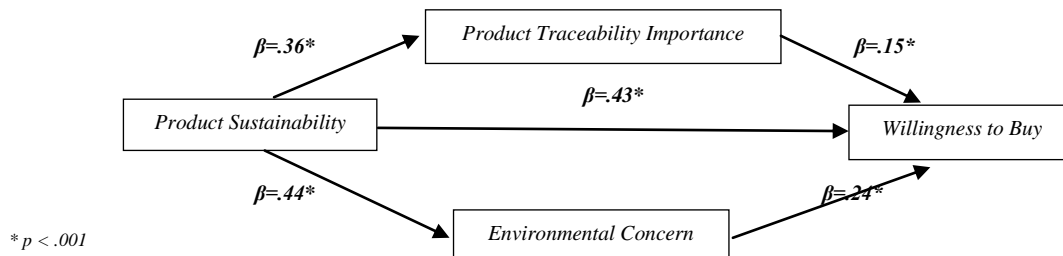

Tab. 2: Results of regression analysis

Regression Equation		Fitting Indices		Regression Coefficient	
Outcome Variables	Predictor Variables	R ²	F	β	t
Product traceability importance	Product sustainability	.14	7.66*	.36	5.27*
Environmental concerns	Product sustainability	.18	10.08*	.44	6.67*
Willingness to buy	Product sustainability	.47	29.38*	.43	7.96*
	Product traceability importance			.15	3.06*
	Environmental concerns			.24	4.54*

* $p < .001$

Note: all control variables (education, occupation, gender, and age) were not significant in all regression (all $p > .05$)

Fig. 2: The mediating effect of Product Traceability Importance and Environmental Concerns on the relationship between Product Sustainability and Willingness to Buy

The parallel mediation model of the relationship between product sustainability and willingness to buy by product traceability importance and environmental concerns was presented in Table 3. The total indirect effect of product sustainability on willingness to buy through product traceability importance and environmental concerns was .59 (95% CI [.49, .70]), from which the indirect effects of product sustainability on willingness to buy through product traceability importance and environmental concerns were, respectively, .06 (95% CI [.01, .11]) and .11 (95% CI [.04, .18]). These confidence intervals suggested that there were significant indirect effects between product sustainability and willingness to buy through both mediators.

Tab. 3: Results of Bootstrap test

Indirect Effect	Effect Size	Boot SE	Boot 95% CI	
			Lower Limit	Upper Limit
Total	.59	.05	.49	.70
Product traceability importance	.06	.03	.01	.11
Environmental concerns	.11	.04	.04	.18

Boot SE: Boot Standard Error; Bootstrap 95% CI: Bootstrap 95% Confidence Interval
 Total: Total effect of Product sustainability on Willingness to buy

With the aim to investigate whether product sustainability may impact consumers' willingness to buy through the product traceability importance and the consumers' environmental concerns, this study used a parallel mediation model. Our study found that product sustainability was found to be positively associated with product traceability importance, the consumers' environmental concerns, and the willingness to buy. Product traceability importance and the consumers' environmental concerns were observed to be positively associated with consumers' willingness to buy. Furthermore, our results demonstrated that product sustainability exerts its effect on consumers' willingness to buy via product traceability importance and the consumers' environmental concerns as mediators.

Research limitations. Future studies could address limitations present in the current research. Firstly, recruiting participants from diverse cultures and backgrounds could enhance the generalizability of findings as the current study only includes Italian participants. Secondly, to establish causality, longitudinal, experimental, and cross-cultural studies beyond the scope of the current research are required. Thirdly, the research solely relied on self-reported data, which may only reflect the participants' subjective perceptions. To obtain a comprehensive understanding of the actual effects, a study incorporating quantitative measurements should be devised. Therefore, it is required warranting caution in the interpretation of results. Lastly, the R² value in this study explained a not-so-high portion of variation (< 50%), and this implied there might be other underlying mediators that need to take into account between product sustainability and willingness to buy in future studies. Additionally, in future investigations, it would be beneficial to

explore more intricate models that incorporate moderators alongside mediators. This approach would enable the examination of particular circumstances in which the relationships are intensified or amplified.

Managerial implications. The present study enriches the knowledge producers and marketers have of the values and attitudes of the consumer decision-making process towards organic food. First, from a producer's perspective, a well-defined marketing strategy highlighting the perceived and desirable values of organic products on consumers' health and lifestyle would be an interesting tool for increasing consumers' environmental awareness and creating more ecological consciousness, especially for consumers with a strong green identity. Second, by emphasizing the product social benefits, it could be possible to enhance customers' overall environment-friendly behavior. Additionally, as consumers are becoming more familiar with organic food consumption and product traceability, the authors recommend marketers to use consumers' different perceptions of product traceability importance for segmenting their markets accordingly and for better targeting their green strategy.

Originality of the paper. This study develops a model that integrates important factors related to organic food consumption to generate a more comprehensive analysis of this mainstream research. In particular, to the best of our knowledge, this is one of the first studies to investigate the parallel mediating role of environmental concerns and product traceability importance to obtain a more focused understanding of how those factors influence consumers' purchasing intention (WTB) when applied specifically to organic food.

Young Generation Consumption Behaviour in Organic Wine Markets: A preliminary analysis

GIOVANNA BAGNATO* ANGELO A. CAMILLO* CECILIA CASALEGNO[▲] CRISTIAN RIZZO**

Framing of the research. Worldwide, exponentially increasing numbers of people are becoming aware of the environmental (Paul et al., 2016) and social (Pfafjar et al., 2022) consequences of their consumption behavior and are displaying a heightened interest in solving the problems that result from unsustainable behavior. Simultaneously, among the main goals of many national, regional, and international organizations and institutions in recent years are sustainable development due to the increasing consciousness regarding the ecological ramifications of human actions (Mensah, 2019). Furthermore, the pandemic period has worked toward a broadening of the importance of the concepts of a shorter supply chain (Casalegno et al., 2020), respect for the environment, and respect for health (Forman et al., 2022), and this has led to an increase in more responsible and, therefore, sustainable consumption of agri-food products (Ben Hassen et al., 2022), among which wine (Moscovici et al., 2022). Literature, indeed, has addressed specific attention to the wine industry in the last decades since its choice is more complex when comparing wine to other food products (Wright et al., 2023), brought not only by the significant number of perceived differences among products and brands but also by the importance of the country-of-origin and the region of production (Defrancesco et al., 2012; Jaeger et al., 2013; Yang & Paladino, 2015). The concept of country-of-origin image has been used to encompass various aspects related to a particular country, such as its identity, political environment, culture, population, history, and economic and technological development. However, it does not refer to the country's products themselves, according to Hamzaoui and Merunka (2006). Additionally, the country-of-origin image is recognized as a factor that influences consumers, simplifying their purchasing choices (Papadopoulos & Heslop, 2002) and helping them with the choice of a product with relevant, tangible, sustainable characteristics also highlighted by certifications that represent essential attributes for consumers' choice of wine (Klohr et al., 2013) nowadays.

Furthermore, the wine industry production has always faced a plethora of environmental challenges (Notarnicola et al., 2017), addressing environmental and social issues at both global and local levels that have been previously neglected, as noted by Christ and Burritt in their 2013 publication; however, in recent times, environmentally sustainable viticultural practices, such as biodynamic and organic methods, have become increasingly important for institutions, producers, and consumers. This has led to extensive research in this area, as highlighted by studies conducted by D'Amico et al. (2016) and Nassivera et al. (2020).

What is said above represents why understanding how internal factors such as perception and motivation affect more sustainable buying behaviors and consumption has strategic importance for firms, particularly wine producers. Among the most crucial consumer models often used in the agri-food marketing literature, there is the Theory of Reasoned Action (TRA) (Fishbein et al., 1980) and the Theory of Planned Behaviour (TPB) (Ajzen, 1991). In keeping with the Theory of Reasoned Action (TRA), an individual's behavioral intention is determined by the information they have about a specific behavior and the expected outcome. The Theory of Planned Behavior (TPB) expands on TRA by examining a broader range of behaviors based on consumer intentions. As noted by Ajzen (1991) Theory of Planned Behavior, an individual's intention to engage in a particular behavior is influenced by three primary factors. These factors are: their attitude toward the behavior, which is their subjective evaluation of the behavior based on perceived advantages or disadvantages; social norms, which are the perceived social pressure to perform or avoid the behavior based on the belief that others would approve or disapprove of it; and perceived behavioral control, which refers to the individual's subjective assessment of the ease or difficulty of performing the behavior based on perceived facilitators or obstacles. During the last ten years, the application of the TBP theory and its models on sustainable behavior has led to the emerging importance of environmental and social issues (Rojas-Méndez et al., 2015; Boncinelli et al., 2019; Caliskan et al., 2021), and several academic studies have highlighted consumers' "pro-environmental behavior" as the main theme (Markle, 2013), also known as "green behavior" (Kaiser et al., 1999).

Since the TPB seeks to explain all behavior of individuals acting of their own free will (Campos-Arteaga et al., 2022), this theoretical model is also valid for the analysis of organic wine consumption behavior (Canova et al., 2020; Taghikhah F. et al. (2021); Caliskan et al., 2021). For this reason, the TPB model (Ajzen, 1991) has been chosen as the theoretical framework for examining predictors of consumer behavior towards organic wine consumption since 2002 with Thøgersen.

Purpose of the paper. Under the lens of TPB, this study examines the possible antecedents of consumers' attitudes of purchasing behavior toward organic wine, which represents an interesting area of research since the economic slowdown caused by the Covid-19 outbreak restricted the demand for organic wine while this market was growing and expected to grow more (Organic Wine Market Forecast to 2028, 2022; Pagliarini et al., 2013).

Furthermore, this analysis is a first step in broader reasoning about post-pandemic organic wine consumption. It considers a sample of young wine consumers belonging to the Z generation (going from 1998 to 2010, according to Kotler et al., 2013), which on the one hand, is approaching the wine market with interest (Casalegno et al., 2019; Castellini & Samoggia, 2018; Radovanović et al., 2017) and, on the other hand, appears to be very sensitive to sustainable issues (Gencoglu & Yarkin, 2019). In addition, the study is focused on Italian wine consumers, given their accentuated wine culture (Casalegno et al., 2019) and deep involvement in their Country of origin (Foroudi et al., 2020). More specifically, the goal of this research is twofold: 1) to isolate factors that can affect the TPB theory determinants (attitudes, social norms, and perceived behavioral control) to understand deeper sustainable Z generation purchase behaviors in the organic wine market (Caliskan A. et al., 2021; Campos-Arteaga, N. et al., 2022); 2) to analyze whether and if young consumers are affected by the country-of-origin effect in choosing organic wine.

Methodology. To the best of our knowledge, no research has been published using a mixed (qualitative-quantitative) methodology which will instead be used in the present study for investigating the factors that would promote the purchase of organic wine by shedding light on the possible gap between intentions and behavior purchase in generation Z (also called digital natives, people born between 1998 and 2010 (Kotler et al., 2013)).

The explorative nature of this study required, at the first stage, the use of qualitative methods (i.e., focus groups) to understand the possible determinants of purchase intention -Zikmund et al., (2013) summarized the advantages of such group discussions as Synergy; Snowballing; Serendipity; Stimulation; Security; Spontaneity; Specialisation; Structure; Speed; Scrutiny-

Then, to empirically estimate the impact of these determinants, an online survey of a sample of Italian consumers was carried out (Wright, 2005). Another aim of this focus group was to identify the items related to Ajzen's (1991) determinants to be included in the quantitative analysis. The focus group interview lasted about 60 minutes and involved individuals with different social backgrounds belonging to Generation Z. In the focus group, all participants were asked about the factors that could promote the intention to purchase organic wine. Participants were chosen according to their ability to make a specific contribution to the research; their voluntary availability; and whether they had something in common with the research topic (i.e., respondents had a particular connection to the wine sector, and all participants stated that they were regular wine drinkers). Accordingly, the participants were chosen randomly but with some homogeneity (Kitzinger, 1995). The list of topics included in the schedule was mainly based on Ajzen's determinants (attitudes, social norms, and perceived behavioral control).

The topics proposed by the moderator of the focus group included: (i) the attitude towards respectful wine, and in particular, the concept of supply and demand encompasses several factors, including the perceived benefits or drawbacks of consuming different types of wine; (ii) social norms that influence whether individuals choose to engage in such behavior based on the perceived approval or disapproval of others; (iii) perceived behavioral control, which refers to an individual's subjective assessment of the ease or difficulty of using organic wine based on perceived facilitators or obstacles. The results of the focus group served to structure the quantitative analysis by administering a questionnaire. It is worth noting that this is a research in progress in which we collect data for quantitative analysis. Therefore, the next section will offer a presentation and discussion of the results deriving from the focus groups.

Results. The results of the focus groups provide some insights into the three determinants of TPB (Ajzen, 1991). Concerning attitudes, the focus group participants identified some common advantages or disadvantages of organic wine consumption. First, most were concerned that these kinds of wines might have a higher price than traditional ones. Indeed, many said they should consider buying organic wine only if the price is comparable to a traditional one. Participants who declared having a certain experience in the wine market expressed another issue: taste. However, other participants showed a favorable attitude toward sustainably grown wine for its capacity to improve health and preserve nature, partially confirming the emergence of environmental concerns among attitudes affecting factors, as Caliskan et al. (2021) stated.

As for social norms, the participants identified various factors that may affect their buying decision. One of the most mentioned categories was that of family members, as Gen Z individuals are still concerned about their opinions, confirming the Taghikhah et al. (2021) analysis of this determinant. A second category mentioned is represented by wine sellers, shop assistants, or people working directly in the cellar: more than one participant revealed their confidence in experts and their advice. On the other hand, there was no alignment for the category of friends because some participants cited friends as potential influencers for various reasons, including being experts; on the other hand, friends might also advise against buying an organic wine because they were skeptical about whether it met all the standards and products that would make it so.

In the last part of the focus group, the interviewed individuals identified as a subjective evaluation of which factors or circumstances might facilitate organic wine purchasing behavior (perceived behavioral control). Many of them, as

factors or circumstances that could influence their purchases, have mentioned experiences such as the opportunity to taste and thus try the product, discount vouchers, and hear the story of the winery from its foundation to the different characteristics of the products that allow you to create a different wine offer from the traditional one, strongly confirming something that the literature has already suggested in the past (Casalegno et al., 2019). As factors or circumstances that might not influence the choice to purchase organic wine, in common agreement, the difficulty of finding the product if the quantity produced is insufficient to satisfy the entire demand and the difference in taste to which the consumer is not accustomed was mentioned.

Eventually, from the conducted analysis, it emerges that consumers belonging to generation Z did not consider the country-of-origin as a factor that would facilitate organic wine purchasing behavior. This leads to directly testing them via a survey in the future.

Research limitations. Since the nature of the present research is a preliminary study, we need to highlight some limitations. Firstly, the sample of respondents will consist of Generation Z only. Future lines of research could examine different generational cohorts and compare them, extending the research to Generation Y -also known as millennials-, to be able to detect possible differences in factors that would lead to the choice of organic wine when comparing two generational cohorts (Kotler et al., 2013).

Secondly, although the three determinants of TPB might give a fair understanding of how sustainable factors affect organic wine buying behaviors, the present research focus group suggests that there are other factors influencing this kind of behavior as well as the main concepts and constructs leading to sustainable behavior and consumption that have been addressed in the marketing literature, beyond the already emerged environmental concerns (Caliskan et al., 2021), such as environmental citizenship (Markle, 2013, p. 908); collectivism (Pérez & Del Bosque, 2013); and consumer perceived effectiveness (PCE) (Ellen et al., 1991). Indeed, pilot analyses are necessary to improve the validity and reliability of the study instrument, and their purpose is to ensure high-quality research (Malmqvist et al., 2019). It would also be interesting to analyze all the different 'environmentally friendly' wine categories and see how much the consumer knows about them. Moreover, it would be interesting to analyze all the different 'environmentally friendly' wine categories -biodynamic wines, natural wines, regenerative wines- and to see how much the consumer knows about them.

Managerial implications. This research deepens the understanding of what motivates organic wine consumption by Generation Z, which undoubtedly represents the most interesting target market since its interest in wine is in an emerging phase. Indeed, literature suggests managers need to deepen their knowledge about young consumers' behaviors (Castellini & Samoggia, 2018; Lior et al., 2017; Thach & Olsen, 2006) since they do represent not only a critical target market but also can create trends and their potential impact on the wine market in the future. Furthermore, the knowledge of new purchase attitudes and concerns helps wine producers and wineries in general to adapt their offerings.

Originality of the paper. The originality of this study consists in the analysis of a generation (i.e., Generation Z) that, according to the existing literature (Castellini & Samoggia, 2018; Radovanović et al., 2017), represents a relevant segment of consumers who still are unknown under many aspects, but can be able to generate new trends and to impact both the traditional and organic wine markets, positively.

Keywords: Organic wine; sustainable behaviors; Theory of Planned Behavior (TPB); Country of Origin (CO); Z generation.

Good bye Waste! Discovering consumer's attitudes toward staple foods enriched with agricultural waste

RAFFAELE SILVESTRI* KAROLINA SALLAKU• DOMENICO MORRONE▲
ANNUNZIATA TARULLI**

Framing of the research: *this study explores the understanding of the territorial capital in sustainable development research by analysing consumers' attitudes and preferences toward food products enriched by agri-waste extracted ingredients. In order to do so, a survey was carried out to perform an exploratory factor analysis for the identification of the main factors that better capture the consumer orientation. Both with a multiple regression analysis, this study aims to understand whether these constructs may be potential drivers toward consumers' purchase intentions.*

Purpose of the paper: *this paper examines the potential consumer's attitudes toward food products enriched by extracted ingredients from a territorial agri-waste supply, in the context of the circular economy for sustainable consumers' behaviours. In addition, the study aims to explore the potential implications of these orientations toward purchase intentions from a territorial capital perspective.*

Methodology: *the study employed a quantitative exploratory research based on a survey that involved 147 Italian respondents. Firstly some descriptive statistics offered a first overview of the phenomenon. Secondly, an exploratory factor analysis determined the main constructs that better explained the consumer's preferences and attitudes. Thirdly, a multiple regression analysis will attempt to understand the main drivers behind the intention to purchase in the context of territorial agri-waste and its re-utilization in the improvements of other food staples.*

Results: *data and analysis identified three main constructs (Food Wellness Attitude, Food Health Consciousness and Food Choice Dilemma). These scales allowed us to explain the attitudes of respondents toward the phenomenon analyzed. Furthermore, a strong intention to purchase toward products enhanced with nutrients from agri-waste was revealed from the statistical descriptions performed.*

Research limitations: *this research has as main limitation the sample size that only allowed to explore in a preliminary approach the phenomenon examined. Further studies will follow by involving a larger sample and employing this study's defined scales and constructs to better investigate the research questions.*

Managerial implications: *the study contributes to support the managerial decisions by exploring consumers' attitudes towards the staple food industry concerning nutrients from agri-waste. Insights could be used to develop new products and successful marketing strategies for businesses. Moreover, the findings could support strategically relevant brand partnerships with suppliers to generate innovative value streams and minimize food waste.*

The originality of the paper. *This paper is characterized by the novelty of the research in understanding consumers' orientation, preferences and attitudes toward the adoption of food products enriched by agri-waste ingredients from a local agriculture. To date, there is a lack of research examining the potential implications of territorial capital and circular economy from a consumer perspective based on empirical evidences.*

Keywords: *agri-waste; circular economy; territorial capital; staple food; sustainable consumer behaviour;*

1. Introduction

Due to the growing importance of sustainable development, pressure is addressing the global food industry to reduce waste and to adopt more sustainable methods. In this context, there is a concerning amount of food waste produced annually that involves also agriculture (88 millions tones in EU annually) according to the European Court

of Auditors (2016). Puglia, a southern Italian region, is experiencing an expansion of the agricultural sector (Ansa, 2023), especially relevant for fruits and vegetable production. Puglia was ranked first in Italy for vegetable crops and second for fruit orchards due to the region's increase in income (756 million euros) and profitability (14 million euros) from export activities. The region is becoming a significant player in the nation's agriculture sector (Region Puglia, 2023). In addition, many agricultural firms are employing a large workforce, becoming vital to the local economy. In this landscape, the natural extracts from a local agricultural waste can be incorporated into food staples as a viable solution to reduce agri-waste and to offer enhanced nutritious value. Nonetheless, the perceptions of consumers for such items ultimately may determine the success of these sustainable practices. For these reasons, the study aims to explore the attitudes of consumers toward these categories of products.

2. Literature review

Since the Brundtland Report in 1987, the academic definitions and conceptualizations of Sustainable Development have undertaken several directions. The most common definition is the one that considers it as: a progress that satisfies the requirements of the present generation without jeopardizing the ability of the next to meet those needs (EU, 2022). The term Sustainable Development was initially used in relation to environmental issues. However, over time it has encompassed a wide range of goals for development since the questions about sustainable development are very complex (Kates et al., 2005) due to the intricated traits of human organizations and natural environments. Elkington (1997) introduced the concept of triple bottom line, which considers three sustainability pillars (people, profit, and planet) that led to the coordinated convergence of a more balanced integration between economic, environmental, and social dimensions of sustainability (Mckelvey, 2002). In this systematic paradigm, Geissdoerfer et al. (2017) positioned the circular economy concept. This idea was first introduced by Ellen MacArthur Foundation (2013), which defined Circular Economy as an economic model characterized by a circular design that seeks to restore or regenerate resources. In this view, the circular economy expresses the environmental dimension of sustainable development that relates mostly to the economic and financial benefits, involving companies, pollution and environment (Geissdoerfer et al., 2017). In particular, Yuan et al. (2008) argued that the cornerstone of the circular economy is the usage of raw materials and energy across numerous phases in a cyclical, repeated and closed implementation flow. According to Wijkman et al. (2015), there are several benefits from circular economy, it firstly attempts to eliminate waste by improving and developing the design of new materials, goods and processes. Secondly, it allows to reorganize in a more sustainable focus, the organizations' business models. In this view, a circular economy leads to use mostly renewable energy, avoiding the misuse of hazardous chemicals and finally consumes only recycling materials. By encouraging the sustainable use and management of natural resources, minimizing waste and pollution, and supporting local economic development, the circular economy can support the growth of territorial capital (Tapia, 2021). The term Territorial Capital was initially used by the OECD (2001) to describe a system of resources pertaining to a certain region or territory with economic, cultural, social, and environmental worth. Using the potential of this complex combination of locally based factors is essential for an efficient development of areas and territories. Camagni (2008) established a lexicon based on the dimensions of materiality and rivalry in order to better comprehend these components. This approach clearly defines the qualities of local assets rather than just listing them, making easier to identify potential interactions and policy implications. Beyond sustainability, there is a need to promote accountability among farmers, businesses and consumers. The relevance of circular economy applied effectively to rural areas development was highlighted by Salvia et al. (2018). All actors should consider social fairness and ecological compatibility for a substantial approach to sustainability (Marchetti et al., 2020). This calls for a multifaceted strategy that addresses, among others, a positive contribution of value from food chains by implementing climate-smart farming practices (El Bilali, 2018). In this view, the present study aims to examine bio-waste from agriculture production as a by-product of staple food enrichment from a consumer behaviour perspective. The circular economy seeks to reduce waste in the agri-food chain while simultaneously making the greatest use of the wastes, by raising their value according to Toop et al. (2017) who introduced a European project for circular agriculture economy. Moreover, scholars examined the circular economy in the agri-food chain sector to explore the potential of agri-waste in the production of biogas (Kapoor et al., 2020); the investigation of biochar production and carbon neutrality (Yrjälä et al., 2022); the examination of agri-waste employment to produce food additives with nutritional value for food products, and sustainable practices in a food chemistry perspective (Chamorro et al., 2022); or to investigate food waste optimization about waste reduction strategies and recycling methods (Bigdeloo et al., 2021). Given the aforementioned literature review, there is a lack of research for an in-depth examination of the attitudes and preferences of consumers for food staples, enhanced with agri-waste by-products. This study aims to fill this research gap based on empirical analysis through a survey, that intended to develop reliable scales for consumer preferences' measurement. Therefore, given these considerations, the following research questions are formulated:

RQ1: what are the consumer's attitudes toward staple foods enriched with nutrients from agri-waste?

RQ2: how can we accurately measure consumers' preferences for staple foods enriched with nutrients from agri-waste?

RQ3: what are the main drivers behind the consumers' intention to purchase staple foods enriched with nutrients from agri-waste?

3. Methodology

3.1. The questionnaire

In order to respond to the formulated research questions, this study applied a quantitative approach through a web-based survey developed on the Google Forms Platform (www.google.forms). This data-gathering tool has several advantages related to accessibility, reliability and data availability (Vasantha Raju and Harinarayana, 2016). As a result, 147 valid responses were collected (only five excluded). Overall, six variables were measured, as composed of 83 items, evaluated on a 7- point Likert scale. The variables were organized in (1) Food neophilia (composed of 10 items, referring to the propensity to try new foods adventures); (2) Food innovativeness (structured in 13 items, related to the degree to which consumers wanted to try new food technologies); (3) Food perceived importance (constituted by 30 items, referring to the importance that consumers attributed to several characteristics and factors of food enriched by nutrients from agri-waste); (4) Healthy choice propensity (organized in 16 items, related to the propensity to make healthier food choices); (5) Food Safety (composed by eight items, related to the perceived relevance of health food features); (6) Food pleasure (6 items, concerning the preferences about hedonic features). The survey was launched among Italian consumers over three months. Respondents were informed about the basic concepts of agri-waste, their territorial origin (from Puglia Region agriculture), and their nutritional aspects, before the data were collected. This study is organized in three main steps. First, an overall examination of the descriptive statistics was conducted to achieve a clear picture of the sample. Second, an Exploratory Factor Analysis was performed to determine the most reliable constructs able to better capture the phenomenon examined. Third, a multiple regression analysis will be executed to test the potential drivers behind the purchase intentions related to foods enriched by territorial agriculture waste components.

3.2 Descriptive Statistics

The descriptive statistics were mainly performed to achieve an overall picture of the respondent's demographics and some additional general information about the phenomenon. From Table 1, there is evidence of a balanced distribution among genders (49.7% male, 50.3% female). The age was grouped into five ranges: less than 20 years (1.4%), 20-30 years (49.0%), 31-50 years (36.7%), 51-60 years (8.1%) and more than 60 years (4.8%). Results revealed a majority of younger consumers (Gen Z) among the sample. Looking at the location distribution, most of the sample was in Puglia (70.1%), while the city area where the residence was located evidenced a majority for city centre (55.8%). Moreover, the respondents declared a high level of education with graduates (46.9%) and master's degree / PhD (23.8%). This results, mostly evidenced a reflection in the occupations' responses such as students (38.8%) and employees (37.4%), with a majority of annual income in the range 21K – 40k (38.1%). In addition, some information about the store choice preferences was collected into four main categories of food staples that resulted in a majority for supermarket distributed in: biscuits (89.8%), breadsticks (74.1%), bread (49.9%), pasta (87.8%) and wine (44.2%). Lastly, respondents were asked about their intention to purchase products enriched with lemons, artichokes, onions and wine extracts. The results evidenced a strong intention to purchase for all the categories of product features involved (range 5-7 Likert points) for lemons (73.4%), artichokes (50.3%), onions (54.4%) and wine (65.3%).

3.3 Exploratory factor analysis

Since this study is exploring a new phenomenon, such as the consumer's preferences and orientation toward food staples enriched by nutrients obtained by a local agri-waste, an Exploratory Factor analysis (EFA) was considered the appropriate approach for the reduction of scales dimension, the evaluation of constructs' validity and the definition of factors structure (Taherdoost et al., 2022). The EFA was performed using the Principal Components with a Varimax rotation as an extraction method (Pallant, 2011) through IBM SPSS. First, the factor analysis followed a criterion for factor loadings cutoffs through communalities values excluding items with values below .40 (Hair et al., 1998). Moreover, from the graphical representation of eigenvalues and the rotated component matrix, the final items were defined in three final factors. In addition, the KMO measure of sampling adequacy value showed respective values (.891 > .60) in line with Taherdoost et al. (2022). In addition, Bartlett's test of sphericity ($p = .000$) resulted significant for all the variables (Netemeyer, Bearden et al. 2003), showing that the correlation matrix was statistically different from an identity matrix. The final factors, as evidenced in Table 2, were also tested for scale reliability. The results revealed a high internal consistency for all the measured constructs. As observed in Table 2, the items are displayed with respective Cronbach's alpha with values above (.7), indicating a very good level of internal consistency (Pallant, 2011).

Tab. 2: Final Scales

Scale Name	Description	Items	Mean	SD	Cronbach's alpha
<i>Food Wellness Attitude</i>	<p><i>The propensity to prioritize health and nutritional benefits for consumers' attitude when deciding food choices.</i></p> <p><i>Items:</i></p> <p>It is important that the food I eat every day:</p> <ol style="list-style-type: none"> 1. Choosing between different foods is quite complicated 4. When I choose food, I am never sure about the choice made 5. The healthiness of foods has little impact on my choices 6. I eat what I like without worrying much about the healthiness of foods 	6	19.054	7.428	.789

* Source: Own Elaboration – SPSS IBM Factor Analysis

3.4 Description of constructs

The final constructs resulted in three main scales that are mainly characterized by the following aspects:

- *Food Wellness Attitude: this scale is composed by twenty-six items that indicates the extend of which the respondents have feelings about the value of consuming food with nourishing features. Moreover it refers to the*

advantages for general health and well-being, by supporting stress and everyday life management. In this scale, consumers have a favourable propensity for food's nutritional value while choosing their diet. They tend to seek foods that are nutritional, protein-rich (benefits for skin, teeth, hair, and nails), and valuable for their health and well-being. Also, there is a propensity to place a high importance on food that support the everyday activities and reduce stress. Food availability and pricing are also significant features since customers conveniently evaluate options that offer a good value for money. This construct could support the research for a further examination of consumers' attitudes toward the benefits of food enriched with ingredients extracted from agri-waste.

- **Food Health Consciousness:** the items of this variable, in total thirteen, indicate that consumers with high scores have the propensity to be aware of the nutritional value of the food they eat, a higher tendency to read food labels, and to be higher educated for dietary decisions. They also prioritise eating a healthy, balanced diet and may see their food preferences as a reflection of their personalities. Therefore, this scale could be further used by research since it reflects a favourable attitude toward the choice of nutritious foods characteristics and nutritional benefits awareness.
- **Food Choice Dilemma:** this construct, composed by six items, reflects a consumer's dilemma in food decision-making and the consequences not only for healthy aspects but also for their social life. While choosing what to eat, consumers may prioritize considerations about food safety or social approval. The items indicate that people who score poorly on this factor might not consider health or social advantages when making food decisions. Generally, this characteristic reflects a lack of positive attitudes toward selecting healthy foods and discomfort in making food judgments.

3.5 Final notes

Using the constructs defined from the previous exploratory factor analysis, the following step will be to enhance the sample size and perform a standard multiple regression analysis (Tabachnick & Fidell, 2007) through IBM SPSS. Moreover, the Variance Inflation Factors (VIF) and Tolerance tests will be computed to test the existence of collinearity among the variables. The purpose is to investigate the most relevant drivers behind the decision to purchase staple food enhanced with agri-waste origin ingredients for a more holistic phenomenon understanding.

4. Conclusions

4.1 Discussion and conclusions

This study aimed at verifying the consumers' attitudes and preferences in choosing food enhanced by agri-waste origin ingredients.

Firstly, the findings highlighted a majority of younger consumers (Gen Z) characterized by a strong propensity for a high intention to purchase this kind of food category. This result is in line with the lifestyle orientation of this generation in buying sustainable food. Gen Z individuals with high environmental consciousness tend to consider more eco-friendly and healthy product features (Su et al., 2019).

Furthermore, this study offers some analytical implications related to the definition of measurement constructs (with a high scale reliability) for the measurement of attitudes directed toward the food categories examined in this study. Identifying the three constructs (Food Wellness Attitude, Food Health Consciousness, Food Choice Dilemma) permits us to achieve a useful tool, relevant for further empirical examinations of this specific topic (DeVellis, 2017).

The results deriving from the analysis of consumers' attitudes towards this food category, measured through the constructs preliminarily proposed by the exploratory factor analysis, will be used to develop new food products. It can enable to exploit agricultural waste, to increase the value for the consumer, to trigger and to exploit virtuous mechanisms of economic and environmental sustainability.

Managers could also use the insights to conceptualize new and successful marketing strategies that consider mostly the propensities and attitudes of consumers. Finally, the findings could support the strategic development of relevant brand partnerships with local suppliers, in the creation of innovative value flows to minimize food waste.

4.2 Limitations and further research

This extended abstract pursued the main objective to perform a preliminary investigation of consumer's sustainable preferences when making staple food choices by developing some relevant measurement scales. This preliminary character is evidenced by the limited sample size, which will be further enhanced in the full paper to achieve the necessary robustness of results. In order to provide a comprehensive picture of the phenomenon under research, the primary drivers that influence purchase intentions will also be studied. Moreover, future research should focus on defining a global theoretical framework, to capture the holistic perspective of the sustainable behaviour.

Personal branding in female entrepreneurship: Exploring narrative devices in the sustainable fashion industry

GIULIA MONTEVERDE* CECILIA PASQUINELLI*
SERENA ROVAI[▲] ANDREA RUNFOLA**

Framing of the research. *The academic literature has witnessed the rise of the female entrepreneurship agenda drawing attention to the need to overcome masculine concepts of the entrepreneur (Ahl, 2006), stereotypes, prejudices, and expectations that gender brings about in the business world (Stead, 2017). While the literature focusing on the male entrepreneur emerged in the 1930s, women entrepreneurship arose in the late 1970s, rapidly evolving between the end of the 1990s and the early 2000s (Jennings and Brush, 2013). Some valuable academic contributions present entrepreneurship as a gendered process and phenomenon (Bird and Brush, 2002; Jennings and Brush, 2013), highlighting differences between women and men in terms of the identified opportunities (DeTienne and Chandler, 2007), barriers to face (Shinnar et al., 2012), and business aspects prioritized when founding a company (DeMartino and Barbato, 2003). Gendered business practices were in focus, concluding that these can be strategic to the entrepreneur's success (García and Welter, 2013). According to Cardon et al. (2017), female entrepreneurs distinguish themselves for an evident passion for people, i.e., they are passionate about “working with family, satisfying customers, and building meaningful relationships with employees, vendors, or affiliates” (page 29).*

In recent years, women have struggled to run and take on important roles within their businesses (Ughetto et al., 2020). The literature has underlined the positive effects deriving from the presence of women in companies, especially when they play leadership roles; to cite a few, according to some authors, women suggest new ideas (Burgess and Tharenou, 2002), are more cooperative (Kuhn and Villeval, 2015), and bring more innovative environments (Cunningham et al., 2017). At the same time, when women start a venture, they usually have to deal with some issues, such as low propensity to risk (Fairlie and Robb, 2009), lack of support from institutions, and poor access to social and financial capital (Thébaud, 2015; Ughetto et al., 2020). In this vein, a particular mention must be reserved for developing countries, where female entrepreneurs face even more challenging entry barriers to the formal labor market (De Vita et al., 2014). Furthermore, it is also necessary to consider a more psychological aspect, according to which women perceive themselves as less skilled than men in creating and leading a business reality (Minniti and Nardone, 2007). Overall, gender equality has not yet been achieved in entrepreneurship due to cultural norms and values that are difficult to eradicate and gender stereotypes against women (Ahl, 2006; Ughetto et al., 2020) who have difficulty reaching legitimacy as female entrepreneurs (Marlow and McAdam, 2015). Social, political, ideological, and economic categories frame and contribute to structuring female identities in both developed and developing countries (De Vita et al., 2014). In this context, women entrepreneurs adopt and exploit self-identity narratives to bridge gender gaps and earn legitimation (García and Welter, 2013; Crosina, 2018, cited in Mmbaga et al., 2020).

Personal branding literature provides an analytical perspective to investigate self-expression through the crafting of personal narratives and imageries. In recent years, the interest in the entrepreneur brand has been revamping both in practice and the literature. The entrepreneur can personify the business venture, with personal branding contributing to the business's competitive advantage (Thomson-Whiteside et al., 2018). The owner-manager's personality is often a key asset for SMEs branding (Resnick et al., 2016). Personal branding has been associated with human branding, self-promotion, self-marketing, reputation management, impression management, and employee branding (Parmentier et al., 2013; Gorbatov et al., 2018; Thomson-Whiteside et al., 2018). There is fragmentation and a lack of consistency in the use of the terminology (Scheidt et al., 2020). A comprehensive definition of personal branding derives from Gorbatov et al.'s review of the literature (2018), according to which it is “a strategic process of creating, positioning, and maintaining a positive impression of oneself, based in a unique combination of individual characteristics, which signal a certain promise to the target audience through a differentiated narrative and imagery” (page 6). The literature

has discussed various elements at the core of personal brands as ingredients to develop self-expression narratives and imageries; some of these are personal qualities, past experiences, values, competencies, and skills (Rangarajan et al., 2017), individual strengths and points of uniqueness (Labrecque et al., 2011), ideas, expertise, and sponsored products (Malik et al., 2023), amount and quality of field-specific cultural and social capital (Parmentier et al., 2013), specialist knowledge, background, skills, qualifications, personality, and customer relations (Resnick et al., 2016), and business and personal life (Md Saad and Yaacob, 2021). Limitations, weaknesses, fears, and imperfections (Thomson-Whiteside et al., 2018) also emerged as a basis for personal brand building. Online platforms and social media have been heavily exploited for crafting personal brands and for personality self-expression (Labrecque et al., 2011). In particular, social media allow individuals to experiment with self-expression forms (Thomson-Whiteside et al., 2018). Artifacts, such as “narrated selfies”, social media photos, and YouTube videos, help individuals craft narratives and project imageries (Gorbatov et al., 2018).

Purpose of the paper. Research on female entrepreneurs and their organizational initiatives is weak and marginal in the academic field (Ahl, 2006), and is still characterized by historical inattention (Hughes et al., 2012). At the intersection between marketing and entrepreneurship, personal branding has been under scrutiny in the case of female entrepreneurs to investigate how they undertake personal branding to support their business in the market (Thomson-Whiteside et al., 2018). Online platforms and social media push general awareness of the importance of controlling personal brands and drawing attention to consistency across channels and audiences (Labrecque et al., 2011). In fact, with the Web 2.0 development, personal branding has been extended from celebrities, politicians, and business leaders to everyone in the conditions to leverage online tools for projecting her/his image (Shepherd, 2005; Labrecque et al., 2011; Kucharska, 2017; Gorbatov et al., 2021). The paper contributes to entrepreneur branding studies by investigating female entrepreneurs’ self-representation and positioning. This study addresses the following research questions: **RQ1)** How do female entrepreneurs communicate their personal brands online? **RQ2)** To what extent are gendered themes used as strategic narrative devices to build the entrepreneur brand?

Methodology. The sustainable fashion industry provides a fertile empirical setting for the proposed inquiry, given the centrality of sustainability values inspiring the entrepreneur as a human being, the firm mission, the organization, and the business model. Sustainability has reached centrality in the fashion industry (Liu et al., 2020), where it remains a key challenge and an area of development. Simultaneously, personal branding is assumed to help entrepreneurs address a threefold challenge, that is, framing a credible and robust sustainable value proposition, which balances the ecological, social, and territorial business aspects; propagating sustainable production and consumption modalities to pursue the entrepreneur’s mission; and avoiding the risk of perceived greenwashing. Thus, we focus on women working in the sustainable entrepreneurship field, of which scant yet growing research has made a case for a gender perspective (Ousios and Farooqi, 2017; Figueroa-Domecq et al., 2022); moreover, women are usually presented as more involved with the fashion system than men (Gupta and Gentry, 2016).

We adopted a content analysis approach to investigate and analyze the narrative devices women entrepreneurs use and exploit to build their personal brands online (Henry et al., 2016). For the study, we selected three fashion companies founded and led, in Italy, by women and based on a sustainable fashion business model. In particular, we considered these three case studies according to their degree of coherence and illustrative capacity for the present study’s objective; to do this, we consulted secondary material (e.g., companies’ websites and social reports, online news archives, and corporate and personal social network profiles). Moreover, all three companies were selected considering the prior research done by the authors of this paper, who related directly to the entrepreneurs. The first business reality examined was founded in 2018. After a period of intense dissemination about the topics of sustainable supply chains and raw materials, “Made in Italy” productions, self-production, positive and harmless entrepreneurship, female empowerment, and links with territories and local organizations, this female entrepreneur decided to start her own business to put into practice the values and the entrepreneurial philosophy in which she believes. For the knitwear production, she uses only Italian yarns already in stock and discarded in warehouses. The second case examined concerns a company born in 2013 from a new and radical fashion idea of its female founder, who advances a sustainability perspective that is highly focused on the social nature and takes into account relationship with communities, passion for crafts, handprints, and fabrics, and redemption for women in need. Finally, the last company was founded in 2018 to connect the passion for historic craftsmanship with that for sustainability. After a personal experience that marked her life, this female entrepreneur runs the venture with the desire to help women in need through her skills in traditional craft techniques in fashion and creates highly recognizable sustainable bags.

To answer the research questions, we proceeded in two phases: a) we conducted preliminary in-depth face-to-face semi-structured interviews with the three female entrepreneurs; b) we carried out a content analysis on the last 50 Instagram posts (i.e., single photos, photo carousels, videos, and reels) of each company (on March 1st, 2023). We considered Instagram as it has a consistent relevance in the social media landscape (Milanesi et al., 2022) and is the social network most used by the selected female entrepreneurs as a means to construct their personal brands. We created an Excel worksheet reporting each company’s posts, the date, the caption, the #hashtags, the number of likes, the number of comments, and some researchers’ preliminary notes. In total, we collected 150 posts on Instagram. The analysis carried out was aimed at identifying the main words used and topics conveyed in line with previous research (see, for example, Ranfagni et al., 2020). For data analysis, we used a mixed qualitative netnographic approach (Kozinets, 2017) and a quantitative text-mining approach.

Results. The analysis’s preliminary findings show how women entrepreneurs rely on some narrative devices for creating their personal brands. Key themes that emerged from the analysis are the following: personal values, passion,

and motivations. The first important topic emerging from data is sisterhood, traceable in posts and texts and evidencing the relevance of ties with other women. The focus of sisterhood is specifically on reinforcing human relations amongst women, especially concerning establishing strong connections and solidarity in critical areas for women in need or in diversity and social inequality subjects. In this sense, the concept of sisterhood refers to women that are not simply those current customers but also potential ones and are demographically varied, from diverse origins, professional careers, races, or ages. Those women may be other entrepreneurs, clients, friends, or simply Instagram surfers. In the posts, showing entrepreneurs' strong empathy with other women is essential, and it comes up as a leitmotif across the diverse cases analyzed. In particular, the willingness of women entrepreneurs to support other courageous entrepreneurs like them strongly emerges; they team up, organize events together, and raise awareness among customers based on a common vision and the same way of doing business.

The second important topic is the passion for sustainability in the fashion industry. Passion for sustainability emerges in varied forms, from the technical aspects related to the production of fashion items to the social implications of the industry itself. The study data show how the different entrepreneurs approach their passion for sustainability from the diverse areas of competencies and made the center of entrepreneurship venture out of it. In their wish to contribute to environmental protection or to increase and stimulate social justice for women, they build their brands' identity and operations around specific sustainable projects that help women victims of violence or rely on only ecological or regenerated materials for their collections.

The third topic is related to motivational content. Female entrepreneurs post texts that encourage other women to succeed in what they want to do. Motivational posts are often associated with their own life evolution as women and professionals and their brand's role in it. In fact, some posts give the brand a critical role in a kind of redemption path that the entrepreneurs experienced in their troubled lives.

The analysis made the core narrative devices emerge as significantly gendered themes. The entrepreneur's gender is not a neutral fact in personal brand building. Instead, it shapes and qualifies the key emerging themes: sisterhood as a personal value refers specifically to solidarity and bonding among women; passion for sustainability is made concrete through women's technical skills and competencies and projects for women and social justice; motivational content, then, is deeply rooted in emancipatory and empowering narratives, telling about barriers and resilience in the entrepreneurs' life paths of female workers and businesswomen.

Research limitations. Despite its contribution, this study presents some limitations. Our research focuses mainly on narratives in text posted by female entrepreneurs on Instagram. Future research could also investigate the visual dimension and what images let the female entrepreneurs show their personal brand. Moreover, this study investigates the topic of personal branding in the context of the fashion industry. While relevant, the result may be affected by this sector. In addition, the study focuses on the fashion industry in the Italian geographical context. While some of those brands have started to face international markets, they are proper to the Italian entrepreneurship context and, consequently, it could also be appropriate to investigate potential similarities or differences in other geographical settings, assuming a more global perspective. Furthermore, future research should adopt a cross-sector approach, investigating to what extent narratives may be specific to fashion or could be replicated by female entrepreneurs in other settings from a comparative perspective.

Managerial implications. The findings suggest that entrepreneur branding can be framed as a gendered business practice (García and Welter, 2013) of strategic relevance to the company's success. The entrepreneur personality may become the company brand personality, with a significant emphasis on abstract and intangible brand values at the expense of functional and tangible brand attributes. While personal values and motivations have emerged in previous personal branding literature, passion adds to the existing knowledge and represents a promising field for narrating the entrepreneur's personality. The existing literature on personal brands warns against a potential loss of authenticity, irritation against an oversharing attitude, and self-commodification (Thomson-Whiteside et al., 2018). In this vein, entrepreneur branding framed as a gendered practice might carry the additional risk of a perceived "gender-washing" for crafting polished narratives of women in business. In an attempt to project positive, emancipatory, and empowering messages, the entrepreneur brand might lose credibility and genuine connections with limitations, weaknesses, and imperfections (Thomson-Whiteside et al., 2018).

Originality of the paper. The original contribution of the paper is threefold: 1) it contributes to the study of female entrepreneurship with a novel approach that focuses on personal branding, supporting their journey into the entrepreneurship venture; 2) it investigates how female entrepreneurs may use digital tools for personal branding strategies to communicate their brand identity, enhance the brand image and reputation, and boost customers' identification; 3) it identifies themes as narrative devices to be exploited for personal branding by female entrepreneurs in the sustainable fashion business.

“Good places”: young adults’ views on domestic destinations

ANNA RITA IRIMIAS* ARIEL MITEV* MARIA DELLA LUCIA[♠]

Framing of the research. *In June 2022 the Italian tourism service providers registered a significant growth in booking confirmations. The National Tourism Agency announced that the summer season looked promising despite the war between Ukraine and the Russian Federation and the galloping inflation (IlSole24Ore, 2022). Previously, during the Covid-19 pandemic, young people had lost their tourist role and once the restrictions were lifted they were craving to travel. Several factors influenced their preferences in destination choices. Tourism marketing campaigns assume that tourists’ decision-making is based on objective quality and value considerations (Kock et al. 2019). However, prior research has evidenced that the symbolic meaning of destinations and the emotions and memories they evoke often play an equally important role in destination selection (Cassia et al. 2018). On one hand, preferences to travel within the home country, especially in the post-pandemic, could be seen as a kind of moral obligation to support the domestic economy. On the other hand, as shown by De Canio, Martinelli and Viglia (2023), domestic destinations are seen as safe and familiar, thus perceived risks are minimal. Kock et al. (2019:436) argued that tourists’ ethnocentrism, i.e. their preference for domestic holidays over international travels, is a “silver bullet for tourism managers” because it is not related to the quality of offerings and amenities but rather to the affective meaning imbued in a place. Given that youth tourists constitute an important target segment for domestic tourism and there is a need to enrich our understanding of how young tourists mentally elaborate on imagery related to their home destinations (Irimiás, 2023).*

Young tourists’ ethnocentrism is investigated by introducing the concept of “good places” that interconnects place attachment to youth domestic tourism and domestic destinations.

Good places: the role of place attachment

Places are imbued with personal meanings catalyzed by the interface between evocative local values and individual characteristics (Chen, Hall and Prayag, 2021). This symbolic relationship influences how a person thinks about and perceives places and featured “good places”. Good place’ is defined by Michalkó (2023:15) as a “tourism destination people talk about, recommend to others, return to visit and can imagine living there”. These attributes strongly link “good place” to place attachment and people’s well-being, concepts widely used in tourism and environmental psychology (Chen and Dwyer, 2018). People-and-place bonding refers to the emotions a place evokes in people and the particular relationship that connects people with a specific setting. As Chen, Hall and Prayag (2021:4) highlighted “sense of place arises where people feel a particular attachment or personal relationship to an area in which local knowledge and human contacts are meaningfully maintained”. The social and emotional feelings catalysed by people’s sense of belonging and the special connection they have with their favourite places positively affect they wellbeing (Canosa, 2023). Sense of place evolves according to the interactions between people and places over time. The experiences lived in the pre- during and post-Covid-19 pandemic have tremendously increased sense of belonging and place attachment. In fact, the pandemic has stimulated reflection within both the academic community and tourism marketers to rethink and redirect tourism development with a focus on ‘good places’, familiar places and local values. Understanding perceptions about good places becomes key to selecting the local values to promote domestic tourism by targeting specific segments, e.g. youth tourists.

The youth tourism

Current marketing discourse on young people continues to use certain stereotypes which are all too easy to fall into, especially when we are trying to quickly and easily identify a consumer segment (Irimiás, 2023). The tourist segment of youth tourists is often described as tech-savvy, narcissistic and in search of personalised products and services (Ketter, 2021). Pencarelli, Gabbianelli and Savelli (2020) argued that young tourists are strongly influenced by the use of technologies in the pre-travel experience. In fact, young tourists choose a tourism destination, collect information, and evaluate offerings based on their preconceptions about places. Although there have been warnings about the ‘sin of homogenisation’ and the stereotyping of tourists (Pearce, 2011:18), research has not yet fully evidenced the rich diversity of young adults’ travel motivations and preferences. Shedding light on this under-researched consumer

segment in terms of young people's attitudes, values and preferences is significant and relevant for both tourism management and the travel industry targeting domestic and international tourism.

Domestic tourism and tourism ethnocentrism

In most countries, domestic tourism has been dominant with respect to international tourism in terms of economic contribution (Massidda and Etzo, 2012). The Covid-19 pandemic widened this gap by affecting familiarity with the place and perceived risks. Once countries started to reopen, domestic destinations were considered safer destinations than pre-pandemic. In 2022, domestic tourism totalled record numbers - 1.53 billion nights spent in tourism accommodations with an increase of 0.7% compared to 2019 (Eurostat, 2023). Domestic tourists' familiarity and attachment are reflected not only by visitor numbers, but also by the purchase of products and services embedding local values and the will to support small-scale local enterprises (Arbulù et al. 2021). Gursoy, Del Chiappa and Zhang (2018:139) argued that tourists' familiarity with the place is particularly important in destination management since it provides a "clear measure of individuals' direct and indirect knowledge about a destination". The higher the familiarity, the more personal information and memories of domestic tourists are linked to previous experiences. Conversely, the less familiar a tourist is, the more one searches for information on review sites and specific travel-related websites. This insight is strengthened by Cassia et al. (2018). Compared to tourists, they found that residents tend to be more critical about a destination's attributes because their perceptions are based on a more objective knowledge.

The increased preference for domestic holidays over international travel manifested by domestic tourists may be explained by the concept of ethnocentrism. Tourism ethnocentrism is defined by Kock et al. (2019:427) as "an individual's prescriptive beliefs and felt a moral obligation to support the domestic tourism economy". In tourism literature, these beliefs are often referred to as a home-country bias. Here, the authors argue that this bias towards domestic destinations constitutes a predisposition to consider local values and familiar places as "good places". Mental representations of domestic destinations are thus more affected by personal and symbolic meanings than by the quality of services or the uniqueness of products.

Purpose of this paper. This research aims to contribute to the theoretical debate on domestic tourism and ethnocentrism brought to light by Covid-pandemic by investigating young tourists' interpretation of "good places" and ethnocentrism with respect to selected destinations conceived as "good places". Accordingly, the paper's main questions are the following:

- How do young adults interpret "good places"?
- What are young people's beliefs about "good places" and how do they create local imagery?
- What aspects of young adults' interpretation of "good places" affect their tourism ethnocentrism?

Methodology. The research employed a qualitative visual method based on participatory videography to explore the concept of "good places" related to tourism ethnocentrism and domestic destinations as interpreted by young people. Videography has been used in social sciences for field research, analysis and representation by combining ethnography with the production of audio-visual media (Pink, 2008). For these reasons, it is considered an interpretative approach along with a cultural production with symbolic meanings (Knoblauch and Tuma, 2011). In consumer research, videographic production has often been used to explore tendencies of subjective interpretation of consumption practices. Strongly believing in the relevance of videography, Kozinets and Belk (2006) called for a broader use of audiovisually literate consumer research. Due to the contemporary social media-influenced society based on active participation and co-creation, videography must reflect a collective participatory approach by allowing a self-made media product. In other words, participants have the chance to express their views, perceptions and the ways in which they experience local values and "good places". As Kozinets and Belk (2005:130) suggested, giving the natives the camera allows the autovideographical technique to have advantages over researcher-conducted observation because it allows a better understanding of participants' perspectives in action and a first person type of data. Additionally, as Pink (2008) pointed out, videography allows researchers to observe the ways participants are engaged in place-making, and this aspect is particularly relevant to this study for interpreting "good places".

A convenience sample of young adults from Trentino Region/Province (Italy) was involved in this exploratory research. Trentino was deemed an appropriate destination to carry out this study because it has an important domestic tourism share and it is frequently described as a "good place" by tourism planners and marketers. Our convenience sampling consisted of 110 Italian undergraduate students enrolled in a tourism management course, who worked in teams of five. The research was conducted between February and May 2022. As Irimiás, Mitev and Volo (2022) argued, tourism management students need to be stimulated to step out of their comfort zone and get involved in collaborative and creative learning tasks. Although most young adults use digital communication technologies in their everyday life, they rarely have the opportunity to use their skills to approach managerial issues (Karakas, Manisaligil & Sarigollu, 2015).

Data were collected following Kozinets and Belk's (2006) guidelines on how to structure participatory videography. Regardless of the research question and material, the method is flexible and follows a sequence of steps suitable for the analysis of visual and textual material (Schreier, 2014). First, participants were asked to build a script in teams on in-class discussions around the topic of "what good places are". Second, based on this script, they were also asked to develop a video storyline linked to a domestic destination that all the team members identified as a "good place". Third, to create a short video of max. 2 minutes that had to be filmed and edited by using a smartphone; background music was optional. To facilitate participants' work, the researchers were available to clarify doubts and queries and to

minimise procrastination. Researchers’ feedback helped participants to develop their perceptions about “good places” and domestic tourism and to concentrate on the filming of the video.

Not all the students took part in this videography research. Participants who successfully engaged in the proposed videographic research in teams met once a week for a period of five weeks. They were considered co-researchers and developed their projects autonomously. They managed to overcome challenges and obstacles during the process, as the following quote shows:

“Preparing the script was difficult from a design point of view, as we had to imagine in advance what the video would look like. What I didn’t expect was the time needed to shoot and edit the video: it’s a much more complex activity than I expected. The main difficulty that accompanied me through all the tasks was the fear of not getting a perfect result, which often drove me to postpone my work”. (female, 22 years old).

Content analysis was carried out by the authors on 19 videos and 32 reflective reports (script and video storylines) developed by participants.

Results. The results of this explorative concern what a “good place” meant to young adults and the local imagery they wanted to represent along with the link of this imagery with young adults’ tourism ethnocentrism and domestic destinations.

“Good places” are mainly featured by young people as natural and cultural environments. 15 videos directly addressed landscape aesthetics (e.g. Lake Garda, Non Valley) and 7 videos featured tangible cultural attractions in urban tourism destinations (e.g. Piazza Duomo in Trento, the Chess Square of Marostica). One of the videos was produced by five female participants who were eager to feature apples as the protagonists of their valley. The shooting location of the video was identified in accordance with all the members of the team. This means that the place had to be meaningful to all of them and elicit emotions. In other words, local imagery reflects also young adults’ sense of belonging and familiarity, their beliefs about domestic destinations along with memories and emotions. The narrative in the video transforms the physical land into a meaningful “good place”.

The following quotes are explanatory examples:

“The main reason we chose the Non Valley as the filming location is that it is an inspirational place full of breathtaking views and wonderful landscapes. The most important thing for us was to represent its natural beauty without trying to advertise it”. (Video team n. 4)

“We believe that the Non Valley is a good place and it has a potential value as an attractive tourist destination. Its particular landscape with apple trees must be respected by tourists visiting our place”. (Video team n. 4)

“This place is particularly meaningful for our group because all of us were born there and have an emotional attachment to it”. (Video team n. 4)

In some cases, participants described a “good place” by linking the meaning of the place and its function with their personal preferences and expression of themselves.

See the next quotes about a “good place” where participants like to “hang out” or “escape”:

“The places in the video were meaningful for all of us because they are our favourite spots in the city and we usually hang out there”. (Video team n.9)

“What we have represented in the video reflects our own perspective of the place as it has always been our cradle. It also reminds us of our childhood. We have learned to appreciate our home as an escape from the boring and monotonous daily-routine”. (Video team n. 6)

The imagery of the city of Trento and its cultural environment reflects another type of bond that young adults have with “good places”. In this case, the research participants identified themselves as insiders of Trento because of the significant lifetime experienced in the city and with peers encountered during their higher education studies.

The following quotes are explanatory examples:

“Trento is particularly meaningful to us. It is where we go to university. We spend our everyday lives in Trento and it has become a second home to us”. (Video team n. 10)

“Living away from home has allowed each of us to grow and become much more independent”. (Video team n. 10)

“The fact that Trento is the place where we each shared this experience of facing challenges, learning from them and growing as a person is one of the main reasons why Trento holds a special space in our hearts”. (Video team n. 10)

These examples highlight different people-and-place bonding and imagery evoked in young people by “good places”. In turn, this imagery and perceptions positively affect ethnocentric views on domestic destinations. On the one

hand, rootedness results from being born or growing up in a place. Sense of belonging is featured as a profound emotional attachment to the home country fed by “childhood memories” and “attachment to beloved people”. The bond to a place here represents a bond to the local community of friends as well.

On the other hand, rootedness results from meaningful life experiences that young people enjoyed in that place and shared with others. Sense of belonging is featured by depicting this place as “a second home”. This place evokes “shared memories and experiences”, “personal meanings associated with that experience”, and “personal development and transformative opportunities” generated by getting out of the comfort zone and their “cradles”. In line with previous studies (Della Lucia et al. 2021), the role of tourism managerial education valuing human and destination values has been found particularly significant in building and transforming sense of place. Due to staycation and domestic tourism, the Covid-19 pandemic has influenced youth’s perceptions about their “second homes” also through negative emotions generated by sense of separation from a “good place” where they enjoy living and develop, as human beings and future tourism manager.

Research limitations. This exploratory study is not free from limitations. First, the research investigates young adults’ perceptions on “good places” and domestic tourism in the post-Covid-19 pandemic era which may limit the generalization of results. Second, the projective technique of videography does not allow to generalize results as well because it is an interpretative research method. In addition, the quality of the videos is not always of a high standard because participants filmed the videos manually and were not experts in videomaking. As Belk and Kozinets’ (2005:138) pointed out about videography, “the type of knowledge produced can be experiential and emotional” compared to other research methods. Further research is needed to investigate the interconnections between a “good place”, tourism ethnocentrism and domestic management. Also, the use of mixed method techniques is also highly recommended.

Managerial implications. This research contributes to our understanding of “good places” seen and experienced by young adults and their connection with tourism ethnocentrism. Preliminary insights are promising from both the theoretical and managerial viewpoint. This research has shown that places, and “good places”, still matter in tourism. And they also matter for young tourists despite the recent emphasis on Metaverse which has led to the downplaying of the relevance of place. Further understanding of “good places”, place attachment and familiarity feeds an urgent and relevant debate on values-based changes in placemaking and (domestic) destination management. Tourism management researchers can further reflect on the meaning of sense of place and what emotions “good places” evoke in different tourism market segments.

From a practical point of view, youth tourists’ imagery, beliefs and emotion associated with “good places” offer destination management organization, tourism marketers and managers some suggestions to improve destination management and marketing by targeting domestic tourism segments and leveraging tourism ethnocentrism. First, the affective and cognitive elements linked to young tourists’ mental elaboration of “good places” may be used to positively influence young adults to engage in travelling in their country. These elements can be leveraged in the communication of selected local values and offerings thus increasing place attachment and familiarity and bringing the destination closer to potential tourists. Second, the comparison of young tourists’ imaginary of domestic destinations featured in self-made videos with destination promotional videos, may highlight significant gaps in the destination branding model (Govers and Go, 2009) targeting different market segments, e.g. young tourists’ perceived place image is skewed because of different individual interpretations of the projected images, situational influences or biased word-of-mouth. Understanding this gap offers significant insight for assessing how important this market segment is (or will be) for domestic tourism and actively design, manage and market tourism ethnocentrism targeting youth tourists.

Originality of the paper. This exploratory study contributes to shedding light on an under-researched tourist segment with reference to domestic tourism and ethnocentrism by taking the perspective of “good places” that evokes place attachment and familiarity with a specific setting. This research topic is investigated by adopting a qualitative visual method that leverages co-created self-made media products and reflective reports to provide new and surprising experiential and emotional insights about the phenomenon. Participatory videography was found particularly appropriate to explore co-researchers’ views and narratives about “good places” they consider also destinations’. Findings offer interesting insights into the possible role of locals and young adults in stimulating to adopt their perspective when considering domestic destinations.

Dynamic capabilities in the internationalisation process: A study on fintech startups

LALA HU* MIRKO OLIVIERI* NUO WANG[▲] DANIELA CORSARO**

Framing of the research. *This study focuses on the role of dynamic capabilities (DCs) in the internationalisation process of fintech startups, which operate in a rapidly expanding industry exhibiting substantial growth and development.*

Fintech companies have captured a third of global banking revenues since 2005 and are expected to continue growing at a significant rate (Statista, 2023). They have rapidly emerged in various countries (Block et al., 2018) and must expand beyond their home markets to scale up (McKinsey, 2022). However, startups face difficulties in financing (Giaretta and Chesini, 2021), capital-related decisions (Nofsinger and Wang, 2011), technology-intensive requirements (Haddad and Hornuf, 2019), and competition from traditional banking institutions and big fintech companies (Statista, 2023). Startups that are international entrepreneurship in nature, are riskier (Buccieri et al., 2020; Sharma et al., 2020) due to longer business distance from geographical, physical, and institutional points of view (Eriksson et al., 2014; Vahlne and Jonsson, 2017). Innovation is crucial for international entrepreneurship (Mitgwe, 2006), which requires time, capital (Ries, 2011), and the ability to respond and adapt to international market conditions (Buccieri et al., 2020).

Dynamic capabilities enable a firm to reconfigure, renew and create resources (Teece et al., 1997), perpetrating entrepreneurial strategic activities (Nayak et al., 2020) and building resilience in international backgrounds (Pitelis and Teece, 2018). Dynamic capabilities are important for the internationalization and sustained success of fintech companies that are entrepreneurial start-ups in nature (Luo, 2000), which are empowered by international orientations (Weerawardena et al., 2007). Knowledge capability upgrading positively enhances adaptive capabilities and helps financial companies achieve performance benefits while internationalizing (Sadeghi et al., 2022). There is a debate on whether knowledge can be categorized as a certain dynamic capability, but the study proposes to distinguish knowledge sources and implementations for classification (Meanwhile, Zámorský et al., 2022). The effects of time, speed, and degree of internationalization on dynamic capabilities are mediated by different variables, including innovation (Weerawardena et al., 2015), opportunity recognition (Wu et al., 2016) and capitalization capabilities, R&D intensity (Chakrabarty and Wang, 2012), and organizational reconfiguring capabilities. Successful firms develop dynamic capabilities that enable rapid internationalization and capability creation and upgrading (Sadeghi et al., 2022). The positioning exercise (Sapienza et al., 2006), environmental dynamism (Buccieri et al., 2020), and network capability development (Torkkeli et al., 2018) also moderate the effects of dynamic capabilities on firm survival and growth (Jantunen et al., 2005).

A global mindset with a clear marketing orientation for companies with international business is considered an essential ingredient (Cadogan et al., 1995; İpek, 2020) in developing dynamic capabilities (Barreto, 2010; Wang and Ahmed, 2007), which can provide firms with a special knowledge of foreign markets (Hoque, 2020; Wright et al., 2007). Relevant research in international business studies has shifted from static correlation on macro industrial variables to a cognitive approach (Nayak et al., 2020; Sadeghi, 2019) of opportunity exploration and exploitation (Hsieh, 2019; Zucchera, 2021). Cognitive capabilities can be collective, creating an interactive system in companies to ensure the formation and development of certain dynamic capabilities (Easterby-Smith and Prieto, 2008). Individual executives such as managers in international business have an important role in management and shaping the ecosystem through special strategic operations (Bouquet, 2005; Helfat and Peteraf, 2015). Managers need dynamic capabilities to identify, forecast, mitigate, and manage the disorders in their everyday operations (Sniazhko, 2019). Relevant studies categorize these dynamic capabilities into personal (Eriksson et al., 2014), inter-organizational (Blomqvist and Levy, 2006), and intra-organizational capabilities (Weerawardena and Mort, 2006). However, international business managers have

difficulties understanding the types of uncertainty in their businesses and developing appropriate strategies to deal with it effectively while internationalising (Sharma et al., 2020).

The research on fintech startups and their dynamic capabilities is in the exploration stage, with a focus on regional studies. The development of dynamic capabilities, such as innovation capabilities, are transforming the financial landscape globally (Muthukannan and Gozman, 2019), allowing fintech startups to reconfigure traditional banking scenarios (Gallego-Gomez and De-Pablos-Heredero, 2020) and spur innovations in the financial industry (Oshodin et al., 2019). Ambidextrous innovation (Buccieri et al., 2020), separating exploratory units from traditional exploitative ones (O'Reilly and Tushman, 2004), contributes to the internationalisation of fintech startups (Hsieh et al., 2019). Fintech companies leverage dynamic innovation capabilities in a business ecosystem with stakeholders, such as technology developers, government, financial customers, and traditional financial institutions (Lee and Shin, 2018), to access resources and exploit opportunities, thereby transforming the status quo of the ecosystem dynamics in financial markets (Alaassar, 2022). Incubators and competitors in the same cluster are two special actors to consider (Haddad and Hornuf, 2019), as larger geographical clusters with incubators attract more new fintech startups, reducing the risk of failure but increasing the likelihood of being acquired (Gazel and Schwienbacher, 2021).

Purpose of the paper. Fintech companies have evolved beyond the hype stage and are now significant players in the financial industry (Lee and Shin, 2018), with both startups and large technology companies like Google, Amazon, Facebook, Apple, and Alibaba offering their services (Statista, 2023a). While established companies have ample resources to leverage their technological capabilities, startups face difficulties in financing (Giaretta and Chesini, 2021), capital-related decisions (Nofsinger and Wang, 2011), technology requirements (Haddad and Hornuf, 2019), and competition from traditional banking institutions and big fintech companies. To address the intense competition in the international marketplace, especially under pandemic-induced uncertainty, dynamic capabilities (DCs) allow firms to reconfigure, renew, and create resources (Teece et al., 1997), promoting entrepreneurial strategic activities (Nayak et al., 2020). Although the validity of DCs as one of the most promising theoretical developments in resilience building, especially for relatively fragile startups, and in addressing the origins of a firm's competitive advantage in both national and international contexts (Pitelis and Teece, 2018) has been thoroughly investigated in academic management literature, no previous studies have analyzed DCs in relation to the internationalization processes of a strongly evolving sector, such as that of fintech startups. The objective of this explorative study is to investigate the DCs' deployment by startups in the fintech sector in their internationalization process. Specifically, we pose the following research question:

RQ. How are DCs deployed by fintech startups in their internationalisation process?

Methodology. To achieve our research objective, we adopted an exploratory approach based on a qualitative multiple-case study analysis (Yin, 2009; Eisenhardt and Graebner, 2007) on fintech startups. We carried out interviews with startups' founders and managers, and other actors involved in the internationalization processes of these firms. According to Eisenhardt and Graebner (2007), the multiple-case study approach is appropriate to build theoretical constructs and propositions, as case studies emphasize the richness of the context in which the phenomena occur. We used a theoretical sampling approach (Eisenhardt, 1989; Yin, 2009) to identify possible cases of fintech startups to analyze through databases, newspaper articles and LinkedIn platform. Among the requirements of the key informants to be involved in this research, they must be founders of fintech startups or have had managerial experiences in such industry. In total, 11 startups' key informants were available to participate in the study. Moreover, to broaden our investigation perspective, we have also involved in this study professionals operating in innovation hubs, startup accelerators and governmental agencies who have supported the internationalisation of fintech startups. In total, we conducted 19 semi-structured interviews with key informants to investigate how they deploy dynamic capabilities in the internationalization process of fintech startups.

The interviews focused on the following main topics: (1) the internationalization process and the level of international commitment of the startup; (2) startups' key capabilities to access and grow in international markets. These topics lay the foundations in the assumption that startups have to face a scarcity of resources. The semi-structured interviews were conducted in virtual mode, i.e. by video call via Microsoft Teams, Google Meet or Zoom, between January 2021 and January 2023 and lasted about an hour. The interviews were recorded and fully transcribed verbatim. The body of transcripts of the 18 semi-structured interviews conducted for this study represent the material which was analyzed by the researchers.

Preliminary findings. Our research focus is on the role of the dynamic capabilities of fintech startup' entrepreneurs in internationalization processes.

The preliminary results of this study show that in the internationalization process of fintech startups, DCs allow entrepreneurs to identify opportunities and reconfigure their business to adapt to the new market. For example, in order to effectively launch the startup's internationalization process, the entrepreneur needs some local actors, such as a country manager to be recruited, who has in-depth knowledge of the culture and the market to be accessed. These local partners play a key role also in the following phase of the internationalization process, which consists in the elaboration of a market access strategy and in the creation of new commercial and institutional agreements. Therefore, it is necessary for the entrepreneur to demonstrate the ability to access a local network to create effective partnerships for the fintech startup and to establish interpersonal relationships with key players for business development in the international market.

For these networking purposes, the key informants involved in this study revealed that the role of digital channels is crucial. In particular, the LinkedIn platform is used by all the interviewed professionals, especially in the early stages of the internationalization process of fintech startups, to identify key players and establish a connection via chat, which turns into a long-term relationship. LinkedIn, in fact, represents the first step in establishing interpersonal relationships which will be strengthened by the interlocutors on the occasion of physical events, such as trade fairs in which startups participate both for networking purposes and for market monitoring, to develop an updated perspective with respect to the fintech industry trends.

Furthermore, trade fairs are a useful marketing tool not only for the promotion of the product/service of the firm, but also for educating partners and other organizations regarding the potential of the startup's offer. In this vein, our study highlights that the fintech sector presents increasingly technologically advanced solutions which need to be communicated effectively to both insiders and end consumers. For this purpose, social media are the most useful digital marketing tools - for example, through platforms such as Instagram, fintech startups have the opportunity to illustrate the characteristics of their products/services by adopting a clear and simple language to inform consumers about the usage they can do with the fintech product/service.

In general terms, with this explorative research, we identify the barriers in the internationalization of fintech startups.

On one hand, as barriers to internationalization we identified:

- (1) the lack of communication of the fintech product/service to both intermediaries and consumers;
- (2) the legal barriers of the country being accessed;
- (3) the limited knowledge of the local market due to the psychic distance.

On the other hand, the objectives that the internationalization strategies of fintech startups aim to achieve are:

- (1) the formation of an international network with key actors, such as international organizations, partners, institutional actors, etc.;
- (2) an increase in the brand strength of the fintech startups internationally;
- (3) the growth of the fintech startup.

To achieve these objectives of the fintech startups' internationalization strategies, we investigated how DCs can help fintech companies' internationalization in the following areas:

- (1) DCs have their agility to be naturally innovative in the fintech industry, since it is a technology and knowledge intensive one. Fintech startups have their innate affinity to adapt themselves to digitalisation or they are born to be digitalised, which permits innovative DCs to perform as effective internationalization strategies;
- (2) followed by aforementioned points, fintech startups are found flexible in resource exploitation and exploration. This binary seeming exclusive relationship can be mobilized dynamically by fintech companies who can leverage their already existing time-saving resources exploitation at maximum level to save limited resources and invest it into potential complementarity exploration while internationalizing.
- (3) DCs in key actors selecting and networking, especially the local stakeholders, are exceptionally valid for fintech startups conducting crucial internationalization steps such as market access approaches and the operational compliance.

Research limitations. Dynamic capabilities are crucial in companies' internationalisation, as well as extensive and complicated. Our study has some limitations as we adopted a qualitative approach based on the case study to analyse a single industry, the fintech industry. Future research could also analyse the internationalisation of startups in other innovative industries to verify any differences in how they deployed dynamic capabilities during their internationalisation process.

Managerial implications. Illustrated by the findings of this study, it can be confirmed that DCs have significant managerial implications for fintech startups' internationalization strategies. Under the resource allocation view, companies need to allocate resources in a dynamic way by exploiting their inherent strengths and exploring potential complementarity of resources. The fintech industry has one certain entry threshold as a knowledge and technology intensive industry. Fintech companies offer intangible service much more than tangible cross border goods. It is beneficial especially when conducting their internationalisation process thanks to the effectiveness and borderless extensibility. Companies' exploiting and exploring capabilities are often considered mutually exclusive in traditional industries. Fintech companies can leverage their already existing time-saving resources exploitation at maximum level and make full use of this "curve crossing" time saved from resource exploitation by applying their dynamic capabilities to explore potential complementarity in order to enhance their international business performance. Relevant potential complementarity of internationalisation can sit in the formation of the "human sense" in business that technology can not reach so far. This requires a strategic approach to resource allocation that prioritizes investment in areas that can generate sustainable competitive advantage. Under the organizational structure view supported by DCs, companies can adopt an organizational structure that enables a systemic organizational structure to elaborate market access strategies, create new commercial and institutional agreements and gain in-depth societal and cultural market knowledge. This may involve offering competitive compensation packages, creating a culture of learning and development, and providing opportunities for career growth to enhance inter- and intra-organisational structures. Under the business relationship view, fintech companies who have successful internationalisation business performances are able to leverage partnerships and collaborations to access resources and capabilities that they may not have in-house. This involves partnering with other fintech companies, traditional financial institutions, technology

companies and even local non-economic stakeholders or actors to share knowledge and expertise. Once this talent pool is created, more resources can easily and efficiently be generalised by resource cycling, mobilizing and sharing with the hope to break the barriers in the internationalisation process. This process is also a process of adapting and learning, in which we witnessed how fintech companies strengthen their mindset to embrace experimentation, failure, and continuous improvement.

Originality of the paper. Despite the extensive research on dynamic capabilities in the international business literature, there is a paucity of studies that examine the role of dynamic capabilities in the internationalization processes of rapidly-evolving sectors, such as fintech startups. In order to fill this gap, in this exploratory study we presented preliminary findings on how entrepreneurial dynamic capabilities are deployed by fintech startups to approach foreign markets.

Keywords: dynamic capabilities; fintech; internationalization; startups

Digitalisation projects in leading industrial district firms: a case of missing local connections? An explorative study

SERENA GALVANI* ELISA CARLONI* ALESSANDRO PAGANO* ROBERTA BOCCONCELLI**

Framing of the research. *It has been widely recognized the role of leading industrial district (ID) firms in the evolution of the industrial district itself and of local connected firms (Ingstrup, 2014; Hervás-Oliver, 2022). Leading ID firms tend to involve local suppliers of production inputs, establish technological collaborations with local firms and knowledge providers and interact with local customers (Hervás-Oliver, 2022). Over time leading ID firms have opened their network to business relationships with partners outside the ID to gain access to valuable resources and market opportunities (Albors-Garrigos & Hervás-Oliver, 2019). This local/global interplay has become increasingly relevant over time and has been subject to an intense scientific and policy-oriented debate both from the ID/cluster and firm perspectives (Grandinetti, 2011).*

One recent emerging pattern affecting the evolution of IDs and clusters is represented by the diffusion of digital technologies (DTs), with a great role played by Industry 4.0 (I4.0)-related digital resources (Bellandi et al., 2019; Hervás-Oliver, 2021). DTs provide opportunities to make production and organisational processes more efficient, to innovate the product/service offering and to improve communication and coordination with operational units/subsidiaries, partner organisations and customer firms based in distant locations. While the cooperation of leading ID firms with local firms has been investigated in depth in the literature (Albino et al., 1998; Camuffo & Grandinetti, 2011), the degree of involvement of local firms and other actors in digitalisation process undertaken by leading ID firms is still largely unexplored. Some studies point out the emergence of parallel cooperative relationships, where large ID firms tend to collaborate with national and global IT providers (Albors-Garrigos & Hervás-Oliver, 2019), while instead small ID firms undertake projects with the advice and support of small IT consultants (Mersico et al., 2022). These initial studies seem to suggest that advanced digitalisation processes could lead to further fragmentation in IDs/clusters, with the development of distinct digital trajectories further weakening local technological linkages and the role of proximity in knowledge exchanges.

Purpose of the paper. *We argue that a better understanding of the nature and mechanisms of cooperation in digitalisation processes between leading ID firms and co-localised actors could provide useful insights over the evolution and strength of ID networks and relationships. This type of analysis could further expand recent contributions on digitalization of IDs/clusters contexts (Bettiol et al., 2020; Albors-Garrigos & Hervás-Oliver, 2019). Therefore, this paper aims to address the following research question (RQ):*

How do leading ID firms undertake and organise digitalisation processes?

To address this RQ a qualitative methodology developing an exploratory case study is adopted. The leading ID firm under investigation is Biesse Group, a large company based in the Pesaro furniture ID and with a leading position in the global mechatronic - woodworking machineries - sector. Over the recent years Biesse has undertaken various digitalisation projects related to I4.0 technological setting and other advanced IT contexts. The examination of Biesse case study is conducted using the Actor-Resource-Activities (ARA) analytical framework as proposed by the Business Network perspective (Håkansson & Snehota, 1995), in line with previous studies concerning intra and inter-organisational dimensions of project-related innovation (Pagano et al., 2021; Havenvid et al., 2017).

Theoretical background. *The ongoing digital transformation is reshaping firms and industries through the diffusion of new DTs (Hervás-Oliver, 2021). Within traditional IDs, which are characterised by a strong manufacturing specialisation, DTs, especially advanced ones related to the I4.0 paradigm (Hervás-Oliver, 2021), can be perceived both as opportunities and threats (Bellandi et al., 2019) by ID firms, as they require relevant adjustments in existing processes.*

While the geographic dimension of IDs might appear outdated in the context of digital transformation (Götz, 2020), previous studies (Götz & Jankowska, 2017) highlight how the intrinsic attributes of the district model - including cooperation, knowledge sharing and interaction processes - may favour the adoption of advanced DTs. Indeed, IDs hold the potential to vehicle business DTs (Götz & Jankowska, 2017; Grashof et al., 2019) as this transformation is “inherently embedded in a co-evolution of manufacturing processes, production systems, corporate strategies and social environment” (Götz, 2020: 58).

This kind of technological and organisational upgrading within ID may take different shapes in terms of initiatives, business partnerships, and projects promoted by both firms and institutions (Pagano et al., 2021). Studies have shown how change processes related to DTs commonly happen through projects (Baier et al., 2022), often stimulated by suppliers or IT partners (Pagano et al., 2021).

Within traditional IDs, large and medium-sized firms with required competencies are keener to exploit DTs in their processes (Bettiol et al., 2020; Ingstrup, 2014; Pagano et al., 2021). Leading firms in local networks have R&D functions and stronger absorptive capacity (Hervás-Oliver, 2022), which allow them to legitimise technologies, coordinate local networks, and influence the technological trajectory of the local ID (Hervás-Oliver, 2021; Ingstrup, 2014; Leick & Gretzinger, 2020). Leading firms often rely on technologies that are outside the district “thematic boundaries”, as innovation requires both the exploitation of local knowledge - what the literature has described as local buzz (Bathelt et al., 2004) - and the exploration of distant knowledge (Hervás-Oliver, 2021; Albors-Garrigos & Hervás-Oliver, 2019; Boschma & Ter Wal, 2007) - that is establishing global pipelines (Bathelt et al., 2004).

While the behaviour of leading firms within IDs, as well as their role of gatekeepers and orchestrators in innovation processes have been extensively explored in the literature (Bettiol et al., 2020; Hervás-Oliver, 2022; Albino et al., 1998), we argue that there is still a gap concerning the analysis of the development of their digitalisation processes in terms of main mechanisms, resources and partnering actors, inside and outside the ID/cluster.

Methodology. The methodology is qualitative and based on an exploratory case study. The case study methodology appears suitable to address the RQ that is processual in nature, with the objective to disentangle the main components of DTs adoption processes both at the company and ID level (Hervás-Oliver et al., 2018). The case under investigation is Biesse, a leading firm in the mechatronic industrial district in Pesaro, central Italy.

The Biesse case is analysed following the development of nine projects concerning DTs adoption over the last seven years (see Figure 1), starting from a “pilot” project in 2015. These projects represent the milestones of Biesse’s digital transformation journey. The selection of the projects has been possible thanks to the knowledge of the company gained during the last five years in the context of an ongoing research project, focussed on Digital Servitization strategy in Biesse Group.

For the specific purpose of this paper, data has been collected through three main sources: participant observation, direct interviews, and documental analysis. Information from the different sources have been triangulated.

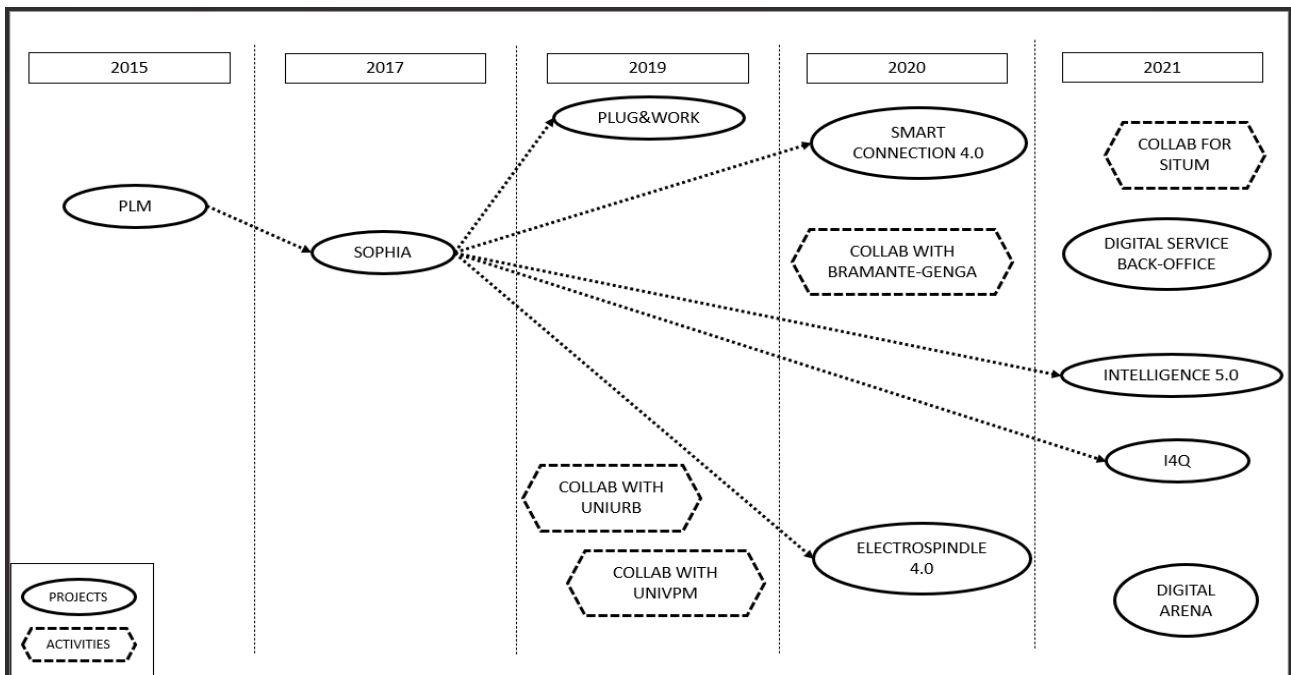

Data has been analysed following the ARA framework. For each project we analysed how the company engaged in relationships with actors inside and outside the ID, the main resources (both organisational and physical resources) and set of activities involved in the relationships. Approaching the RQ through ARA has already been proved effective in catching the complexity of the issue under investigation (Pagano et al., 2021; Pagani & Pardo, 2017).

Results. Biesse is a leading firm in its sector, with a strong orientation to innovation. The company registered over 200 patents and received recognition for its innovation capability in product and process technologies. In the last 10 years the company pursued an innovative path linked to a digital transformation process. Following a project-based approach, several initiatives took place over time (see Figure 1).

One of the first projects on digitalisation regards the implementation of a Product Lifecycle Management (PLM) technology to handle information and processes at every stage of the product/service lifecycle within the global supply chain. The project, started in 2015, was based on a collaboration with a distant actor, Siemens, which was chosen because of previous collaborations, advanced technological capabilities, and the opportunity to obtain an open solution. The goal was to optimise processes that in many cases were hybrid and unstructured, reduce errors and response times of inadequate systems, and provide information about products to all stakeholders within the company.

In 2017, exploiting the opportunities emerging from the I4.0 national plan and the PLM technology, Biesse officially started the SOPHIA project, a Digital Servitization strategy based on the Industrial Internet of Things (IIoT). SOPHIA is a digital platform enabling customers to adopt a range of services to simplify and rationalise work management. It was realised in partnership with the consultancy firm Accenture, selected for its long-term experience with innovative projects and the ability to contribute on both the technological and business dimensions. Microsoft was involved in the project as the supplier of cloud and route-engine systems, while a few local customers in the furniture sector took part in the pilot sessions of SOPHIA. This project represented a deep change in Biesse’s business model toward services and implied an internal reorganisation of roles and functions: a Service Innovation Unit was set up, as well as a sales team dedicated to services, new professional roles emerged as the Digital Marketing Manager and the Service Innovation Manager. SOPHIA allowed the social recognition of Biesse as a digitally transformed and I4.0 company and it accelerated its digital transformation process, triggering the emergence of collateral projects - also with new actors - within a wider business network.

Fig. 1: Main projects activated within the digital transformation path of Biesse

Source: Authors own elaboration

Among them, Biesse took part in the Plug & Work project in 2019, which connects eight leading firms in the woodworking sector between Italy and Germany to develop a common language for communication between machineries from different producers. Competences of each firm were shared in the project, coordinated by a German and a European sectoral association, and supported by producers in the UMATI (Universal Machine Tool Interface) league. During the same year, the digital transformation process of Biesse was reinforced by the collaboration with local universities. On the one hand, training activities on digital themes were settled with the University of Urbino. On the other hand, three Ph.D. students from the University of Urbino and the Marche Polytechnic University started collaborating with Biesse on digital and innovation research projects. Biesse thus strengthened existing relationships with universities in relation to its digitalisation process.

The year 2020 has been crucial in this process. Two new projects linked to SOPHIA were deployed. First, with the aim of increasing competences on the IIoT and supporting SMEs to adopt it, a joint project between Biesse and Orchestra arose - the Smart Connection 4.0 project - aimed at providing an integrated hardware and software solution to connect SOPHIA with the ERP system available by the customer. Orchestra is an innovative start-up from the Torino Polytechnic University. Second, a partnership was signed between Biesse, the Marche Region, the Marche Polytechnic University, La Sapienza University, and EN4 (a start-up from the Umbria Region) to join forces in the digital innovation process of the territory. The project named Electrospindle 4.0 involved the realisation of an interconnected electrospindle embedded in a digital productive process, from the supply chain to the final user. Concurrently, a new Organisational Unit was launched within Biesse, the Innovation Lab, which combines local and foreign resources. In particular, the Lab, meant as an innovation accelerator oriented toward Open Innovation, is made of Biesse, the AdlerInlight Technology Observatory in Israel, and Manifattura, a local innovative consultancy start-up. Manifattura, whose CEO already collaborated with Biesse on innovation projects via his previous career role, offers innovation and change management capabilities to drive an open innovation approach in the manufacturing sector. The new partnership with AlderInlight further contributes to open to international collaborations, aiming to achieve new innovation models. The effort of Biesse to achieve a territorial digital transformation was endorsed by the collaboration activated with a local high school, the Bramante-Genga, through which the firm and the institution train young students to become innovative woodworkers with a strong digital awareness.

The push to digitalisation of Biesse was further promoted in 2021, when it joined a project within the Horizon 2020 program named I4Q (Industrial Data Services for Quality Control in Smart Manufacturing), involving 24 actors from more than 10 European nations to control quality in smart production systems using IIoT. This project sprung from the interconnection opportunities given by the IIoT technology of SOPHIA on the one side, and the open innovation model realised within the Innovation Lab on the other. Contextually, a new project linked to the local territory started under the name of Intelligence 5.0. It consists of a partnership between Biesse, the Marche Region and the Marche Polytechnic University, with the goal to develop advanced IIoT solutions and collaborative sensors, therefore contributing to the generation of the so-called 'smart factories'. Such collaboration is the result of open innovation efforts initiated within the Innovation Lab and the expertise on IIoT technologies acquired via the SOPHIA project. In this scenario of 'diffused' digitalisation, Biesse continued the collaboration with local universities and companies by joining the SITUM project, aimed at promoting joint activities in the areas of innovation and internationalisation.

Finally, two more projects fostered the digital transformation of Biesse, which is still ongoing. One is the digitalisation of service back-office, originated by the partnership with two distant actors, Atlantic and Salesforce, and based on the co-design and development of a CRM platform to digitalise internal processes related to sales, marketing and communication, field service, and technical assistance. Here, partners were selected according to their global competences and the great experience in digitalisation processes. Also, Salesforce was already a partner of Biesse, with whom the CRM solution of the company was co-designed in 2008. The other one is the Digital Arena project, namely the web platform for integrated communication with stakeholders, through which it is possible to organise online events, live demo, training sessions. The Digital Arena was developed in partnership with Acanto, a local web marketing agency, with whom Biesse has a long-lasting business relationship. The role of Biesse IT department in these projects was crucial, in the light of its strong technical competences allowing the company to undertake internal activities and engage with key providers of digital solutions.

Preliminary discussions, conclusions and limitations of the research. The analysis of the digitalisation projects deployed by Biesse in the last seven years allows us to gain a preliminary understanding of the undertaking of such projects by leading ID firms and of the degree of involvement of local ID actors. The initial key insights are filtered through the three dimensions of the ARA framework (Håkansson & Snehota, 1995).

With regard to the actor dimension, it emerges how DTs-related projects are pushing towards distant-to-the-district contexts through the establishment of formalised relationships with external actors (Hervás-Oliver, 2021; Albors-Garrigos & Hervás-Oliver, 2019; Boschma & Ter Wal, 2007), such as business partners, consultancy agencies, and IT providers. These external actors are chosen in the light of previously established relationships (Havenvid et al., 2017) or for the specific expertise and knowledge on DTs-related projects. In some cases, as in the Plug & Work project, external actors are embedded in the project itself, as Biesse takes part in European projects focussed on innovation of the woodworking sector. At the same time, the formal involvement of few selected local actors takes place through ad hoc activities and formal collaborations (Mersico et al., 2022), as in the case of research activities undertaken in collaboration with local universities, the pilot testing of SOPHIA involving selected local ID firms, or the projects activated with Acanto and Manifattura.

Concerning the activity dimension, the analysis points out an interconnection among the projects implemented: the development of specific skills and knowledge within one project allows subsequent projects to be based on the newly created knowledge and technology (Havenvid et al., 2017). Moreover, inter and intra-organisational activities connected to DTs-related projects can be identified. From an inter-organisational perspective, Biesse shows the effort of a leading firm to develop activities with engaged local actors, such as universities and high schools, with whom a digitalisation-related knowledge dissemination process started. Internally, inter-organisational activities impacted the structure of the company, leading to an organisational reconfiguration (Cenamor et al., 2017).

Finally, in terms of resources, the case of Biesse highlights the need to access both internal and external ones. On the one hand, Biesse collected highly specialised resources from external actors, both close and distant in space, chosen for their particular know-how. On the other hand, building and reinforcing internal resources demonstrated paramount to embarking on and pursuing a digital transformation (Yeow et al., 2018). In Biesse, the leadership of the IT department, its strategic prominent role, and its deep knowledge facilitated the digital transition. The same is true for the Service Innovation Unit in the SOPHIA project that, with the key support of Accenture, developed internal resources related to digitalisation and IIoT, which allowed triggering new projects such as Plug & Work or Smart Connection 4.0.

These preliminary results represent a starting point as the research is still in progress. The future research steps concern further collection of data at the project level and an effort in conceptually developing a link between the digitalisation process and the project level, and the intra and inter-organisational dimensions of the evolution of leading ID firms, with the goal of contributing to the recent debate on digitalisation of IDs/clusters and ID/cluster firms (Bettiol et al., 2020; Albors-Garrigos & Hervás-Oliver, 2019) and more in general on knowledge development and exchange in IDs/clusters (Belussi & Sedita, 2012).

Managerial implications. At the managerial level, the explored case study presents some preliminary insights for industrial firms undertaking a digitalization journey. The adopted ARA framework reveals criticalities and strengthens of adopting DTs in terms of actors, resources, and activities. When considering the former, business relationships assume a crucial role to allow digitalisation projects' realisation; however, firms should be able to activate relationships on a double level, i.e., close and far from the district. Partners should be selected not only based on mutual trust and geographical proximity, but also considering their set of digital knowledge, the ability of growing together, and the potential added value they can bring to the final customer. In relation to activities, managers should demonstrate the ability to simultaneously orchestrate multiple projects with different partners, along with the internal monitoring of organisational activities. Finally, concerning resources, a dual effort of firms is asked in the attempt to successfully develop a digital transition: acquire new resources from the market in a continuous way, and deploy a learning-based approach aimed at internalising such resources with time and experience.

Originality of the paper. This research, though at its preliminary stage, presents elements of originality both in the investigated topic and in the adopted theoretical framework. Indeed, the research topic is original in the aim of exploring the role of leading ID firms in undertaking digitalization processes, with a focus on the link such firms have with the surrounding industrial context. Original is also the adoption of the ARA framework to explore this topic, which allows to highlight implications of digitalisation projects with a detailed and fine-grained lens.

Il diritto all'uguaglianza nelle strategie europee e nazionali. Un'indagine sul livello di allineamento delle cooperative italiane

NORA ANNESI* CHIARA DE BERNARDI* MASSIMO BATTAGLIA* MARCO FREY*

Inquadramento della ricerca. L'attenzione ai diritti umani è un tema al centro, da ormai molti anni, delle discussioni dell'Unione Europea. Nel 2012 e, successivamente, nel 2015, l'UE ha adottato il quadro strategico sui diritti umani e la democrazia volto a stabilire principi, obiettivi e priorità, tutti volti a migliorare l'efficacia e la coerenza della politica dell'UE in questi settori. Negli ultimi anni, però, causa l'inasprimento dei conflitti e l'emergere di nuovi rischi, i diritti umani sono stati seriamente messi in discussione. Nel 2020, l'UE ha emanato il nuovo piano d'azione sui diritti umani e la democrazia 2020-2024, che definisce prioritario rafforzare l'impegno dell'Unione a promuovere attivamente l'attuazione a livello globale dei principi guida delle Nazioni Unite su imprese e diritti umani e di altre linee guida internazionali pertinenti, quali le linee guida OCSE destinate alle imprese multinazionali. In questo contesto, nasce la direttiva 2022/2464 (sulla rendicontazione di sostenibilità) sottolinea il dovere di diligenza delle imprese ai fini della sostenibilità che invita le imprese ad attuare processi di attenuazione degli impatti negativi sui diritti umani e degli impatti ambientali negativi, ad integrare la sostenibilità nei loro sistemi di governo e di gestione, e ad inquadrare le decisioni aziendali in termini di diritti umani, impatto climatico e ambientale. All'interno della sfera dei diritti umani, le imprese sono tenute ad adottare una strategia in materia di diritti umani, basandosi sulle norme internazionali esistenti, ossia i Principi Guida delle Nazioni Unite su imprese e diritti umani, e la norma OCSE in materia di condotta d'impresa responsabile.

Tra i diritti umani, il diritto all'uguaglianza (Titolo III della Carta dei diritti fondamentali dell'EU / Art. 3 della Costituzione) merita particolare attenzione. Si parla di uguaglianza quando ci si riferisce, tra le altre, alla non discriminazione, in tutte le sue forme, alla diversità culturale, religiosa e linguistica, ai diritti del minore e degli anziani, alla parità tra donne e uomini, e all'inserimento delle persone con disabilità. La rilevanza di questi temi è provata anche dal loro inserimento sia all'interno del PNRR (Piano Nazionale di Ripresa e Resilienza) del 2021, che denomina la missione M5 "inclusione e coesione", sia nell'Agenda 2030 dove il tema dell'uguaglianza è fortemente presente. Citiamo, ad esempio, l'SDG 5, che si pone come obiettivo quello di raggiungere l'uguaglianza di genere, l'SDG 8, che punta ad ottenere una crescita economica inclusiva, garantendo un lavoro dignitoso per tutti, o l'SDG 10, che mira a ridurre la disparità nei redditi e nelle opportunità, promuovendo l'inclusione sociale, economica e politica di tutti. Se si sposta l'attenzione a livello italiano, l'inquadramento legislativo è complesso e in continuo aggiornamento. Citiamo, oltre alla sopracitata Costituzione, la legge 125/1991 sulle pari opportunità e azioni positive, il Codice delle Pari Opportunità (D.Lgs. 198/2006) e la legge 162/2021, che aggiorna tale codice. Infine, la UNI PDR 125:2022, la prassi di riferimento che definisce le linee guida sul sistema di gestione per la parità di genere.

Da questa premessa normativa emerge, quanto più, che, per quanto riguarda il diritto all'uguaglianza e, più in generale, i diritti umani, i diversi attori si trovano di fronte una spinta istituzionale significativa (Di Maggio and Powell, 1983; Scott, 1987; Scott, 2008). Qualsiasi sia la sua declinazione, per il suo raggiungimento, le imprese, sappiamo, hanno un ruolo fondamentale. Esse, quale strumento principale per la creazione di posti di lavoro, dovrebbero offrire condizioni lavorative dignitose attraverso tutta la catena del valore, soprattutto per i gruppi svantaggiati, ridistribuendo in modo più equo gli stipendi fra i propri dipendenti. Esse sono anche chiamate ad adottare politiche interne e procedimenti che garantiscano gli stessi diritti ed opportunità lavorative alle donne rispetto alla componente maschile, e ad investire esternamente in programmi di emancipazione economica per donne e ragazze, incentivando così la crescita economica e lo sviluppo sociale. Sebbene ci sia ancora molto da fare, le imprese stanno adottando sempre più questo orientamento strategico. Esistono però società che hanno, per natura, un fine mutualistico e non lucrativo: le società cooperative. Una "cooperativa" è un'organizzazione incentrata sulle persone che, fornendo beni e servizi, genera profitti (Heras-Saizarbitoria, 2014). Secondo i principi cooperativi a cui questo tipo di

organizzazioni devono aderire e promulgati dall'Alleanza Internazionale delle Cooperative (ICA), le cooperative si caratterizzano per natura per controllo democratico da parte dei soci e per una libera adesione (senza alcuna discriminazione sessuale, sociale, razziale, politica e religiosa) da parte di tutti coloro che sono aperti alle responsabilità che tale adesione comporta. Le cooperative dovrebbero, secondo i principi ICA, investire anche nell'istruzione e nella formazione per i loro membri, consentendo di contribuire in modo più efficace allo sviluppo sostenibile dell'organizzazione. Le cooperative tendono, quindi, naturalmente ad operare per lo sviluppo sostenibile delle loro comunità (Giagnocavo; 2011). In questo senso, il naturale orientamento alla sostenibilità dovrebbe sottendere una attenzione e un impegno verso la dimensione sociale della stessa.

Obiettivo del paper. Obiettivo del paper è comprendere quale sia la situazione attuale e quali sono gli orientamenti delle cooperative rispetto alle tematiche dei diritti umani e, in particolare, del diritto all'uguaglianza. Attraverso una ricerca esplorativa condotta su 1744 cooperative, lo studio risponde alle seguenti domande di ricerca: cosa stanno facendo le cooperative italiane per garantire il diritto di uguaglianza? Quali sono i margini di miglioramento?

Dato il forte orientamento sociale di questi attori, è fondamentale poter fare una ampia riflessione su come il sistema cooperativo si stia muovendo nei confronti delle sfide della sostenibilità e delle varie trasformazioni ad esse associate. L'Italia vuole pienamente allinearsi a questa visione strategica (della direttiva sopracitata, delle linee guida OCSE, ecc.), perché tale prospettiva costituisce un'opportunità per riallineare la ripresa e i nostri percorsi di crescita al quadro europeo. Le imprese sono chiamate ad essere protagoniste di questa evoluzione e, tra di esse, c'è ampio spazio per il sistema delle cooperative, da sempre orientato ad un'economia solidale e sostenibile. Il paper vuole quindi: (1) fornire un assessment sullo stato attuale delle cooperative dal punto di vista della sostenibilità sociale, letta attraverso la dimensione del diritto all'uguaglianza, (2) affermarsi come una guida per tutte quelle cooperative che non hanno ancora declinato il proprio contributo al tema e (3) mostrare al sistema cooperativo i propri margini di miglioramento in termini di diritto all'uguaglianza e, più in generale, di impegno verso la sostenibilità sociale.

Metodologia. Per rispondere agli obiettivi sopracitati, è stata svolta un'indagine di tipo quali-quantitativo che ha visto la somministrazione di un questionario. Il campione delle cooperative di riferimento è stato individuato cercando di raggiungere più realtà possibili. Per questo motivo, è stata individuata la Confederazione Cooperative Italiane (Confcooperative), la principale organizzazione di rappresentanza del mondo cooperativo e delle imprese sociali italiane. Confcooperative ha, da anni, in atto un percorso strategico nel campo della sostenibilità che sta progressivamente diventando più profondo e capillare, e che mira ad orientare e supportare le cooperative e imprese aderenti. Il questionario (Appendice), utilizzato per indagare come le cooperative si stiano muovendo nei confronti della sostenibilità, è stato articolato in 3 macro sezioni: (i) intergenerazionalità e parità di genere; (ii) lavoro dignitoso e welfare; (iii) impegno per l'inclusione e la parità. Al fine di indagare in profondità la situazione attuale delle cooperative rispetto alle tematiche dei diritti umani analizzate nella ricerca, nella terza sezione, si è inclusa una domanda a risposta aperta, così da permettere un'analisi di tipo qualitativo.

Il questionario è stato pre-testato con il supporto di tre cooperative, di diverse dimensioni. Questo ha permesso di ottenere un feedback sulla completezza del questionario e quindi di riscrivere le domande se necessario per evitare eventuali discrepanze. Il questionario è stato somministrato nel 2020 e le risposte sono state raccolte attraverso una piattaforma online. L'anonimato degli intervistati è stato garantito, come consigliato da Nederhof (1985). Il questionario è stato somministrato a 13.789 cooperative e imprese sociali. Complessivamente, 1.744 hanno fornito risposte complete al questionario, con un tasso di risposta pari al 13%. Osservando la dimensione dei rispondenti, il campione è rappresentato dal 4% di cooperative di grandi dimensioni¹, dall'81% di piccole e di medie dimensioni² e dal 15% di micro³.

Allo scopo della ricerca è quindi stata quindi condotta una prima analisi sulle domande a risposta chiusa che consentisse di fornire un overview del contesto cooperativo in Italia. Una seconda analisi si è focalizzata sui contenuti della domanda a risposta aperta allo scopo di scendere nel dettaglio dei progetti e delle iniziative che le cooperative identificano come prioritari rispetto al diritto all'uguaglianza. Secondo un approccio induttivo, i ricercatori hanno quindi individuato gruppi di iniziative omogenee e le hanno classificate in categorie allo scopo di dettagliare i contenuti scoprendone obiettivi, attori chiave, destinatari o beneficiari e strumenti adottati.

I risultati che seguono, in questo senso, forniscono una lettura quali-quantitativa del fenomeno indagato.

Risultati. I risultati che seguono presentano il dettaglio dello stato della situazione delle cooperative italiane rispetto al diritto all'uguaglianza. Questa prima parte permette di delineare il reale quadro di implementazione di pratiche e azioni, attuali e future, relative al raggiungimento di tali diritti.

In primis, l'inclusione e la valorizzazione dei giovani e delle donne è un tema cruciale. Come si evince dalla figura 1, le cooperative con una significativa componente giovanile sono solamente il 2,5%. All'estremo opposto, quasi il 23% del campione dichiara di non avere giovani. Con riferimento al numero di giovani che occupano posizioni dirigenziali, in $\frac{3}{4}$ delle cooperative non vi è nessuna figura (Figura 2). Questo trend cambia quando si guarda al numero di donne

¹ Occupano oltre 250 occupanti, il cui fatturato annuo supera i 50 milioni di euro oppure il cui totale di bilancio annuo supera i 43 milioni di euro

² occupano meno di 250 persone, il cui fatturato annuo non supera i 50 milioni di EUR oppure il cui totale di bilancio annuo non supera i 43 milioni di euro

³ occupano meno di 10 persone, il cui fatturato annuo non supera i 2 milioni di EUR oppure il cui totale di bilancio annuo non supera i 2 milioni di euro

dirigenti, con un 27,6% delle cooperative in cui vi è una prevalenza di tali figure e con un 14,8% che arriva ad averne più dei ¾. Anche in questo caso, la classe prevalente, rimane comunque quella in cui non vi è nessuna donna dirigente (Figura 3).

A questi dati che fotografano la situazione delle cooperative, se ne aggiungono alcuni di pianificazione (Figura 4 e 5). L'individuazione di obiettivi di aumento generale di queste componenti è più diffusa: se nel caso dei giovani, arriva fino al 44,7%, nel caso della parità di genere è leggermente inferiore, con un 35,5%.

Il lavoro dignitoso è un altro tema rilevante con riferimento all'uguaglianza. Tra le varie domande poste nella seconda sezione del questionario, merita attenzione quella relativa alle scelte organizzative e alla gestione delle persone all'interno della cooperativa e della catena di fornitura. Si ricorda, a tal proposito, che la direttiva 2022/2464 sottolinea l'importanza dell'attenzione al rispetto dei diritti umani secondo una prospettiva sia interna che esterna all'organizzazione. Come si evince dalla figura 6, c'è una forte attenzione delle cooperative con riferimento alla dimensione interna. Se il 40,4% del campione (705 cooperative) dichiara di essere molto attento a sviluppare un corretto work-life balance per i dipendenti, il 45,8% si impegna molto nella gestione della maternità/paternità, e il 41,2% è attento nel valorizzare le diversità all'interno della cooperativa, facendone un punto di forza. I dati mostrano, però, che questo livello interno di attenzione non è pari per quanto riguarda la dimensione esterna: solamente il 4,8%,

84 cooperative su 1744, afferma di stimolare i fornitori ad un'etica gestione dei lavoratori. Una quota significativa, il 41%, dichiara invece di non farlo per nulla o poco. È forte quindi il segnale di come l'impegno alla gestione delle risorse umane, che appare ancora circoscritto all'interno cooperativa stessa, sia da estendere alle rispettive sfere di influenza, cominciando dalla catena di fornitura.

Con riferimento alla terza sezione del questionario, emergono situazioni interessanti. Per quanto riguarda la parità di genere, al fine di capire nel dettaglio il significato attribuito a tale diritto dalle cooperative, si è chiesto se ci fossero dei piani specifici per migliorarne la qualità. La tabella 1 mostra che, per tutti i piani quali, ad esempio, la parità nei processi decisionali, o la sensibilizzazione e formazione del personale rispetto a tali tematiche, la maggioranza del campione dichiara di avere un impegno nella media. Tra le iniziative indagate, merita attenzione quella relativa alla conciliazione degli impegni lavorativi con la vita privati, con il 36,9% e il 17,1% di cooperative che dichiarano un impegno, rispettivamente, forte e fortissimo.

Tab. 1: Avete dei piani specifici per migliorare la parità di genere. Indicare con quale informazione siete d'accordo con le seguenti affermazioni

	Per nulla	Poco	Mediamente	Molto	Moltissimo	Totale
Pari opportunità nel processo decisionale relativo alle posizioni lavorative messe a concorso	14,5%	10,1%	32,2%	28,3%	14,9%	100%
Promozione delle pari opportunità nello sviluppo professionale	9,2%	8,4%	31,8%	33,5%	17,1%	100%
Organizzazione del lavoro orientata a favorire la conciliazione tra gli impegni professionali e la vita privata	7,5%	6,7%	31,7%	36,9%	17,4%	100%
Individuazione dei fenomeni di violenza di genere all'interno dell'organizzazione con messa in mora dei responsabili e tutela delle vittime	18,2%	10,0%	25,6%	27,7%	18,5%	100%
Sensibilizzazione di tutto il personale relativamente ai temi delle pari opportunità	12,7%	11,5%	32,3%	28,1%	15,4%	100%

Focalizzandosi sull'inclusione e la parità – sull'uguaglianza – in termini più ampi, ed in linea con le domande della sezione 2, è stato chiesto al campione, che livello di impegno avesse la loro cooperativa in termini di valorizzazione delle diversità. I risultati (Figura 7) mostrano come, in aggiunta alla parità di genere, le cooperative dichiarano di impegnarsi molto (31,8%) e moltissimo (24,7%) nell'inclusione delle persone fragili. In generale, si può affermare che emerge una significativa volontà delle cooperative di essere attente a questi temi con circa l'80% delle cooperative che dimostra di impegnarsi, almeno mediamente, in tutte le categorie.

Fig.7 - L'impegno della cooperativa in termini di valorizzazione della sostenibilità

Per comprendere più in profondità come le cooperative si impegnano per il raggiungimento del diritto all'uguaglianza, in tutte le sue forme, sono state raccolte le descrizioni di alcune iniziative di inclusione e di pari opportunità svolte dalle cooperative. L'analisi condotta ha consentito di individuare l'insieme delle azioni attraverso cui le cooperative gestiscono e valorizzano le disuguaglianze. L'analisi ha portato in particolare all'identificazione di due principali categorie di azioni, quali quelle relative alla (1) dimensione organizzativa interna e alla (2) dimensione sociale esterna. Tali categorie identificano la capacità della cooperativa di impattare all'interno o all'esterno della propria organizzazione.

Per ognuna delle due dimensioni sono quindi stati individuati due livelli di sub-categorie di cui il primo finalizzato ad identificare i temi di azione ed il secondo finalizzato ad identificare le singole azioni implementate (fig. 8).

LA DIMENSIONE ORGANIZZATIVA INTERNA

Oltre il 50% delle azioni mappate afferiscono alla dimensione organizzativa dell'impresa e sono relative ai temi "parità", "governance" e "flessibilità".

La parità

Il diritto è l'uguaglianza è stato individuato da alcune cooperative in una parità letta a 360° senza distinzione o priorità tra le diversità legate al sesso, la razza, l'orientamento sessuale o religioso e la cultura. La parità è stata definita embedded ovvero pienamente incorporata nei principi e nel modus operandi della cooperativa. In questo senso non è stato identificato nessun particolare progetto finalizzato a tutelare la parità perché già pienamente integrata a livello organizzativo:

"Dovendo organizzare il comparto delle risorse umane secondo criteri di titoli richiesti dagli accreditamenti,

l'unico elemento che gioca a favore o sfavore di una nuova assunzione è il possesso dei requisiti richiesti, il sesso, l'orientamento sessuale, la religione e la provenienza non hanno mai costituito un elemento di scelta e men che meno di discriminare"

(Cooperativa di medie dimensioni attiva nel settore sociale)

Altre cooperative che hanno interpretato il diritto all'uguaglianza attraverso un concetto di parità generalizzato, hanno invece dichiarato di utilizzare l'organizzazione di eventi, seminari e momenti di formazione e sensibilizzazione come strumenti per aumentare la consapevolezza dei propri dipendenti sui temi della diversità e per facilitare la gestione della stessa nella loro organizzazione, in particolare:

"Organizziamo corsi di formazione interni con cadenza bimestrale su temi relativi a tecniche di gestione dei conflitti e delle obiezioni, a tecniche di comunicazione efficace e alla promozione del dialogo interculturale"

(Cooperativa di medie dimensioni attiva nel settore della formazione)

La governance

All'interno della dimensione organizzativa alcune cooperative hanno identificato nel modello di governance adottato la propria strategia per gestire e valorizzare le disuguaglianze presenti. L'adesione ai principi dello standard

SA 8000 relativo al rispetto dei diritti umani universalmente riconosciuti è stato più volte identificato come strumento e come garanzia della propria attenzione e rispetto delle disuguaglianze:

“La cooperativa è certificata SA8000 dal 2012 ed è molto attenta all'inclusione e alle pari opportunità e più precisamente; nell'accesso al lavoro; nella retribuzione; nelle prestazioni lavorative e nella carriera”

(Cooperativa di medie dimensioni attiva nel settore della salute)

All'interno delle imprese che hanno identificato nel proprio modello di governance la strategia per la gestione delle disuguaglianze, alcune hanno parlato di processi decisionali condivisi. In particolare il coinvolgimento di tutti i dipendenti costituisce l'elemento di forza di questo gruppo di cooperative. Il processo decisionale descritto può considerare la partecipazione di tutti i dipendenti al CdA (dichiarato soprattutto dalle piccole cooperative) o può essere il risultato di un esercizio di ascolto costante dei propri dipendenti allo scopo di includere tutte le prospettive dell'organizzazione:

“Ogni settimana Presidente e vicepresidente dedicano un'ora ai singoli dipendenti per richieste o altro, una volta al mese viene organizzata la riunione con tutti i dipendenti per aggiornarli sulla situazione della cooperativa, infine le assemblee per il bilancio sociale sono aperte a tutti”

(Cooperativa di piccole dimensioni attiva nella cura degli spazi verdi)

Flessibilità

La flessibilità lavorativa è lo strumento attraverso cui le cooperative principalmente assicurano che le singole esigenze legate alla “diversità” siano rispettate e che i propri dipendenti non siano esclusi per una rigidità strutturale. Le cooperative individuano due principali tipologie di esigenze che portano i dipendenti a chiedere variazioni sull'organizzazione ordinaria del lavoro. Le esigenze familiari quali nuove nascite, cura dei propri cari o di altro tipo portano i dipendenti a riorganizzare la propria vita lavorativa e la flessibilità garantita dalla cooperativa consente di annullare le differenze e continuare a svolgere il proprio operato in linea con nuove esigenze:

“In caso di maternità si mettono in atto tutte le modalità che possano agevolare il rapporto lavoro e famiglia”

(Cooperativa di medie dimensioni attiva nel settore agricolo)

La flessibilità lavorativa tutela le differenze anche quando sono legate a temporanee o minoritarie esigenze culturali. Le cooperative assicurano il rispetto delle diversità attraverso la ri-modulazione di orari e turni durante il periodo di ramadam, l'attenzione alle abitudini alimentari dei vari gruppi religiosi allo scopo di rendere i pasti un momento di aggregazione per tutti e la possibilità di indossare l'abbigliamento che rende a proprio agio i dipendenti:

“Nella RSA di un ente religioso cattolico lavora una operatrice musulmana con velo. A volte ciò è difficilmente accettato per il retaggio culturale degli assistiti anziani del territorio”

(Cooperativa di medie dimensioni attiva nei servizi socio-assistenziali)

Empowerment

Le iniziative di empowerment messi in piedi dalla cooperativa per includere giovani, fragili e donne passano attraverso processi finalizzati a potenziare il capitale umano attraverso una formazione mirata o attraverso l'inserimento lavorativo, all'interno della propria organizzazione, di soggetti fuori dal mercato del lavoro.

I processi di formazione finalizzati alla crescita professionale sono rivolti, la gran parte delle volte, a personale strutturato della cooperativa. Lo strumento di formazione è utilizzato come strategia per aumentare la responsabilità a giovani dipendenti che non hanno ancora compreso il proprio potenziale o a donne al rientro dalla maternità:

“viene stimolato in ogni dipendente, di tutti i generi, la possibilità di acquisire nuove competenze. In particolare, il Cda propone iniziative di formazione volte a dare incarichi e responsabilità a giovani e donne”

(Cooperativa di medie dimensioni attiva nei servizi ambientali)

Altre iniziative di empowerment sempre rivolte alla dimensione interna della cooperativa riguardano l'assunzione di nuovo personale a valle di processi di formazione mirati. I soggetti destinatari di tali percorsi formativi sono principalmente quelli identificati come fragili perché appartenenti a categorie socialmente emarginate quali extra-comunitari, ex-detenuati, ex-dipendenti o donne che hanno subito violenza. La definizione dei processi di formazione parte da attività di assessment finalizzate a potenziare i soggetti individuati:

“la cooperativa preferisce avvalersi dell'impiego di mediatori culturali per individuare la formazione necessaria all'inserimento lavorativo”

(Cooperativa di grandi dimensioni attiva nei servizi di pulizia)

DIMENSIONE SOCIALE ESTERNA

Il 45% delle azioni mappate ha la capacità di fornire un contributo alla promozione e gestione delle diversità all'esterno del contesto cooperativo. Tali azioni sono state raggruppate in tre aree omogenee quali: “partnership”, “servizi offerti” ed “empowerment”

Partnership

Le cooperative hanno individuato tra i progetti speciali finalizzati a promuovere, gestire e valorizzare l'inclusione, l'importanza delle partnership con attori o reti locali che hanno potenziato la loro singola capacità di azione. I progetti presentati hanno mostrato attenzione ai più vari temi, ma soprattutto hanno messo in luce l'importanza di alcuni attori locali che sono stati individuati in modo trasversale da tutte le cooperative. In particolare sono stati individuati: servizi sociali, le comunità montane, gli enti amministrativi comunali, le agenzie di mediazione, le imprese private, enti di ricerca, sindacati, enti amministrativi regionali, scuole e la Commissione Europea.

Tra i progetti finalizzati all'inserimento lavorativo di soggetti fragili presso enti, organizzazioni o realtà diverse dalla cooperativa vengono spesso individuate capacità artigianali che consentono l'indipendenza economica di chi ne prende parte e vengono stimulate iniziative imprenditoriali:

“Insieme ad una impresa locale abbiamo avviato l'inserimento lavorativo di donne fragili in progetto di circolarità e laboratorio sartoriale”

(Cooperativa di medie dimensioni attiva nel settore della formazione)

Altre partnership sono state indicate come funzionali per lo sviluppo di progetti di inclusione sociale finalizzati ad avvicinare la comunità di cittadini ad un gruppo minoritario di diversa etnia, a promuovere i diritti LGBT, a favorire la comunicazione tra soggetti provenienti da diverse aree del mondo o lo sviluppo del linguaggio:

“lavoriamo con le scuole per creare prodotti che rendano accessibile l'informazione e la lettura per l'infanzia, pensati soprattutto per bambini con difficoltà di comunicazione e bambini stranieri”

(Cooperativa di piccole dimensioni attiva nel settore della comunicazione)

Servizi offerti

Il gruppo di iniziative identificate all'interno della voce servizi offerti fa principalmente riferimento all'organizzazione di eventi finalizzati all'inclusione sociale o alla sensibilizzazione su tematiche specifiche destinati alle comunità di cittadini su cui la cooperativa opera.

Tra gli eventi di inclusione sociale è importante il riferimento di molte cooperative al tema della disabilità. La cultura e gli spettacoli sono spesso il veicolo attraverso cui il messaggio di uguaglianza è trasferito alle comunità.

Gli eventi organizzati possono portare alla trattazione di più argomenti che caratterizzano la diversità e l'esclusione sociale:

“lo spettacolo è focalizzato sul tema degli stermini razziali. Attraverso il linguaggio della danza e della recitazione, attori e ballerini professionisti si esibiscono a fianco di comparse composte da persone fragili e l'obiettivo del progetto è quello di portare avanti valori e conoscenze pulite”

(Cooperativa di piccole dimensioni attiva nel settore della cultura)

Allo stesso modo le cooperative hanno indicato l'adesione e l'organizzazione di giornate focalizzate sulla sensibilizzazione delle comunità su temi specifici relativi alle diversità:

“abbiamo organizzato una giornata di sensibilizzazione promossa per i soci e aperta al pubblico in collaborazione con altre realtà del Terzo Settore del territorio di riferimento sul tema dell'inclusione con animazione, giochi e attività”

(Cooperativa di medie dimensioni attiva nel settore culturale)

Empowerment

L'empowerment, raccontato dalle cooperative, attraverso le proprie iniziative finalizzate ad avere un impatto all'esterno della propria organizzazione, è fortemente legato al concetto di formazione. Gran parte delle iniziative di formazione ha lo scopo di potenziare gli individui fragili (donne vittime di violenza, donne con minori a carico, migranti, ...) per renderli più sicuri di loro stessi (corsi di autodifesa) o per renderli idonei al mercato del lavoro. Questi tipi di percorso si caratterizzano per una minore strutturazione del processo; non vi è quindi un diretto e certo inserimento lavorativo:

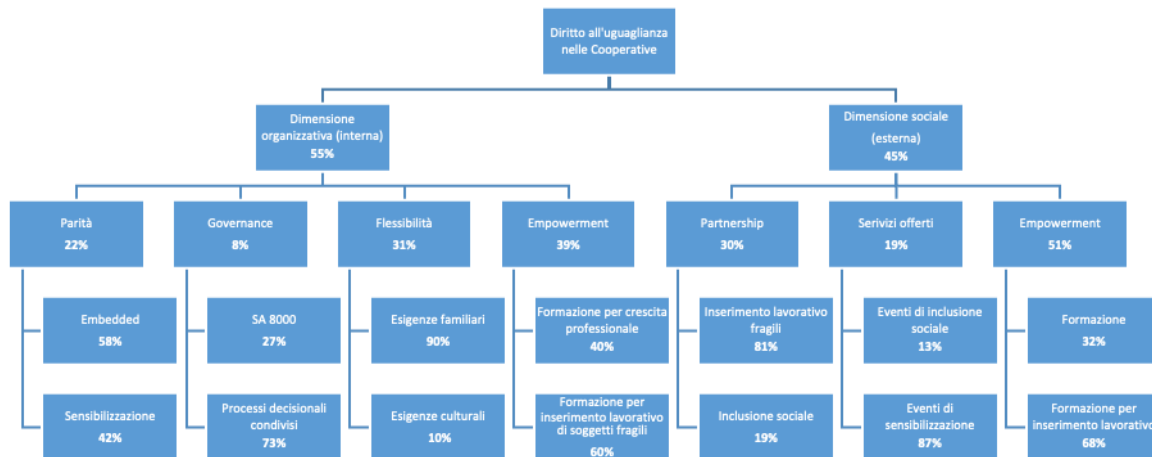

“Effettuiamo corsi di formazione professionale finalizzati anche all'inclusione di giovani e ragazzi/e in condizioni di svantaggio sociale, anche segnalati dai servizi sociali istituzionali” (Cooperativa di piccole dimensioni attiva nel settore della formazione)

La formazione finalizzata all'inserimento lavorativo in contesti esterni alla cooperativa invece si basa sulla definizione di percorsi di formazione concordati che mirano a rendere il soggetto fragile formato per uno specifico tipo di mansione:

“forniamo corsi di formazione in olivicoltura, sartoria, cameriere di sala ed agricoltura rivolti a soggetti svantaggiati con inserimento lavorativo nelle aziende del territorio”

(Cooperativa di piccole dimensioni attiva nel settore dell'agricoltura)

Figura 8 - I risultati

Limiti della ricerca. L'analisi condotta presenta dei limiti che costituiscono spunti e obiettivi per il miglioramento della ricerca.

In primo luogo, metodologicamente, la costruzione del questionario ha risposto maggiormente a logiche di indagine investigativa finalizzata a preparare il terreno ad una più strutturata ricerca. In questo senso, sul breve periodo è prevista una analisi più dettagliata e metodologicamente strutturata della ricerca.

L'analisi ha inoltre preso in considerazione una sola confederazione di cooperative. L'analisi comparata dei risultati mostrati con altre confederazioni di cooperative potrebbe fornire risultati interessanti. È infatti opportuno sottolineare che le confederazioni sono il risultato di un processo storico e culturale di adesione di cooperative che sponano una specifica linea politica. In questo senso non è da escludere che altre unioni di cooperative possano essersi orientate su iniziative e progetti differenti.

Infine, un'altra criticità è legata al numero di fonti analizzate. La ricerca è attualmente priva di una triangolazione di dati che potrebbe rafforzare il quadro disegnato. L'analisi dei sistemi di reportistica redatti, dei canali web e social delle singole cooperative, e ulteriori informazioni raccolte per mezzo intervista, potrebbero integrare e completare il quadro in modo più esaustivo.

Implicazioni manageriali. Le implicazioni manageriali che possono essere dedotte dall'analisi condotta sono principalmente applicabili al mondo cooperativo o possono fornire una guida per la definizione di policy CSR di altre tipologie di imprese.

In un contesto italiano, ma soprattutto, europeo, in continua evoluzione per quanto riguarda queste tematiche e le normative sul tema, le cooperative potrebbero aver bisogno di un quadro di riferimento più chiaro e di "spunti" pratici da chi ha già avviato il proprio percorso. L'introduzione di iniziative di questo tipo può costituire un processo di miglioramento che, se monitorato, può costituire un tema importante per la comunicazione verso l'esterno e per la rendicontazione del proprio impegno. Il sample analizzato suggerisce che le cooperative, e più in generale le organizzazioni, possono fare molto, sia nella dimensione organizzativa sia in quella sociale, per fornire il proprio contributo.

La ricerca mostra come l'attenzione ai temi dell'uguaglianza necessiti sia una integrazione formale e formalizzata all'interno dei propri sistemi di governance, anche stravolgendoli, sia della creazione di reti territoriali con altri partner strategici attivi sui temi o che possano fungere da facilitatori. In quest'ottica, i dati informano che le azioni messe in campo nella dimensione interna sono più numerose rispetto a quelle nella dimensione esterna. Questo elemento prova, da un lato, la scarsa consapevolezza del proprio potenziale impatto sull'esterno e, dall'altro l'adeguatezza dei piani d'azione europei in materia di diritti umani, che invitano gli attori ad agire lungo tutta la catena di fornitura e non "limitare" le azioni all'interno dei loro confini. Pertanto, se lo studio dimostra che le cooperative si stanno organizzando per allinearsi a questa visione, solo poco più del 20% dichiara un impegno forte o fortissimo (fig.6). Le azioni descritte vogliono essere un primo spunto di riflessione per i manager e soci che mirano all'implementazione di un percorso strategico rispettoso dei diritti umani.

Originalità del paper. Il significativo numero di risposte ottenute con il questionario costituisce un elemento distintivo della ricerca, permettendo di delineare un quadro esaustivo del contesto cooperativo e mettendo in luce l'interesse delle cooperative a partecipare ad indagini mirate sul tema.

Inoltre, secondo la conoscenza degli autori sono pochi o assenti i contributi scientifici che analizzano in modo qualitativo, su così larga scala, le iniziative e le pratiche adottate dalle cooperative sul tema.

Molte cooperative infatti individuano la piccola dimensione (in realtà spesso superiore ai 10 dipendenti) nella causa di una mancanza o carenza di iniziative.

In linea generale, sono molteplici i contesti pubblici e privati che possono focalizzare l'attenzione sui temi dell'uguaglianza anche, semplicemente, ripensando la modalità di erogazione dei propri servizi o di gestire il proprio core-business. Le organizzazioni dovrebbero considerare la capacità di contribuire al tema attraverso specifiche

azioni, e, ove possibile, attraverso la formalizzazione di routine in grado di integrare in modo ufficiale e sistematico tali impegni.

Le azioni individuate sono infatti troppo spesso il risultato di processi informali che rischiano di perdersi in periodi di crisi, di contrazione della cooperativa o dell'organizzazione o nel momento di un cambio dei vertici aziendali. L'assenza di una formalizzazione, rende ancora più rari i casi in cui tali iniziative sono monitorate nel loro impatto, interno ed esterno. L'applicazione di sistemi di monitoraggio, anche non strettamente connessi alle iniziative implementate, potrà contribuire alla loro potenziale crescita.

Parole chiave: uguaglianza; inclusione; sistema cooperativo; diritti umani.

Appendice

Questionario.

SEZIONE 1. INTERGENERAZIONALITÀ E PARITÀ DI GENERE.

- A) Quanti sono i giovani (under 35) che oggi lavorano nella cooperativa (%)
- Non sono presenti under 35
 - La presenza di under 35 non è prevalente ma è comunque rilevante (>20%)
 - La presenza di under 35 non è prevalente ma è comunque molto rilevante (>35%)
 - La presenza di under 35 è prevalente (>50% ma <75%)
 - La presenza di under 35 è fortemente maggioritaria (>75%)
- B) Quanti di loro hanno un ruolo dirigenziale (% su ruoli chiave)
- Nessuno
 - >20%
 - >35%
 - >50% ma <75%
 - >75%
- C) Quante sono le donne che ricoprono ruoli dirigenziali (% su ruoli chiave)
- Nessuno
 - >20%
 - >35%
 - >50% ma <75%
 - >75%
- D) Avete obiettivi e piani per aumentare la quota di giovani e/o di donne
- Quota giovani
- Nessun Piano
 - Obiettivo di aumento generale
 - Obiettivo quantificato
 - Piano generale
 - Piano con azioni dettagliate
- Quota donne
- Nessun Piano
 - Obiettivo di aumento generale
 - Obiettivo quantificato
 - Piano generale
 - Piano con azioni dettagliate

SEZIONE 2: LAVORO DIGNITOSO E WELFARE

- A) La cooperativa ha messo in campo specifici programmi per migliorare la qualità del lavoro dei propri dipendenti
- Nulla di specifico
 - Impegno generale
 - Programmi soprattutto connessi alla pandemia
 - Abbiamo da sempre programmi specifici
 - Programmi specifici di cui verifichiamo l'impatto
- B) Quanto misurate la soddisfazione dei vostri lavoratori
- Nessuna misurazione
 - Misurazioni qualitative e sporadiche
 - Misurazioni quali/quantitative non sistematiche
 - Misurazioni sistematiche quali/quantitative
 - Svolgiamo indagini di clima periodicamente
- C) Con riferimento alle scelte organizzative e alla gestione delle persone all'interno della vostra cooperativa e nella gestione della catena di fornitura siete d'accordo con le seguenti affermazioni?
- Conciliamo al meglio il tempo di vita e il tempo di lavoro dei nostri dipendenti
- Per nulla
 - Poco
 - Mediamente
 - Molto
 - Moltissimo
- Prima, durante e dopo la maternità/paternità agevoliamo al meglio il reinserimento del genitore
- Per nulla
 - Poco
 - Mediamente
 - Molto
 - Moltissimo
- Valorizziamo al meglio le diversità come ricchezza della nostra organizzazione
- Per nulla
 - Poco
 - Mediamente
 - Molto
 - Moltissimo
- Tutti i lavoratori della cooperativa hanno pari opportunità nei percorsi di sviluppo/cARRIERA in relazione alle loro effettive capacità

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Stimoliamo i nostri fornitori a fare altrettanto

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

D) Con riferimento al welfare aziendale all'interno della vostra cooperativa con quale affermazione siete d'accordo?

Esiste una policy di welfare aziendale?

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

I dipendenti possono disporre di un pacchetto di benefit sociosanitari

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Esistono spazi dedicati al benessere personale (palestra biblioteca, spazi collettivi)

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Esiste un asilo nido

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Vengono incentivate forme di volontariato aziendale

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

SEZIONE 3. IMPEGNO PER L'INCLUSIONE E LA PARITÀ

A) Quanto reputate che la vostra cooperativa si impegni in termini di valorizzazione delle diversità

Genere

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Età

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Nazionalità

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Religione

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Persone fragili

- Per nulla

- Poco
- Mediamente
- Molto
- Moltissimo

B) Avete dei piani specifici per migliorare la parità di genere. Indicare con quale informazione siete d'accordo con le seguenti affermazioni:

Pari opportunità nel processo decisionale relativo alle posizioni lavorative messe a concorso

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Promozione delle pari opportunità nello sviluppo professionale

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Organizzazione del lavoro orientata a favorire la conciliazione tra gli impegni professionali e la vita privata

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Individuazione dei fenomeni di violenza di genere all'interno dell'organizzazione con messa in mora dei responsabili e tutela delle vittime

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

Sensibilizzazione di tutto il personale relativamente ai temi delle pari opportunità

- Per nulla
- Poco
- Mediamente
- Molto
- Moltissimo

C) Indicare brevemente un'iniziativa significativa nell'ambito dell'inclusione e delle pari opportunità

Verso un rinnovato modello di leadership. Un'analisi qualitativa.

PAOLO ROSSI*

Inquadramento della ricerca. *La vulnerabilità del genere umano, in un mondo globalizzato e interconnesso, è emersa chiaramente a seguito della pandemia da Covid-19, confermando in maniera epidemiologica le responsabilità dell'uomo nei confronti della biodiversità, spesso ai confini più remoti del globo dove si pensava che un potenziale problema sarebbe rimasto confinato (IUCN, 2020). L'esistenza di tanti centri e tante periferie ha favorito una diffusione a grappoli del virus, per cluster simultanei (Fauci et al. 2007), influenzando delicati equilibri in tutto il mondo, con un impatto reale che si osserverà realmente solo nei prossimi anni, soprattutto a danno di popolazioni residenti nelle aree rurali (KWS, 2018), dove milioni di bambini hanno perso oltre metà delle lezioni in presenza, trovandosi quasi un anno in ritardo rispetto al punto scolastico nel quale dovrebbero essere.*

Al contempo, la pandemia ha generato un forte impatto negativo sul benessere dei lavoratori e, di conseguenza, sulle loro performance. Il lavoro a distanza è stato integrato in molte attività e molti manager hanno dovuto apprendere come supportare e motivare i propri collaboratori per preservare il loro stato di salute mentale: flessibilità, autonomia e fiducia sono termini che hanno acquisito un nuovo e più profondo significato per ogni tipologia di business, nel tentativo di ridurre il senso di solitudine e isolamento venutosi improvvisamente a creare (Stick, 2020; Whitlaw, 2020). Molti manager si sono dovuti dedicare all'organizzazione del lavoro dei propri dipendenti, a discapito della propria leadership riconosciuta in presenza, apprendendo rapidamente l'uso di strumenti di comunicazione e modalità di coordinamento prima mai sperimentate, con il risultato di generare un importante paradosso di maggiore apparente autonomia e, al contempo, un aumento di stress personale con conseguente riduzione della produttività (Luciano, 2016; Kirchner et al., 2021).

L'azienda a responsabilità limitata del XX secolo era specializzata, statica e non aveva necessità di individuare di continuo nuove strategie di posizionamento o focalizzarsi su tematiche, oggi imprescindibili, quali sostenibilità ed etica (Hammonds, 2003; Seers, 2008), ma la rivoluzione digitale e la globalizzazione di fine secolo hanno concentrato il potere economico e finanziario in mano a pochi, che hanno alimentato rendite di tipo speculativo (Zamagni, 2020), e la crisi del 2008 ha evidenziato l'interconnessione di ogni forma di ecosistema, sociale, ambientale, finanziario e istituzionale (Wilson, 2004; Bruni, 2015).

Alcuni autori considerano innovazione e reputazione driver odierni fondamentali per un business di successo nel lungo periodo, quali tematiche che devono ritrovare un loro più profondo significato nell'orientare manager e leader in contesti sempre più poliedrici, al fine di generare un impatto positivo per l'intera collettività, bilanciando interessi di shareholder e stakeholder, dando vita a forme di neo-isomorfismo organizzativo capaci di ridisegnare modelli di business socialmente orientati in grado di affrontare e superare ogni crisi, presente e futura (Radicchi, 2014; Hildebrand et al., 2022). Gli attuali modelli, però, non rispondono più in maniera pertinente e completa alle esigenze di un futuro incerto come quello che, anche a causa del conflitto bellico in corso in Ucraina, costringerà molti Paesi a considerare nuove operazioni di austerità, provocando ulteriori disagi a livello sociale (Sherburn, 2021): l'uomo deve tornare a essere posto al centro di una crescita economica sostenibile e lo sviluppo integrale deve essere anteposto alla sola sostenibilità economica, orientando le imprese ai principi del bene comune con interesse generale (Le Crosnier, 2009; Maggi, 2021).

Le imprese possiedono una responsabilità imprenditoriale (Biggeri et al., 2021) e, sempre più, le relazioni hanno acquisito il valore di bene relazionale, fondativo di ben-essere collettivo (Paglione, 2014): collaboratività, inclusività e complessità sono le parole chiave delle nuove teorie di leadership, ma anche resilienza e anti fragilità dovranno esservi incluse, a seguito della pandemia che ha recentemente obbligato tutti a rivedere i propri riferimenti concettuali (Thompson et al., 2020). Le imprese di un domani molto prossimo dovranno essere guidate con sempre rinnovata motivazione, orientando positivamente il capitale umano a disposizione (Marocci, 2018; Benmira et al., 2020), incorporando una mission sociale che fornirà nuove opportunità di partecipazione, garantendo il raggiungimento per l'impresa di vera efficienza, di tipo economico quanto sociale (Boniolo, 2021; Storr et al., 2022).

Compito del leader sarà sempre più quello di dare valore al valore delle risorse umane nel loro complesso (Argiolas, 2014), come hanno fatto a metà del Novecento imprenditori socialmente orientati quali Olivetti, Borsalino e Leumann (Landoli, 2021) e, ancor prima di loro, verso le metà dell'Ottocento, alcuni visionari che hanno condizionato in senso positivo il proprio ecosistema socio-imprenditoriale (Ricciardi, 2014) dando vita, nella Torino dell'epoca, a

* PhD - Università del Piemonte Orientale
e-mail: paolo.rossi@uniupo.it

modelli imprenditoriali la cui mission sociale poneva al centro gli ultimi, con il risultato di originare business socialmente orientati oggi ancora prosperi, che hanno affrontato e superato con successo la recente pandemia e numerose precedenti crisi locali, in diverse periferie del mondo.

Obiettivo del paper. Numerosi contributi scientifici evidenziano che, in relazione al periodo storico, gli elementi distintivi alla base dei principali modelli di business differiscono e, conseguentemente, anche l'approccio alla leadership tende a mutare a seguito della sua contestualizzazione: in altri termini, vi è generale accordo sul fatto che i modelli di business e gli stili di leadership siano dinamici e tendano a incorporare "il qui ed ora" del momento storico. In tal senso, gli studiosi tendono a individuare nuovi modelli da proporre e nuovi stili a cui ispirarsi per poter meglio rispondere alle esigenze del periodo storico in cui si è radicati. A parere di chi scrive, tale sforzo intellettuale potrebbe non essere necessario poiché, spesso, potrebbe essere sufficiente uno sguardo al passato per trarre ispirazione e proporre modelli di business e stili di leadership non nuovi, ma rinnovati, attualizzati e adattati alle esigenze contemporanee. Il presente lavoro si inserisce in tale dibattito sempre attuale nel tentativo, da un lato, di comprendere e delineare l'evoluzione dei modelli di business e dei modelli di leadership e, dall'altro lato, di individuare tra i tanti modelli del passato quello che, più degli altri, potrebbe essere adeguato a rispondere alle esigenze dei tempi correnti, in quanto guidato da specifici valori, carismi e virtù.

Nello specifico, si intende contribuire al significativo impegno di ricerca, ancorché non esaustiva, di precedenti autori che hanno indagato su carismi e virtù posseduti da fondatori di Organizzazioni carismatiche, leader visionari - in grado di conciliare libertà e partecipazione, diversità e appartenenza per la vita, fiducia nel prossimo e attenzione alla sostenibilità (Cicchese, 2019; Longhitano, 2019) - permettendo a coloro che li hanno seguiti di assimilare, diventando il proprio sogno (Nayar, 2013) la visione originaria del fondatore stesso (Sartori, 1997). In linea con ciò, si sono approfondite alcune tematiche rimaste inesplorate, quali lo studio delle caratteristiche intrinseche di un determinato ecosistema sociale e le peculiarità di innovazione e visione imprenditoriale che hanno dato origine a specifici modelli di business, quali strumenti a cui oggi potrebbe attingere un leader socialmente orientato per guidare la propria impresa in un mondo denso di vulnerabilità e incertezza, guardando innanzi con coraggio e seguendo la propria via, la propria visione, con cuore e passione, intelligenze e competenze, per il bene proprio e dell'umanità (Radcliffe 2004; Orobator 2022).

Le domande di ricerca che hanno ispirato il presente lavoro sono, pertanto, le seguenti:

RQ1 Esiste un modello di leadership sviluppatasi nel passato che possa risultare adeguata alle esigenze attuali?

Se sì, RQ2 Quali sono le determinanti di questo modello e come agiscono?

RQ3 In che modo possono contribuire a sviluppare nuovi modelli di business sostenibili?

Per individuare una valida risposta ai quesiti di ricerca proposti, poiché a oggi non esistono studi simili in letteratura, si è deciso di intraprendere un'analisi esplorativa. Nello specifico, il presente lavoro analizza in profondità le Organizzazioni fondate dai Santi Sociali della Torino del 1800: l'Istituto Missioni Consolata fondato dal beato Giuseppe Allamano nel 1901, la Congregazione di San Giuseppe fondata dal beato Giuseppe Murialdo nel 1873, la Società Salesiana di San Giovanni Bosco fondata da san Giovanni Bosco nel 1859 e la Congregazione delle suore di San Giuseppe Benedetto Cottolengo fondata da San Giuseppe Benedetto Cottolengo nel 1830. Attraverso la metodologia del multiple case study è stato possibile analizzare un'elevata quantità di fonti primarie e fonti secondarie di dati e, successivamente, effettuare una cross case analysis che ha permesso di rilevare comunanze e difformità tra i diversi casi.

Metodologia. La metodologia del case study ha assunto sempre più importanza e rilevanza tra i ricercatori, ancorché il disegno e il contenuto del medesimo cambi molto da un caso all'altro e, normalmente, la scelta della metodologia rifletta la domanda di ricerca. La situazione presa in esame nel presente studio - le Organizzazioni fondate dai Santi Sociali - può rappresentare un caso rivelatore di un fenomeno poco indagato in precedenza, consentendo di investigare attività svolte all'interno delle stesse che rientrano nella "quotidianità", esercitate ripetutamente senza però essere oggetto di esplicitazione: per far ciò è, pertanto, necessario captare e comprendere a fondo le peculiarità del contesto in cui esse operano (Mabry, 2008).

Includendo la ricerca più casi, si parla di multiple case study, con l'obiettivo di individuare similitudini e fenomeni in contrasto. Ciò implica normalmente un maggior dispendio di tempo dedicato alla ricerca ma, al contempo, fornisce una risposta maggiormente rappresentativa (Gerring, 2004). Il case study considerato ha incluso l'analisi di una ricca varietà di fonti di dati tra cui interviste, dati di archivio, risultati di indagini, video e fotografie: le interviste hanno rappresentato una fonte primaria di raccolta dei dati, attraverso la predisposizione di un protocollo di intervista semi-strutturata redatta sulla base della letteratura e degli approfondimenti trovati in merito al case study. La cross-case analysis, metodologia che prevede l'esplorazione approfondita delle somiglianze e delle differenze tra i casi, al fine di supportare la generalizzazione empirica e le previsioni teoriche, ha permesso di passare in rassegna le proxy più comuni individuate, identificando il case study come uno strumento utile a generare materiale adeguato per una successiva discussione intorno a un problema concreto (Solberg et al., 2006): a tal fine, è risultata fondamentale la chiara identificazione iniziale del contesto, che nel caso specifico è l'ecosistema di Torino del 1800.

Il Protocollo di intervista si è composto delle seguenti parti, aventi l'obiettivo di guidare l'intervistato lungo un percorso che da una narrazione personale portasse a una visione d'insieme della sua Organizzazione e del suo orientamento verso il futuro. Innanzitutto, si è cercato di mettere l'intervistato a proprio agio permettendogli di raccontare qualcosa di sé stesso, della sua storia personale e familiare e delle motivazioni che l'hanno incoraggiato/a entrare nella Congregazione o nell'Istituto. In seguito, si è cercato di approfondire, insieme, quale fosse il carisma ispiratore del fondatore, sulla base del quale lui/lei, e molti altri in seguito, hanno scelto proprio quella particolare

Congregazione/quell'Istituto per la vita. A partire da alcune considerazioni sull'attualità della proposta dell'Organizzazione, si è cercato di approfondire come questa si sia evoluta nel tempo e come sia organizzata ancora oggi, intervallo domande a carattere personale con alcune più strutturali e di insieme. Successivamente, si è approfondito il modello economico alla base della sostenibilità attuale della Congregazione/dell'Istituto e quale fosse il modello di leadership riconosciuta dell'Organizzazione. Infine, si è cercato di allargare lo sguardo rispetto alla società odierna, nella quale la Congregazione/l'Istituto opera, rispetto a una rinnovata proposta di senso per i giovani.

Risultati. I risultati dello studio hanno evidenziato alcune Tematiche ricorrenti di carattere organizzativo-gestionale e di orientamento socio-imprenditoriale.

Le tematiche ricorrenti sono state, a loro volta, classificate in base a una logica corrispondente a quanto segue: tematiche specifiche della tipologia di Organizzazione prese in esame (Carisma, Attenzione ai poveri, Emergenza educativa), tematiche organizzativo-gestionali (Governance, Innovazione, Sostenibilità, Dimensione missionaria e laicale), tematiche di orientamento socio-imprenditoriale (Visione imprenditoriale, Visione socialmente orientata, Ricerca di senso). Mentre le prime prendono in considerazione alcune peculiarità alla base della mission stessa delle Congregazioni/Istituti, le seconde comprendono aspetti più legati al proprio modello organizzativo e al proprio ecosistema. Infine, le terze indagano su come tale modello di business socialmente orientato possa essere stato così longevo e ancora attuale, comprendendo alcune proposte di senso anche per il futuro.

Fig. 1: Tematiche ricorrenti e alcune relative citazioni esemplificative emerse dalle interviste

CARATTERE ORGANIZZATIVO GESTIONALE	SPECIFICITÀ DI CONGREGAZIONI / ISTITUTI	ORIENTAMENTO SOCIO-IMPRENDITORIALE
<p>Governance</p> <p>La fatica della discontinuità nel servizio di autorità (IMC)</p>	<p>Carisma</p> <p>Non si può diventare santi se prima non si è soddisfatti come uomini (SSGC)</p>	<p>Visione imprenditoriale</p> <p>Don Bosco è un unico marchio con diversificazione del rischio (SDB)</p>
<p>Innovazione</p> <p>Sistema binario per la gestione di comunità e Opere, rispettando i tempi di ciascuno e la reciproca libertà del perseguimento dell'obiettivo (CSI)</p>	<p>Attenzione ai poveri</p> <p>Ciascuno di noi è il locandiere che permette di mantenere aperta la locanda dove il buon samaritano, che è Cristo, può affidarci i suoi poveri (SSGC)</p>	<p>Ricerca di senso</p> <p>Non sono i discorsi che convincono, ma le esperienze significative della vita (IMC)</p>

Da tali tematiche è stato possibile estrapolare alcuni costrutti generali, che hanno originato una matrice basata su quattro dimensioni principali: Ecosistema, Organizzazione, Leadership e Sostenibilità.

La matrice pone in evidenza, per ciascuna dimensione principale individuata alla base del carisma di ciascuna Organizzazione, alcuni elementi considerati di particolare importanza, suddivisi in categorie positive (+), negative (-) e alcune sulle quali soffermarsi con attenzione (!). Infine, ciascuna dimensione è esplicitata e riassunta da una frase esemplificativa (indicata nella matrice tra parentesi).

Fig. 2: Matrice dimensionale

<p>ECOSISTEMA (la persona al centro)</p> <p>vocazione personale ed esperienza (+) disumanizzazione e nuove periferie (!) fragilità e solitudine (!)</p>	<p>ORGANIZZAZIONE (il valore dell'ambiente)</p> <p>corresponsabilità e sinodalità (+) fiducia e reciprocità (+) flessibilità e sistema binario (!) discontinuità e visioni limitate (-)</p>
<p>LEADERSHIP (orientare, non seguire)</p> <p>semplicità e trasparenza evangelica (+) capacità di relazione (+) attitudine organizzativa (+) conoscenza, analisi e conseguenze (-)</p>	<p>SOSTENIBILITÀ (dalla necessità le risposte)</p> <p>visione globale (+) condivisione e ordine di valori (+) poveri e professionalità oltre lo standard (!)</p>

Si sono quindi analizzati gli elementi peculiari delle Tematiche organizzativo-gestionali, mettendole a sistema con le Tematiche di orientamento socio-imprenditoriale e al proprio Ecosistema di riferimento. L'analisi di alcune sotto-dimensioni specifiche di ciascuna dimensione ha permesso di osservare come lo sviluppo di modelli di business socialmente orientati possa essere condizionato da fattori internamente influenzabili, come il livello di innovazione, e da fattori esterni, come l'orientamento sociale, presenti in ogni specifico ecosistema. Mentre il primo è, a sua volta, funzionale al livello di formazione fruibile, il secondo necessita di un vero e proprio mutamento di mentalità che, una volta innescato, permetterà ai processi avviati di accelerare producendo il cambiamento sistemico dell'intero ecosistema.

Fig. 3: Relazione tra tematiche ricorrenti ed ecosistema di riferimento

Dalla ricerca condotta emerge quale personale contributo alla letteratura e spunto di riflessione per futuri possibili approfondimenti sul tema, come la nascita e l'evoluzione di modelli di business socialmente orientati sia funzione di fattori internamente influenzabili - come il livello di innovazione - e fattori esterni - come l'orientamento sociale - di un determinato ecosistema. Mentre il livello di innovazione è certamente funzione del grado di formazione e del numero di leader presenti nell'ecosistema, l'orientamento sociale è favorito da un cambiamento di mentalità che necessita di una determinata maturazione per poter essere considerato sistemico. Inoltre, il fattore tempo assume un ruolo rilevante nel sistema, con un andamento decrescente di rilievo all'aumentare del processo di cambiamento sistemico che coinvolge l'intero ecosistema: in sostanza, a un certo punto il sistema reagirà sempre più velocemente, influenzando a vicenda i soggetti attivi nel medesimo, come nel caso della crescita esponenziale delle Società Benefit di cui si è preso atto nell'ultimo periodo storico.

Limiti della ricerca. La letteratura esaminata non evidenzia con sufficiente riflessione, se non per il fenomeno relativamente recente delle Benefit Corporation, le caratteristiche di carisma personale, responsabilità sociale e visione imprenditoriale socialmente orientata che i nuovi leader dovranno possedere per guidare Paesi, imprese e collettività fuori da crisi che, inevitabilmente e senza preavviso, si presenteranno: cambiamento climatico, pandemia e guerra sono le direttrici di una tempesta perfetta che hanno stimolato una profonda riflessione su come, proprio con tali difficoltà all'orizzonte, alcune Organizzazioni abbiano utilizzato tali elementi di forte criticità quali fonte di stimolo per innovarsi, identificare nuove finalità di beneficio comune da perseguire ed evolvere promuovendo un cambiamento di pensiero, e azione, in tutti i membri dell'Organizzazione stessa, con una rinnovata strategia di sostenibilità da perseguire insieme.

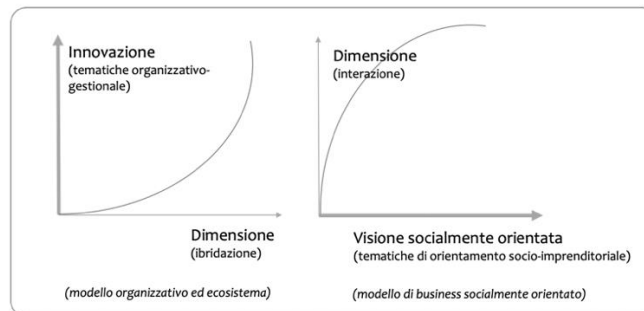

Implicazioni manageriali. Il presupposto di partenza è che alla base del modello organizzativo socialmente orientato delle Organizzazioni prese in considerazione - tematiche specifiche della tipologia di Organizzazioni considerate - vi siano gli elementi peculiari della propria mission, che nella fattispecie comprendono i soggetti destinatari del proprio intervento (l'attenzione ai poveri) considerati all'interno del fenomeno in espansione rilevato (l'emergenza educativa) al quale essi cercano di dare risposta attraverso le proprie peculiarità (il carisma): come già descritto, il carisma è una cosa viva che si adatta alle necessità del tempo, per rispondere alle fragilità incarnate dai poveri - di qualunque tipo esse siano - e che, nel tempo in cui viviamo, si esplicano in difficoltà non solo economiche ma anche affettive, sociali ed educative. Più l'Organizzazione è diffusa e più ampia è la risposta che viene chiamata a dare a tali bisogni, maggiore è il numero di soggetti raggiunti e più ampio è il numero di Opere realizzate. Ovviamente, tale crescita non può essere indefinita ma, anzi, in quanto le Congregazioni operano in aree geografiche ben definite, a un certo punto si satura rallentandone l'espansione: in termini grafici, esso può essere rappresentato graficamente da un'onda - come quella generata da un sasso gettato in uno stagno - parziale che, man mano che si espande, diminuisce la sua intensità.

Tra le tematiche organizzativo-gestionali prese in considerazione, considerando le tematiche della sostenibilità come imprescindibili per la sopravvivenza dell'Ente, la dimensione missionaria e laicale come peculiare di ciascuna Organizzazione presa in considerazione e la Governance come un elemento codificato da norme di diritto canonico, risulta che l'unico elemento variabile - tra quelli presi in esame - è l'innovazione: essa può esplicarsi in molte forme come, per esempio, l'introduzione del sistema binario per la gestione differenziata di Opere e Comunità o la riorganizzazione di singole Opere riunite in una unica più complessa, come un polo culturale missionario, per offrire una proposta più completa a chi desidera avvicinarsi a tale esperienza. Qualunque sia l'elemento di innovazione e rottura con il passato, l'evidenza dimostra che una maggior innovazione, di carattere o finalità sociale, non può che generare benefici positivi per l'Organizzazione stessa, la sua sostenibilità e il suo modello organizzativo. Graficamente, possiamo posizionare l'innovazione sull'asse delle ordinate e ipotizzarne un andamento crescente positivo all'aumentare della dimensione dell'Ente, a causa di una maggior ibridazione da parte di membri religiosi e laici - come affermato anche nell'importanza espressa della dimensione missionaria e laicale - oltre che da una maggiore creatività che, man mano che aumenta, porta a un cambiamento sistemico dei processi creativi.

Le tematiche di orientamento socio-imprenditoriale analizzate sono fortemente caratterizzate da una visione imprenditoriale socialmente orientata delle stesse. Pur mantenendo come caposaldo, al centro di ogni intervento, la persona e un suo bisogno da soddisfare, ciò può manifestarsi da parte delle Organizzazioni esaminate con un coraggio che, normalmente, solo un imprenditore visionario può possedere, attraverso un'intuizione di qualcosa in cui spesso solo lui, prima di tutti gli altri, crede: una risposta da offrire al mercato - sia esso anche solo sociale - attraverso un

nuovo servizio o una nuova proposta può determinare il successo di una nuova Opera - che permette magari, anche, di diversificare il rischio del non essere capace a innovare - e restituire ai giovani una risposta alla ricerca di senso che la nostra società indugia a soddisfare. Più saranno le proposte, più si potranno attrarre nuovi giovani, nuove risorse e nuovi talenti, da valorizzare e far crescere, per il futuro di sé stessi e del sistema all'interno del quale essi con-vivono e operano. A livello grafico, si potrebbe posizionare una visione di imprenditoria socialmente orientata sull'asse delle ascisse e considerare che, all'aumentare della dimensione dell'ecosistema di riferimento - e del numero di persone che in esso interagiscono - corrisponde una maggiore possibilità di nascita e sviluppo di nuove idee imprenditoriali socialmente orientate.

Fig. 4: Relazione tra fattori variabili

Lo studio e l'approfondimento delle determinanti individuate in modelli di leadership socialmente orientati sviluppatasi in passato, e ancora rispondenti alle attuali esigenze di nuovi modelli di business più sostenibili, potrebbe fornire, a livello teorico, un valido supporto per la formazione di futuri leader socialmente orientati, spesso già naturalmente presenti nelle aree periferiche del mondo, dove Organizzazioni quali quelle esaminate hanno dato vita a Opere sostenibili nel tempo, basate su modelli di business social driven oriented, capaci di generare un vero cambiamento sociale sistemico. Nella pratica, ciò potrebbe contribuire a modificare consolidati equilibri del rapporto centro-periferie a favore di queste ultime dove, spesso, sono già presenti elementi di innovazione e orientamento sociale capaci di umanizzare valori e professionalità, per andare oltre quanto richiesto per il raggiungimento del trade-off economico di impresa, ri-ponendo al centro di ogni processo economico la centralità della persona.

Originalità del paper. Dalla ricerca condotta emerge come la nascita e l'evoluzione di modelli di business socialmente orientati sia funzione di fattori internamente influenzabili - come il livello di innovazione - e fattori esterni - come l'orientamento sociale - di un determinato ecosistema. Il livello di innovazione è certamente funzione del livello di formazione e del numero di leader presenti nell'ecosistema, mentre l'orientamento sociale è generato da un cambiamento di mentalità che necessita di una determinata maturazione per poter essere considerato sistemico. Inoltre, il fattore tempo assume un ruolo rilevante nel sistema, con un andamento decrescente di importanza all'aumentare del processo di cambiamento sistemico che coinvolge l'intero ecosistema: in sostanza, a un certo punto il sistema reagirà sempre più velocemente, influenzando a vicenda i soggetti attivi, come nel caso della crescita esponenziale delle Società Benefit di cui si è preso atto negli ultimi mesi del presente anno.

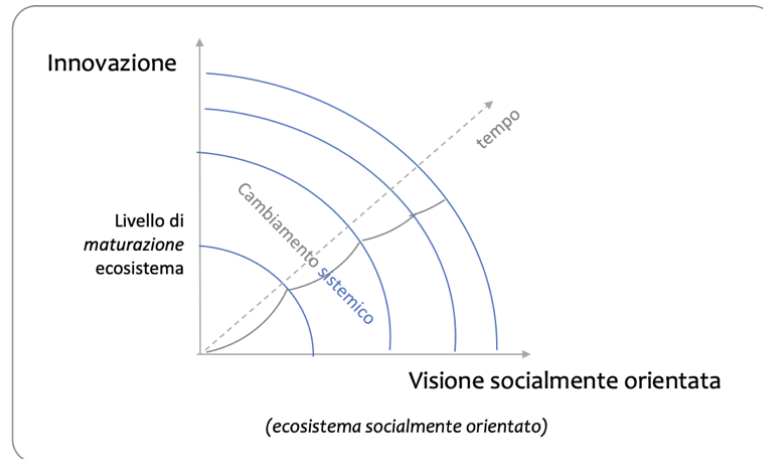

Mentre in passato pochi Centri fungevano da catalizzatore per tutti i soggetti orientati verso un determinato approccio al business, lo spostamento dell'equilibrio centro-periferia e la nascita di molteplici periferie - secondo un modello poliedrico - rendono complessa la generalizzazione di quanto sopra esposto. Tuttavia, un rinnovato equilibrio centro-periferie a favore di queste ultime, dove spesso sono naturalmente presenti elementi di innovazione e orientamento sociale capaci di umanizzare valori e professionalità, si ritiene sia da considerarsi un fattore di successo per imprese socialmente orientate che, attraverso nuovi modelli di business, sapranno riporre al centro dei medesimi le persone, in un mondo sempre più interconnesso e in affanno di visione profetica, colmando quel vuoto di sussidiarietà che lascerà sempre spazio a modelli di business social driven oriented, come avevano intuito oltre duecento anni fa i leader delle Organizzazioni esaminate.

Il lavoro di ricerca condotto ha permesso di individuare similitudini e divergenze dei diversi modelli di leadership delle Organizzazioni prese in esame, evidenziandone costrutti comuni e differenze: come sopra illustrato, lo stile di leadership, il modello organizzativo e l'ecosistema di riferimento sono le tre direttrici su cui si è indagato, che ogni Organizzazione ha sempre tenuto in debita considerazione per garantire la sostenibilità, in ogni periferia e nel corso di numerose crisi, del proprio modello di business socialmente orientato.

In ogni contesto studiato, le interviste condotte e lo studio delle fonti a disposizione hanno evidenziato l'importanza e il valore della trasmissione della storia delle proprie origini e del carisma iniziale del fondatore alle generazioni future, per non farsi orientare da logiche solo efficientistiche o burocraticistiche, nel tentativo di generare solo sostenibilità economica, per rispondere alle principali domande di senso sull'esistenza, per le quali le Opere promosse nelle diverse periferie del mondo dovrebbero essere una conseguenza di tale quesito e non la risposta stessa.

La visualizzazione grafica di quanto sopra esposto non è semplice, ma si potrebbe azzardarne una semplificazione, per esempio, attraverso il lancio di tanti sassi contemporaneamente nel medesimo stagno, con onde che, in base alla dimensione del sasso e alla distanza, si intersecano l'un l'altra.

Organizzazioni ibride per lo sviluppo regionale: strategie di cambiamento regionale

GIANLUCA GIONFRIDDO* VALENTINA CUCINO* MICHELA LAZZERONI[▲]
ANDREA PICCALUGA** MARIA GIULIA GARCEA**

Inquadramento della ricerca. In risposta alle cruciali sfide ambientali e sociali, le organizzazioni aziendali sono sempre più chiamate ad avere un ruolo positivo nella società e contribuire al benessere delle persone e del pianeta (Ferraro et al., 2015; George et al., 2016; Kibler and Muñoz, 2020). In particolare, il fenomeno delle Organizzazioni Ibride sta attirando interesse per il suo potenziale di istituzionalizzare l'impegno pro-sociale delle organizzazioni aziendali (Battilana and Dorado, 2010; Pache and Santos, 2013).

Nelle Organizzazioni Ibride convivono molteplici logiche istituzionali, ovvero la logica commerciale della generazione di ricavi e la logica sociale della generazione di impatto sociale (Besharov and Smith, 2014). Attraverso lo stesso modello organizzativo, dunque, le Organizzazioni Ibride perseguono contemporaneamente obiettivi finanziari e sociali, mirando a raggiungere lo sviluppo sostenibile ed al contempo massimizzando la redditività (Battilana et al., 2022).

Grazie alla loro capacità di navigare la complessità organizzativa e i trade-offs socio-finanziari (Battilana et al., 2022; Besharov and Smith, 2014), le organizzazioni ibride possono affrontare efficacemente le esigenze sociali delle comunità locali o i problemi ambientali delle aree rurali, senza rinunciare alla sostenibilità finanziaria (Doherty et al., 2014; Hestad, Tåbara and Thornton, 2020). Per questo motivo, le Organizzazioni Ibride possono diventare agenti di cambiamento positivo all'interno dei sistemi regionali (Rinkinen et al., 2016; Roundy, 2017), stimolare lo sviluppo economico delle comunità locali e delle aree rurali (Grillitsch, 2019; Wu et al., 2017) e garantirne il benessere sociale ed ambientale (Truffer and Coenen, 2012).

Tuttavia, non si conosce molto sulla relazione tra organizzazioni ibride e sviluppo regionale. La letteratura ha teorizzato approcci imprenditoriali per i percorsi di sviluppo regionale (Fritsch and Mueller, 2004; Grillitsch, 2019; Grillitsch et al., 2022; Wirth et al., 2023), ma solo pochi studi hanno indagato empiricamente come le organizzazioni ibride contribuiscano allo sviluppo regionale attraverso specifiche strategie di cambiamento (Steinerowski and Steinerowska-Streb, 2012).

Obiettivo del paper. Per colmare questa lacuna, questo studio adotta la prospettiva della Teoria della Strutturazione (Giddens, 1984), che evidenzia la relazione interdipendente tra agenti e strutture. Secondo il concetto di "dualità della struttura" (Sewell Jr, 1992), la struttura sociale plasma e limita l'azione degli agenti, fornendo regole, norme e istituzioni che ne guidano e regolano il comportamento. Tuttavia, gli agenti - individui e i gruppi - sono in grado di sfidare e modellare le strutture esistenti attraverso le loro azioni, portando così al cambiamento sociale.

Il presente studio approfondisce la seconda parte del concetto di dualità della struttura, analizzando il ruolo svolto dagli agenti nella trasformazione delle strutture sociali, al fine di apportare un cambiamento positivo per lo sviluppo regionale. In particolare, il quadro teorico di Giddens e postula l'esistenza di tre tipi di strutture - ossia "significazione", "dominazione" e "legittimazione" - che possono essere trasformate dalle azioni degli agenti.

Le strutture di "significazione" sono di tipo culturale ed interpretativo della realtà, influenzano la comprensione collettiva e la comunicazione (Stones, 2017; Staber and Sydow, 2002). L'integrazione dello sviluppo regionale a questo livello promuove un cambiamento nei valori e nelle credenze condivise, sostenendo così lo sviluppo regionale (Huggins and Thompson, 2019).

Le strutture di "legittimazione" stabiliscono regole normative e forniscono linee guida operative (Staber and Sydow, 2002). Integrando lo sviluppo regionale a livello di legittimazione, le organizzazioni implementano pratiche specifiche per creare valore sociale o ambientale (James and Halkier, 2016).

Le strutture di “dominazione” concedono autorità e risorse e operano a livello di gestione strategica (Staber and Sydow, 2002; Jarzabkowski, 2008). A questo livello, si assegnano risorse finanziarie e materiali e si definiscono relazioni di potere formali, garantendo un'implementazione di successo (Pike et al., 2016).

Il presente studio mira a comprendere come le Organizzazioni Ibride agiscano come agenti di cambiamento positivo per lo sviluppo regionale, tramite l'implementazione di azioni che creano valore sociale o ambientale per le comunità locali. Al fine di facilitare la costruzione della teoria, viene proposto il quadro concettuale di Figura 1, che incrocia gli aspetti di ricerca di questa indagine – valore di sostenibilità e strutture – per identificare tre possibili strategie di cambiamento per lo sviluppo regionale. Analizzando le azioni di cambiamento attuate da un campione di quattro Organizzazioni Ibride localizzate in centro Italia, l'obiettivo della ricerca è di indagare come le Organizzazioni Ibride creino valore di sostenibilità - sociale o ambientale - per lo sviluppo regionale attraverso la trasformazione di una delle tre strutture di significazione, legittimazione e dominazione. La Figura 1 illustra tre strategie di cambiamento distinte che sono il risultato dell'aggregazione di azioni di cambiamento che impattano sulla stessa struttura.

Fig. 1: Quadro concettuale delle strategie di cambiamento delle Organizzazioni Ibride per lo sviluppo regionale

STRUTTURE (dello sviluppo regionale)	VALORE DI SOSTENIBILITA' (per lo sviluppo regionale)	
	Valore sociale per le comunità locali	Valore ambientale per le comunità locali
1 Significazione – Processo di conferimento di senso, cultura, credenze e valori alla base dello sviluppo regionale	Strategia di cambiamento 1	
2 Legittimazione - Creazione di norme, procedure e pratiche esplicite che sottendono lo sviluppo regionale	Strategia di cambiamento 2	
3 Domination – Autorizzare comportamenti e allocazione di risorse che sostengono lo sviluppo regionale	Strategia di cambiamento 3	

Metodologia. Per selezionare le Organizzazioni Ibride che operano in una specifica macroregione italiana è stata condotta una selezione mirata seguendo le indicazioni di Etikan et al. (2016). L'Italia è stata scelta come campo d'indagine poiché è altamente popolata da organizzazioni aziendali con scopi pro-sociali (Ferrigno and Cucino, 2021), è il primo paese europeo ad aver introdotto lo status giuridico di Benefit Corporation nel 2016 (Clark and Babson, 2012), e ha una forte e duratura tradizione di imprese con scopi pro-sociali (Perrini et al., 2006). La selezione è avvenuta nel gennaio 2020, seguendo tre fasi: raccolta delle comunicazioni stampa contenenti parole chiave nel titolo come "missione pro-sociale", "sociale e commerciale", "persone, pianeta e profitti", esclusione delle imprese non a scopo di lucro o senza uno scopo pro-sociale evidente dopo l'osservazione dei loro siti web e selezione di quattro organizzazioni ibride della stessa macroregione italiana, diverse per settore e dimensioni dei dipendenti.

Raccolta dati. Gli autori hanno utilizzato dati da tre fonti distinte: (a) tre round di interviste semi-strutturate con CEO ed esecutivi delle Organizzazioni Ibride selezionate durante il periodo febbraio 2020 - settembre 2020, febbraio 2021 - dicembre 2021 e gennaio 2022 - ottobre 2022; (b) osservazioni partecipanti tra marzo 2021 e ottobre 2022; e (c) materiali archivistici, come articoli online, articoli di giornale, contenuti mediatici e rapporti.

Analisi dei dati. In primo luogo, gli autori hanno utilizzato l'analisi dei contenuti per comprendere i dati provenienti da diverse fonti e hanno organizzato i dati in modo cronologico. In secondo luogo, gli autori hanno isolato ciascuna “azione di cambiamento” intrapresa dalle Organizzazioni Ibride. Ciascuna azione di cambiamento è stata analizzata separatamente da due dei quattro autori. In terzo luogo, gli autori hanno esaminato le azioni di cambiamento e hanno concordato sulla loro codifica. Gli autori hanno garantito risultati affidabili attraverso la triangolazione dei dati provenienti da diverse fonti e ottenendo un feedback dettagliato sia da soggetti interni che esterni all'analisi per migliorare la validità delle loro interpretazioni.

Risultati.

Azioni di Cambiamento

Per "azione di cambiamento" si intende qualsiasi intervento da parte delle Organizzazioni Ibride selezionate che influisce sui processi in corso di un'entità socialmente strutturata (Hult and Lennung, 1980), purché abbia implicazioni per lo sviluppo regionale. I risultati suggeriscono la presenza di 38 azioni di cambiamento attuate dalle Organizzazioni Ibride analizzate. Queste azioni si concentrano prevalentemente sugli stakeholder interni, come i dipendenti, ma riguardano anche gli stakeholder esterni, compresi i fornitori. In particolare, quattro azioni coinvolgono i dipendenti, mentre sei azioni coinvolgono i fornitori o i collaboratori esterni. Inoltre, otto azioni si rivolgono ai cittadini, quattro azioni coinvolgono altre imprese, due azioni coinvolgono i comuni e due azioni coinvolgono organizzazioni non profit. Infine, due azioni si concentrano sui prodotti delle imprese, mentre sei azioni si concentrano sui progetti delle imprese.

Strategie di Cambiamento

I risultati suggeriscono che le Organizzazioni Ibride possono contribuire allo sviluppo regionale (1) “guidando”, (2) “realizzando” o (3) “orchestrando” il cambiamento per lo sviluppo regionale. Più concretamente, la strategia “guidare il cambiamento” si riferisce alla capacità delle Organizzazioni Ibride di plasmare positivamente la cultura, i valori e le logiche istituzionali di altri agenti che operano nella stessa area locale, contribuendo così allo sviluppo

regionale influenzando altre azioni; la strategia "realizzazione del cambiamento" si riferisce all'implementazione diretta da parte delle Organizzazioni Ibride di azioni che apportano un cambiamento positivo per lo sviluppo regionale, come programmi ambientali, procedure di reclutamento o iniziative sociali locali; la strategia "orchestrare il cambiamento" si riferisce all'allocazione da parte delle Organizzazioni Ibride di risorse finanziarie, umane o materiali per raggiungere lo sviluppo regionale, mirando a implementare sinergie con altri agenti. Attraverso queste strategie, le Organizzazioni Ibride apportano un contributo significativo allo sviluppo regionale (Steinerowski and Steinerowska-Streb, 2012).

Strategia 1: Guidare il cambiamento per lo sviluppo regionale

La strategia di guida del cambiamento si riferisce alla capacità delle Organizzazioni Ibride di plasmare la cultura, i valori e le logiche istituzionali degli altri agenti operanti nella stessa area locale. In questo modo, le Organizzazioni Ibride possono contribuire allo sviluppo regionale influenzando positivamente le azioni di questi agenti. Essenzialmente, la strategia "guidare il cambiamento" si concentra sulla capacità delle Organizzazioni Ibride di agire come agenti di cambiamento plasmando il comportamento e le decisioni degli altri attori nell'area locale. Questa strategia può essere altamente efficace nel creare un ambiente collaborativo e di supporto per raggiungere obiettivi comuni legati allo sviluppo regionale. Promuovendo i metodi di lavoro artigianali e la diffusione della cultura locale, le Organizzazioni Ibride possono generare un impatto sociale positivo sui territori locali. In particolare, le Organizzazioni Ibride possono guidare un cambiamento culturale che porta a un cambiamento nei valori e nelle assunzioni condivise verso i valori sociali ed ambientali.

I valori condivisi creano un ambiente caratterizzato da una cultura di fiducia condivisa e di meccanismi di apprendimento collettivo, che a loro volta facilitano la cooperazione tra le imprese in una regione (Maskell and Malmberg, 1999). Quando le imprese in una regione condividono valori comuni, è più probabile che sviluppino un senso di scopo condiviso e stabiliscano relazioni di rispetto e fiducia reciproca. Questi valori condivisi e la fiducia reciproca creano una base per la cooperazione e la collaborazione tra le imprese, portando allo sviluppo di meccanismi di apprendimento collettivo che consentono la condivisione di conoscenze e migliori pratiche. In definitiva, questo può portare a una comunità imprenditoriale regionale più coesa e produttiva, che ha il potenziale per migliorare la competitività della regione (Boschma, 2004).

Inoltre, le Organizzazioni Ibride possono contribuire alla preservazione del patrimonio locale, delle tradizioni culturali e della conoscenza, che viene sempre più riconosciuto come componente importante dello sviluppo sostenibile (UNESCO, 2015). Promuovendo e preservando la cultura locale, le Organizzazioni Ibride possono anche attirare visitatori e turisti, stimolare l'economia locale e creare opportunità di lavoro. Pertanto, promuovendo metodi di lavoro artigianali e la cultura locale, le Organizzazioni Ibride possono generare un impatto sociale positivo sui territori locali, favorire un senso di identità del luogo tra la popolazione locale e contribuire alla preservazione del patrimonio locale.

Questo approccio considera i luoghi come parti costitutive delle Organizzazioni Ibride, non solo come i siti in cui operano o cercano di avere un impatto sociale. In altre parole, i "territori locali", vengono intesi come più di semplici posizioni geografiche. Essi si sviluppano all'incrocio di posizioni e hanno significati simbolici e conseguenze materiali (Gieryn, 2000).

Strategia 2: Realizzare il cambiamento per lo sviluppo regionale

La strategia di realizzazione del cambiamento si riferisce all'implementazione diretta di azioni da parte delle Organizzazioni Ibride che portano un cambiamento positivo per lo sviluppo regionale. Queste azioni possono includere programmi ambientali, procedure di reclutamento e iniziative sociali locali, tra gli altri. Essenzialmente, la strategia di "realizzazione del cambiamento" si concentra sull'implementazione diretta di iniziative pratiche che migliorano la qualità della vita nella regione in cui operano le Organizzazioni Ibride. Ciò comporta l'integrazione di obiettivi e programmi sociali, nonché considerazioni etiche, in tutti i processi decisionali, in tutte le politiche e le azioni (Carroll, 1991). Le Organizzazioni Ibride spesso stabiliscono strategie collaborative con altre organizzazioni locali, come aziende, comuni o partner senza scopo di lucro, per sviluppare programmi che supportano la comunità.

In linea con Bode et al., (2019), questo studio mostra come le partnership tra aziende e organizzazioni non profit possano essere un potente motore di cambiamento sociale. Lavorando con scuole o università, le Organizzazioni Ibride possono investire in programmi di formazione professionale e supportare iniziative locali di istruzione e formazione per migliorare le competenze e l'occupabilità della forza lavoro locale.

Le Organizzazioni Ibride danno anche priorità alle considerazioni etiche e alla responsabilità sociale, che vengono sempre più riconosciute come elemento chiave dello sviluppo sostenibile (Carroll, 1991). Adottando obiettivi e programmi sociali, le Organizzazioni Ibride possono sostenere la comunità locale, promuovere la coesione sociale e contribuire al raggiungimento degli obiettivi di sviluppo sostenibile. Pertanto, le Organizzazioni Ibride possono dare un contributo significativo al cambiamento sociale mediante l'implementazione di azioni concrete che supportano la comunità locale e promuovono la responsabilità sociale. Inoltre, stabilendo strategie e partenariati collaborativi con altre organizzazioni locali, le Organizzazioni Ibride possono sfruttare le loro risorse per guidare un cambiamento positivo e raggiungere gli obiettivi di sviluppo sostenibile.

Strategia 3: Orchestrare il cambiamento per lo sviluppo regionale

La strategia dell'orchestrare il cambiamento è un processo attraverso il quale le Organizzazioni Ibride allocano risorse finanziarie, umane o materiali per raggiungere obiettivi di sviluppo regionale. Ciò può comportare la strategia diretta di azioni di cambiamento o la collaborazione con altri agenti per implementare sinergie. Il focus principale di questa strategia è quello di allocare efficacemente le risorse per guidare cambiamenti positivi nella regione in cui l'Organizzazione Ibride operano. Adottando questo approccio, le Organizzazioni Ibride possono allineare strategicamente la loro pianificazione con obiettivi a lungo termine, con risultati sostenibili e positivi per la regione. Pertanto, la strategia "orchestrare il cambiamento" svolge un ruolo cruciale nel facilitare l'uso efficace delle risorse per raggiungere un cambiamento duraturo nelle comunità servite. In particolare, dopo aver affrontato le questioni culturali e di valore e aver dimostrato la fattibilità degli interventi a sostegno delle comunità locali, queste organizzazioni mobilitano risorse umane e finanziarie per raggiungere lo sviluppo regionale. Questo approccio coinvolge l'integrazione di varie risorse, tra cui le persone, le risorse finanziarie e le strutture organizzative, per raggiungere obiettivi di sviluppo sostenibile.

Inoltre, questo studio mostra come le Organizzazioni Ibride operino spesso in aree rurali, con l'obiettivo principale di creare valore a lungo termine per la comunità. Per raggiungere questo obiettivo, sfruttano le loro reti e mobilitano risorse per migliorare la qualità della vita della popolazione locale. In particolare, le Organizzazioni Ibride si concentrano sugli obiettivi di sviluppo sostenibile e integrano considerazioni sociali ed ambientali nei loro modelli di business.

Le Organizzazioni Ibride mobilitano le risorse umane creando opportunità per il talento locale e promuovendo programmi di capacità (Bacq and Janssen, 2011). In particolare, allocano risorse finanziarie per creare attività commerciali locali, sostenere iniziative locali e promuovere l'uso di materiali e pratiche sostenibili (Mair and Marti, 2006); riducono anche l'uso di materie prime rare e implementano strumenti di monitoraggio delle prestazioni ambientali per garantire il successo delle loro iniziative. Pertanto, le Organizzazioni Ibride hanno il potenziale per creare valore a lungo termine per le comunità locali, mobilitando strategicamente risorse e integrando considerazioni sociali ed ambientali nei loro modelli di business.

Limiti della ricerca. Questa ricerca presenta diversi limiti che dovrebbero essere presi in considerazione. In primo luogo, lo studio include solo le prospettive delle imprese stesse e non quelle di altri stakeholder come i clienti o i fornitori. L'inclusione dei punti di vista di questi gruppi potrebbe fornire una comprensione più completa del fenomeno investigato. Inoltre, l'uso di un approccio qualitativo e la piccola dimensione del campione di soli quattro casi di Organizzazioni Ibride potrebbero limitare la generalizzazione dei risultati. Studi futuri potrebbero affrontare questa limitazione utilizzando un approccio misto e includendo un numero maggiore di partecipanti. Inoltre, la ricerca futura potrebbe estendere l'analisi a una scala più ampia, in particolare a livello nazionale in Italia.

Un'altra limitazione dello studio è la sua dimensione geografica. Le Organizzazioni Ibride analizzate hanno sede in Italia, il che potrebbe non essere rappresentativo di altri paesi o regioni. Tuttavia, diversi autori hanno dimostrato l'importanza dello studio dell'Italia come paese interessante dal punto di vista dello sviluppo regionale (Bellandi et al., 2021; Bellandi and Santini, 2019). Studi futuri in contesti simili potrebbero essere condotti per convalidare i risultati attuali.

Infine, è importante notare che lo studio è stato condotto in un punto specifico nel tempo e che i risultati potrebbero non essere applicabili in futuro poiché l'ambiente aziendale è in costante evoluzione. Proiezioni longitudinali potrebbero essere impiegate in studi futuri per monitorare l'evoluzione del fenomeno nel tempo e garantire la rilevanza continua dei risultati.

Implicazioni manageriali. Lo studio ha implicazioni pratiche per i responsabili delle politiche e per i professionisti su come sfruttare efficacemente il potere dell'innovazione sociale per guidare uno sviluppo regionale sostenibile. In primo luogo, questo studio può aiutare i responsabili delle politiche e i manager a comprendere come sfruttare efficacemente il potere delle organizzazioni ibride come agenti di cambiamento e può anche aiutare le comunità e le regioni a identificare aree in cui possono utilizzare queste strategie di cambiamento per raggiungere i loro obiettivi di sviluppo. In secondo luogo, i manager dovrebbero essere formati sui concetti di responsabilità e sviluppo regionale (Laranja et al., 2008). In terzo luogo, le imprese dovrebbero integrare gli obiettivi di sviluppo regionale nella loro strategia aziendale per sostenere la comunità, ciò può comportare benefici economici in termini di reputazione e accesso a risorse locali qualificate (Asheim et al., 2011). Infine, i responsabili delle politiche dovrebbero coinvolgere maggiormente le imprese nella dinamica dello sviluppo regionale per incoraggiare la loro partecipazione alle strategie di sviluppo della comunità.

Originalità del paper. Questo studio risponde alla richiesta di Kibler e Muñoz di "ripensare al ruolo che l'azione prosociale innovativa può svolgere nelle regioni" (Kibler e Muñoz, 2020, p. 1317), sottolineando il potenziale delle imprese a base territoriale nel promuovere la sostenibilità sociale ed ecologica nelle comunità locali (Shrivastava and Kennelly, 2013). Più in dettaglio, questo studio mira a comprendere meglio come le azioni di cambiamento attuate dalle Organizzazioni Ibride (1) creino valore sociale o ambientale per le comunità locali e le aree rurali e (2) trasformino le strutture sociali (Roundy, 2017; Smith and Stevens, 2010), ovvero i pattern ricorrenti e le regolarità nelle pratiche e nelle attività sociali (Merton, 1968).

Per colmare questa lacuna, lo studio adotta la prospettiva della teoria della strutturazione (Giddens, 1984), che evidenzia la relazione interdipendente tra agenti e strutture. Attraverso un'analisi qualitativa dell'impatto di 38 azioni di cambiamento sulle strutture sociali di significazione, dominazione e legittimazione e sulla creazione di valore sociale

o ambientale, viene costruita una matrice 2x3 per identificare tre alternative strategie di cambiamento per lo sviluppo regionale.

Parole chiave: organizzazioni ibride; sviluppo regionale; teoria della strutturazione; strategie di cambiamento

Social capital ed economia circolare: rafforzare il legame per lo sviluppo dei territori

SOFIA MAURO* ALESSANDRA DE CHIARA• LUIGI SERGIANNI▲ ANNA D'AURIA**

Inquadramento della ricerca. Il dibattito accademico ha ampiamente discusso sull'importanza delle relazioni intrattenute dalle imprese locali per lo sviluppo del territorio di appartenenza. La vicinanza geografica tra le imprese contribuisce a creare obiettivi e valori condivisi, favorisce lo scambio di conoscenze e di risorse, sostenendo l'innovazione e generando vantaggi competitivi (Porter, 1990; Presutti et al., 2017; Cavallo et al., 2020; Bressanelli et al., 2022). Allo stesso modo, la qualità del contesto socio-culturale è stata descritta come driver strategico per la generazione di conoscenze specifiche. Il territorio è un bacino di competenze, conoscenze e tradizioni che lo rendono unico nel suo genere, genera meccanismi di interazioni sociali e reti di relazioni interpersonali (Garofali, 1991; Magnaghi, 2012; D'Auria, 2014) che sostengono la competitività delle imprese e del territorio stesso (Vaccà, 1993; Rullani, 1999; Becattini, 2000; Leydesdorff, 2000; Golinelli, 2002). Ricadute importanti sono state poi individuate anche a livello emotivo. Il forte senso di appartenenza delle imprese al territorio (García-Villaverde et al., 2017), l'importanza dei legami informali, basati sull'amicizia (Vuorinen e Kurki, 2012), il ruolo della fiducia, sono considerate risorse strategiche che sostengono le relazioni tra le imprese, lo scambio di informazioni, il trasferimento di conoscenze tacite, la riduzione dei costi di controllo delle operazioni, limitando anche comportamenti opportunistici (Landry et al., 2002; García-Villaverde et al., 2017; De Chiara, 2012).

Tutti questi elementi sono racchiusi nel concetto di social capital, tradizionalmente definito come le connessioni tra gli individui alle reti sociali e alle norme di reciprocità e di affidabilità che ne derivano (Putnam, 2000). Utilizzato per descrivere l'insieme di norme e relazioni sociali incorporate nella struttura sociale che consentono alle persone di coordinare l'azione per raggiungere gli obiettivi desiderati (World Bank, 1985), in una prospettiva manageriale, il social capital descrive l'insieme delle norme e delle reti che facilitano processi di cooperazione e azioni coordinate (Putnam et al., 1993). Esso si compone di una dimensione strutturale, una relazionale ed una cognitiva (García-Villaverde et al., 2017), che descrivono, rispettivamente, le forme di interazione sociale, le relazioni di fiducia e la cultura condivisa, che hanno la finalità di creare risorse che possono essere utilizzate per il bene dell'individuo e di un'intera collettività (Dakhli e De Clercq, 2004).

Il concetto di social capital acquista dunque una rilevanza strategica nei processi di interazione e cooperazione (Akçomak e Ter Weel, 2009) essendo in grado di agire sull'innovazione delle imprese (Thompson, 2018) e sullo sviluppo dei territori. Si è affermato che le interazioni basate sulla fiducia, facilitano la comunicazione, l'inclusione sociale e un senso di appartenenza condiviso, generando un ambiente favorevole che consente di avvicinare e condividere la conoscenza all'interno della rete e di accedere più facilmente alle reti esterne (Kilpatrick et al., 2021). Inoltre, si è evidenziato che la crescente complessità ed i relativi costi dell'innovazione richiedono sempre più crescenti livelli di cooperazione e condivisione, laddove il social capital ha anche la capacità di funzionare da sostituto di altre risorse (Parker, 2018), non disponibili nella comunità di appartenenza (Eriksson e Rataj, 2019).

Stretti legami tra imprese e sistema locale possono sostenere l'innovazione di tipo sostenibile (Perrini e Tencati, 2008; Nogueira et al., 2019; Bernardi et al., 2022), ed il social capital può stimolare il coinvolgimento anche delle PMI nei percorsi di sviluppo sostenibile (Stam e Van De Ven, 2019; Dentoni et al., 2021). In particolare, con riferimento all'economia circolare, l'approccio dell'industrial symbiosis – un sotto-insieme dell'ecologia industriale – descrive il coinvolgimento di industrie tradizionalmente separate che, in un approccio collettivo alla costruzione del vantaggio competitivo, si scambiano materiali, energia, acqua e/o sottoprodotti (Chertow, 2000). Tale approccio è considerato una strategia chiave a sostegno della transizione verso l'economia circolare (European Commission, 2015; Baldassarre et al., 2019; Domenech et al., 2019; Lüdeke-Freund et al., 2019) e richiama l'importanza strategica della complessa interazione all'interno di una rete di stakeholder, ciascuno con identità specifiche e individuali, che contribuisce alla co-creazione di un ecosistema di valore condiviso (Merz et al., 2009; Pera et al., 2016).

L'economia circolare rappresenta dunque un ambito di studio interessante per analizzare l'importanza del social capital per lo sviluppo di modelli di business circolari (Aldieri et al., 2021; Tseng et al., 2022), conseguendo benefici economici, ambientali e sociali a livello micro, meso e macro (Averina et al., 2022).

Obiettivo del paper. *La relazione tra social capital e innovazione, all'interno di modelli di business circolari, rappresenta il contesto della presente ricerca.*

In letteratura il social capital è chiamato in causa nei processi innovativi, in quanto sottolinea i vantaggi che imprenditori ed attori locali, appartenenti ad un'intensa rete collaborativa, possono conseguire in termini di acquisizione di nuove conoscenze, di opportunità e di tecnologie (Doh e Acs, 2010). Le relazioni consentono di avvicinare diversi attori sociali ed economici, permettendo loro di interagire e lavorare insieme, al fine di integrare le loro conoscenze (Pagano et al., 2018, Iacobucci e Perugini, 2021).

Accogliendo le tesi della relazione tra social capital ed innovazione, il presente lavoro intende indagare il ruolo del social capital nell'ambito delle innovazioni dell'economia circolare, mettendo in risalto, in linea con alcuni studi, come le pratiche di apprendimento collaborativo (Dovey, 2009) e l'esistenza di forti legami di fiducia (Thompson, 2018) influiscono sulle attività innovative. Il dibattito ha sottolineato ampiamente che il senso di fiducia e di appartenenza, contribuiscono alla formazione di partnership (Eriksson e Rataj, 2019), avvicinando attori e imprese apparentemente distanti tra di loro, che collaborano alla produzione di innovazione; così come ha evidenziato che le imprese difficilmente innovano in isolamento, ma necessitano di interagire e cooperare con altri attori economici e sociali, valorizzando anche le conoscenze e le risorse già presenti nel territorio in cui sono ubicate (Porto Gómez et al., 2016) e traendo vantaggio dalle opportunità che il territorio può offrire (Suchek et al., 2021). La costruzione di nuove interazioni tra imprese profondamente legate al loro territorio, da cui traggono ispirazione e fonti di vantaggio (Soderstrom e Weber, 2020), e la riscoperta del radicamento locale possono delinearci come strategie efficaci e innovative per creare e condividere valori (Mair et al., 2016), con positivi effetti economici, sociali e ambientali (Attig e Brockman, 2017).

La prospettiva di ricerca utilizzata in questo lavoro accoglie questo approccio, nel tentativo di delineare l'importanza del radicamento locale e del social capital per lo sviluppo di modelli dell'economia circolare e nel migliorare la performance economica, sociale ed ambientale delle imprese e dei sistemi locali.

Il modello dell'economia circolare è descritto come un modello alternativo all'economia lineare. Esso mira ad affrontare le questioni ambientali assicurando la crescita economica; è un modello nel quale i componenti ed i materiali mantengono il loro valore e vengono riciclati, rigenerati o riassorbiti dall'ambiente naturale (Inigo e Blok, 2019). Nell'economia circolare, relazioni forti tra gli attori attivano un'azione collettiva che consente di affrontare questioni di interesse comune (Zhuang et al., 2021; Triguero et al., 2022). Korhonen et al. (2018), sostengono che integrare i valori del social capital all'interno di un'economia circolare, può garantire un'economia della condivisione ed assicurare decisioni democratiche e partecipative (Padilla-Rivera et al., 2020). Il social capital influisce inoltre sui processi organizzativi e contribuisce ad aumentare l'efficacia e l'efficienza dei processi per abilitare le pratiche circolari. Esso è considerato il vero "collante relazionale" (McGrath e Sparks, 2005), come pure si è indagato sugli effetti positivi prodotti sui territori, attraverso la creazione di nuovi posti di lavoro, nuove opportunità di business che sostengono lo sviluppo economico regionale (Stam e Spigel, 2018), ed al tempo stesso quello ambientale, assicurando la transizione green dei territori, e lo sviluppo sociale, migliorando la qualità di vita.

In linea con questi studi, il paper intende analizzare la relazione tra i modelli di business circolari ed il social capital- inteso nel legame che l'impresa ha con il proprio territorio e con gli altri attori del sistema locale- ed indagare i possibili effetti sui territori. Seguendo questa prospettiva di studio, saranno considerate due domande di ricerca (RQs):

(RQ1) Il social capital è determinante nelle imprese che adottano modelli di business circolari?

(RQ2) Quali vantaggi la relazione tra social capital ed economia circolare produce per il sistema locale?

Metodologia. *La ricerca condotta si è sviluppata in due fasi: dapprima è stata condotta una review della letteratura per la formulazione di un quadro teorico attraverso il quale osservare le evidenze empiriche; successivamente, è stata condotta un'analisi su un campione di imprese. In dettaglio, sulla base di quanto emerso dalla revisione della letteratura, è stato proposto un framework teorico per l'interpretazione dei legami tra social capital ed economia circolare, indentificando gli aspetti che saranno indagati nell'indagine empirica.*

L'osservazione delle evidenze empiriche è stata condotta su 51 imprese che hanno adottato pratiche di economia circolare in Italia, il campione è prevalentemente composto da imprese di piccole e medie dimensioni al fine di essere maggiormente rappresentativo rispetto al tessuto imprenditoriale italiano composto prevalentemente da piccole e medie imprese. L'indagine è stata condotta su dati secondari tratti dalla piattaforma italiana dell'economia circolare <https://economiecircolare.com/atlante/> e consultando i siti web delle aziende nel periodo di riferimento maggio - dicembre 2022.

L'indagine sul legame tra social capital e innovazione circolare ha riguardato i seguenti aspetti (Tab.I):

Block A – Innovazione e territorio. Questa sezione intende indagare quanto l'innovazione circolare è legata al territorio e nasce dalla realtà locale di riferimento dell'impresa che adotta pratiche circolari, mettendo in evidenza la capacità della stessa di cogliere le opportunità territoriali;

Block B – Innovazione e collaborazione con attori territoriali. Questa sezione si basa sull'individuazione della presenza di collaborazioni con attori locali per lo sviluppo dell'innovazione circolare;

Block C - Social capital e sviluppo del territorio. In questa sezione si intende analizzare la presenza di specifici vantaggi, riscontrati dalle imprese indagate, per il sistema locale, derivanti dell'innovazione circolare prodotta valorizzando il social capital.

Tab. 1: Elementi oggetto di indagine

Relazione	Aspetti indagati
<i>Blocco A – Innovazione e territorio</i>	<i>Descrizione del territorio</i> <i>Descrizione delle specificità territoriali</i> <i>Descrizione dell'innovazione circolare sulla base delle specificità del territorio</i> <i>Descrizione dei valori e della cultura industriale del territorio</i> <i>Descrizione di comportamenti responsabili derivati dall'esistenza di un forte legame tra l'impresa ed il sistema locale</i>
<i>Blocco B – Innovazione e collaborazione con attori territoriali</i>	<i>Descrizione delle collaborazioni con partner territoriali</i> <i>Tipologia di partner</i> <i>Dichiarazione di vantaggi generati dalle collaborazioni</i> <i>Dichiarazione di vantaggi economici</i> <i>Dichiarazione di vantaggi ottenuti dall'implementazione di pratiche di economia circolare</i>
<i>Blocco C - Social capital e sviluppo del territorio</i>	<i>Dichiarazione di vantaggi per l'implementazione di comportamenti responsabili</i> <i>Descrizione di vantaggi per il territorio derivati da comportamenti responsabili</i> <i>Dichiarazione di implementazione di pratiche di innovazione circolare finalizzate al benessere del sistema locale</i> <i>Dichiarazione di vantaggi derivati dall'implementazione di pratiche di innovazione circolare per il sistema locale</i>

Fonte: Elaborazione degli autori

Risultati. *Dall'analisi svolta sul campione di imprese circolari, seguendo il framework derivato dalla review della letteratura, emerge una chiara influenza del social capital nell'avvio e nello sviluppo di imprese circolari. Come detto, la scelta di un set di imprese che adottano un business model circolare deriva dalla volontà di indagare le ricadute del social capital sulla capacità innovativa delle stesse, aspetto fondamentale per la realizzazione di un modello di business circolare. Ponendo, quindi, le imprese circolari come realtà altamente innovative, si definisce il legame tra social capital e innovazione sulla base dell'influenza territoriale in tali imprese.*

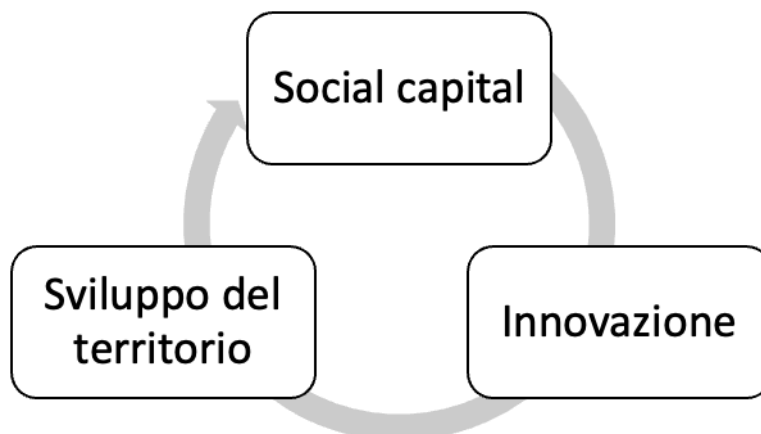

In accordo con il framework proposto, l'analisi di questa relazione verte su tre macroaree: territorio, partner, sviluppo. Con riferimento al territorio, gli indicatori utilizzati per determinare il legame tra il territorio e l'impresa riguardano principalmente la comunicazione che la stessa impresa fa rispetto all'importanza del territorio e dell'influenza di quest'ultimo nell'output dell'impresa. Come si evince dal framework questi sono: la descrizione del territorio, descrizione delle specificità produttive locali, descrizione dei valori o della cultura del territorio, la realizzazione di un'idea imprenditoriale che nasce dalle specificità territoriali. Nel campione analizzato il legame col territorio è stato così descritto: il 43% delle imprese descrive il territorio in cui operano, il 31% ne descrive le specificità produttive e la stessa percentuale ne descrive i valori o la cultura. Poco più della metà, il 51%, definisce le peculiarità territoriali parte caratterizzante della loro idea, mentre il 53% dichiara che l'implementazione di comportamenti socialmente responsabili deriva dal forte legame con il territorio. Infine, circa il 50% del campione totale dichiara di aver adottato comportamenti socialmente responsabili in virtù del forte legame col territorio e delle relazioni con partner locali. A sostegno di quanto sopra, si riportano alcune citazioni di imprese tra quelle esaminate: "Infatti, il laboratorio, che si insedia nel Cilento, in un'area a forte valenza paesaggistico-naturalista con buone potenzialità di sviluppo integrato, contribuisce alla diversificazione dell'economia rurale e coniuga aspetti di tradizione (tessitura con telaio manuale) a innovazione tecnologica, come l'uso di stampante 3D, per la realizzazione di prodotti d'arredo e accessori di moda"; "FILAB s.r.l. è nata nel 1998 nella Piana di Paestum, la Terra dei Miti"; "un laboratorio di ricerca e sviluppo in cosmesi naturale, che con i suoi prodotti cerca di raccontare l'anima di una terra, il Cilento"; "iniziative in grado di ricostruire e valorizzare le radici culturali e identitarie del proprio territorio tramite la conoscenza dell'agricoltura, delle tradizioni e della storia locale".

Con riferimento all'importanza del ruolo dei partner territoriali, la condizione ricercata in quest'area è la collaborazione con attori del territorio, partner radicati nella medesima area dell'impresa esaminata e i vantaggi che ne derivano. La frequenza di queste collaborazioni con le realtà circolari del campione analizzato è molto alta, pari, cioè, al 71%, evidente segno di stretta correlazione tra i due fattori. Sebbene non indagato in questo studio, ma obiettivo di futuri lavori nonché monito per la ricerca, risulta molto interessante la fattispecie in cui la collaborazione nasca dalle fondamenta di legami personali pregressi degli attori coinvolti e che proprio in funzione di ciò si dia vita all'attività circolare. Alcuni esempi di affermazioni che sono state ricondotti a tali aspetti sono: "Tra le attività della società vi è stata anche la collaborazione con l'azienda Gaia GB Agricola (Montoro, AV)"; "I colori del Mediterraneo - Tingere con le piante" è un'associazione nata come spin-off Accademico dell'Università degli Studi di Salerno che opera nel settore della green economy e dell'economia circolare".

Infine lo sviluppo è l'ultima macroarea in cui si collocano tutti i vantaggi, diretti e indiretti, per gli attori coinvolti e per l'intera realtà territoriale. Gli elementi di indagine individuati, limitati anche dalla scelta di una desk research, sono: le conseguenze dell'implementazione di comportamenti socialmente responsabili ovvero la produzione di benessere per il sistema locale. Questi elementi evidenziano l'impatto del social capital nello sviluppo del territorio generando vantaggi per tutti gli attori territoriali. In dettaglio, il 92% delle imprese dichiara di aver contribuito alla produzione di benessere per il sistema locale, confermando gli effetti positivi dell'innovazione circolare sullo sviluppo del territorio. Alcuni esempi concreti sono: "De Matteis ha ridotto il proprio impatto attraverso l'installazione di un impianto di cogenerazione in grado di produrre più dell'80% dell'energia necessaria"; "Lavandula ha ridotto al minimo la quota di rifiuti non differenziabili, eliminato quasi del tutto l'utilizzo della plastica, ha scelto l'utilizzo di energia elettrica prodotta al 100% da fonti rinnovabili"; "Ammàno è una realtà in cui ogni aspetto della vita quotidiana e professionale sarà volto alla valorizzazione del territorio calabrese, delle sue tradizioni e del suo potenziale, in un'ottica di un basso impatto ambientale"; "diffondendo all'interno dell'azienda la cultura del rispetto e della prevenzione dell'inquinamento ambientale; sensibilizzando, coinvolgendo e motivando i propri lavoratori e fornitori al rispetto dell'ambiente e del territorio in cui operano".

Il legame riscontrato tra realtà innovative, ovvero le imprese circolari, e il social capital pone quest'ultimo all'interno di un circolo virtuoso generatore di innovazione e sviluppo del territorio (figura 1).

Fig. 1: Il circolo virtuoso generato dal social capital; fonte: elaborazione degli autori

Limiti della ricerca. Il paper intende analizzare la relazione tra il social capital e l'innovazione, all'interno di modelli di business circolari, nonché i possibili effetti sulla transizione green dei territori.

Lo studio è stato condotto esaminando dati secondari tratti dalle imprese considerate per la composizione del campione; pertanto, gli autori si ripromettono di approfondire l'indagine coinvolgendo gli imprenditori in maniera diretta, soprattutto al fine di osservare aspetti di natura immateriale, come l'importanza della componente emotiva quale collante tra impresa e territorio e quale motore per l'implementazione di pratiche per lo sviluppo sostenibile (Vuorinen e Kurki, 2012; García-Villaverde et al., 2017), e l'importanza della fiducia nelle relazioni tra gli attori che operano e collaborano nell'ambito di un medesimo territorio (Dakhli e De Clercq, 2004).

Inoltre, un altro aspetto che ci si ripromette di approfondire riguarda la soddisfazione nel collaborare con gli attori locali, così come l'importanza del social capital nelle diverse tipologie di modelli di business circolari (come la sharing economy o la resource recovery) (Aldieri et al., 2021; Tseng et al., 2022).

Implicazioni manageriali. Il presente lavoro offre un duplice contributo, proponendo implicazioni teoriche e manageriali. In primo luogo, lo studio ha consentito la definizione di un framework teorico costruito sui legami tra social capital e l'economia circolare. La definizione di un framework per l'interpretazione dell'importanza del social capital per le imprese che operano in termini di innovazione si ritiene possa rappresentare un utile strumento per la valutazione di pratiche e la definizione di iniziative che mirano allo sviluppo sostenibile del territorio.

In dettaglio, i risultati hanno confermato l'importanza del ruolo del territorio quale attore, supportando il riconoscimento del patrimonio territoriale come valore e vantaggio competitivo per il sistemi locali, e confermando l'importanza del valore territoriale quale elemento su cui puntare per dar vita all'interazione e alla cooperazione tra i

diversi attori (pubblici e privati), e allo sviluppo locale sostenibile (Magnaghi, 2012), anche grazie a forme di riqualificazione territoriale (D'Auria, 2014), e considerando aspetti di natura immateriale, di cui si evidenzia la necessità di ulteriori indagini (Dakhli e De Clercq, 2004). Ciò consente anche l'identificazione di implicazioni di policy, vale a dire l'importanza del ruolo delle istituzioni locali nell'indirizzare e promuovere lo sviluppo di pratiche green, attraverso la collaborazione tra diverse categorie di attori locali, come già suggerito da Leydesdorff (2000), che vedeva nella collaborazione tra imprese, istituzioni ed enti di ricerca la chiave per uno sviluppo basato sull'innovazione.

Con riferimento alle implicazioni manageriali, lo studio ha evidenziato quanto il social capital possa incidere sulla scelta di avviare imprese circolari, ma soprattutto l'importanza della consapevolezza delle imprese nel puntare sul capitale sociale anche nel ripensamento di supply chain in ottica circolare. I risultati hanno anche evidenziato che nell'ambito dell'implementazione di pratiche circolari, l'esistenza di relazioni stabili con imprese e stakeholder locali consente la produzione di valore non solo per l'impresa e per gli attori direttamente coinvolti, ma per l'intera comunità circostante (Pucci et al., 2020). Le imprese circolari sono infatti in grado di svolgere un ruolo significativo nelle comunità e per le economie locali, attraverso la realizzazione di processi e cambiamenti che hanno come obiettivo quello di poter contribuire alla riduzione dei danni ambientali e supportare sistemi circolari (Suchek et al., 2021; Triguero et al., 2022), affinché si possa garantire benessere collettivo.

In sintesi, le stabili relazioni tra imprese e diversi stakeholders possono dare origine a pratiche innovative di successo partendo proprio dall'individuazione di specificità territoriali, al fine di produrre valore sia per le imprese che per i territori stessi (Nogueira et al., 2019).

Parole chiave: social capital; economia circolare; risorse locali; territorio; collaborazione

La collaborazione locale come driver all'innovazione sostenibile: uno studio esplorativo sugli attori chiave nel settore agroalimentare

NORA ANNESI* VALENTINA CUCINO*

Inquadramento della ricerca. *La partnership, ovvero la creazione e la gestione di relazioni con altri attori al fine di raggiungere uno scopo prefissato, è al centro dell'Agenda 2030 dell'ONU per il raggiungimento di un mondo più sostenibile (Battaglia et al., 2020). Anche il settore privato, incluso quello agroalimentare, è chiamato a contribuire agli obiettivi di sviluppo sostenibile (SDGs) in linea con i propri obiettivi di business. Nell'ambito del settore privato, il settore agroalimentare, ovvero l'insieme di attività orientate alla produzione, trasformazione e distribuzione di prodotti alimentari rappresenta il 9% del prodotto interno lordo dell'Unione Europea ed ha un significativo potenziale nel contribuire agli obiettivi di sviluppo sostenibile delle Nazioni Unite. Molti degli obiettivi sono infatti direttamente collegati alla catena del valore agroalimentare, come la lotta alla fame (SDG 1), la qualità della nutrizione (SDG 2), l'occupazione e la crescita economica (SDG 8).*

La Commissione Europea, attraverso la Direzione Generale per la Ricerca e l'Innovazione ha infatti sottolineato l'importanza di identificare linee di finanziamento che possano facilitare l'innovazione del settore e che siano facilmente accessibili da parte delle imprese agro-alimentari a prescindere dalla loro dimensione (Verbeek et al., 2019).

In questo contesto, il contributo alla sostenibilità da parte del settore agro-alimentare non può prescindere però da una innovazione dello stesso. Secondo la strategia europea Farm to Fork, il settore dovrebbe considerare i problemi legati all'impatto generato nei processi sopra descritti e introdurre pratiche e innovazioni finalizzate a ridurre la propria impronta ecologica.

Negli ultimi anni, la ricerca e lo sviluppo nel settore agricolo stanno diventando una questione cruciale, soprattutto per rispondere alle crescenti esigenze del mercato globale e, in generale, per lo sviluppo dell'innovazione rurale (Passarelli et al., 2023). Tuttavia, secondo le analisi condotte a scala comunitaria, il settore agroalimentare si caratterizza per difficoltà nella crescita economica e strutturale, per frammentazione, e per una bassa propensione alla diffusione di nuove tecnologie a causa della bassa spesa dedicata all'innovazione. La scarsa competitività e scarsa propensione all'investimento in R&D è legato appunto alla piccola dimensione delle imprese del settore in Europa. Il 99% delle imprese agro-alimentari sono infatti identificate come piccole imprese e meno del 50% di esse ha investito nell'innovazione negli ultimi 3 anni (Verbeek et al., 2019).

L'innovazione, in questo quadro, è definita dalla letteratura come l'introduzione di pratiche e tecnologie in grado di ridurre l'impatto dell'impresa e, a larga scala, del settore sulle tre dimensioni della sostenibilità ovvero ambiente, società ed economia (Imaz and Eizagirre, 2020; Varadarajan, 2017).

In linea con queste premesse risulta strategico capire quali possano essere i driver in grado di condurre le imprese agro-alimentari ad una evoluzione che rispecchi ed integri gli obiettivi globali di sviluppo sostenibile. In particolare, considerata la piccola e media dimensione delle imprese del settore, secondo l'IFAD è fondamentale investire nella creazione di partenariati pubblici e privati per rafforzare la rete, sostenere la finanza agroalimentare e l'accesso alle risorse economiche (IFAD, 2015).

Obiettivo del paper. *L'obiettivo del paper è quello di identificare la combinazione ottimale di relazioni che permettono alle aziende operanti nel settore agroalimentare di generare innovazione sostenibile.*

Per rispondere alla domanda la ricerca ha analizzato le relazioni di oltre 71 imprese operanti nel settore agroalimentare prendendo in considerazione le relazioni costruite allo scopo di introdurre pratiche di sostenibilità e la loro capacità di accedere a fondi dedicati all'innovazione. Più in dettaglio, attraverso una Qualitative Comparative Analysis, la ricerca mira ad individuare la combinazione ottimale di relazioni sistematiche che le aziende operanti nel campo agroalimentare devono attivare per produrre innovazioni sostenibili. I risultati consentono quindi di delineare il migliore network possibile per una impresa operante nel settore agroalimentare che la conducano ad una evoluzione basata sull'innovazione e la sostenibilità.

I risultati sono inquadrati all'interno del framework "Attore-Rete" (Actor Network Theory, ANT) che ha come scopo proprio quello di analizzare dinamiche ricorrenti tra attori facenti parte di uno stesso network (Doak and

• Ricercatore di *Economia e Gestione delle Imprese* – Scuola Superiore Sant'Anna
e-mail: valentina.cucino@santannapisa.it

Karadimitriou, 2007) e portare evidenze che aiutino a capire gli elementi di successo e/o di fallimento di un network nel raggiungimento di un obiettivo comune (Tatnal and Gilding, 1999). In linea con lo scopo più alto della ANT, il contributo proposto vuole delineare implicazioni che possano guidare manager e policy maker nella strutturazione di network più efficaci nel settore agro-alimentare. Lo scopo della teoria è infatti studiare i processi dinamici mediante i quali le reti di relazioni si formano, si spostano e hanno effetto (o meno) (Rydin e Tate, 2016). In altre parole, l'Actor-Network-Theory (ANT) (Callon, 1986; Latour, 1987) è stato identificato come il quadro generale a supporto per la comprensione dell'efficacia delle relazioni nelle iniziative dedicate all'innovazione sostenibile.

Metodologia. Per rispondere alla nostra domanda di ricerca, è stata utilizzata la QCA. In particolare, tre ragioni ci hanno spinto a utilizzare la metodologia QCA. In primo luogo, questa metodologia ci permette di analizzare le relazioni causali tra configurazioni o combinazioni di risorse (relazioni) e un risultato di interesse (innovazione sostenibile) (Ragin 2008; Schneider e Wagemann 2012). In secondo luogo, la QCA ha ricevuto una crescente attenzione da parte degli studiosi di management (Cucino et al., 2021; Sperber e Linder 2018) e di innovazione (Cucino et al., 2023; Yang et al., 2023). Infine, l'obiettivo di questa metodologia non è quello di dimostrare l'esistenza e l'entità di una relazione causale tra due variabili come nella statistica inferenziale, ma piuttosto di rivelare modelli che supportino l'esistenza di tale relazione causale (Schneider e Wagemann 2010).

Nel nostro studio abbiamo utilizzato una tecnica specifica di QCA denominata fuzzy set qualitative comparative analysis (fsQCA). La fsQCA adotta la logica fuzzy per ampliare le possibilità offerte dalla QCA dicotomica. In questo modo, è possibile esprimere l'appartenenza a un insieme in un intervallo di valori compreso tra 0 e 1, ottenendo così una scala di appartenenza (Ragin 2000).

Per la nostra analisi, abbiamo preso in considerazione 71 imprese italiane di differenti dimensioni e distribuite su tutto il territorio italiano. La selezione dell'Italia come contesto di riferimento è motivata dalla sua comprovata leadership nella produzione agricola (Pino et al., 2017; Proietti et al., 2016; Rossi et al., 2020). Le imprese sono state selezionate perché inserite all'interno di un network nazionale che intende monitorare i progressi dei settori produttivi italiani rispetto ai temi della sostenibilità. A ciascuna di queste aziende è stato somministrato un questionario in italiano che mira ad individuare le relazioni e i loro risultati in termini di innovazione sostenibile.

La metodologia QCA inizia con la procedura di calibrazione. Attraverso questa procedura, abbiamo operazionalizzato i dati raccolti come punteggi che permettono di definire l'appartenenza o meno della condizione a un gruppo predefinito. Abbiamo effettuato la trasformazione dei dati in punteggi utilizzando la calibrazione diretta proposta da Ragin (2008). La Tabella 1 mostra tale calibrazione dei dati.

Tab. 1: Calibrazione

Risultato/condizioni	Descrizione	Calibrazione
Risultato: innovazione sostenibile	Variabile dicotomica: risultati in termini di innovazione sostenibile	Si -> 1 No ->
Condizioni		
Università	Variabile dicotomica: relazioni stabili con università ed enti di ricerca	Relazioni stabili -> 1 Relazioni non stabili - 0
Istituzioni locali	Variabile dicotomica: relazioni stabili con istituzioni locali (es. Comune)	Relazioni stabili -> 1 Relazioni non stabili -> 0
Istituzioni nazionali	Variabile dicotomica: relazioni stabili con istituzioni nazionali	Relazioni stabili -> 1 Relazioni non stabili -> 0
Associazioni	Variabile dicotomica: relazioni stabili con istituzioni associazioni non profit	Relazioni stabili -> 1 Relazioni non stabili -> 0
Cooperative	Variabile dicotomica: relazioni stabili con cooperative	Relazioni stabili -> 1 Relazioni non stabili -> 0
Altre organizzazioni non profit	Variabile dicotomica: relazioni stabili con altre organizzazioni non profit	Relazioni stabili -> 1 Relazioni non stabili -> 0

La fsQCA prevede diverse fasi (Ragin 2006); la prima consiste nella costruzione di una tabella di verità, una matrice con righe di $2k$ dove k è il numero di condizioni casuali utilizzate nell'analisi. Ogni riga della tabella è associata a una combinazione di attributi. La tabella di verità riporta tutte le possibili combinazioni logiche di condizioni e il risultato associato a ciascuna configurazione. Ogni riga della tabella di verità rappresenta una delle combinazioni logicamente possibili di condizioni, compresi i casi per i quali non esistono prove empiriche (Schneider e Wagemann 2012). La seconda fase riduce il numero di righe della tabella della verità considerando due condizioni, una soglia di frequenza e una di coerenza. Seguendo Ragin (2008), abbiamo applicato una soglia di frequenza pari a 1 e una soglia di coerenza pari a 0,8, rispettivamente. La terza fase utilizza un algoritmo basato sull'algebra booleana per semplificare la tabella di verità. Nel nostro studio, abbiamo utilizzato l'algoritmo di Quine-McCluskey (utilizzato nel pacchetto software fsQCA 3.0) per minimizzare logicamente le dichiarazioni di sufficienza, semplificare la complessità e ottenere una risposta più parsimoniosa (Schneider e Wagemann 2012).

Risultati.

Analisi delle condizioni necessarie. Questo tipo di analisi ci permette di determinare se alcune delle condizioni causali analizzate possono essere considerate come condizioni necessarie per il verificarsi di un determinato risultato. In altre parole, l'analisi verifica se la presenza di una condizione è necessaria per garantire l'output, ossia, nel nostro caso: l'innovazione sostenibile. Una condizione è necessaria per il risultato se tutti i casi che presentano la condizione presentano anche il risultato e non ci sono casi che presentano il risultato e non presentano la condizione (Schneider e Wagemann 2012). In linea con questo ragionamento, consideriamo condizione necessaria quella con una consistenza superiore a 0,9 (Schneider e Wagemann 2010). La consistenza misura quanto l'evidenza empirica supporta l'esistenza di una relazione tra la configurazione e il risultato (Ragin 2006). La Tabella 2 mostra l'analisi delle condizioni necessarie considerando sia la presenza di una condizione che la sua assenza. Poiché la consistenza per ogni condizione è inferiore alla soglia di 0,9, possiamo affermare che la nostra analisi mostra che nessuna delle condizioni da sola è necessaria per determinare l'output "innovazione sostenibile".

Tab. 2: analisi delle condizioni necessarie

Risultato: innovazione		
	coerenza	copertura
Istituzioni locali	0.76	0.61
~ Istituzioni locali	0.23	0.43
Istituzioni nazionali	0.23	0.42
~ Istituzioni nazionali	0.76	0.75
Università	0.72	0.75
~ Università	0.27	0.32
Associazioni	0.67	0.68
~ Associazioni	0.19	0.30
Cooperative	0.67	0.68
~ Cooperative	0.32	0.43
Altro	0.38	0.79
~ Altro	0.61	0.46

Analisi delle condizioni sufficienti. La metodologia fsQCA prevede l'analisi delle condizioni sufficienti. Come evidenziato da Schneider e Wagemann (2012), una condizione è sufficiente per il risultato se tutti i casi che presentano la condizione presentano anche il risultato, ma ci sono anche casi che presentano il risultato ma non la condizione. In questo modo, l'analisi delle condizioni sufficienti identifica tutte le condizioni che sono sufficienti per il verificarsi del risultato. Per il nostro studio, consideriamo una soglia di frequenza di 1,0 e una soglia di coerenza di 0,80, entrambe coerenti con Kraus et al. (2018). Il modello utilizzato per la nostra analisi contiene quattro condizioni:

Innovazione sostenibile=f(relazioni con Istituzioni locali, Istituzioni nazionali, Università, Associazioni, Cooperative, Altro)

Il metodo fsQCA consente di analizzare le combinazioni - ovvero le configurazioni - delle condizioni che portano al verificarsi del risultato di interesse, ovvero risultati in termini di innovazione sostenibile. La Tabella 3 mostra i risultati della nostra analisi.

Tab. 3: Risultati

	Copertura grezza	Copertura unica	Consistenza
Istituzioni locali* ~ Istituzioni nazionali*Università*Associazioni*Cooperative*Altro	0.21	0.21	0.86
Copertura della soluzione:0.21			
Coerenza della soluzione: 0.84			

In particolare, mostra come l'uso della soluzione intermedia permetta di identificare una configurazione sufficiente (Cucino et al., 2021; Rihoux e De Meur; 2009) per ottenere risultati in termini di innovazione sostenibile: la combinazione delle relazioni tra istituzioni locali, università, associazioni, cooperative ed altre organizzazioni no profit. In altre parole, attraverso la collaborazione sistematica tra gli attori locali del settore agroalimentare, le organizzazioni riescono ad innovare in modo sostenibile.

Inoltre, seguendo Ragin (2008), è stata anche riportata la copertura grezza e la copertura singola. La copertura grezza si riferisce al numero di casi che presentano il risultato di imprese agricole che producono innovazione sociale in una determinata configurazione diviso per il numero totale di risultati di innovazione sociale. La copertura singola, d'altra parte, indica la proporzione di casi di imprese agro-alimentari che producono innovazione sociale coperti unicamente da una determinata configurazione. Ciò significa che nessun'altra configurazione copre questi casi. Come visibile nel nostro caso, le due misure hanno lo stesso valore perché c'è solo un percorso di soluzione.

Studi precedenti hanno suggerito come il successo a lungo termine delle organizzazioni dipende dalla capacità delle imprese di creare valore per un'ampia gamma di stakeholder (Berman et al., 1999; Ogden e Watson, 1999; Ruf et al., 2001). Più concretamente, questo studio contribuisce agli studi relativi alla teoria ANT mostrando come le reti e le relazioni tra gli attori diventano l'oggetto principale del vantaggio competitivo per le organizzazioni che intendono soddisfare i principali stakeholder (Huang e Chang, 2008; Tallman et al., 2004; Pallotti e Lomi, 2011). Di conseguenza, l'esistenza di relazioni sociali gioca un ruolo cruciale nel raggiungimento di performance competitive da parte di diversi tipi di imprese (Granovetter, 1985; Uzzi, 1996; Prato, 2018).

Inoltre, questo studio contribuisce agli studi sulla prossimità geografica mostrando come le interazioni spazialmente vicine (cioè locali) tra le imprese sono di grande valore per la performance innovativa delle PMI (Doran et al., 2012) e l'uso sistematico di reti locali sono particolarmente importanti per le imprese che non possono impegnarsi in frequenti interazioni di rete a distanza. In questo contesto, diversi autori analizzano come la rete di relazioni sociali consente alle organizzazioni di accedere a risorse strategiche per accrescere il proprio vantaggio competitivo (Pallotti e Lomi, 2011) e di produrre norme relazionali, come la fiducia e l'impegno (Granovetter, 1985) e di contribuire allo scambio di conoscenze e risorse tacite attraverso interazioni (serendipiche) faccia a faccia. Per questo motivo, l'aspetto della prossimità spaziale è riconosciuto come un fattore importante della struttura e del funzionamento della rete (Capello e Faggian, 2005; Westlund e Bolton, 2003).

Limiti della ricerca. *I limiti della ricerca sono legati all'assenza di triangolazione dei dati raccolti. La naturale prosecuzione della ricerca prevede infatti l'approfondimento dell'evoluzione dei network identificati come "efficaci" attraverso dati secondari o attraverso interviste mirate. L'osservazione relativa all'acquisizione di eventuali brevetti potrebbe, ad esempio rendere il quadro più chiaro o, in alternativa, l'analisi delle performance ambientali dell'impresa legate alle pratiche introdotte grazie all'utilizzo di fondi dedicati all'innovazione potrebbe fornire una quantificazione dell'impatto generato su lungo periodo. Inoltre, la ricerca ha preso in analisi un solo settore. È quindi opportuno immaginare l'applicazione del medesimo modello ad imprese operanti in diversi settori allo scopo di osservare l'esistenza delle medesime dinamiche osservate.*

In linea con il quadro teorico utilizzato, inoltre, future ricerche potrebbero integrare l'analisi integrando ulteriori variabili non umane relative alla relazione tra gli attori (es. utilizzo di chat per la gestione del network, la presenza di riunioni periodiche, ecc.) o relative alla dimensione individuale delle imprese (es. sistemi di reporting di sostenibilità; adesione a sistemi di certificazioni, ecc.).

Implicazioni manageriali. *Il contributo proposto ha l'obiettivo di delineare implicazioni pratiche che possono aiutare manager e policy maker nel settore agro-alimentare a comprendere l'importanza delle connessioni. La teoria ANT mette in evidenza l'importanza delle connessioni tra le entità e come queste connessioni possono influenzare il successo o il fallimento di una rete. Manager e policy maker dovrebbero quindi prestare attenzione alla struttura e alla qualità delle connessioni all'interno delle reti agro-alimentari.*

Questo studio potrebbe aiutare i manager a riconoscere la fluidità delle relazioni. Infatti, la teoria ANT sottolinea che le relazioni tra le entità possono cambiare nel tempo. Manager e policy maker dovrebbero essere consapevoli di questo e essere pronti ad adattarsi alle modifiche delle relazioni all'interno della rete agro-alimentare.

Ulteriore contributo di questo studio è quello di promuovere la fiducia e la trasparenza tra le relazioni. Lo studio infatti sottolinea l'importanza della fiducia tra le entità e della trasparenza nelle relazioni. Manager e policy maker dovrebbero promuovere questi valori all'interno delle reti agro-alimentari per favorire una collaborazione più efficace.

Infine, è importante fornire un maggiore sostegno manageriale ed imprenditoriale al comparto agro-alimentare, soprattutto nei contesti dove la frammentazione fondiaria è elevata e le imprese agricole sono di piccole dimensioni e i contesti rurali di paesi in via di sviluppo, affinché possano avere accesso a servizi, informazioni, workshop e corsi di formazione, che aumentino la probabilità di stringere relazioni con altri attori, in un processo di innovazione aperta (Bellandi e Caloffi, 2010).

Inoltre, è importante sottolineare l'importanza della creazione di reti tra le imprese e tra queste ultime e le istituzioni locali. Come afferma Saxenian (1994), le imprese che collaborano e creano reti di relazioni tra loro e con le istituzioni locali, hanno maggiori possibilità di successo nell'innovazione e nello sviluppo economico.

Altro punto importante è la necessità di rafforzare la collaborazione tra università e imprese, al fine di creare un legame tra ricerca e sviluppo nel settore agro-alimentare. Come sottolineato da Etzkowitz e Leydesdorff (1995), la collaborazione tra università e imprese è un'importante fonte di innovazione e sviluppo.

In sintesi, manager e policy maker possono utilizzare queste informazioni per sviluppare strategie che favoriscano la creazione di reti più efficaci e resilienti nel settore agro-alimentare

Originalità del paper. *Lo studio vede come principale elemento di originalità l'utilizzo di una metodologia che consente di individuare la combinazione di relazioni sistematiche che facilitano le imprese ad introdurre innovazioni sostenibili. L'applicazione della QCA per lo studio di relazioni costituisce lo strumento ideale attraverso cui fornire quelle evidenze che l'Actor-Network Theory cerca fin dal suo sviluppo teorico (Latour, 2005). In termini di originalità quindi la combinazione dello strumento analitico QCA e del quadro teorico consente di mettere in luce l'importanza dei legami tra attori umani e non umani nella costruzione della realtà sociale e consente di dare loro un volto in termini di ruolo sociale svolto. Secondo l'ANT, gli attori (persone, oggetti, idee, tecnologie, etc.) non agiscono individualmente, ma sono in costante interazione e formano una rete di attori interconnessi, che influenzano reciprocamente le loro azioni e le loro relazioni.*

In questo senso, la ricerca ha considerato non solo gli attori umani coinvolti nel processo di introduzione di innovazioni sostenibili, ma anche quelli non umani, come ad esempio le tecnologie e le infrastrutture che facilitano

l'introduzione di innovazioni sostenibili. L'innovazione sostenibile, quale output esplorato nella ricerca, è, come suggerito dalla teoria, il risultato dell'efficace relazione tra i soggetti coinvolti nel network che, collaborando, allargano il proprio potere relativo e le proprie potenzialità rispetto ad uno scopo prefissato. Inoltre, l'ANT riconosce l'importanza di considerare l'attore stesso come una costruzione sociale, il risultato di un insieme di relazioni con altri attori. Questo implica che gli attori non hanno un'identità fissa e immutabile, ma possono mutare nel tempo in base alle loro relazioni con gli altri attori della rete. In questo modo, l'Actor-Network Theory può fornire un utile supporto alle imprese che intendono introdurre innovazioni sostenibili, aiutandole a comprendere e gestire le relazioni tra gli attori coinvolti e a creare una rete di attori interconnessi e collaborativi. In sintesi, l'utilizzo dell'Actor-Network Theory rappresenta un ulteriore elemento di originalità della ricerca, che si propone di fornire alle imprese gli strumenti necessari per individuare e gestire le relazioni tra gli attori coinvolti nel processo di introduzione di innovazioni sostenibili.

Parole chiave: collaborazione locale; innovazione sostenibile; relazioni; Actor-Network Theory;

The new kitchens - mapping and description

ALBERTO SUSCO* DAVIDE CANAVESIO* MONICA CUGNO* REBECCA CASTAGNOLI**

Framing of the research. *The COVID-19 pandemic had a significant impact on the restaurant and food delivery industry. Restaurants, pubs and nightclubs were among the first to be closed due to lockdowns and restrictions imposed to limit the spread of the virus. Even restaurants that were able to stay open saw a drop in revenue due to capacity restrictions and reduced consumer demand. (Souza et al., 2022)*

The need for social distancing and increased health and hygiene concerns have also led to a change in consumption behaviour. There has been an increase in home deliveries and a greater adoption of take-away and take-away dining options. While some restaurants have had to close, others have had to quickly adapt to these new modes of service. (Norris et al., 2021)

Not all categories of restaurants have been affected in the same way by the recent pandemic, in fact of the three most common types, which can be described as follows, by size and type of service offered (Cognizant, 2009):

- *Quick Service Restaurants: or QSRs, are a type of restaurant characterized by rapid product preparation, usually taking less than ten minutes from the time of ordering. This type of restaurant is designed to meet the needs of time-poor customers, such as travelling workers or people queuing for a quick lunch. The target customers of these restaurants are generalists, but they mainly appeal to young individuals or people with tight schedules.*
- *Casual Diners / Family Restaurants: are a type of restaurant that combines some of the features of Quick Service Restaurants (QSRs) with table service. They usually have quick order preparation, inheriting much of the operations from QSRs, but also offer a more traditional dining experience with table service. These restaurants are mainly aimed at families with young children or informal dinners with many guests. The menu offered is often large and varied and includes options for the whole family, including children's options. The accompaniment and condiment options are often customizable to meet the needs of individual customers.*
- *Full-Service Restaurants: or FSR, are a type of restaurant characterized by fuller table service and a more formal atmosphere than other restaurant categories. They offer more elaborate dining rooms and "mise en place" so that customers can enjoy a more complete dining experience. Preparation is generally slower and more elaborate than in the previously described categories such as QSRs or Casual Diners. These restaurants are the oldest type of restaurants, often family-run. Their target clientele is wide and varied and includes families, couples, groups of friends and business travelers. Full-Service Restaurants are also often associated with special events such as weddings, birthdays, business dinners and other occasions. In general, they offer more flexibility and a wider range of options to meet customers' needs than restaurants in other categories.*

Those in the QSR category, and to some extent Casual Diners, were more resilient to the impact of COVID19 due mainly to their propensity for Take Away and Food Delivery. Determined, for the most part, by the more simplified types of operations required for food preparation.

In addition, changes in consumer behavior have also led to an increase in the adoption of online food delivery platforms, such as UberEats, Deliveroo, Glovo, JustEat. (Ahuja et al., 2022) These platforms allowed restaurants to continue serving customers even when they could not accommodate them within their premises. (Muangmee et al., 2021) If during the pandemic period, the delivery channel was necessary for the continuity of the restaurants. Even after the alleviation of restrictions, it remained constant, establishing itself as one of the most used sales channels.

Travel restrictions and the need to avoid crowds have also led to an increase in demand for home cooking. (Gerritsen et al., 2021) This has given rise to the growth of so-called 'Dark Kitchens' that are virtual restaurants physically located within existing kitchens that use home delivery and delivery through online platforms to reach their customers. (Rinaldi et al., 2022) These restaurants are based on a business model that allows them to eliminate location and equipment costs, focusing only on food production and delivery. (Seghezzi and Mangiaracina, 2020)

So far, we have referred to Dark Kitchens as a generic term to define new kitchen layouts dedicated to delivery, but within this macro set, we can precisely define at least three categories. It is therefore possible to subdivide catering types according to room configuration, type of service and location inside or outside a conventional restaurant. (Choudhary, 2019; Osservatorio Food Service, 2020; Shapiro, 2023)

- i) Dark Kitchen: The simplest and least impactful formula for small catering operators involves the partition of an area of the existing restaurant kitchen into a separate unit, dedicated exclusively to the production and management of food delivery. This management is particularly effective when the activity is in a high-density area with flows concentrated in a small portion of time, since it does not create conflict with the production dedicated to table service, exponentially increasing the restaurateur's possibility of reaching his customers. This solution also includes take-away.*
- ii) Ghost Kitchen: Restaurant model in which a single operator runs a remote kitchen-lab, within which he develops one or more brands exclusively dedicated to food delivery or take-away that fall solely under his management. The preparation takes place within a premises with no public administration and no signage. The different brands generally refer to alternative products, developed based on the analysis of consumption data of the area within which it operates. Generally, each of the brands refers to a different ethnic offer to guarantee a superior depth of offer and an optimization of work cycles.*
- iii) Cloud Kitchen: Restaurant model in which several operators share a kitchen and many of the operating costs. It is, to all intents and purposes, a co-working model for catering, where a company provides several operators with a pre-equipped space with sufficient equipment and technical facilities to start up their own home delivery catering brand. ("Virtual Kitchen the Digital Catering in Food Delivery") Within the area there will be from two to more caterers, each managing their own assigned unit and with no entrepreneurial or operational ties between them. Some aggregators and Food Delivery platforms create Cloud Kitchens on their own to be rented to restaurateurs who undertake to produce exclusively for them, constraining the development of the restaurateur's brand and not allowing them to operate in full entrepreneurial freedom. It requires a minimum start-up time. (Shapiro, 2023)*

Those described above are the three main models developed in the post-pandemic period; it is not mandatory that a specific catering company should adopt only one of them. They can be adopted simultaneously in different areas, even in the same city, and can also be mixed, as needed.

Purpose of the paper. *What has not yet been clarified by the existing literature, however, is which model is most widely adopted by the three main restaurant sectors, divided by type of service offered to the customer, namely Quick Service Restaurants, Casual Diners and Full-Service Restaurants, (Cognizant, 2009) and it is important to address the correct type of kitchen to the correct type of service offered by a restaurant brand.*

In this article, we aim to report on the investigations carried out to understand how restaurants, with many sales through the delivery channel, adapted their production processes to the significant increase in sales in this channel, which occurred during the pandemic period.

The most important question is to understand which catering sectors have adopted at least one of the Dark Kitchen models and to identify, for each of the three sectors, which kitchen model(s) is/are most widely used.

This research is potentially relevant, as the current literature is not sufficiently complete to accurately classify which are the new production processes in home catering, a sector that is gaining importance very quickly and will be increasingly relevant in the future.

It may present a novel character in that no research seems to exist to determine which process is most widely used in the various catering sectors. This is useful both as a basis for subsequent scientific research and as a point of reference for all companies wishing to develop their own home ordering capabilities.

Methodology. *This study utilized a mixed-methods research design that incorporated both inductive and deductive approaches to observe, via a non-participant observer methodology (Ostrower, 1998), and collect primary data (Hox and Boeijs, 2005) on the use of food delivery by restaurants. The inductive approach involved open-ended observation and data collection (Kyngäs, 2020), while the deductive approach involved structured observation and data collection (Hyde, 2000). The study was conducted observing food delivery apps and through direct interview with food companies. The sample size included observable restaurants that were open during the study period, which was from October 1, 2022, to February 28, 2023.*

The data collection process involved two stages. In the first stage, the inductive approach was used to observe and document the use of food delivery by restaurants. This involved open-ended observations of the types of food delivery services used by each restaurant, such as Uber Eats, Glovo, JustEat and Deliveroo.

In the second stage, the deductive approach was used to collect structured data on the use of food delivery by restaurants. This involved observing each restaurant and documenting whether they were using food delivery services, and if so, which services they were using.

The data were analyzed using qualitative methods. The data collected in the inductive stage were analyzed using content analysis to identify common themes and patterns in the types of food delivery services used by restaurants.

The study was conducted by applying all possible ethical standards for research involving human beings. In fact, no personal information about restaurants or their owners was collected or shared, and the study in no way involved intervention or manipulation that would harm the restaurants or their customers.

In addition, the direct and personal collection of data through the most common food delivery applications available made it possible to eliminate any bias that might be caused by some differences in classification of types of kitchens, which interview subjects may have due to differences in vision, experiences and perspectives. (Lowe and Zemliansky, 2011)

Results. We expect to find precisely how many companies use Dark Kitchens, how many Ghost Kitchens and how many Cloud Kitchens. In addition, the aim is to break down the number of companies found, into the three main catering sectors, so that we can create a matrix that is easy to understand to determine which of the chosen organizational models is most frequently used and by which sector.

The matrix will be useful to be able to formulate hypotheses on the reasons why these models are adopted, as we expect to find a close correlation between the characteristics of the types of kitchens and the main characteristics of the catering service modes.

At present, the results are not yet fully defined, as it would be necessary to look at other companies in the restaurant industry to get a broader pool of restaurant numbers and product differentiation. The research is still ongoing precisely because it is hoped to observe other companies in the industry to increase the number of cases considered.

Thirty-six restaurants were considered at the time, divided between QSRs, Casual Diners, and FSRs. Only restaurants that do food delivery, and only restaurants that use some sort of separate or outsourced kitchen were targeted to narrow down to only those that have the potential to develop new kitchen models to speed up orders and increase revenue through this channel. Of the thirty-six companies considered, thirty-five were taken from the sample of companies operating in northern Italy, while one was an American company, which was interviewed and visited personally, in order to serve as a benchmark for the categorization of all the others.

Already from data collection, there is a strong imbalance between QSR and Casual Diners restaurants and Full-Service restaurants, as the first two categories mentioned are usually more likely to place home orders.

Tab. 1: Classification of restaurants in restaurant categories.

QSR	Bao Lab; FOORBAN; 85Pizza Ghost; Nutribees; Delivery Valley; Bendito Burrito; Milanese House; Meraki Pita; The Urban Kebab; Dirty Burger; mila's sandwiches; Hot Dog Nation; French Tacos Club; Scandal Burgers;Pescaria; I Love Poke; Scomposto; Butcher's Burger; MamiPoke; Corner Bistro; Spazio Sushi - Poke e Onigiri; Lime Thai; Poke Shop; Susheria;Pinseria SB; Whimsy Kitchen; Bun Burger; I Love Poke; The Egg
Casual Diners	Calavera;Taqueria Guadalupe; It's Just Wings; Maggiano's Specialities; Casa Quesadillas; Pizza Zero;
FSR	Amici Miei

Upon analysis, it became apparent that most foodservice operators are primarily employing Ghost Kitchen and Cloud Kitchen models to run their businesses, with only a small number of operators using the Dark Kitchen model as their main approach. From this inductive analysis, an initial result already emerges, where among all restaurant categories, QSR makes extensive use of food delivery and relocated kitchens, Casual Diners, make use of them but in a very limited way while FSRs are not interested in having delivery chains.

Tab. 2: Counting which operators, from which sector, use dark kitchen

	Ghost Kitchen	Dark Kitchen	Cloud Kitchen	Total
QSR	16	-	12	28
Casual Diners	2	3	1	6
FSR	-	-	1	1
Sum	18	3	14	35

Based on the data presented in the table, and from an inductive point of view, it can be concluded that the Quick Service Restaurants have the highest number of Ghost Kitchens and Cloud Kitchens with a total of 28 kitchens. On the other hand, Casual Dining and Full-Service Restaurants have very limited presence in Ghost Kitchens and Cloud Kitchens with only 1 kitchen each. This suggests that the trend of ghost kitchens and cloud kitchens is primarily being adopted by Quick Service Restaurants. It is also interesting to note that Dark Kitchens are much less popular, with only 3 kitchens in total used only by Casual Diners restaurants that have Virtual Brands - Brands specially created for delivery -. Overall, this data suggests that ghost kitchens and cloud kitchens are becoming an increasingly popular way for Quick Service Restaurants to expand their reach and compete in the market.

These inductive results are derived from the data collection and reflect the trends and patterns observed in the firms. It turns out that in the four categorizations provided, Restaurants tend to use Ghost Kitchens the most, with

Cloud Kitchens following soon after, while Dark Kitchens are used much less. These results fill the gap in the literature, where there is currently no clarification of the categories nor a study exploring which of these is used the most.

The reason why the restaurants using the innovative production models described above are mainly QSR restaurants, known for their fast service and affordable prices, is because of the high volume of home food sales they have, for which they need to decentralize production for delivery from the eat-in, to avoid concentrating too much flow within a restaurant. These restaurants prioritize efficiency and speed to meet the demands of a growing delivery market, which makes them ideal for testing and implementing new production methods.

In contrast, FSR restaurants have no need or motivation to create a separate, alternative production unit for home delivery alone, as they focus primarily on on-site service, taking care of everything from production to customer care.

In any case, further research is needed to understand the factors behind these trends and the potential impact on the restaurant industry and what the impact is on consumers.

All types offer advantages especially to QSR restaurants, but there are some reasons why cloud and ghost kitchens may be preferred to dark kitchens.

They are a fully equipped commercial kitchen designed exclusively for delivery and take-out orders. It operates as a separate entity from the main restaurant and generally has a more limited menu and does not have mail room for on-site dining. Ghost and cloud kitchens are often located in urban areas where real estate costs are lower and allow restaurants to expand their reach without investing in a new physical location.

On the other hand, dark kitchens are kitchens embedded within existing restaurants, this can help restaurants save on overhead costs such as rent and utilities, allowing them to prepare food for delivery and takeout.

Another reason why ghost and cloud kitchens may be preferred over dark kitchens is that they offer more control over the food preparation process. In this way, in fact, the restaurant has full control over the kitchen alone and can ensure that the food is prepared according to its specific standards, without having to worry about room management and contamination from it.

Research limitations. *The research on dark kitchen categorization is an essential contribution to understanding the fast-growing and rapidly evolving dark kitchen industry. However, there are several limitations that researchers and readers should acknowledge.*

A fundamental limitation of the study is both the small sample size and the geographic scope of data collection, part of the study results may not be fully representative of the entire global dark kitchen sector. The data may reflect some of the characteristics of the selected sample of dark kitchens within a particular region or country. Therefore, generalizing the results to a larger population may be difficult.

One limitation of the study is the framework of categories used, which may not be exhaustive or comprehensive enough to capture all possible facets of dark kitchens. The latter are particularly dynamic and the characteristics are constantly evolving, which may lead to the emergence of new categories or subcategories that may not be included in the current framework. It is possible that other schemes give slightly different results, but this cannot affect the results and conclusions of the study.

Another drawback of the study is that some of its assumptions are based on secondary data sources, such as apps and websites. These sources provide a general picture of the state of dark kitchens, although they may not be entirely accurate or up to date. Also, it is possible that not all dark kitchens in each location are covered by these sources, which may make it difficult for the study to draw reliable results.

In conclusion, research on the categorization of dark kitchens provides valuable insights into the structure and organization of the sector. However, researchers and readers should be aware of the limitations of the study, including the small sample size and limited geographical scope of the data collected, the limitations of the categorization framework used, the reliance on secondary data sources, and the lack of qualitative data on the experiences and perspectives of dark kitchen operators and customers. Addressing these limitations in future research could improve understanding of the dark kitchen sector, its associated complexities and help inform policies and practices that promote its growth and sustainability.

Management implications. *The emergence of new types of kitchens is indicative of the rapidly evolving foodservice industry, which is increasingly reliant on technological and operational innovation. Researchers have an important role to play in exploring the impact of these innovations on various aspects of the industry, from work organization to consumer behavior.*

One area of research that of particular interest may be the impact of new kitchen models on the organization of operations within restaurants. Dark kitchens, ghost kitchens, and cloud kitchens all require different operational structures and may involve different levels of automation. Researchers could then explore how these differences affect the characteristics of work in the industry, including work requirements and conditions.

Another research area of high interest is the changing nature of food consumption and the diminishing boundaries between traditional food service channels. Dark kitchens, ghost kitchens, and cloud kitchens all operate in the digital space and rely heavily on online ordering and delivery platforms. This raises questions about the impact of these trends on consumer behavior, social interaction, and cultural norms related to food. In future research, it is possible to explore how these changes affect food choices, eating habits and the social meaning of shared meals.

The development of new cooking models also highlights the importance of agility and adaptability in the restaurant industry, especially in times of crisis. The recent pandemic had a significant impact on the industry, and companies that were able to adapt quickly to market conditions that changed very quickly were more successful in weathering the

storm. It may also be interesting to study how the emergence of new kitchen models affects industry competition, innovation, and the ability of companies to respond adapt to the changing market.

Another key benefit of outsourced kitchens is the ability to expand reach and reduce overhead. Dark kitchens, ghost kitchens, and cloud kitchens offer companies the opportunity to operate in smaller spaces and with fewer staff, or otherwise trained differently due to the absence of the room, while still offering a wide variety of dishes for online ordering. This can enable businesses to serve more customers, creating economies of scale, particularly by going after the segment of customers who prefer to order food from the comfort of home.

These new kitchen models, which offer faster delivery times and greater convenience, can also benefit customers through reduced order times.

In conclusion, the emergence of new types of kitchens is indicative of the growing importance of technological and operational innovation in the foodservice industry. It thus becomes increasingly crucial, however, to explore the impact of these innovations on various aspects of the industry, including work organization, consumer behavior, and industry competition. While in part these new kitchen models offer many benefits to businesses and consumers, they may also offer challenges in terms of food safety and quality control due to the increased workload and the distance of the restaurant from customers' view. Addressing these challenges will be essential to ensure the sustainability and success of these new kitchen models in the years to come.

Originality of the paper. The paper on dark kitchen categorization represents an important contribution to the existing literature on the food industry. By providing a comprehensive framework for categorizing dark kitchens based on their primary business model, the paper enables a deeper understanding of this new and rapidly evolving phenomenon. This framework considers the unique characteristics and operational models of each type of dark kitchen, allowing for a more nuanced analysis of the factors that have contributed to their growth and popularity.

One of the main strengths of this paper is its ability to bring out the increased use of these kitchens as a new business model in the food industry. The paper recognizes how changing consumer preferences, technological advances, and the rise of delivery platforms have played a significant role in the increased use of dark kitchens. By analyzing the different categories of these, the paper provides insights into the factors that have made this business model so attractive to foodservice players.

The paper also offers a detailed examination of the potential advantages and disadvantages of adopting the dark kitchens model. The framework for determination allows for an analysis of the unique characteristics and operating models of each type of dark kitchen, highlighting potential advantages and disadvantages such as increased efficiency, flexibility, control over the quality of food produced, and the potential for development for the delivery industry in general.

The biggest potential disadvantage of dark kitchens is the lack of transparency and oversight, which can lead to concerns about food safety and quality control. Because food is prepared at a different location than where it is consumed, and undergoes transportation with conditions that are often uncontrollable, there may be a lack of oversight and regulation as there is in traditional catering, where dishes are consumed a very short distance from where they are produced.

In addition, companies may have to ensure that quality control standards are maintained across multiple locations or platforms, which can be challenging from an operational perspective, as increased fragmentation can lead to operator inattention or a lack of time and personnel for control.

However, dark kitchens potentially offer more advantages than disadvantages, such as reduced overhead costs and the ability to offer a greater variety of dishes. By operating in smaller spaces and with lower staffing requirements, companies can serve more customers cost-effectively, taking advantage of economies of scale.

Overall, this analysis on the categorization of which operators, from which sectors, use the dark kitchen model provides a valuable contribution to the food industry literature, offering a comprehensive framework for understanding about this new business model and for companies to understand which model is best suited to their goals and objectives. The paper recognizes the unique characteristics and operating models of each type of dark kitchen and in part analyzes the potential advantages and disadvantages of this trend, placing greater emphasis on correctly targeting each dark, ghost and cloud kitchen model to the correct food service industry, categorized into QSRs, Casual diners and FSRs. In doing so, the paper offers insights into the factors that have contributed to the growth of dark kitchens and food delivery in general and what the potential implications might be for the food industry and the economy as a whole.

Keywords: dark kitchen; cloud kitchen; ghost kitchen; food service; restaurant; food safety; consumer behavior; management; food delivery; food app; QSR.

The role of consumers in Logistics and Supply Chain Management research: a systematic literature review

BENEDETTA BALDI* ILENIA CONFENTE* BARBARA GAUDENZI* IVAN RUSSO**

Framing of the research. *The advent of the internet followed by the increased use of mobile technologies, the rapid development of omni-channel supply chains and the wide span of information available to consumers, have shifted the positioning of the academic literature about logistics and supply chain management towards more consumer-oriented practices. Indeed, technology hold a crucial role in informing, networking and empowering consumers, which are increasingly recognized as key stakeholders and active players in the value creation processes (Ta et al., 2015; Kirchoff et al., 2019).*

In the early logistics and supply chain management (LSCM) literature, consumers have been recognized by scholars as key actors of supply chains (Stolze et al., 2016); in fact, foundational definitions of supply chain management (SCM) specifically included the ultimate consumer as a key entity to supply chains (Mentzer et al., 2001; Cooper et al., 1997). However, end consumers have largely been considered as “passive recipients” of logistics and supply chain decisions and outputs (Ho and Tang, 2009; Ta et al., 2015), and the supply chain-consumer relationship has been under-investigated (Ta et al., 2018; Abbey et al., 2019; Simpson et al., 2019).

Scholars have recently put an emphasis on the need to focus the SCM debate on consumers (Esper and Peinkofer, 2017). Consumers’ behavior, perceptions and attitudes are increasingly based on and impacted by logistics and supply chain management outcomes and they are thus strategic inputs that need to be incorporated in the LSCM research for creating efficient and effective SCM processes (Frankel et al., 2008; Griffis et al., 2012). One of the gaps emerged from the literature is the need towards a more consumer-centric mindset in the logistics and supply chain management studies, thus fostering and emphasizing the dialogue and integration between the LSCM and the marketing roots (Esper et al., 2020). Still in the last decade, Mentzer et al. (2008) stated that supply chains had to be designed and managed taking customers in mind. Consumer issues have become so vital that they must be central to how contemporary logistics networks and integrated supply chains are managed, even for firms further upstream (Esper et al., 2020).

Consumers behaviors and insights should be deeply analyzed in order to understand how they impact every core logistics and supply chain management processes, including those further upstream, and on the other way around to investigate how LSCM activities and outcomes shape consumer behaviors and perceptions.

Purpose of the paper. *The purpose of the review analysis is to explore the LSCM literature and to provide a broad understanding of how the role of consumers has been studied in the literature, investigating in detail the approached themes, the theories and methodologies used to frame the analyses and thus providing a basis for the knowledge advancement. Thus, the research aims at addressing the following research questions:*

RQ1. How has the role of consumers been studied by LSCM scholars?

RQ2. Which are the principal themes approached when the role of consumers is analyzed in the LSCM literature?

RQ3. Which are the main theories and methodologies do scholars adopt?

By answering the research questions, the current study seeks to make several contributions. First, by reviewing the studies published over years in eleven of the top logistics and supply chain management journals, a comprehensive overview of the state of the art is provided, which stands as a starting point to advance research. Second, the research field is contextualized, providing an overview of the key themes about consumers in the LSCM domain. Third, the most frequently used theories and research methodologies to address the topic are identified. This mapping process of the theories currently used allows for a better understanding from which perspective the topic has been examined (Swanson et al., 2018) and allows to identify other possible theories to foster knowledge, as well as for the research methods.

Methodology. *The current study combines a systematic literature review and a bibliometric analysis to answer the research questions. The systematic review is a well-established method for contributing to knowledge development, by the means of synthesizing and analyzing the state of the art, thus identifying relevant issues and opportunities for future*

research (Tranfield et al., 2003). What makes the difference in the systematic reviews with respect to the narrative literature reviews are the four main principles on which it is built on: transparency allowing maximum replicability; inclusivity of studies and sources; explanatory nature of the synthesis of the data collected; and, heuristic outputs of the analysis, consisting of suggestions and guides that don't provide a detailed solution to a specific problem but need to be contextualized by managers' expertise (Denyer and Tranfield, 2009). Due to the narrow scope of the study and the manageable dataset (Donthu et al., 2021), the systematic literature review was deemed as an appropriate method for investigating theories and methodologies used by scholars to study consumers in the LSCM domain.

To ensure rigor and validity of the analysis (Tranfield et al., 2003), the structured literature review is conducted by following the guidelines outlined by Denyer and Tranfield (2009), which recommend five main steps to follow (see Figure 1): 1) question formulation, 2) locating studies, 3) study selection and evaluation, 4) data analysis and synthesis, 5) reporting and using the results.

Supporting the systematic review with a bibliometric analysis aims at strengthening the advancement of theory. Indeed, the two review methodologies are complementary (Donthu et al., 2021) and, hence, they both can coexist in a single review article (Mukherjee et al., 2022). While the systematic review relies on a qualitative approach, the bibliometric analysis relies upon the application of quantitative techniques (Broadus, 1987; Aria and Cuccurullo, 2017). Moreover, the bibliometric analysis produces a systematic review, easing transparency and reproducibility of the processes (Aria and Cuccurullo, 2017). In the current research a rigorous bibliometric analysis is performed following Donthu et al. (2021).

Fig. 1: Research steps

The locating studies step aims at selecting all the available publications relevant for the research questions, thus ensuring an exhaustive coverage of the literature (Denyer and Tranfield, 2009). The search was firstly performed using the Scopus database, which is one of the wider databases of peer-reviewed scientific journals. Subsequently, a further search was performed in the Web of Science database, thus ensuring a cross-check between the two databases in order not to neglect important contributions for the analysis. Indeed, while Scopus has a broader coverage of sources than Web of Science, the latter provides access to older sources (Farooque et al., 2019).

The leading journals in logistics and supply chain management that bounded the search were selected according to journals publishing high-quality logistics and supply chain management research, journals well represented in previous logistics and SCM literature reviews, and highly ranked journals according to the 2021 Association of Business Schools (ABS) Journal Guide (Chartered Association of Business Schools, 2021), as suggested in Swanson et al. (2018). Accordingly, a sample of eleven top journals in the field was identified (including e.g., JBL, IJPDLM, IJLM, SCM, to mention a few).

Once identified the relevant LSCM journals, a comprehensive search was conducted by using the following title, abstract and/or keywords search query: ("supply chain*" OR "supply chain management" OR "logistics" OR "logistics management") AND ("consumer*" OR "end-consumer*" OR "end-customer*" OR "ultimate customer*" OR "end-user*" OR "final customer*" OR "b2c").

The articles' search was not bounded in time, to facilitate the acquisition of all relevant contributions and to capture a comprehensive representation of the topic. However, to narrow the scope of the literature, the document type was restricted to research articles in order to obtain only peer-reviewed documents (Kotzab et al., 2023), and just papers published in the English language were considered.

The final search yielded a number of 510 articles from the Scopus database, while a total of 536 papers were obtained from the search on Web of Science. By removing all the duplicates, the initial sample was composed by 637 academic articles. To ensure data accuracy and relevancy, several screening processes were conducted by examining each article individually to ensure fit with the research objective (Wang et al., 2017). At first, the articles' title and abstract were carefully read and evaluated with respect to the research questions. A further, much detailed, screening process was conducted on the remaining articles thorough a full-text review, in order to identify the studies more suitable for the scope of the research.

Moreover, the following inclusion criteria was applied: only empirical papers that focused on consumers as unit of analysis within the logistics and supply chain management domain were included in the review (Esper and Peinkofer, 2017). Thus, empirical approaches such as the collection and analysis of primary and secondary data, the use of surveys, case studies, interviews and experiments were considered for the review, while non-empirical approaches such as mathematical modeling and conceptual papers were excluded (Carter and Liane Easton, 2011). Furthermore, to be consistent with the scope of the analysis, all the studies that focused mainly on suppliers, manufacturers, retailers, third-party logistics as unit of analysis were not considered.

The screening processes resulted in a final sample of 90 research papers consistent with the aim of the review, published between 2000 and 2022. The bibliometric analysis is conducted by the use of an open-source tool called bibliometrix, developed in the R-language (Aria and Cuccurullo, 2017). The findings of the bibliometric analysis serve as a "starting point and complementary partner" (Mukherjee et al., 2022) to other review methods, to provide an overview of the sample of articles.

Results. Several outputs emerged from the performance analysis and science mapping techniques for bibliometric analysis. Figure 2 shows the growing interest of the scientific community among the theme as represented by the evolution in the number of publications over the 22-year period. Starting from 2000 and for the following 11 years, few studies investigated consumers in the logistics and supply chain management research field. However, since 2012 the scientific production has considerably increased, by reaching its peaks in 2019 and 2022.

Fig. 2: Annual scientific production

Furthermore, by employing the science mapping analysis, it is possible to generate a historical view of the evolution of the discipline through the analysis of the connections between the 90 documents in the sample over time. Figure 3 shows the historiographic map, i.e., the chronological citation network of the documents included in the sample. Each node represents a document, and each connection between two nodes represents a direct citation relationship between the two documents. What the map offers is a picture of how the discipline evolved, by highlighting the connections between the studies in the sample and the papers' dependences.

Fig. 3: Historiograph

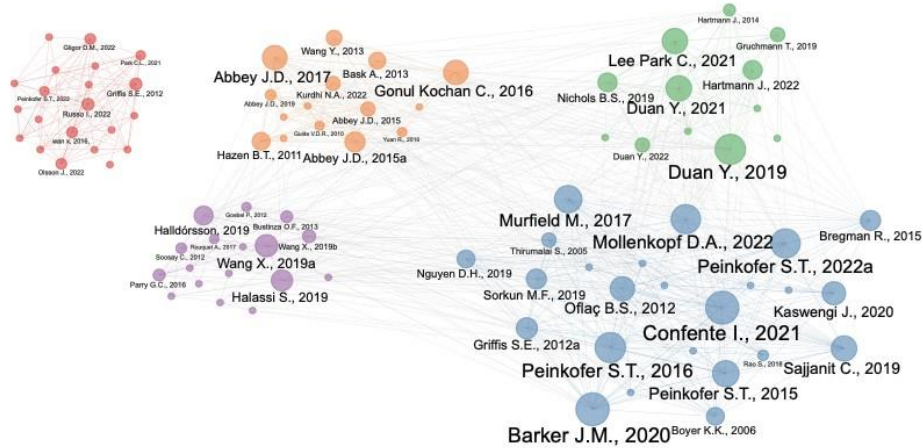

The historiograph highlights the overall evolution of the theme in the literature, what emerges is that the first contribution in the sampled articles is the one of Zinn and Liu (2001), which gave origin to the research field by investigating consumers' response to stockouts. This research represented the first attempt in approaching consumers from a supply chain management perspective. Several years later further contributions investigated the theme of logistics customer service (Dadzie et al., 2005; Thirumalai and Sinha, 2005). The research of Dadzie et al. (2005) inspired lots of researches from 2012 onwards, as proven by the several linkages that branch out from it. The discipline subsequently evolved by approaching the products' cannibalization issue (Guide and Li, 2010), consumers' response to service failures (Oflaç et al., 2012) and reverse logistics (Hazen et al., 2011; Griffiths et al., 2012). Wang et al. (2013) started investigating consumers' intentions towards remanufactured products in closed-loop supply chain. The most prolific period started in 2015 with the study conducted by Peinkofer et al. (2015) on the impact of price promotions on consumers' response to stockouts, and the publications of Abbey et al. (2015a), Abbey et al. (2015b), Agrawal et al. (2015) focused on closed-loop supply chain and remanufactured products, which inspired lots of subsequent analysis. Even more recently, the environmental and circular issues were combined with the investigation of the impact of information disclosure (Duan et al., 2021; Peinkofer and Jin, 2022), the relevance of supply chain transparency and visibility (Duan et al., 2022; Kraft et al., 2022; Mollenkopf et al., 2022) and the perception of consumers as prosumers, hence co-producers of value (Halassi et al., 2018; Halldórsson et al., 2019; Gligor and Maloni, 2022).

Figure 4 depicts the output of the bibliographic coupling, which is a science mapping technique stating that two articles that share common references are similar in their content. Indeed, the strength of the bibliographic coupling of

two articles is defined as the number of references that the articles have in common (Aria and Cuccurullo, 2017). Thus, the bibliographic coupling analysis allowed to divide the sampled articles in five main thematic clusters, which can be recognizable by the main focus on: a) online retailing, b) closed-loop supply chain, c) sustainable supply chain management practices and supply chain transparency, d) value co-production/co-creation and last-mile logistics, e) logistics customer service.

Fig. 4: Bibliographic coupling

The complementary systematic analysis allowed for an in-depth review of the sampled articles focusing on both theories and methodologies adopted by scholars to investigate consumers related issues in the LSCM domain.

The content analysis of the 90 articles in the sample uncovered 49 articles (54.4 per cent) that explicitly uses at least one formal theory (Gligor et al., 2019) to study consumers in the LSCM domain. The analysis pointed out that some articles are based upon only a single theory (e.g., Hartmann et al., 2022), while some others used more than one theory (e.g., Barker and Brau, 2020). Therefore, as in Brown and Dant (2009) and Clifford Defee et al. (2010), the current research relies on the incidence of theory as unit of analysis, thus allowing multiple classifications of individual articles (in the case in which more than one theory is used). A total of 51 unique theories were identified in the sample, resulting in 75 theoretical incidents. Table 1 provides a detailed list of the 10 theories, with respective frequencies (absolute and cumulative), that account for the 45.3% of the total theoretical incidents found in the sample, i.e., those theories utilized more than once in the sample of articles considered for the analysis.

Tab. 1: Most frequently utilized theories

Theory	Frequency	%	Cumulative % of theoretical incidents
Expectation-disconfirmation theory	7	9.3	9.3
Signaling theory	6	8.0	17.3
Service-dominant logic theory	5	6.7	24.0
Attribution theory	3	4.0	28.0
Theory of perceived risk	3	4.0	32.0
Diffusion of innovation theory	2	2.7	34.7
Procedural justice theory	2	2.7	37.3
Theory of planned behaviour	2	2.7	40.0
Theory of reasoned action	2	2.7	42.7
Transaction cost theory	2	2.7	45.3

The research methodologies applied in each of the 90 articles of the sample have been identified and categorized according to the classes proposed by Clifford Defee et al. (2010). Six categories have been considered, plus an “other” category that collects all the methodologies that did not fit in the other groups. Table 2 summarize the findings. What emerges from the analysis of the research methods is that the most widely used methodologies are experimental study, counting for 36.7% of the sample, and survey data (31.1%). The less explored methods are mixed methods and archival data. Hardly used are the interviews, applied only once in the sample, consistently with the unit of analysis of the research, i.e., consumers.

Tab. 2: Research methods

Research methods	Frequency	%
Experimental study	33	36.7
Survey	28	31.1
Case study	10	11.1
Mixed methods	8	8.9
Archival data	6	6.7
Other	4	4.4
Interviews	1	1.1
Total	90	

Figure 5 provides a detailed view of the application of the seven categories of methodologies over time. Till 2011 few methodologies have been adopted, mainly surveys and case studies. Starting from 2012, where the literature about the topic started to grow, diverse methodologies have been experienced. The graph shows an exponential increase in the last ten years in the use of experimental studies. Archival data and mixed methods, even if less adopted, have been increasingly adopted as research methods in the last five years. As regard surveys and case studies, their use remained almost constant in the overall timeframe.

Fig. 5: Research methods over time

Theoretical implications. The current research proposes to deepen the understanding of the past research to be a first step for knowledge advancement and future development of the discipline (Esper et al., 2020).

A big picture of the state of the art is provided thanks to the bibliometric analysis, which allowed the authors to present the intellectual foundations and the historical evolution of the topic, thus addressing the first and the second research questions. Moreover, the systematic review shed light on the main theories and methodologies used in the logistics and supply chain management field to study consumers, as intended in the third research question. A noteworthy contribution is that, as resulted from the review, the theories mostly used to study consumers in the logistics and supply chain domain does not coincide with those identified as being mostly used in the logistics and supply chain management literature, according to Gligor et al. (2019). Indeed, the theories mostly used to study consumers as unit of analysis are those belonging to the psychological and microeconomic domain; while, the sociological and consumer choice theories, are still underused. Furthermore, the analysis of theories revealed that some studies relied upon more than just one theory, thus highlighting the existence of a complementarity relation between different theories (e.g., signaling theory and attribution theory; commodity theory and prospect theory; diffusion of innovation theory and theory of reasoned action). These complementarities could inspire future research. Finally, as resulted from the analysis of the methodologies applied to study consumers, experimental studies and surveys are the most common methods. The suggestion is thus to advance the use of the less utilized methodologies, one above all analyzing archival data.

Managerial implications. Although this type of research is primarily intended for providing scholars with a review of the state of the art to foster future research, there are implications for managers too. Due to the growing importance of the role of consumers in the logistics and supply chain management field, there is an urgent need at the managerial level to include consumer behaviors and related activities within supply chain strategies and operations. Based on that, future studies should attract the interest of managers to facilitate consumers' involvement in the supply chain processes and decision-making processes, hence, incentivizing managers-consumers collaborations. Furthermore, the current study offers insights on the key themes on which managers should invest to engage consumers and thus achieving a competitive advantage.

Originality of the paper. At the best of the authors' knowledge, this is the first literature review combining a systematic analysis and a bibliometric analysis focusing on consumers in the logistics and supply chain management field. The two complementary methodologies allowed for a quantitative study of the publications in the sample, emphasizing the bibliographic and thematic characteristics of the sample, and further allowed for a more in-depth

analysis shedding light on the theories and methodologies used by SCM scholars to study consumers in the field of research. Moreover, this research offers insights into the patterns in the LSCM literature studying consumers' behavior and related activities and suggests promising research directions.

Research limitations. Even though the study aimed at conducting a comprehensive and rigorous analysis, it has some limitations. The subjectivity of the systematic literature has been reduced thanks to the more objective bibliometric analysis, however, a certain degree of discretion remained in the analysis. First, the analysis was limited to eleven logistics and supply chain management journals which, even though are the leading journals in the LSCM domain, they are not the only feasible outlets for LSCM scholars to publish in. Thus, future research should extend the scope of the research by considering a wider basket of logistics and supply chain management journals. Moreover, the classification of the research methodologies suffers of a subjectivity issue related to the utilized categorization. Furthermore, the themes approached when studying consumers in LSCM, have been identified relying on a content analysis, which coding process could be revised in future research. Lastly, the search query and the research in keywords, title, abstract has been conducted according to previous literature. This could be a limitation that future research could address.

Keywords: Systematic literature review; consumer; supply chain management; logistics management; bibliometric analysis

Blockchain technology as an actant for value co-creation in the healthcare ecosystem

SARA EBRAICO* ANNA ROBERTA GAGLIARDI*

Framing of the research. According to Akaka and Vargo (2014) and Huang and Rust (2017), technology is an essential component of service because it alters how service is managed, innovated, and provided. This is one of the main reasons why technology is so important in the service industry. Initially, technology framed in service-dominant (S-D) logic was meant as an operant resource that could act on other resources to co-create value (Akaka and Vargo, 2014). It is possible to achieve value co-creation via resource integration, namely by properly combining a number of different - and complementary - resources.

Vargo and Lusch (2008) asserted that according to S-D logic value is always co-created by integrating resources among various stakeholders for the mutual benefit of all parties involved. The beneficiary is the one who consistently and exclusively makes the phenomenologically and unmistakably one-of-a-kind determination of value. The beneficiary is the one who operates within a particular setting and makes use of a specific set of resources, including technology. To determine the significance of the interdependence of actors and their social relations, the “value in a social context” model (Edvardsson et al., 2011) is applied. This model was developed by Edvardsson, et al. (2011), value in social context places an emphasis on understanding resources as social constructions and conducts an in-depth analysis of the effects of social forces on the co-creation of value as well as how value is perceived. In line with this, technology is conceptualized as a component of service systems because these systems are meant to be “value-co-creation configurations of people, technology, and value propositions connecting internal and external service systems and shared information (for example, language, laws, measures, and methods)” (Maglio and Spohrer, 2008). In other words, technology is a part of service systems because it shapes a value proposition.

Among its multiple use and goals, technology makes it easier for people to share information one another, and it can also pave the way for new kinds of collaborative forms of value creation (Bredback and Maglio, 2016). In addition, Sundbo and Gallouj (2000) - even before S-D logic stressed the relevance of technology as a support for resource integration - discovered that technological advances have the potential to adapt and evolve dynamic patterns among multiple actors through the facilitation of communication.

The focus on multiple actors shaped service dynamics and was increasingly furthered in S-D logic through the metaphor of the service ecosystem, as when dealing with ways for providing services this notion was brought up for discussion as a consequence of the interactions that took place between the various service systems (Peters, 2016). Service ecosystems are referred to as “relatively self-contained, self-adjusting systems of resource-integrating actors connected by shared institutional arrangements and mutual value creation through service exchange,” according to the definition provided by Vargo and Lusch (2016). The service ecosystem perspective focuses attention on the role of institutions as shared norms or “rules of the game” (Williamson, 2000), in the process of value co-creation.

An additional benefit of understanding a service ecosystem is that it sheds light on the relationship between technologies and institutions that influence each other. According to Lusch and Nambisan (2015), technology enables the creation of a network among various actors, thereby balancing the tension between the implementation of an architecture of participation based on a shared worldview and the cognitive distance between them. This tension is caused by the fact that technology enables the creation of a network among various actors. Additionally, technology can be defined as a collection of practices and procedures that increase visibility in value co-creation activities (Akaka and Vargo, 2014; Lusch and Nambisan, 2015).

According to this point of view, technology becomes an active agent in the service ecosystem due to the fact that it acts as an intermediary of knowledge, facilitating connections between resources and skills, and overcoming boundaries that exist within the ecosystem (Lusch and Nambisan, 2015). Recent studies have focused on the role of intermediaries as a category of actors that foster interactions at both the actor-to-actor (A2A) level and the many-to-many level (Mele and Russo-Spena, 2015). Russo-Spena and Mele highlighted the fact that the emergence of new actions and practices can be seen as a result of the incorporation of new technologies that played the role of a mediator. This statement is confirmed in multiple ways, since technology play this active role by serving as a facilitator for interaction between a number of different actors, which allows for the connection and combination of resources and

practices. From this perspective, technology was seen as both a resource and an artifact that could help humans perform their actions in a more efficient manner. This is a fundamental tenet of this perspective. There is an immediate and pressing need for reflection on the role that newly developed technologies play in emerging of the service ecosystem as well as changes in the behavior of the actors that comprise the ecosystem. To this extent, in line with previous studies (e.g., Pohlmann and Kaartemo, 2017; Russo-Spena and Mele, 2020), we draw on the tenets of actor-network theory (ANT) in order to gain an understanding of how the development of technology enables “human evolution” in terms of the complex interplay between “tools, language, and intelligence” (Gibson, 1991). According to the actor-network theory (ANT), technology and society are not two separate spheres but rather influence one another as they are mutually constitutive (Callon and Latour, 1992). In other words, technology and society are not independent of one another.

According to Callon (1990), human beings and non-human entities, both of which are thought of as agents, are connected through networks that serve as the foundation of their social relationship and are mediated by intermediaries. These networks form the basis of their social relationship. The process of mutual definition and adjustment was set in motion by the intermediaries, which ultimately resulted in the formulation of the concept of translation. The word “Translation” served as the impetus for beginning this process. In order to have a complete understanding of this concept, it would be needed “a translator, something that is translated, and a medium in which the translator is inscribed” (Callon, 1990, p. 143). According to the findings of the study that was carried out by Callon and colleagues (1986), the degree to which transactions are irreversible is dependent on “the extent to which it is possible to go back and the extent to which it shapes and determines subsequent translations.” According to Callon and Latour (1992), networks are complex processes that involve the linking of various actors and intermediaries on the basis of the convergence of interests shared by all parties involved. These interests are shared by all parties involved in the process. The translation concept, which involves the formation of a body of allies between human and non-human actors, is what leads to the actor-network interactions that occur as a result. The translation is concerned with the mechanisms of power (Law, 1992): it is not concerned that the larger the organization is, the greater its power; rather, ANT scholars analyze how, through the stabilization and reproducibility of the interactions, the effects generated, such as size, result in power becoming “macrosocial” (Law, 1992). The translation is concerned with the mechanisms of power because it is not concerned that the larger the organization is, the greater its power is. According to this point of view, knowledge is the result of an organized network that is composed of a wide variety of different types of materials.

The S-D logic lens emphasizes the role of technology as an operant resource, a part of the service system, and influences other resources, the service ecosystem as an agent of human activities, changing their knowledge and skills. ANT scholars argued that technology has a primary role in influencing direct social construction, resulting in a macro-social effect. This view highlights a lack of understanding of the social aspects of technology from the S-D logic perspective. For this aim, we focused our study to expand the axioms of S-D logic (resources, value co-creation, service ecosystem) including the key concepts (actant, actor-network) of ANT theory to investigate a specific technology blockchain in healthcare ecosystem. The purpose is to underline the importance of social aspects in expanding value co-creation in the healthcare ecosystem.

Blockchain is a distributed ledger that can record transactions promptly, in a way that can be verified, and in a way that is permanent is what is meant when people talk about “blockchain technology.” According to Treiblmaier (2019), blockchain technology is considered to be a disruptive technology. Blockchain technology can be defined as a distributed ledger that records transactions in an efficient, verifiable, and permanent manner. According to Saberi et al. (2019), a transaction is added to the blockchain in the form of a new block using a predetermined timestamp after it has received majority approval from all nodes. The consensus mechanism, which consists of a set of rules, is responsible for making this addition. By linking the transactions along the chain in the appropriate chronological order, this function protects the transactions and guarantees that their integrity is preserved. Several authors (Abeyratne and Monfared, 2016, Dutta et al., 2020) identified the opportunities of blockchain applications by basing their findings on the primary characteristics of the underlying technology, which include decentralization, immutability, transparency, and process integration. Recent studies (Papanikolaou et al., 2023; Papadonikolaki et al., 2023) contribute to the literature by conceptualizing the blockchain ecosystem to emphasize the link between blockchain and the architecture of an ecosystem embracing the technology attributes. The healthcare industry is a complex network of crucial actors and the recent health crisis raised attention to improve service quality (Russo-Spena and Mele, 2020). Other scholars (Russo Spena et al., 2023; Mačiulienė and Skaržauskienė, 2021) examined the results of traceability and immutability features to increase collaboration and actors’ engagement. The majority of contributions have demonstrated a focus on technical benefits, such as reducing transaction costs, frauds, and errors (Spanò et al., 2023), but additional effort is required to understand how blockchain could affect people’s behavior (Massaro, 2021).

Purpose of the paper. On the basis of these two points of view, we arrived at the conclusion that it was necessary to conduct research into the potential for blockchain technology to act as an actant in the process of value co-creation within the healthcare ecosystem. Within the context of the healthcare system, the application of blockchain technology presents a significant opportunity for effecting change. Over recent years, the potential of technologies such as blockchain is completely transforming the healthcare ecosystem. Building on a S-D logic approach and actor-network theory, the need to overcome the firm boundary and include a social approach to value co-creation is increased as a result of the decentralized infrastructure that is underpinned by blockchain technology. The purpose of this research is to make a contribution by advancing the role of blockchain technology as an actant to shape value co-creation and service ecosystems.

Methodology. *In order to investigate how the integration of blockchain technology into the healthcare ecosystem could lead to an increase in value co-creation, we opted for a qualitative research approach. According to (Pinch & Bijker, 1984), there is a need for a symmetrical explanation that treats successful and failed blockchain implementation for exploring the value co-creation process in the healthcare ecosystem. Our goal is to investigate the combination of the main axioms of S-D logic with the key concepts of ANT theory. Given this goal, we assumed that the success of technology may not be suitable to explain the value co-creation process. The process of our research was broken down into two stages. To begin, we investigated of two separate case studies, each covering a period of two years of observations to achieve more solid consideration, despite the newness of blockchain. In order to engage in interpretative observations for our research, we based it on the perceptions derived from the personal experiences of blockchain providers (Gehman et al., 2018).*

Second, in order to carry out the data coding and analysis, we utilized the Gioia method (Gioia, 2004). This was done in order to provide a response to the research question of how blockchain could improve the social interactions between actors, value co-creation, and service ecosystems in the process of shaping the future of the organization. The method made the investigation of the meaning beyond the facts and events possible, allowing for further interpretation. (Gioia, 2014) suggests that the Gioia method could be useful in helping to ground the emergent theory in the informant's understanding of their own experience. When using this methodology, all of the findings and conceptualizations are initially founded on the interviewer's observation of the processes and structures that socially construct the phenomena; these observations are referred to as first-order findings. This method of conducting research makes it possible to assume a solid methodological posture and achieve a closer correspondence between empirical observations and theory.

Because of the nature of your studies is exploratory, we chose two distinct nonprofit associations, one based in Switzerland and one based in Italy, due to the prominent roles they play in developing a blockchain healthcare ecosystem among the members of the associations. One of these associations is located in Switzerland, and the other is located in Italy.

The associations have been formed with the intention of fostering communication and collaboration within the healthcare ecosystem in order to speed up the process of developing a blockchain solution. These two businesses stood out among the others potential units of analysis because of the parallels we found between their missions and organizational charts. In-depth and semi-structured interviews with the respondents, including the company's founders and managers, were carried out by our team between November 2021 and February 2023. We asked broad questions defined according to the literature review such as, "What are the motivations that guided the choice to use blockchain?" as an example. What exactly were the outcomes that were discovered? Who are the most important players, and what are the main steps in the process? What are some of the challenges associated with implementing blockchain technology? The goal is to concentrate on the perceptions and actions of the actors that emerge from the data in order to socially reconstruct the knowledge that they have of reality (Walsham, 2006). Each of the interviews was recorded, and then the recordings were transcribed word for word. In addition, secondary data have been consulted on a consistent basis in order to collect any new information that may have become available (Bell and Bryman, 2007). In the second step, we implemented the Gioia method (Gioia, 2021) to obtain a systematic representation and adequately represent the opinions of blockchain associations as well as the implications those opinions have for the companies that are involved.). Each of the interviews was recorded, and then the recordings were transcribed verbatim.

We are in a spotless state of mind when we approach the data analysis. Following the coding of the interview and the reporting of the first-order categories that were derived from the interviews, we combined these first-order categories into second-order categories. According to Gioia (2014), the researchers' exploratory work served as the basis for the development of the abstract and creative second-order categories. These categories provided a deeper insight into the interviewers' experience. Each researcher separately coded the data from their interviews and then verified the validity of the other researchers interviews to reduce subjectivity bias.

The final stage of the research process is the configuration of the data structure, which aims to provide a comprehensive understanding of all of the themes and the ways in which they are connected. Then, we presented a grounded theory that elucidated the concepts as well as the interrelationships between them that are responsible for explaining phenomena (Corley and Gioia, 2011). According to Gioia (2021), the data structure places an emphasis on the relationship and the dynamics between the emergent concepts that are used to describe the phenomenon.

Results. *We compared the central tenets of S-D logic, which include value co-creation, ecosystems, and actors' roles as resource integrators, with the fundamental ideas that underpin ANT theory, which include translation, actor-network, and actant. The S-D logic is comprised of the following: value co-creation, ecosystems, and actors' roles as resource integrators. After that, we did some research on the role that blockchain technology plays as an actor, and as a result, we were able to provide some novel insights that can be used to boost the understanding of value that is co-created within the ecosystem of blockchain technology and through its use in healthcare. According to Gummesson and Mele (2010), the process of value co-creation invariably involves several different actors from different backgrounds coming together to form networks.*

Because of the myriad of different ways in which these networks interact with one another, resource integration is made possible by them. If everything goes according to plan, blockchain will produce the necessary infrastructure to support the varied interests of actors and to make it easier to share data. Patients could monitor who can access their data, co-creating value and increasing the efficiency of datasets (Hermes et al., 2023). Decentralization promotes trust

among patients, physicians, and caregivers based on the real-time tracking of patient health status (Hermes et al., 2020). Decentralization ensures the integrity of data and enables service interactions among patients, physicians, and caregivers. These stakeholders will each derive a mutual benefit from their participation in blockchain because blockchain will provide the infrastructure they require to protect their interests. They find answers to problems by having an all-encompassing perspective of the ecosystem as a whole and developing solutions that are tailored to the requirements of the organisms that comprise the ecosystem. Because of this discovery, the idea of value co-creation has been refined to the point where it now takes into account the concept of translation as a fundamental driver for maintaining interactions between the various stakeholders within a decentralized infrastructure.

An objective that serves the best interests of both parties must have as its primary motivating force the interests of the allies and their mutual dependence on one another. The idea of value co-creation as a process that benefits both parties equally is something that needs to be acknowledged by every organization. The successful implementation of blockchain has produced results that demonstrate the necessity of expanding data integration in order to manage equality for inputs in accordance with a mutually shared process of value co-creation. In addition, patients are able to exercise control over their data if there is a representative of the patients' interests serving on the board of directors. Because there is a need to strike a balance between the interests of various relevant social groups, blockchain could provide a solution to this problem by addressing it with its operational model and the transparency with which it makes decisions. The monitoring of priorities and interests using blockchain technology could also help healthcare actors in better aligning their own interests with the benefits they aimed for. Blockchain technology generates an infrastructure that is not biased toward any particular ecosystem in order to solve problems.

Its ecosystem, which is based on digital trust, guarantees the governance of mutual purposes by actors who are interdependent on one another. This comprehension needs to be based on the formulation of the idea of mutual benefits as well as the elaboration of the intentions. In the second scenario, the expansion of the solution was not determined just by value co-creation, despite the fact that the process of value co-creation is connected to the characteristics of decentralization and shared information that are associated with blockchain technology. This is because value co-creation cannot occur without the interests of the allies. This was because there was an unbalance between the individual's contribution and the mutual benefits that were shared with each other. According to the ANT theory, the phrase "relevant social group" is utilized to refer to organizations or institutions that are made of organized groups of different individuals. The most important requirement is that all of the members of a particular social group share the same set of meanings that are attached to a particular artifact, which in this instance is the advantage that is associated with blockchain technology. This is the most important requirement.

In the healthcare ecosystem, how the value is derived from the shared data and how new value co-creation could be attributed is more related to transparency and visibility features. On the other hand, in case of not achieving the aimed goals, the primary benefits are related to data anonymity in order to preserve the interest and competitive advantages of the single firm. In addition, blockchain might not be useful for engaging external stakeholders because they do not see a mutual benefit for their participation in the form of data integration. This is a potential drawback of the technology. There is not purposed to align interests by overcoming the information asymmetry, which is considered a key basis for a company's competitive advantages. This is because there is no purpose to doing so. This perspective brings to light the absence of social value co-creation, which elevates the problem without taking into consideration the benefits to others. In addition to this, the participants who are included in the blockchain have different relevance according to the ownership of data and their influence on other actors. The actors who are truly essential to the development of this method of creating value for both parties together are not involved. In spite of the fact that the underlying infrastructure is blockchain-agnostic, the presence of this feature does not inspire trust in the ecosystem. This is due to the fact that the transparency of the system is viewed more as a drawback (requiring additional controls and sanctions) than an advantage. When there is no shared value associated with the blockchain solution, increased actor participation may be possible if rules are developed that improve decentralized governance and transparency.

Research limitations. The purpose of this study was to investigate the potential role that blockchain technology could play as an agent within the healthcare ecosystem by applying S-D logic and ANT perspectives. The findings cannot be generalized in any way because of this direct consequence of the situation, as well as because of being derived from two cases, thus further confirmation may be achieved with additional analyses. On the other hand, prospective research has the potential to increase the breadth of coverage of the case studies that are investigated.

Managerial implications This work has focused on highlighting the role of blockchain as an actant in the healthcare ecosystem. Based on the principal axioms of S-D logic (actors as resource integrators, value co-creation and service ecosystem) combined with the key concepts of ANT theory (actant, actor-network), the discussion does not simply refer to data integration, coordination and decentralized governance but involves the emergence of a mutual and shared value among diverse actors to enhance the value co-creation process. The role of Blockchain emerges as an actant to impose the blockchain feature (transparency, coordination, data integration, decentralized governance) as values for members' co-evolution. Data integration addresses the new role of blockchain as an actant to balance the input shared by each participant with the benefits received. The need for equality in the coordination process foster the development of use cases guided by mutual interests. The governance mechanisms frame the neutrality of blockchain infrastructure to support a digital trust ecosystem based on the representation of each actor to achieve a mutual beneficial purpose. The study contributes to further research on S-D logic to reshape the value co-creation process considering mutual benefits and aligned interests of actors and their social relevance. Exploring further mechanism to

balance their input and benefits contributions incentivize actor's virtuous behavior and rules for improve ecosystem governance.

Originality of the paper. *To the best of the authors' knowledge, there have been no studies that have investigated an understanding of blockchain implementation that is founded on the primary axioms of S-D logic combined with the fundamental concepts of ANT theory. This is the case despite the fact that there have been a number of studies that have investigated various aspects of blockchain implementation. In this study, a case study of both a successful and unsuccessful implementation of blockchain technology is investigated as a potential actant. For the purpose of enhancing value co-creation within a healthcare ecosystem, the objective is to place an emphasis on social and shared value co-creation, with the goal of striking a balance between the respective mutual benefits of relevant social groups. As a result of this research, we achieved a better understanding of how the blockchain technology has the potential to integrate mutual and shared value co-creation that occurs within the service ecosystem.*

Hospitals in rural areas: what differences in the patient populations and perception of the service quality?

ELISA PERUZZO* SABINA DE ROSIS* GAIA BERTARELLI[▲] SABINA NUTI**

Framing of the research. Many researchers and scholars in the management field investigate the importance of collecting, understanding and valuing local perspective and interactions/networks in local or rural areas (Drucker, 1995; Lai and Nepal; Petheram and Campbell, 2010). They underline that local communities have diverse cultures, social norms, symbols, values, knowledge, and practices compared to non-local areas, for their sense of place and the acknowledge of being 'at the edge of the empire' for remoteness and accessibility issues (Gashi Nulleshi and Tillmar 2022).

Wilson and colleagues (2009) report in their study the main definition used to define "local areas" or "rural areas", that we embrace as territories "not included in metropolitan statistical areas" (Mueller et al., 2004) or a community in which "there are some commercial activities", but not immediate access to services (Crandall and Weber, 2005). For local communities, the literature stresses the presence of several barriers and difficulties in these areas (Macintyre et al., 1993; Levy et al., 2017; McGowan et al., 2021; Gashi Nulleshi and Tillmar 2022, Pelletier et al., 2020):

- Cultural opportunities (e.g., policies, social events, religious and organizations, community group, physical activities);
- Distance and transportation that represent/cause logistical difficulties and limit access to basic services (e.g., education and training; health, welfare services and emergency services; employment and workplace) (Crandall and Weber, 2005; Khan et al., 2020);
- Infrastructure and facilities (Khan, 2023);
- Digital technologies, connections and quality of broadband that support linkages, communication and interactions among citizens and stakeholder (Khan, 2023) and enable telemedicine, virtual consultations, remote visits and monitoring (Ferrè et al., 2021; Bosa et al., 2022).

In our work, we consider healthcare sector since several authors have explained that disparities in health outcome and health inequalities are more evident in rural areas (Hulme et al., 2022; Schopfer 2021; Harrington et al., 2020; Iglehart 2018). In fact, the centralization in urban areas of some complex and highly specialized healthcare services (for example in oncologic care, which was necessary for reaching the minimum threshold of volumes that assures more positive outcomes), has produced equity implications and increased the barriers in access to optimal care for residents of rural areas (Stitzenberg et al., 2009). Recently, Rasi-Heikkinen and Airola (2023) reported several potential gaps in health opportunities and outcomes, in relation to the availability, quality and costs of health services in rural areas.

The distinction between high-specialized hospitals (second level), medium-level hospitals (first level) and basic hospital (proximity) has been also introduced in Italy, for producing better outcomes, by the Ministerial Decree no. 70/2015. The proximity hospitals should serve a population between 80,000 and 150,000 inhabitants. They are characterized by basic emergency services, and a limited number of specialties, such as Medicine, General Surgery, Orthopaedics and Traumatology. The mission of the proximity hospitals is to promote the widespread provision of services and a greater equality of access, particularly in remote and rural areas, while fully respecting the proximity principle. The hospitals of the first level serve populations around 150,000-300,000 people, present first level emergency departments and have a higher number of specialties for addressing more complex health conditions if compared to the proximity hospitals. The second level hospitals serve populations of around 600,000-1,200,000 individuals, provide second level emergency services, and have a higher number of high-specialized services for addressing high-complex health conditions. The proximity and first level hospitals often serve rural and remote areas, which are characterized by low density of inhabitants, which produces a shrinkage of public services, as well as

difficulties in accessing to the workplace (Vainieri and Nuti 2022), as confirmed by the international literature about the remote areas (Crandall and Weber, 2005; Khan et al., 2020).

In addition to the variations related to the healthcare services provision, we also considered the variability introduced by the people's characteristics. Some scholars underline that rural individuals may define "health" differently from their urban peers on the basis of their personal health-related beliefs, attitudes values and knowledge (Gessert et al., 2015). Thus, considering the community-based participatory approach and the importance of active and willing involvement of healthcare services' users, we focused on the users' perception of healthcare services. In particular, our study regards the individuals' experience and satisfaction with hospitalization. The patient experience of healthcare services is a key indicator of quality and outcome, and a key aspect to manage for practitioners. As stated by Berry (2019, pag. 79), "in no other service is managing the "customer experience" more important than in healthcare" (Berry, 2019). In fact, measuring patient experience and satisfaction for identifying the determinants of service quality is a key activity for organizations (Tremblay et al., 2015), since allows to identify and reducing gaps (i) between management perception of customers' expectations and service quality specifications; (ii) between service quality specifications and actual service delivery; (iii) between service delivery and external communications to the customer (Baron et al., 2018).

The Patient-Reported Experience Measures (PREMs) are the most used tools to collect users' voice. It allows to capture the patient's point of view about what happened during the experience with the healthcare services (Kingsley and Patel, 2017). With regard to the hospitalization, the key the standard dimensions of experience are access to the hospital, relationship with professionals, hospital comfort, emotional and informational support, together with satisfaction and overall evaluation of the hospitalization (Coulter et al., 2009). PREMs serve the purpose of managing, monitoring and improving patients' experience with health services as measuring, and evaluating and reorganizing services from patient feedback means promoting the evolution in health systems towards a more patient-centred care (Nuti et al., 2017; De Rosis et al., 2022). The patients' point of view may contribute to making available to healthcare policymakers, managers and practitioners pertinent and useful information for patients and providers. Patients' contribution is increasingly crucial in the service improvement, redesign of healthcare services and co-creation health (Verhoef et al., 2009; McColl-Kennedy et al., 2012; Levy et al., 2017; Pennucci et al., 2022). Their engagement in the service quality evaluation is a key aspect of value co-creation (Fusco et al., 2022) and can increase the people perception of their role and their feeling of being empowered, with a particular reference to the rural areas (Munoz 2013).

However, also patient experience and satisfaction can be affected by the institutional characteristics of providers and the service they provide. Murante and colleagues (2014) underlined the differences between patients admitted in medical and surgical wards: the first are generally older and more likely to suffer from chronic conditions, than those in surgical departments. They also differ in terms of propensity of 'leaving against medical advice' (PLHAMA) that is associated with patient satisfaction (Murante et al., 2014), and with other dimensions of performance, such as outcomes (30-day mortality) (Grillo et al., 2018).

A very interesting finding of these authors (Murante et al., 2014; Grillo et al., 2018) is that this latter association is significant for surgical admissions, whereas it is not for medical ones. Thus, in medical pathways, hospitalization may represent a specific stage of a complex, multi-provider pathway, and should be investigated separately. This is particularly important, considering that proximity and first level hospitals in rural areas mainly provide at least two kinds of services, namely medicine and general surgery, which, however, provide basic level of services and address low-complex health conditions if compared with first and second levels hospitals.

Purpose of the paper. Given these premises, our aim is to investigate:

- (i) whether and how much the characteristics of patients discharged by hospitals located in rural areas are consistent with, or differ from, the expected characteristics of patients in these areas, as identified by the regulatory acts.
- (ii) whether and how much the characteristics of patients who provide their feedback on experience with care provided by hospitals located in rural areas are consistent with, or differ from, the characteristics of patients discharged from the same hospitals.
- (iii) what additional information the patients provide reporting their experience with care in hospitals located in rural areas.

These research questions consider the specific mission and institutional characteristics of hospitals in rural areas, within the Italian healthcare system, as anticipated into the premises of this research work.

Methodology.

Research Setting

Our research regards the regional healthcare system of Tuscany Region (Italy).

In 2018, Tuscany Region joined the Patient-Reported Experience Measures PREMs Observatory (De Rosis et al., 2020; De Rosis et al., 2019). The Observatory collects and reports both quantitative and qualitative patient-reported data on the experience with hospitalization. In the period 2018 to 2022, nearly 260,000 patients discharged from public Tuscany hospitals were contacted to answer the questionnaire on hospitalization experience and more than 76,000 patients provided their feedback.

We first identified hospitals in rural areas, on the base of the Regional Government Resolution no. 32/2014 (Annex B3), the National Decree of the Ministry of Health no. 70/2015, and the data from the Performance Evaluation System (PES) of Tuscany Region for the number of beds for ordinary hospitalization (updated at the 2022) (Table 1).

The first step of research was devoted to the identification of the rural areas and relative healthcare providers in Tuscany. Based on the Regional Government Resolution no. 32/2014, we first identified the municipalities in the inner areas of six provincial areas of the Tuscany Region, namely Lucca, Livorno, Siena, Arezzo, Grosseto and Florence (Giunta Regionale, delibera no. 32/2014). This resolution categorized municipalities in rural areas into 'degrees of remoteness', based on the measurement of the distance between the area and the closer attraction pole: from intermediate periphery (20-40 minutes) to the periphery (40-75 minutes) to the ultra-periphery (>75 minutes). The attraction poles are areas with at least the presence of the following three kind and levels of services: (i) high schools and second-degree educational centres or more, (ii) emergency departments and services in hospitals (DEA) or more, and (iii) train stations with medium-high number and level of regional trains or more. These three services are among the nine criteria used for calculating the indicator on the level of services' provision of the Italian Ministries of Health, Education, Culture and Istat. As shown in the Table 1, according to this categorization, each province presents one or more hospitals located in a rural area, for a total of seven hospitals in remote areas.

The second step was the selection of hospitals on the base of the DM 70/2015. Following its hospitals' classification, we considered proximity and first level hospitals.

The third step was the computing on the number of beds for ordinary hospitalization, using data from the PES of the Management and Healthcare Laboratory (<https://performance.santannapisa.it/pes/start/start.php>).

Tab. 1. Hospitals located in rural areas of Tuscany Region

Provinces	Rural Hospitals	Categorization from Reg. Gov. Resolution no. 32/2014	Categorization from DM 70/2015	Number of beds (Ordinary Adm. 2022)
Lucca	Santa Croce Hospital (Castelnuovo di Garfagnana)	Periphery	Base/Proximity	51
Livorno	Civile Elba Hospital (Portoferraio)	Ultra-periphery	Base	57
Siena	Ospedali riuniti della Valdichiana	Intermediate periphery	Base	120
Arezzo	Civile Bibbiena Hospital - Casentino	Periphery	Base/Proximity Proximity	48
	Sansepolcro Hospital (Valtiberina)	Periphery		43
Grosseto	Sant'Andrea Hospital (Massa Marittima)	Periphery	Proximity	54
Florence	Borgo San Lorenzo Hospital	Periphery	Base/Proximity	99

Finally, we focused our analysis on the ordinary hospitalization in medical departments, because, as anticipated, the patient experience is affected by the hospital ward of hospitalization and is significantly different in medical and surgical departments (Murante et al., 2014).

Data collection

In the first step of our research, we intend to use the regional hospital administrative database on hospital discharge (SDO), for extracting the main characteristics of patients discharged from hospitals located in local areas (i.e., sex, age, education).

In the second step, we intend to use the data collected via PREMs Observatory, both socio-demographic characteristics (i.e., sex, age, education) and patient-reported experience. The PREMs questionnaire collects the patients' perception of experience and satisfaction with the hospitalization service. The questionnaire consists of closed-ended questions and 5 narrative sections who follow the hospitalization experience from admission to discharge (the full questionnaire is available in De Rosi et al., 2020). The questionnaire investigates the following issues detailed in the Table 2:

- Emotional support
- Engagement
- Informative support
- Technical aspects and Hospital comfort
- Satisfaction with hospitalization

Tab. 2. Aspects of the experience investigated by the PREMs questionnaire: dimensions and items.

Aspect	Items investigated
Emotional support	Management of fears and anxieties – doctors
	Management of fears and anxieties – nurses
	Pain management
	Respect and dignity – doctors
	Respect and dignity – nurses
Informative support	Respect and dignity - staff
	Clarity information – doctors
	Clarity information – nurses
	Discharge Communication on Selfcare
Engagement	Discharge Communication on Therapy
	Patient’s involvement
Technical aspects and Hospital comfort	Information to relatives
	Teamwork
	Silence
Satisfaction	Cleaning
	Overall evaluation
	Willingness to recommend

The data for this study refer to the period December 2021 - December 2022 and are related only to patients discharged from medicine departments in the rural hospitals.

Data analysis

For the analysis, we used SAS and STATA statistical software.

Primarily, we intend to analyze the characteristics of patients discharge from medical departments and compare them to the characteristics of patients that the rural hospital should care, according to the regulatory acts.

Second, the analysis will be aimed at comparing data from administrative data - SDO and data collected through PREMs survey, to identify differences among these two populations.

In both cases, we will use matching methodologies, such as the Coarsened Exact Matching procedure, to match the observations from the two databased, thus identifying the more similar records between the two datasets. Age, sex, and educational level were considered as variables for matching the records. The matched dataset has been used to verifying if the characteristics of all the discharged patients recorded in the administrative data for rural hospitals and the ones who replied to the PREMs questionnaire are significantly different.

Then, for the analysis of experiential aspects we will use observations from the PREMs questionnaire to identify the level of satisfaction and the key aspects characterizing the experience with care in rural hospitals. To this end, we will first perform descriptive analyses of each PREMs item (i.e., mean, standard deviation, distribution). We will perform different test, both parametric and non-parametric, according to the distribution of observations we will find.

Results. The study is still ongoing.

Table 3 reports the number of PREMs questionnaires that we used for this study, considering only the medicine department of the hospitals in rural areas for the period December 2021 – December 2022. In the period considered, we will exclude the Ospedali Riuniti della Valdichiana for the low number of responses.

Tab. 3: Number of PREMs questionnaire per hospital

Rural Hospitals	Number of questionnaires
Santa Croce Hospital (Castelnuovo di Garfagnana)	132
Civile Elba Hospital (Portoferraio)	231
Ospedali riuniti della Valdichiana	20
Civile Bibbiena Hospital - Casentino	182
Sansepolcro Hospital (Valtiberina)	144
Sant’Andrea Hospital (Massa Marittima)	45
Borgo San Lorenzo Hospital	149

We expect to find some differences in the population served by rural hospitals if compared to the population defined by the regulatory acts. For examples, hospitals in touristic rural areas could have younger and healthier patients. We expect to find additional differences in the population served by rural hospitals and those who decided to participate in the PREMs survey. Since this latter is fully digital, it could inhibit or least the participation of older and fragile people (Pennucci et al., 2020), despite the most important population of patients in rural areas is represented by the elderly people. This could affect the perception of experience reported by patients, since younger, more educated, and healthier individuals report more severe evaluations (Murante et al., 2014).

Nevertheless, we expect to find a more positive perception of the relational aspects of the hospital stay in rural areas, due to the sense of the place we mentioned above, but also a more critical evaluation of technical aspects in the rural hospitals due to the perception of remoteness and challenging assess to excellence and innovation that characterizes the rural areas (Gashi Nulleshi and Tillmar 2022).

Finally, Italy presents inter- and intra-regional avoidable variation in the quality of services and outcome produced in healthcare (De Belvis et al., 2022; Vola et al., 2022), which affects equity in the healthcare services' provision. Thus, we intend to compare the data of the Tuscan region with data of another Italian region (i.e., Veneto Region) that joined the PREMs Observatory.

Research limitations. We report some limitations that open roads for future studies.

First, our work is focused only on an Italian Region. Future studies could investigate intra-regional differences in other Italian regions since the conditions and circumstances change from territory to territory.

Second, additional analyses could be done at the level of each single provincial area, in order to go in depth into local roots of the differences that emerged from the first analysis.

Third, in this study we used only a quantitative approach, but further studies could consider qualitative methods (e.g., interviews, focus group, ethnography) to collect more data about people's sense-making, shared understandings and contextual situations and so interpreting these preliminary results with the contribution of local people.

Managerial implications. We expect to provide insights in relation to different matters.

First, our findings will have implication on the aspects that healthcare organization have to take into account when dealing with local areas, communities and people. The patients' perception can provide valuable information on the quality of care provided, and, therefore, the unmet needs and expectations of people cared in rural hospitals. As suggested by Pelletier and colleagues (2020), understanding the needs of who faces increased barriers to health care is the starting point to address health inequities (O'Mara-Eves et al., 2013; Wallerstein and Duran, 2006).

Other implications can regard the opportunities of involvement of elderly, alone and/or more fragile people in the remote areas. Thus, is extremely important to investigate the levers of participation of the different targets of people, also considering the role of local communities (Longo and Barsanti, 2021). This is true also with regard to the methodologies and process for increasing a wider people engagement in co-assessment initiatives.

Finally, our results can provide preliminary evidence on whether and how much healthcare organizations are rooted in the communities where they are located, by considering their values, norms, expectations. This is a core aspect to consider for increasingly connecting the excellence of the public healthcare service from the urban and central organizations to the periphery of the system (Vainieri and Nuti, 2022).

Originality of the paper.

The methods used to conduct the study contributes to its originality, since the source of data (i.e., PREMs Observatory) is unique and, prospectively, it allows to combine qualitative and quantitative methods in a unique way.

Finally, this research has managerial and policy implications and provides preliminary recommendations, which could be a valuable contribution to the field.

Keywords Rural areas; patient-reported experience; healthcare; community-based participatory approach

The role of familiness on the digital transformation processes: highlights from wine SMEs

ALESSANDRA COSTA* TINDARA ABBATE* ANGELO PRESENZA[♠]

Abstract

This study examines the role of familiness on the digital transformation processes of low-tech SMEs operating in the South Italy. By adopting a multiple case studies approach on nine family-owned wine SMEs, the study offers a better understanding of the main factors-individual, process and organization- that influence the adoption and the implementation of digital technologies relevant for the operativity of these organizations. The findings have important implications for those businesses engaged in innovation paths related to digital transformation, with the aim at improving business processes, gaining operation efficiencies, reducing costs and supporting existing and potential relationships. Specifically, the factors identified could help family-owned SMEs to manage their digital transition, in the lens of the inevitable reconfiguration of their strategic and organizational models.

Framing of the research. *The study responds to Basly and Hammouda (2020)'s call for research based on family businesses and digital entrepreneurship by presenting empirical evidence from the specific context of Small and Medium Enterprises (SMEs) and providing useful insights for both academics and practitioners. This is because the existing research regarding the digitization paths of this typology of firms is still scarcely explored even if, in the current scenario, family SMEs that intends to remain competitive cannot postpone this challenge, by adapting their business model to the pressing challenges related to the digitalization, which concretely imposes to deep reshape the company from its vision to strategies, practices, organizational structures, internal processes, capabilities and competences, and culture (Fitzgerald et al., 2014; Gurbaxani and Dunkle, 2019). Indeed, the adoption and implementation of innovative digital technologies, such as big data, artificial intelligence (AI), Internet of things (IoTs), blockchain, cloud computing, virtual and augmented reality just to list some of the main recent innovations (Arnold et al., 2016; Nambisan, 2017), involve diverse business processes, products and services' proposals, and new types of customer experiences (Nambisan et al., 2019). Digital technologies require building new digital assets, skills and competences, and capabilities (i.e., digital agility, digital networking capability and digital data analytics capabilities) (Verhoef et al., 2021) and the adequate design of new learning processes within the organizations. Certainly, this implies that entrepreneurs have to acquire a new and diffuse digital mindset, a new digital approach based on different motivations, behaviours, routines, competences and organizational capabilities that support them to navigate information-dense digital environments (Nambisan et al., 2019) and to implement digital technologies and applications that increasingly transform products/services and production processes (Basly and Hammouda, 2020).*

The transition towards the digitalization of activities and processes, involving changes in different firms' areas, could be very complex in the family-owned SMEs, which have to evolve, maintaining their flexibility and agility, for applying innovative digital business models as well as being open to the development and adoption of new digital technologies, infrastructures and platforms (i.e., social media, cloud computing, online communities, etc.) (Riswanto, 2021) in their socio-economic contexts. Specifically, these organizations, oriented to exploit business opportunities related to data-driven value creation, have to face continuous challenges in their evolutionary paths, addressed by digital initiatives and projects.

However, main challenges and/or barriers referring to the specific characteristics of family-owned SMEs can effectively influence the orientation toward digital transformation adoption. In particular, family-owned SMEs show high ability but low willingness to innovate (Chrisman et al., 2014), usually due to different factors, such as financial (insufficient funding), legal (regulatory concerns), technological (legacy technology limitation), and human factors (Ano and Bent, 2021); long-term orientation; the obsolescence of their business models; conservativeness of traditional practices and approaches; prioritization of non-economic goals over economic goals; preference of incremental innovations over radical and disruptive ones, and human resources, that could lower the openness towards innovative

solutions (Bennedsen et al., 2007; De Massis et al., 2013). In other terms, the characteristics above mentioned can effectively represent factors that may limit and/or impede the exploitation of further growth opportunities related to digital transformation and to the successful development and experimentation of digital ways of doing business that can create and capture more value for the firm (Nambisan et al., 2017; Ano and Bent, 2021).

The specificities mentioned above can be concretely extended to family-owned SMEs operating in the wine context, which represent the sample selected for the empirical analysis of this research. In particular, this study has selected the wine industry because it is increasingly assuming relevant economic role in many countries (Galati et al., 2017; Rossi et al., 2012), and it exhibits an incredible technological shift over the last few decades (Giuliani et al. 2010,). It has recently manifested structural industrial and market changes, which have affected competitive dynamics, supply relationships and consumer behaviours (Fait and Iazzi, 2008), by determining deep changes at business and environment levels as well as at entrepreneurial processes level (Rossi et al., 2012; Bernetti et al., 2006).

The paper develops an empirical analysis focused on the family-owned winery SMEs operating in South Italy. Italy is the first largest wine-producing country (Mediobanca Research Area, 2022) and the second wine exporting nation (International Organization of Vin and Wine, 2019), with significant employment relevance and socioeconomic impacts (Broccardo and Zicari, 2020a). Italian wineries are mainly represented by family small businesses with long-term, outstanding traditions and the wine they produce embodies values, symbols, and traditions, which together express the family's mindset (Broccardo and Zicari, 2020b; Contà et al., 2015).

Purpose of the paper. With these premises and the intent to fill the gap existing in literature, the objective of this research is to examine the role assumed by familiness on the digital transformation processes of SMEs operating in the wine industry. Specifically, the following research questions are investigated: What are the main dimensions of family-owned SMEs that influence digital transformation processes? What is the role of familiness in the digital transformation of wine SMEs?

Methodology. The analysis is circumscribed to Sicily, one of the most important Italian wine regions with a variety of terroirs, favorable climatic conditions, experience and entrepreneurial spirit, traditional methods and techniques, that have contributed to a huge diversity of grape and wine styles. With 98.992 hectares, Sicily is "the first Italian wine-growing region by vineyard area, and the tenth in the world, even if it is the fourth Italian region for overall production with a yield per hectare lower than many other regions" (www.assovinisicilia.it). Additionally, Sicily ranks first in Italy for organic vineyard area, with an extension of 26.241 hectares, equal to 27% of the organic vineyard area of Italy, which amounts to 117.378 hectares (Unicredit-Nomisma, 2022). Regional exports recorded a strong rebound (+16.8%) compared to the collapse of 2020 and recorded an increase of 20.7% compared to 2016 (Unicredit-Nomisma, 2022). In term of quality, the Sicilian wines are confirmed also for 2021: the incidence of Dop wines is in line with the national average (40% Sicily; 43% Italy), the incidence of IGP wines is higher in Sicily compared to the national average (34% Sicily; 26% Italy) (Unicredit-Nomisma, 2022).

Generally, wine producers are small-sized companies (Zanni et al., 2009; Presenza et al., 2016), usually family owned- and-managed (Chirico and Nordqvist, 2010) and rarely listed on national or international financial markets. The relationship between family and wine product is extremely strong and the wine is the result of territorial values, symbols, and traditions (Abbate and Cinici, 2014). Recently, Sicilian wine sector is increasingly characterized by complex and dynamic processes of structural changes in the vineyard, in the cellar and in the communication activities. Numerous SMEs have been committed in the definition and implementation of projects oriented to improve quality production within a sustainable perspective, to develop profitable export processes, and to experiment and implement innovative technologies (Unicredit-Nomisma, 2022).

The study uses multiple case study method, which is considered suitable for developing theories on phenomena where little is known about their dynamics, especially referring to the context where they occur (Yin, 2003). The research uses a multiple case study approach because it allows comparing the results of each case with the other ones to reveal similar patterns and, consequently, to confirm emerging concepts (Davis and Eisenhardt, 2011). Additionally, with this approach it is possible to obtain more generalizable and robust evidence than a single-case study, allowing for further theory extensions (Davis et al., 2007). Different reasons led to this research approach. Firstly, the topic here considered is complex and less investigated, hence calling for the theory-building (Eisenhardt, 1989). Secondly, this approach allows for a close correspondence between theory and data (Glaser and Strauss, 1967). Thereby, this study follows Eisenhardt's (1989) approach for theory building, as well as the guidelines proposed by Yin (1984). It adopts an exploratory, qualitative research design to investigate the phenomenon in detail since no prior empirical research is available (Eisenhardt, 1989). In this respect, this study performs semi-structured interviews with the entrepreneurs of nine Sicilian winery family-owned SMEs.

We selected the winery family-owned SMEs based on two main criteria: being localized in Sicily and being at least in the second-generation stage. The informants were determined by snowballing, that is, the researchers identified the family-owned SMEs members to be interviewed based on information achieved from 'Le Donne del Vino', an association founded in 1988 with the aim of promoting knowledge and culture of Italian wineries. We contacted the identified companies, telephonically or via e-mail, by illustrating the focus of our analysis. Through this activity we were able to interview six family-owned SMEs. In order to achieve variance in the sample, that also allows to exceed a possible gender-related bias, the interviewees were asked to provide additional names outside the association. This further activity permitted to reach three more interviewed. The nine interviews allowed the authors to have a deep representation of the state-of-the-art, thus addressing our two research questions. Data was collected between November 2022 and January 2023.

Results. *Based on the empirical evidence, findings show how familiness influence the digital transformation of family-owned SMEs and highlight three main dimensions - individual, process and organization - relevant for the introduction and use of digital technologies in the productive and innovative activities of these organizations.*

The findings of this study are collected into two groups: the role of familiness in the digital transformation process and the main factors influencing digital transformation strategy and process of the selected family-owned SMEs.

Regarding the first group, the empirical analysis underlines the role that familiness assumes in the definition and implementation of digital transformation processes, by facing inevitable challenges determined by digital technologies adoption and by the necessity to preserve the firm's sustainability within a context of increasing uncertainty and of possible business crisis.

In particular, the organizations here investigated highlighted the different generational perspective that explains the exploitation of digital opportunities and, consequently, the development of digital transformation projects. In many cases, the entrepreneurial bridging, the period during which older generations manage the operations while younger ones implement innovative ideas, represented an interesting opportunity for inter-generation collaborations oriented to the experimentation and exploitation of novel activities, methods of productions and forms of communications. On the other hand, findings revealed that if the economic and decision-making power is concentrated in the hand of a senior family member, this could translate in a more rigid operational structures and in less decisional independence in operative process. This is particularly true when the family owner is skeptical towards digital technologies and the firms' operativity requires the adhesion and the engagement in digital initiatives, at least temporarily and in a fashion timely. When family members seem reluctant to invest with their own money, because of uncertainty, public funding could be a persuasive argument for pursuing concrete digital advancements.

Concerning the second group of results, this study highlights the different factors - individual, process and organization - that can influence digital transformation processes in family-owned SMEs operating in the traditional contexts. It shows that these factors can differently act as "barriers" or "facilitators" for adopting advanced digital technologies within the organizations involving activities, processes, and resources and, in general, for facing the challenges related to the digital transformation initiatives by efficaciously addressing efforts, investments, and achieving long-term objectives. At the individual level, digital transformation processes allow to distinguish between production skills - related to production processes - and those related to commercialization, marketing, and communication competences. In relation to the processes, during the interviews, most of the times it emerged that Sicilian SME wineries realized the urgency for digital transformation, but a strategic orientation and a consequent strategic formulation for digitalization is still absent in most of cases. However, they are more likely to evolve stepwise following digital technologies advancements in most of their organizational processes. The third aspect of digital transformation of Sicilian family wineries was related to the organizational aspects. Even if all of our sampled firms are actively involved in digital transformation processes, little has been made so far in organizational terms, and no one is actually introducing a business model innovation.

Research limitations. *This research has some limitations that provide potential opportunities for future research directions. Firstly, the theoretical insights here advanced are substantial rooted in the investigation of diverse case studies. Hence, scholars could consider research projects for the generalization of the findings by developing and performing other empirical investigations that are based on different methodological approaches (i.e., longitudinal case studies across diverse industry, surveys ad hoc, etc.) and innovative ways for collecting and analyzing data. Secondly, other limitations are linked to the sectorial and regional dimensions. In fact, the case studies here selected are representative of the phenomenon under investigation within the wine sector. However, as a future research direction, other studies in family-owned low-tech SMEs adopting digital transformation processes in different sectors, as different empirical settings, might strengthen the findings proposed by this study. In addition, this study focuses on the family-owned low-tech SMEs operating in Sicily. Therefore, involving family-owned low-tech SMEs operating in different geographical areas, with different historical, economic, cultural conditions, could be fruitful for additional investigations able to improve the existing literature at the intersection of the digital transformation and family involvement.*

Managerial implications. *The present study supports family-owned low-tech SMEs oriented to consider the innovation paths related to the adoption and implementation of digital transformation and, consequently, to apply digital technologies with the aim at improving business processes, gaining operational efficiency, reducing costs, and supporting different interactions and relationships with customers (existing and potential). The factors here underlined can be useful for firms that intend to start an inevitable digital transition, even if this has relevant implications and determines a consistent reconfiguration of strategic and organizational models by requiring the development of diverse professional competences and capabilities, often acquired from external sources, or developed within the organization through adequate learning mechanisms and processes. In this perspective, family-owned SMEs have to consider that the efficacious introduction, adoption and use of digital technologies (blockchain, big data, artificial intelligence, etc.) in their activities and in their processes needs necessarily innovative skills and competences by activating a coevolution process between skills and competences, innovation and digital technologies (Ciarli et al., 2021). However, in this challenge perspective, family-owned low-tech SMEs are pressing called for an innovative cultural approach oriented to sustain the radical change of the organization by activating paths towards the digital configuration in the present as well as in the future.*

Originality of the paper. *This study contributes to the field of family SMEs in at least two ways. From one side, it highlights the role of familiness assumed in the digital transformation processes and activities; from the other, it*

initiates to deepen the knowledge regarding the principal dimensions that influence family-owned SMEs in their activities and projects oriented to the adoption of digital technologies within their boundaries.

Keywords: digital transformation; familiness; SME; wine industry; digital transformation factors

Passing on Self-Compassion: Analysis of Succession Success Drivers in Family-Owned Small Businesses

AHMAD RAZA BILAL* ZESHAN AHMED• TAHIRA IRAM▲ TEHREEM FATIMA**

Framing of the Research *Female successors demonstrate strong loyalty and respect for their parent firms (Belchior and Lyons, 2021). They are recognized because of their family business in their social circles. This is why female successors are concerned about the stability and longevity of their family business. Every family business passes through the highs and lows of its life cycle (Mbedzi and Simatele, 2022). An accurate cognitive approach and psychological well-being (self-compassion) of a female successor may help smooth business operations, even during economic unrest (Neff Kristin, 2022). Stability in the family business's operations and growth owing to the successor's self-compassion may increase the longevity of the family business. However, the literature shows a scarcity of studies on the relationship between the successor's self-compassion and the success of F-OSB. So, the R.Q.1; whether a female successor's compassion has a significant relationship with the succession success of F-OSB.*

Self-compassion was assessed in two ways: inward and outwards. Inward compassion refers to an individual's attention towards self-understanding, self-appraisal, and self-love. In contrast, outward compassion involves maintaining care for others and building quality relationships with peers/managers/predecessors (Boellinghaus et al., 2014). Female successors with inward compassion prioritize their psychological well-being, inner strength, and physical health (Boellinghaus et al., 2014). They might consider that knowledge or educational attainment might improve business decision making (Dias and Davila Jr, 2018). Rational decision-making due to education may increase the self-compassion of the successor to polish their entrepreneurial capabilities, and it may increase the likelihood of a firm's stability (Bonesso et al., 2018). However, the literature is silent on the role of female successors' education in improving self-compassion and succession success in F-OSBs. So, the R.Q.2; whether a female successor's education moderates the relationship between self-compassion and the succession success of F-OSB.

The outward compassion of a successor may instigate him to build strong relationships and minimize conflicts among family members and units to work for the betterment of their family business. Teamwork of family members due to strong bonds and trust may increase the family firm's performance and preserve its longevity (Galadanchi and Bakar, 2017). But, how a successor's strong relationship with the predecessor instigates her self-compassion to increase growth and stability across generations is still silent. So, R.Q.3; whether the predecessor-successor relationship moderates the relationship between the female successor's self-compassion and the succession success of F-OSB. Predecessors have a strong affection and extra care for their successors. They prefer the successor's comfort and underestimate the need for their successor's education (Elsaid et al., 2016). They think they can teach their successors more than any college or university. That's why successors of family businesses are less likely to get an education up to the post-graduate level (Barbera et al., 2015). However, the literature is silent to answer whether a strong relationship between predecessor and successor may help the F-OSB to preserve their longevity across generations during an economic slowdown or the female successor's education. So the R.Q.4; whether the predecessor-successor relationship is more influential for a successful succession transition or the female successor's education?

Purpose of the paper. *COVID-19 has put the survival of family businesses at risk (Kraus et al., 2020). Rius (2013) revealed that 90% of the world's firms are family-owned. Similar to other economies, Malaysia's economy is also based on family owned small businesses (F-OSB). F-OSBs contribute to Malaysia's GDP by 39%, exports by 25%, and employment by 47.8% (Mohamad et al., 2021). Klynveld Peat Marwick Goerdeler (KPMG), an international firm, surveyed the impact of COVID-19 on F-OSBs. They reported a 69% drop in revenue, a slump of 8.56% in employment, a significant decrease in employees' working hours, and a close-down of 14% of family businesses in Malaysia (KPMG, 2022). KPMG also reported that 83% of family businesses faced a decline in sales and profitability during the during-and-post-pandemic period.*

Economic unrest after the pandemic has increased the likelihood of business failure (De Massis and Rondi, 2020). Such a complicated situation has damaged the F-OSB successor's cognitive and rational decision-making approach (Kollmann et al., 2019). Day-to-day losses or difficulty in meeting break-even have raised psychological issues among successors. These issues not only increase self-compassion, but also influence the performance and longevity of the family business. A short life span of F-OSBs (succession failure) is a hot debate in family business literature and a matter of deep concern for economies (Wijayanti et al., 2021). This matter becomes more significant when it moves around the F-OSB's succession transition and the self-compassion of female successors. Male and female successors may play an equally vital role in transacting the F-OSB into subsequent generations (Ahmad et al., 2022). However, female successors confront a higher level of self-compassion than males.

The erratic growth of family-owned small businesses (F-OSB) for an unprecedented period led to self-compassion among female successors. Therefore, this study examines the relationship between a female successor's self-compassion and succession success by focusing on moderating the role of the predecessor-successor relationship and a female successor's education. We also compared the influence of the predecessor-successor relationship and successor's education on the success of F-OSB.

Methodology. *This study used a cross-sectional approach. Primary data were collected from female Malaysian F-OSB successors. We targeted female successors designated as CEO, chairmen, or managing directors of F-OSB. The reasons for this selection are as follows: 1) they have a small social circle compared to their male counterparts, are less likely to share their business issues, and face self-compassion. 2) they have authority in strategic decision-making and may significantly influence the succession transition (Strike et al., 2018). This study targets the retail sector to obtain better insights (Knight et al., 2020).*

The authors tracked the list of F-OSBs from the SME Corporation in three districts: Kuala Lumpur, Labuan, and Johor Bahru. The researchers imposed a few filter questions to target the exact F-OSB: 1) F-OSB must be five years old, 2) two or more family members are involved in the operations of F-OSB, 3) successor possesses shareholdings of 50% or more, and 4) F-OSB should have employees between 5-30. A total of 469 female successors voluntarily participated in this study. However, 342 responses were received, a response rate of 73%. Thirteen questionnaires were discarded due to incomplete or inconsistent responses. The final sample size was 329 patients.

In this study, 82% of the participants were male and 69% were middle-aged (i.e., between 40-60 years old). 62% belonged to the 2nd, 23% to the 3rd, and 8% to the 4th generation. This study used PLS-SEM with Smart-PLS software for the data analysis. There are a few reasons for using the PLS-SEM. 1) It is second-generation software capable of dealing with data multicollinearity issues. 2) Despite the low number of responses, it provides reliable and valid results. 3) PLS-SEM deals with formative and reflective measurement constructs (Sarstedt and Cheah, 2019).

Results. *The results of the direct relationship between the exogenous and endogenous constructs. The successor's mindfulness (H1a: $\beta = 0.082$ and $t = 4.116$) has a positive association with succession success. The successor's self-isolation (H2a: $\beta = -0.079$ and $t = 3.649$) has a negative association with succession success. The successor's self-judgment (H3a: $\beta = 0.111$ and $t = 4.013$) has a positive association with succession success. Predecessor-successor relationship (H5: $\beta = 0.169$ and $t = 9.644$) has a positive association with succession success. At the same time, the successor's education (H6: $\beta = 0.657$ and $t = 38.842$) has a positive association with the succession success of the F-OSB.*

The moderating mechanism explains how the direct effect of self-compassion (mindfulness, self-isolation, self-judgment) on succession success changes when the moderating variables' predecessor-successor relationship and successor's education increases in standard deviation. The simple slope analysis in the figures below was employed to evaluate the moderating effect. The results show that predecessor-successor relationship interaction (H1b: $\beta = -0.018$ and $t = n.s$) has a non-significant moderating impact on the relationship between mindfulness and succession success of F-OSB. The predecessor-successor relationship moderate non-significantly (H2b: $\beta = 0.018$ and $t = n.s$) in the relationship between self-isolation and succession success. While the predecessor-successor relationship moderates (H3b: $\beta = -0.111$ and $t = 4.660$) negatively the relationship between self-judgment and succession success of F-OSB.

The successor's education interaction (H1c: $\beta = 0.129$ and $t = 5.510$) significantly affects the relationship between mindfulness and succession success. The successor's education is moderate negative (H2c: $\beta = -0.078$ and $t = 3.770$) in the relationship between self-isolation and succession success. The successor's education moderates positive (H3c: $\beta = 0.030$ and $t = 1.370$) the relationship between self-judgment and succession success. In addition, education does not moderate (H4: $\beta = 0.027$ and $t = n.s$) the relationship between the predecessor-successor relationship and succession success. The R^2 values for the endogenous variables indicate that the proposed theoretical model explains 78.5% of the variance in succession success, exhibiting good model predictability.

We compared whether a predecessor-successor relationship or a female successor's education is more influential on the self-compassion and succession success of F-OSB. The T-values of the moderating effect of the female successor's education and the predecessor-successor relationship demonstrate that a female successor's education has a greater significant influence on increasing the likelihood of succession success than the predecessor-successor relationship.

The results concluded that mindfulness, self-judgment, predecessor-successor relationship, and education of female successors have a positive relationship, while self-isolation has a negative association with the success of F-OSB. The predecessor-successor relationship does not moderate the association of mindfulness and self-isolation with succession success, but self-judgment does. However, the female successor's education moderates the association of mindfulness and self-isolation with succession success, but not the association of self-judgment and the predecessor-successor

relationship with succession success of F-OSB. Furthermore, a female successor's education has a greater impact on succession success than the strong relationship between the predecessor and successor. Post-graduate level education increases the female successor's mindfulness and decreases her self-isolation; thus, it contributes to the transaction of the F-OSB into subsequent generations. Moreover, this study reveals that the female successor's education attainment up to the post-graduation level may play a more significant role in the succession transition during an economic downturn than her strong relationship with her predecessor. Our findings indicate that despite lavishing female successors with affection and extra care, predecessors should emphasize their high-level educational attainment.

Our study offers three contributions. First, the present study contributes to the literature by examining the direct link between a successor's self-compassion and the succession success of F-OSBs. In addition, this study investigates a novel moderating mechanism of female successor's education and the predecessor-successor relationship between self-compassion and the succession success of F-OSB. Family business literature emphasizes the successor's education and maintenance of relationship quality. But literature is silent to guide which factor helps the female successors more for succession success, particularly when her business is passing through a complicated situation (Kubiček & Machek, 2019). Second, we apply the self-control theory to evaluate the female successor's self-compassion role theoretically and empirically in F-OSB (Rauthmann, 2020). We utilize the moderating mechanism of the successor's education and predecessor-successor relationship to explain the relationship between self-compassion and succession success. Third, our results are helpful for the members of F-OSBs and urge the policymakers to introduce successors' psychological wellbeing programs nationwide. This study advises that predecessors should consider educating their female successors rather than providing them support with a strong relationship.

Limitation. This study investigated three constructs of self-compassion; however, future research should examine the remaining three constructs. We focused on only three districts in Malaysia; however, the remaining ten districts should also be examined to generalize the results. In this study, the data were collected during the endemic phase; however, post-endemic studies should compare these results. In addition, a comparative study should be performed between Muslim and non-Muslim developed and developing countries. There is a need to induce different moderating and mediating mechanisms between exogenous and endogenous variables. For instance, financial literacy, self-enhancement, and business experience can be potential moderators and mediating variables, such as value congruence and willingness to lead.

Theoretical Implications. The results of this study have several theoretical implications. First, self-compassion, self-judgment, self-isolation, and mindfulness may increase the likelihood of successful F-OSB succession. Second, this study found that female successors who isolated themselves from their social circles may increase the possibility of succession failure. However, successors with high mindfulness and self-judgemental traits may anticipate future obstacles and take proactive measures to successfully transact their F-OSB into subsequent generations. This study indicated that a postgraduate female successor could manage her self-compassion traits and may transact their F-OSB into successive generations. However, the predecessor's affection and support towards her successor may not help her deal with her self-compassion during stressful situations and lead the F-OSB to subsequent generations.

We can extrapolate from self-control theory that female successors become more self-judgmental when they fail to meet their goals. They developed their skills and took advantage of their education to pass on their F-OSB to the next generation. However, the dynamic role played by their predecessors is somewhat muted for succession transition. Self-control theory also explains how insufficient effort or a female successor's failure to restrain her desires results in self-isolation. Self-isolation contributes to business failure in subsequent generations. The predecessor may not have been able to help her overcome her self-isolation. Nevertheless, a highly educated female successor may be able to rationalize the situation and return to her business to ensure its success. Self-control theory helps explain why female successors with high mindfulness visualize and rationalize their future. A mindful female successor develops strategies to overcome future hazards, which may result in successful succession. However, a post-graduate female successor may rationalize her priorities without her predecessor's support, bring about a work-life balance, and become able to preserve the longevity of their F-OSB.

Management Implications. In the during-and-post COVID period, F-OSBs face a higher drop in revenues and profitability. This drop trend may be due to seasonal or economic instability, or stability changes. For instance, a prolonged decline in sales and profitability during COVID-19 or any complex situation causes successors to feel depressed. Therefore, the concept of self-compassion was selected for in-depth investigation. This study suggests that predecessors and family members should not leave female successors alone to handle financial or non-financial crises. Thus, their support may preserve the longevity of F-OSB. Moreover, this study suggests that predecessors should emphasize the education of female successors and let them use the cognitive skills that were polished during their educational attainment. A well-educated female successor not only deals with compassion traits but also turns him mature, groomed, and trained enough to transact F-OSB into subsequent generations.

The pandemic hurts F-OSB's financial position and raises psychological issues. This study implies that vaccination and the financial packages provided by the government are not sufficient for family businesses' performance and survival across generations. Still, psychological support, training, entrepreneurial courses, and workshops should also be part of during and post COVID treatments. Therefore, a post-recovery programme must be proposed to increase the growth and profitability of family enterprises. Governments should activate entrepreneurial support and educational programs through virtual gatherings. Officials should listen to their problems and allocate problem-solving committees at the district level.

Originality. *Intertwining the conservation of self-control theory, this paper extends novel insights into the above-stated association is provided through the moderating role of the predecessor-successor relationship and the female successor's education. This paper will benefit business founders, family business successors and researchers.*

Visible adoption into the family firm dynamics: how does it shape local roots? A single-case study

CINZIA DESSÌ* ANGELA DETTORI• LAURA FERRARI^ MICHELA FLORIS** ROSA ROSNATI**

Objectives. *The recent increasing immigration flow is affecting most developed countries (Castles, Haas and Miller, 2015) and is generating relevant changes in society, labor market, and families compositions. Most studies have focused on samples of first- or second-generation immigrant youth, while less attention has been paid to international adoption which may be considered as a “quiet” migration process (Lovelock, 2000; Weil, 1984). As its practical and legal institution means the movement of children from their birth country to adoptive parents’ one. Between 2004 and 2019, nearly 169.000 children were placed in international adoptions into European countries (Selman, 2019). In the last few decades, Italy was the first receiving European country for number of foreign minors authorized to enter for adoption purposes (Commission for Inter-country Adoptions, 2019). Most adoptions are transracial and entail the placement of a child from a different ethnic group into families with a majority ethnic background (Baden et al., 2012). Nowadays, an increasing number of international transracial adoptees are navigating through emerging adulthood and enter into world work. As a result of this phenomenon, organizations and firms are increasingly called to adequate and renew their management styles and strategies to manage ethnic diversity (Duchek et al., 2020).*

This phenomenon of silent migration is slowly changing the structure of host families, of the social contexts affected by this trend, and organizations in general. This aspect has often been underexplored by both the psychosocial literature and management literature, where, for example, family businesses undoubtedly undergo a change in their family, cultural and managerial structure. Thus, family businesses are witnessing transformative facts despite the lack of attention of scholars as well as the psychosocial literature that largely overlooked. For instance, scholars argue that ethnic diversity within firms enhances organizational performance (Ely et al., 2012) (Herring, 2009), concurs to create a positive firm image (Kim, 2006), promotes small business venturing (Boudreaux, 2020), and when ensured also in the board, it reduces the likelihood of large-scale discrimination lawsuits given their propensity to advocate for underrepresented groups in the workplace (Abebe & Dadanlar, 2019), and enhances stakeholder management (Fernandez & Thams, 2019).

On the other hand, psychosocial literature was primarily focused on the impact of ethnic diversity on family relationships and adoptees’ ethnic identity development. Research findings emphasize the importance of whether or not racial and ethnic differences are acknowledged. Within adoptive families, giving value to the adopted child’s racial and ethnic heritage as a vital component of the family urges parents’ enculturation regarding the child’s birth culture (Anderson et al., 2015) which turned out to promote the adopted child’s ethnic identity development. In fact, shaping the ethnic identity is a highly complex task for transnationally adopted children, as their ethnic identity is often different from that of adoptive family members (Lee, 2003) and parents’ cultural socialization could serve as a crucial factor in triggering adoptees’ exploration of their ethnic identity, which has proved crucial predictor of their psychological well-being (Castle et al., 2011; Ferrari et al., 2015, 2017). Recent studies (Ferrari et al., 2019; 2021) focused on which contextual factors are able to contribute to developing the ethnic identity among intercountry adoptees, suggest the importance to consider the role played by social contextual feedback regarding intercountry adoptees’ ethnic differences, especially when are negative and discriminatory.

However, how the adoptees’ racial and ethnic differences may be related and influence the social context acknowledgement and acceptance of their ethnic difference have not been explicitly examined.

In fact, the impact of a change in the family structure, however, produces effects not only within the family as a natural organization, but also externally at the social level as a result of the bidirectional influence between the family and the surrounding social context. This aspect generates “welcoming” areas and more “resistant” area to this

phenomenon because they are rooted in closed contexts and little inserted in international exchanges. In this direction, the local roots where the family and the family business operate can undergo more or less marked transformations that would deserve specific attention from scholars. Over time, following Granovetter's theorization (1985), family business scholars have recognized the significance of the context to the family business, building upon the theory of embeddedness the significance of local relationships to and from the family business to the context. Local relationships are based on trust, the exchange of information (Uzzi, 1997), and provide firms with a unique opportunity to establish long-term relationships with local stakeholders in order to convey a perception of credibility, preserve the firm's reputation, and ensure a competitive advantage (Upton et al., 2001). In other words, businesses appear to be the result of their local context and history, which transform a geographical region into a social space with its own values, languages, beliefs, culture, and tradition (Granovetter, 1985).

Due to the social and geographical proximity, economic ties in such a social space are not solely motivated by a desire to pursue good economic and financial results, but also to embody mutual trust, knowledge sharing, and positive outcomes for all local actors in terms of legitimization, friendship, and social inclusion (Ben Letaifa & Rabeau, 2013) especially in closed and small geographical context. This happens above all for micro and small businesses, which are frequently managed by families who do not take decisions without taking into account the context in which they are embedded (Wallace, 2002) because they are habitually aligned to the local expectations (Alsos et al., 2014). In line with this is the awareness that the link of the family business with its local roots takes on a huge thought.

To our knowledge, however, the attention of scholars towards the role of local roots for the family business has focused above all on how these have an effect or not towards their propensity to internationalize, neglecting how they can influence the internal dynamics within the family business. In fact, while the literature has primarily focused on evaluating the external behavior of the family business to loosen its local roots towards internationalization strategies, little has been done to analyze how this can occur through a change in the family structure. In particular, what happens when a family firm experiences a change in the family structure with the peculiar entry of a new family member through adoption, in particular a visible adoption, is entirely unexplored. At the same time, this topic is increasingly relevant to the unprecedented changes that the worldwide social structure has been living because of the immigrant flows, due to the fact that there is a common consensus that family businesses have a strong connection to their home region and local roots (Bird & Wennberg, 2014) with a reluctance to broaden their visions (Fernández & Nieto, 2005; Fernández & Nieto, 2006). Scholars have argued that family firms often have to strive with the tension whether to stick to their local roots (Block & Spiegel, 2013; De Massis et al., 2018) due above all with the fear to break their traditional oriented strategy, embracing a conservative behaviors (Gómez-Mejía et al., 2007; Kotlar et al., 2018).

If family businesses are important bridge-builders between local and global environments (Baù et al., 2021), the composition of the family structure formed by individuals by different origin resulting in a multicultural family represents an intriguing scenario to analyze in terms of the family business's tendency to remain or not rooted in its local roots. In fact, family business possesses a unique structure that simultaneously manages the internal family dynamic and the financial affairs, involving different generations. The current Italian economic situation reveals that a majority of business companies are family-run, which means that family firms bear a significant impact on the economic and social development of our country. It is also evident that Italian firms are based on a delicate balance between family and business, which may be challenged especially when adoption comes in. Facing ethnic differences, which gives visibility to the history of adoption, represents one of the crucial challenges for transracial adolescent adoptees, for dynamic in the family that runs a business, and also in the relational context where the family business works and has its local roots. Based on these reflections, this study aims to investigate how visible adoption impacts family firms' dynamic and local roots in a closed-minded geographical context of the south of Italy. Due to the novelty of the research aim, we adopt a single-case approach that is exploratory in nature and can help us to uncover interesting insights and new emerging themes.

Methodology. We adopted a qualitative method through an inductive and interpretive approach, employing a single case study (Eisenhardt & Graebner, 2007; Karra et al., 2006; Yin, 2008), that allows an in-depth investigation of a contemporary phenomenon within its real-life context (Koporcic et al., 2019; Pettigrew, 2014; Yin, 2008). We carried out family research assuming a multiformat perspective and collecting data from all family members; as a consequence our unit of analysis was the family.

A qualitative research design is particularly relevant to organization and management studies because allows 'understanding the dynamics present within single settings' (Eisenhardt, 1989, p. 533) and it is particularly appropriate for family business studies (De Massis & Kotlar, 2014) to penetrate the veil of the family and avoid gathering data that is not useful (Litz, 1997). To fully understand the organizational phenomena associated with family involvement in and/or influence on business as well as their antecedents and consequences, scholars need to combine multiple perspectives and navigate multiple levels of analysis. In this respect, the case study design appears to be a well-suited methodology, as it (i) copes with the situation in which there are manifold variables of interest that are embedded in the context of investigation and (ii) relies on multiple sources of evidence, with data needing to converge in a triangulation fashion (Yin, 2013). Moreover, to our knowledge, there are no studies that investigate the effects of visible adoptions in family firms to challenge local roots. Thus, an exploratory approach is needed, and the single-case study constitutes a suitable theory-building approach that is deeply embedded in empirical data, in fact gathering data through interviews and combining it with factual information allows to produce theory that is accurate, interesting, and testable (Eisenhardt & Graebner, 2007). Finally, the case selected, which is a micro firm located in a small village in the center of Sardinia (Italy) that has experienced a visible adoption of an adolescent adoptee, is in line with Patton's

suggestions (1990: 273), which underline that the “logic and power of purposeful sampling lies in selecting information-rich cases for study in depth. Information-rich cases are those from which one can learn a great deal about issues of central importance to the purpose of the research”.

Data Gathering

In the present research we assume a multi-instrument approach in order to go into depth into the representations of adoptive family's members. Semi-structured interviews and two graphic instruments were used. Besides, we relied on a combination of primary and secondary data sources. For primary data, in-depth semi-structured interviews were conducted via Teams following an interview protocol divided into two parts (Legard et al., 2003). The interviews were conducted in Italian, audio-recorded and transcribed verbatim by the authors, as authorised in advance by the interviewees who signed an informed consent form. Specifically, in the second quarter of 2020, we conducted five in-depth semi-structured interviews with members of the chosen family firm, each of which lasted 50 minutes on average. Assuming a family perspective, based on a multi-informant approach, in our study, we collected data from all family members: the emerging adult adoptee, mother, father, sister and brother. The emerging adult adoptee was born in Ghana, arrived in Italy when he was 14 years and was adopted when he was 18 years. Interviewing several informants avoided the bias of personal perceptions and minimized the possibility of distortions to the researchers. In fact, as Stake (1995) has pointed out, each interviewee should be treated as having their own story to tell. The interview questions, intended to encourage interviewees to freely discuss their experiences and personal viewpoints, avoided technical terms from the academic literature. Additionally, we used two psychological instruments: the Family Life Space (Gozzoli & Tamanza, 1998) and the OSIO (Schubert & Otten, 2002). The first is a graphic and projective instrument which allows to understand the representation of the family and working universe. This symbolic drawing allows to investigate the quality of personal relationships with family, friends, and the local community, by using graphical signs inside or outside a circle that represents the family life space. The second propose three graphical items for describe to the level of identification between two considered groups (in our case, the family and firm group). Each item consists of seven pictures of two increasingly overlapping circles, labeled “Self” and “Family”, “Self” and “Firm”, “Firm” and “Family”. OSIO is a subjective perception of the self in the intergroup situation. It allowed us to deepen our knowledge on the overlap of self and ingroups, and the extent of family and business relationships are overlapping.

Data Analysis

After the interviews were transcribed, five independent coders read through the interviews and they scanned them for emergent themes that appeared important to answer the research question (Reay & Zhang, 2014). A content analysis was conducted without using software such as NVivo in order to avoid biases in Cohen's kappa (Kim et al., 2016), which calculates reliability at the character level and was thus unsuitable for our study's higher unit of analysis (e.g. sentence and paragraph). We thus conducted the content analysis by combining the nomothetic approach advocated by Eisenhardt (1989) and the Gioia methodology (Gioia et al., 2013). The analysis based on the Gioia methodology ended with the creation of a graphic representation of the data to show how the raw data were processed into themes from first-order concepts to second-order themes and, in turn, to aggregate dimensions. First-order coding involved examining what was said during the interviews and generating items. The outcome of that process was squared to identify several themes based on theoretical orientations and drawn from the interview material itself. We later used those themes to develop subthemes and units of meaning. Second-order coding, as recommended by Gioia et al. (2013), required aggregating the items from the first step at different levels of abstraction (Thiétart, 2014). During the analysis, we iteratively switched between qualitative evidence and extant theory (Denzin & Lincoln, 2000; Silverman, 2001). This permitted us to use extant insights to extend theory, by revealing stimulating new insights. Finally, as the theoretical framework grew more explicit, we compared it further with literature to highlight similarities and differences from prior research, strengthening internal validity and refining constructs and relationships. The theoretical logic is thus typically a blend of arguments from case evidence, prior research, and stand-alone logic (Eisenhardt & Graebner, 2007).

Findings. Results of interviews' in depth-analysis underlie that visible adoption exerts profound influence on three main levels: family, firm, and local.

Family level

Concerning the family level, the visible adoption affects family equilibrium and family embeddedness in terms of:

- Acknowledgement of the ethnic diversity

The owning family demonstrates a natural proclivity towards the acceptance of ethnic diversity. All family members agreed in valuing the ethnic diversity as a relevant resource for the family and the firm. Exemplary quotes are the following: “For us the skin color is not a problem: it's a value, a source of mutual enrichment” (father); “Dad did the right thing (...) welcoming him [referred to the adoptee] and protecting him” (sister);

- Ethnic diversity as stress moderator

Ethnic diversity is a stress reliever in family relationships. An interesting extract is: “He [referred to the adoptee] has a different perception of time than ours. Let's say he is calmer in everything. We must remind him that the times must be respected. (...) however this is a gift of him. Whenever we are nervous, he has the power to calm and reduce stress on a family level.” (mother).

Firm level

Regarding the firm level, the visible adoption influences the firm in terms of:

- *Implicit and intuitive Diversity Management*
Diversity is managed involuntarily without the adoption of formal Diversity Management practices, as follows: “(...) it was a matter of time. Everyone would have accepted it and did it. No strategy or forcing. Initially it was not easy, we also lost customers, but my father preferred to think of him [referred to the adoptee] rather than the firm.” (brother).
- *Ethnic diversity as entrepreneurial accelerator*
Adoption represents an essential entrepreneurial accelerator. A meaningful quote is the following: “He [referred to the adoptee] came here with nothing. He could neither read nor write nor count. (...) We thought of teaching him a trade. (...) adoption has certainly accelerated and concretized some business ideas that we already had and today we find ourselves with a new branch of our family firm in which he spends his efforts, investing towards his future.” (mother).

Local level

Referring to the local level, the visible adoption influences the territory in terms of:

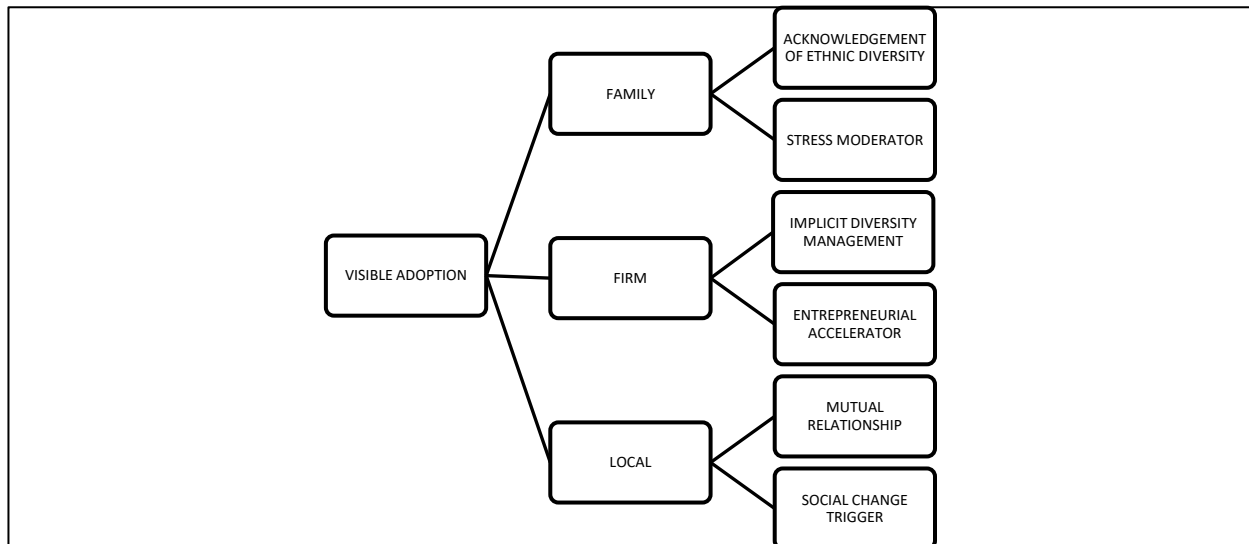

- *Mutual relationship*
A dense network of relationships is established between the adoptee and the local territory, as follows: “Initially, he [referred to the adoptee] was viewed with suspicion (...) there was some resistance against him. But he hasn’t lost his smile and now has many friends”. (brother).
- *Social change trigger*
Adoption represents a relevant driver that changes local culture, enhancing inclusivity. An interesting extract is the following: “(...) Now it is nice to see that all citizens appreciate him [referred to the adoptee]. (...) they changed their way of seeing certain things that have always seemed normal to us. (...) today they even come to the bar and explicitly ask for his cappuccino because it’s better than mine [laugh].” (father).

Finally, in the Family Life Space, family members drew symbols referring to adoptive event showing that this event is crucial for family members; adopted person and their family members adds relevant element concerning the firm inside the circle suggesting that they perceive a positive belongingness and closeness between family and firm’s contexts.

At the same time, the OSIO tool shows a high level of self-categorization in both family and firm systems and a strong overlapping between family and firm, even if at a different extent among family members due to their role within the firm.

Figure 1 synthesizes findings and shows the effects of visible adoption on the three emerged levels.

Fig. 1: Effects of visible adoption

Specifically, adoption not only changes the family structure and deeply affecting the family functioning, but produces also profound effects on the family business management and on the local roots, habits and equilibrium. What is most striking is the action of moderator of stress both in the family and in the firm, as well as the entrepreneurial behavior dictated by the desire to offer an opportunity to the adoptee which takes the form of an evolution of the firm growth. Moreover, visible adoption acts as a driver to promote social change within the local context, by producing open-minding thinking and enhancing social capital.

Findings contribute, first, to visible adoption literature opening a new niche of research; second, to family business studies by introducing the understudied event of visible adoption, as a situation that creates a rupture in family

dynamics and, thus, impacts family business management and behavior; and third, to local embeddedness studies, invoking the role of visible adoption in changing closed minding and resistance toward diversity. Many adoptive families are multicultural in nature and have a number of resources that could expand beyond the family boundaries and - through the family firm - fertilize the surrounding context in the direction of spreading a more inclusive culture.

Practical implications. This study highlights the potential effects that can be generated by the inclusion of adopted young in the ownership and management of the family business. The phenomenon of adoptions, particularly those visible, is growing and it is expected that the considerable migratory flow of the last twenty years will lead to the proliferation of situations similar to the case analyzed. The results, therefore, would seem to suggest effective food for thought to family entrepreneurs and consultants to evaluate the evolutionary potential of companies and the social changes of the territory, as a result of the phenomenon of adoptions.

Limitations of the research. The main drawbacks can be identified in the exploratory approach adopted, that, however, is motivated by the fact that to our knowledge no studies have already deepened the topic, and in the need of a longitudinal approach to investigate if and how the effects of visible adoption tend to change in a large timespan. Further studies could be enlarged the sample to understand if findings can be generalized, and repeat the same analysis within the sample firm to explore potential changes.

Originality. This study was driven by the interest in investigating the mechanisms that are activated within family businesses as a response to the phenomenon of visible adoption. To our knowledge, this is a understudied topic, thus, we believe that this research is particularly original both in management studies and psychological studies.

Keywords family firms, visible adoption, family embeddedness, local embeddedness, case study

Does corporate sustainability impact SMEs' competitiveness? A meta-analytic review

LEUL GIRMA HAYLEMARIAM* STEPHEN ODURO*
ALESSANDRO DE NISCO[▲] GIADA MAINOLFI^{**}

Framing of the research. *Corporate sustainability has been a topic of intense study interest among practitioners and academics in national and global contexts throughout the past several decades. The continuous ecological imbalances and disasters, such as environmental pollution and climate change, fast resource shortages, and global warming, contribute to the urgency of this study topic. Manufacturers' operational activities have often been identified as one of the key contributors to the worldwide environmental catastrophe (Wong and colleagues, 2013; Afum et al., 2020). Within the business setting, sustainability indicates that a company's success is characterized by financial variables such as profits and return on investment, as well as environmental and social issues, without sacrificing its ability to meet future needs (Gardberg and Fombrun, 2006; Dyllick and Hockerts, 2002). Sustainability practices that are eco-sound include utilizing ecologically friendly development, raw materials, packaging, dissemination, and even recycling after a product's life span. It outlines environmentally friendly measures used throughout the production process. These practices include recycling, environmental conservation, waste management and reduction, regulatory compliance, and pollution control (Jabbour et al., 2015; Neves et al., 2014).*

As a result, a genuinely sustainable organization must meet economic, environmental, and social objectives all at the same time (Elkington, 1998). According to Adams et al. (2016), corporate sustainability is a process guided by principles rather than a coherent notion, a modern phenomenon that affects all businesses. Both large and small companies can participate in corporate sustainability; however, small and medium-sized enterprises SMEs will innovate in sustainability completely differently (Bos-Brouwers, 2010; Sen, 2014). Therefore, it is essential to notice that sustainability occurs at the organizational level across economic, environmental, and social activities, such as new product innovation, business processes, and supply chain management procedures (Adams et al., 2016). Social integrity, environmental integrity, and economic prosperity are the three pillars underpinning sustainability (Bansal, 2005; Rishi, Jauhari, and Joshi, 2015), also termed as the Triple bottom line (3Ps-People, Planet, and Profit) (Elkington, 1997)

Social sustainability represents the humanitarian side of the business, emphasizing justice in access and opportunity and relating to issues of poverty, economic inequality, education, and health (Aggerholm, Andersen, and Thomsen, 2011; Yong et al., 2020). The social dimension of sustainability encompasses issues such as job creation, education, and employee general well-being. Environmental sustainability denotes the strategic choice to include environmental goals in a firm's tactical, functional, and innovative actions by "reducing production waste and emissions through three taxonomies, namely, pollution control, pollution prevention, and product stewardship" (Masocha, 2018, p.3). The economic-oriented sustainability involves how a firm preempts matters such as profitability, product quality and safety, customer satisfaction, and supply chain management in their dealings with suppliers, customers, and stakeholders in the marketplace (Yusoff and Adamu, 2016). SMEs' competitiveness involves the firm's ability to meet its profitability, efficiency, and growth needs in a given period (Baeshen, Soomro, and Bhutto, 2021). Scholars revealed that these sustainability principles in terms of financial and human resources management, organizational structure, environmental management status, technological approach, manufacturing activity, external cooperation, and innovativeness influence SMEs' environmental strategy alternatives and, consequently, their competitiveness (Denicolai, Zucchella and Magnani 2021). The modern economy emphasizes the need for sustainable transformation as a critical engine of innovation and company renewal, particularly for SMEs.

Purpose of the paper. *SMEs play a critical economic role in many nations, especially in developing economies-in the areas of innovation, employment, GDP contribution, entrepreneurial skills, etc. However, empirical research on the concept of corporate sustainability in the context of SMEs is limited (Masocha, 2018; Wu et al., 2017). According to Klewitz and Hansen's (2014) extensive systematic literature review, we still lack a clear picture concerning corporate sustainability in SMEs since a few preceding research has examined this systematically. Even the earlier literature reviews that have been conducted (e.g., Del Bro and Junquera, 2003; Klewitz and Hansen, 2014; Walker et al., 2008) appear to be commentaries and qualitative, not quantitative, summaries. Furthermore, notwithstanding the widespread agreement that corporate sustainability adoption can improve SMEs' innovation, financial, and non-financial performance, empirical findings on the relationship between these outcomes are inconclusive and contradictory, with some studies reporting positive relationships (Baeshen, Soomro, and Bhutto, 2021; Ardyan, 2017), some no significant relationships (Malesios, Dey, and Abdelaziz, 2020; Jayeola, 2015), and others negative relationships (Brink, 2021; Jové-Llopis ad Segarra-Blasco, 2018). Moreover, the empirical studies are fragmented across contexts, cultures, countries, and disciplines. These research lacunas render it daunting to understand comprehensively how and to what degree corporate sustainability influences the competitiveness of SMEs and the boundary-spanning conditions (moderators) that facilitate or impede the success of corporate sustainability strategies by SMEs. Nevertheless, missing till today in this stream of research is a meta-analysis that calibrates and synthesizes the fragmented studies to clarify the contradictory and anecdotal findings.*

Followingly, we adopt meta-analysis, which is "a quantitative, formal, and epidemiological study design that is used to systematically combine and assess the results of previous scientific studies to derive conclusions about that body of research" (Haidich, 2010, p.12), to quantify and summarize the disparities and commonalities of the extant literature on the corporate sustainability-SMEs competitiveness relationships while exploring the contingencies that may account for between-study variance. More specifically, drawing on the Resource-based view RBV of the firm that assumes that a company may get a competitive advantage by combining resources, which are Valuable, Rare, Inimitable, and Organization (VRIO) (Barney 1991) and the stakeholder theory that posits that organizations thrive and prosper by pleasing several stakeholder groups, including consumers, employees, investors, suppliers, media, governments, and rivals (Clement, 2005; Donaldson & Preston, 1995), we seek to answer the following two research questions: 1) To what extent does corporate sustainability influence SMEs' financial and non-financial competitiveness? 2) What contextual and methodological moderators account for heterogeneities in this focal relationship? Our intended contribution is threefold. First, we contribute to recent literature on sustainable-oriented innovation by examining the extent to which corporate sustainability-economic-oriented, social-oriented, and environmental-oriented innovation practices impact SMEs' competitiveness across the extant literature. Second, we test boundary-spanning conditions, namely contextual moderators (i.e., sector, (agriculture, manufacturing vs. service), economic development (developing vs. developed), global sustainable competitiveness index (high GSCI vs. low GSCI), and culture (high vs. low individualism). Third, we consider methodological factors (i.e., sample size (small vs. large) and publication status (published vs. non-published) that may account for between-study variance in this focal relationship, as well.

Methodology. Following the conventional methods of secondary data analysis, we conducted a bibliographic keyword search to select articles that examined the relationship between GM and firm performance from 1980 to 2022 (March) in well-known internationally recognized business and management databases: Web of Science, Scopus, EBSCO, Google Scholar, ABI Proquest, and Emerald Insight. We searched by entering the undermentioned keywords in the title, abstract, and keywords field in the databases by using the Boolean operations such as "OR, AND, NOT: corporate sustainability (e.g., "social sustainability," "ecological innovation," "eco-innovation," "green innovation," "environmental innovation," "sustainable innovations," "sustainable oriented innovations," "economic-oriented innovations," "economic sustainability," "environmental sustainability" "sustainability in SMEs," etc.): SMEs' competitiveness: (e.g., "SMEs performance," innovation performance, "customer performance," "environmental performance," "firm performance," "competitive advantage," "financial performance," "marketing performance," "non-financial performance, etc.). Articles were included in the analysis based on the following criteria: (1) English language, full-text online scholarly articles that examined at least one dimension of corporate sustainability (e.g., economic-oriented, social-oriented, and environmental-oriented) in relation to SMEs' competitiveness; (2) the study had to be quantitatively manipulated; that is, the study provides coefficient metric or enough statistical information to facilitate the computation of correlation coefficients; and (3) studies without correlation coefficients provided r-variants (F-test, T-test, regression, etc.) that can be converted to r-coefficients.

A total of 4356 articles were generated from the initial search, but we filtered these papers against different elements such as scholarly articles, year, and English language. We also removed the duplicate papers and non-quantitatively analyzed papers. After the inclusion and exclusion phases, 112 studies in 115 independent scholarly articles were identified, with 166125 observations and 101 effect sizes. The meta-analysis metric that has been employed is the Pearson correlation coefficient metric. The correlation coefficients were either picked directly from the study or computed through the r-variants (Hunter and Schmidt, 2004). Subsequently, we adjusted the effect sizes for reliability to correct for attenuation arising from random measurement error (Hunter and Schmidt, 2004). Using a random effects model, we tested publication bias, which indicates that positive results are easier to publish when compared to negative ones using the conventional method known as the funnel plot and Fail-safe N, but we found no publication bias issues. Finally, the significance of the moderator analysis was examined via subgroup analysis using QB. Our results are shown in the next section.

Results. Our first analysis provides the findings of the overall or aggregate effect of corporate sustainability on overall SMEs' competitiveness and the relative effects of the dimensions of corporate sustainability-social-oriented, economic-oriented, and environmental-oriented sustainable innovations. First and foremost, our results show that the average strength of the aggregate effect sizes is significantly small-moderate (.20-0.53), according to the criteria suggested by Cohen (1988), where an effect size of .20 is interpreted as small; .50 equates to a medium effect, and effect size larger than 0.80 is deemed as large effects.

In particular, we found that the overall impact of corporate sustainability on the overall competitiveness of SMEs is positively and significantly moderate ($r = .41$; $CI = .46$; $.53$) since the confidence interval does not include zero. The Fail-safe N discloses that 11067 primary studies are required to render this finding non-significant. This finding, in line with the stakeholder theory, implies that sustainable-oriented innovations can positively enhance the sustainable competitive advantage of SMEs in the short and long run., highlighting the importance of implementing sustainability actions in a firm's strategic initiatives as these initiatives can please stakeholders by stimulating their interest and patronage of a firm's products and services (Baeshen, Soomro, and Bhutto, 2021; Ardyan, 2017). Concerning the aggregate impact of the sub-dimensions of corporate sustainability, our results demonstrate that environmental-oriented sustainable innovations have the largest impact on SMEs' competitiveness ($r = .34$), followed by social-oriented innovations ($r = .32$), with economic-oriented innovations scoring the least impact on SMEs' competitiveness ($r = .20$), and the $QB = 15.49$; $p = .001$, indicating that the mean difference is significant. This result means that SMEs' commitment to environmental sustainability by reducing production waste and emissions through the taxonomies of product stewardship, pollution prevention, and pollution control (Masocha, 2018) can significantly enhance their profitability, efficiency, and growth even more than their commitment to social sustainability and economic sustainability. Moreover, vis-à-vis the disaggregate SMEs' competitiveness indicators, our findings show that the impact of corporate sustainability (all dimensions) on non-financial competitiveness is the largest ($r = .40$) compared to the financial competitiveness ($r = .38$), and the $QB = 54.63$; $p = .001$, which means that the mean difference is significant. This finding demonstrates that the sustainable-oriented innovations of SMEs impact non-financial performance more than financial performance aspects (Martins, 2022). Thus, corporate sustainability initiatives have a higher probability of enhancing the non-financial efficiency and effectiveness of firms than financial growth and efficiency (Denicolai, Zucchella, and Magnani 2021)

The study's second objective focuses on analyzing the contextual and method moderators explored in the study. Concerning the moderator analysis of the contextual factors, our first finding reveals that the sector of operation significantly influences corporate sustainable innovations performance, such that it is larger in the SMEs involved in manufacturing ($r = .50$) than those in the service ($r = .32$) and in the agriculture sector ($r = .12$). Moreover, the Global Sustainability Competitive Index (GSCI) of a country (i.e., natural capital, resource efficiency & intensity, intellectual capital, governance efficiency, and social cohesion) plays a significant moderating role in the corporate sustainability-SMEs' competitiveness relationships, indicating that SMEs in countries with low GSCI perform better ($r = .47$) than those in countries with high GSCI ($r = .36$). This finding highlights that the orientation of countries with low GSCI towards sustainable development can be observed as an important contribution to sustainable competitiveness. This implies that the function of government as a political entrepreneur in the process of promoting environmentally innovative technologies in developing economies.

Also, culture (individualism) has a significant moderating effect on corporate sustainability performance, such that SMEs operating in high individualistic cultures perform better in GM ($r = .48$) than those in a low individualistic culture ($r = .40$), which agrees with the literature that individualistic cultures are more likely to protect the environment, due to the belief that positive attitudes associated with the environment, are driven by selfish reasons, like enhancing social status (Morren and Grinstein, 2016). However, some scholars believe that collectivist cultures (i.e., those that are greatly unified in groups (Gallego-Alvarez and Ortas, 2017) are more likely to be connected to better environmental performance, as they are inclined to care about others and the well-being of society (Morren and Grinstein, 2016). Also, our analysis reveals a significant difference in the performance of SMEs operating in countries with high human development index (HDI) and those with low HDI, such that SMEs in countries with high-level HDI present larger effect sizes ($r = .48$, $p < .001$) than those with low-level HDI ($r = .40$, $p < .001$). This implies that structural differences in countries regarding income level, GDP, education, innovation, etc., can account for SMEs' performance differences. This result could also be spurred by the fact that developed economies have to adopt a more stringent carbon tax based on their concerns about industrial competitiveness, which, in turn, can stimulate firm efficiency and productivity.

Vis-à-vis the methodological moderators, we found that publication status accounts for between-study variance in such wise that effect sizes in the published studies produce larger effect sizes ($r = .41$, $p < .001$) than those in unpublished studies ($r = .29$, $p < .001$), which means that the publication status of an article can account for between-study variance (i.e., heterogeneities). Lastly, for sample size, it was found that those studies with large sample sizes present larger effect sizes ($r = .33$, $p < .001$) than those with small sample sizes ($r = .29$, $p < .001$), indicating that large sample sizes produce more accurate and reliable results than small sample sizes.

Research limitations. The findings and the potential limitations of this meta-analytic review offer insightful directions and suggestions for future research in this research stream. First and foremost, our meta-analysis was based only on bi-variate analysis without examining the causal effects. Future studies can employ meta-structural equation modelling to account for mediators. For instance, future studies could examine causal effects with eco-capability, supply chain management capability, organizational capability, and intellectual capital as mediators using METASEM. Moreover, we adopted a quantitative approach of meta-analytic review, which excludes studies that were analyzed

qualitatively. Thus, we suggest that future meta-analytic review employs a qualitative meta-analysis (QMA) approach, as advocated by Combs, Crook, and Rauch (2019), to integrate the qualitative studies. Again, our analysis of the moderating factors excludes many other important factors that could be examined. For instance, for the contextual factors, future studies could provide analysis of the moderation effects of other factors like competitive dynamism, firm age, industry intensity, type of firm (profit versus non-profit), nature of business (B2B vs. B2C), etc., as moderators. Likewise, the analysis of methodological factors could verify those examined in this study while investigating other factors like study design (experimental vs. survey), theory usage (theoretical vs. atheoretical studies), study type (cross-sectional vs. longitudinal), and year of publication, among others, to help explain the between-study variance in the corporate sustainability performance results. Again, we have examined the impact of corporate sustainability on SMEs' competitiveness. However, future studies could advance our understanding regarding the relationship between corporate sustainability and consumer behavioral outcomes like willingness to pay more, word of mouth, purchase intention, and actual purchase behavior. It can also be noticed that we examined only the triple-bottom-line of sustainability-social, economic, and environmental innovations of SMEs. But as we are aware, there are other dimensions of sustainability like product-oriented sustainable innovations, market-oriented sustainable innovations, organizational-oriented sustainable innovations, and process-oriented sustainable innovations (Klewitz and Hansen, 2014). To this end, we recommend that future meta-analyses examine how each of these sustainable innovations can influence SMEs' performance. Finally, we limited our analysis to a particular context, SMEs, which opens the avenue for future researchers to include large enterprises to allow for cross-context comparative analysis. Notwithstanding these shortcomings, we believe that our aggregate findings on the corporate sustainability-SMEs competitiveness relationships add some nuances to the ongoing debate and discussion of the potential value of corporate sustainable innovations to firms and clarifies the mixed results to provide some theoretical consistency and coherency on the phenomenon.

Managerial implications. We believe this meta-analytic review's findings could significantly inform managerial activities and initiatives concerning corporate sustainability and SMEs' competitiveness. First, our finding emphasizes the importance of implementing and adopting corporate sustainability initiatives and programmes in SMEs' strategic orientations and strategies. The investment pays off and is worthwhile, and thus, SMEs, with their limited resources, can integrate corporate sustainability activities into their strategic orientation to enhance their competitive position in today's pro-environmental business setting. Thus, our results that corporate sustainability-social-oriented, economic-oriented, and environmental-oriented-have a positive and significant impact on the overall, financial, and non-financial competitiveness of SMEs-defy all odds to highlight the potency of corporate sustainability on firm competitiveness and superior performance. It is also interesting to note that corporate sustainability positively and significantly relates to corporate profitability despite the cost of implementing environmental-sustainable initiatives. These findings demonstrate that although corporate sustainability engagements may sometimes suffer from perceived greenwashing and financial constraints, their performance gains far exceed the cost associated with the investment, demonstrating that a SMEs' ethical, ecological, and faithful environmental, economic, and social conduct can garner consumers' trust and patronage of its products and services, which in turn, can enhance competitive advantage over time.

Second, our aggregate results show that the expected mean effect is $r=.41$, which is considered for a practical purpose (Cohen, 1988). However, managers need to consider the relationship's moderate or medium effect. Because of the medium nature of the average effect, managers must not view corporate sustainability as a short-term strategy but as a medium-term or long-term strategy. Moreover, findings impliedly show, in addition to the expected mean effect ($r=.41$), that the relative strength of corporate sustainability on enterprise varies (e.g., environmental-oriented sustainability > social-oriented sustainability > economic-oriented sustainability)-a finding that has key implications for SMEs in terms of their strategic orientation and resource allocations. For instance, SMEs should invest more in environmental-oriented sustainability innovations in their strategic and sustainability initiatives since it impacts firm competitiveness the most. Lastly, SM managers will also need to take into consideration the moderating factors like sector, culture, and GSCI of their countries. For instance, those in the manufacturing sector can strongly implement strategies more as well as those in the low-GSCI as the little environmental sustainability efforts can stimulate competitiveness in terms of profitability, efficiency, and growth over time.

Originality of the paper. Empirical research on the corporate sustainability-SME competitiveness relationships has been in the limelight of scientific research in the innovation and sustainability literature in the past few decades. However, because of the problem of 'perceived greenwashing,' which can affect people's patronage of an organization's products and services, coupled with the inconclusive and contradictory results of the phenomenon, it is not really certain whether corporate sustainability investment pays off for SMEs or not. Moreover, because studies are scattered across contexts, cultures, and disciplines, we have a limited understanding of the contextual and method factors that may influence findings and account for heterogeneities. Our meta-analysis, which integrates RBV of the firm, stakeholder, and institutional theories, makes the first pioneering effort to integrate the findings across the extant literature to establish the extent to which corporate sustainability influences the competitiveness of SMEs. A meta-analysis advances knowledge in this research stream by providing more definitive conclusions (Combs et al., 2011; Fern and Moroe, 1996) than qualitative reviews (Phan et al., 2018). Followingly, our meta-analytic review provides evidence to support corporate sustainability's positive and significant impact on SMEs' competitiveness, indicating that the investment is worthwhile. Hence, SMEs can invest in this by adopting green business models, green chemistry, green messages, circular economy, eco-friendly technologies, socio-environmental technologies, etc., to achieve sustainable competitive advantage.

Tematiche ESG ed impresa familiare: un focus sugli assetti di governance delle imprese familiari quotate

FRANCESCO MIRONE*

Inquadramento della ricerca. *Le imprese familiari sono sempre più al centro dei sistemi economici di tutto il mondo (De Massis et al, 2018).*

Tale tipologia di imprese, tanto peculiare quanto disomogenea, oltre ad essere protagonista del mondo imprenditoriale ha generato, grazie alla sua natura multidisciplinare, una costante e crescente attenzione da parte della comunità scientifica internazionale che, negli anni, ha analizzato in profondità il fenomeno, evidenziandone prerogative e peculiarità (Rovelli et al, 2021).

Uno dei focus principali su cui si è concentrata la ricerca, in special modo negli ultimi dieci anni, è quello relativo al rapporto tra impresa familiare e sostenibilità.

Tale connubio risulta quanto mai affascinante per gli studiosi di management perché da un lato risponde alla sempre crescente esigenza di indagare, migliorare ed implementare l'approccio sostenibile delle imprese mentre dall'altro individua in quella familiare una tipologia di impresa perfetta per tale analisi (Rees & Rodionova, 2015); tale assunto nasce dal presupposto per il quale l'impresa familiare risulta essere particolarmente propensa ad adottare strategie sostenibili in ragione della correlazione che vede la reputazione della famiglia proprietaria indissolubilmente legata a quella dell'impresa che possiede e, nella maggior parte dei casi, gestisce in prima persona (Habbershon & Williams, 1999; Chua et al, 1999).

Pertanto, in quest'ottica ma soprattutto in questo specifico periodo storico, uno dei temi relativi alla sostenibilità delle imprese che più calamita l'attenzione degli studiosi è quello riguardante l'applicazione di criteri ESG (Clementino & Perkins, 2021). Il classico tema della "responsabilità sociale d'impresa", infatti, negli ultimi anni si è evoluto in approcci più strategici e mirati attraverso i quali attuare politiche finalizzate alla sostenibilità (Lorenzo & Rojas, 2021); tra questi vi è indubbiamente quello relativo ai criteri ESG, i quali prevedono tre dimensioni interdipendenti: economica, ambientale e sociale (Gjergji et al, 2020).

I criteri ESG descrivono un'azienda secondo parametri non finanziari, valorizzandone la portata sociale ed ambientale (Revelli, 2017), contestualizzando crescita economica e salvaguardia della comunità e del territorio in cui opera con l'obiettivo di creare un modello di crescita che contemperi questi due obiettivi in una prospettiva di lungo periodo (Jebe, 2019). La vicinanza di tali obiettivi con quelli che da sempre connaturano l'impresa familiare (Berrone & Gomez-Mejia, 2012) rende, quindi, perfettamente collegabili e sovrapponibili i due fenomeni.

Come sostenuto da Habbershon e Williams (1999), l'interazione tra l'obiettivo dell'impresa ed i valori e gli obiettivi della famiglia rende le imprese familiari uniche.

L'attitudine a perseguire e consolidare risultati non esclusivamente finanziari ma socio-emozionali (Berrone et al, 2012), l'attenzione al rapporto umano con tutti gli stakeholder unito alla tutela del territorio di appartenenza (Cabrera-Suarez et al, 2001), il desiderio di esercitare e preservare il controllo e l'influenza della famiglia, la salvaguardia dei valori, dell'identità e della reputazione della famiglia proprietaria (Sirmon & Hitt, 2003), rendono gli obiettivi e la natura di un'impresa familiari diametralmente opposti rispetto a quelli di un'impresa non familiare (Gómez-Mejía et al, 2007). Proprio questa preminenza dei valori socio-emozionali avvicina maggiormente, ed in modo quasi automatico e naturale, le imprese familiari alle tematiche ESG.

Venendo all'attualità, a dimostrazione delle sempre crescente attenzione, tanto del mondo imprenditoriale quanto di quello accademico, che caratterizza il rapporto tra impresa familiare e tematiche ESG e su quanto e come le imprese recepiscono, adottino e divulgano tali politiche, risulta di particolare interesse l'indagine condotta da Ernst & Young in collaborazione con l'Università di St. Gallen in Svizzera, secondo cui il 78% delle imprese familiari incluse nel Family Business Index ha avviato una reportistica sui progressi fatti nel campo della sostenibilità, creando una vera e propria "Agenda ESG".

In valore assoluto si tratta di un contributo molto importante su scala globale, visto che le più importanti 500 imprese familiari vantano un giro d'affari complessivo pari a 7.280 miliardi di dollari e occupano ben 24,1 milioni di persone. L'indagine sottolinea anche come nonostante esistano oggi circa 600 framework ESG che creano una certa confusione, molte aziende sono andate avanti con il lavoro e tra queste circa il 59% utilizza standard di rendicontazione consolidati mentre un altro 19% pubblica in modo indipendente i propri rapporti di sostenibilità.

* Ricercatore (RTDA) in *Economia e Gestione delle Imprese* – Università Telematica Pegaso.

Pertanto, obiettivo del presente studio è focalizzare l'analisi sul fattore G, quello relativo alla governance, nella fattispecie contestualizzandolo nelle imprese familiari quotate in borsa.

L'idea di incentrare la ricerca sul tema della governance nasce dall'analisi dei risultati contenuti nella XIV edizione dell'Osservatorio AUB, promosso da AIDAF (Associazione Italiana delle Aziende Familiari), Cattedra AIDAF-EY di Strategia delle Aziende Familiari (Università Bocconi) e UniCredit, con il supporto di Borsa Italiana, Fondazione Angelini e Camera di Commercio di Milano Monza Brianza Lodi.

Ogni anno, infatti, l'Osservatorio monitora tutte le aziende familiari italiane che hanno superato la soglia di fatturato di 20 milioni di euro e pubblica un report incentrato su uno specifico topic.

L'edizione 2022 (presentata a fine gennaio del 2023) è dedicata alla diversity nelle strutture di governance delle imprese familiari italiane ed ha come obiettivo primario quello di presentare una analisi puntuale delle strutture di governance allo scopo di indagare il grado di diversity presente negli organi di governo delle aziende familiari.

Per la prima volta, però, l'Osservatorio AUB ha esteso l'indagine oltre i confini nazionali ed ha presentato un'analisi comparata di alcuni indicatori di governance delle aziende familiari quotate sui mercati Euronext (in ordine, Amsterdam, Bruxelles, Dublino, Lisbona, Milano, Oslo e Parigi). L'analisi si è concentrata sui seguenti indicatori:

- **la leadership familiare:** le aziende familiari di Milano hanno circa il 44% di CEO appartenenti alla famiglia di controllo. Una incidenza superiore si registra soltanto in Francia (55,6%). Tutti gli altri mercati registrano una maggiore apertura al vertice;
- **un Presidente familiare:** in oltre 3 aziende su 4 (77,4%) della Borsa di Milano, tale carica è ricoperta da un membro della famiglia; si tratta di un dato superiore di almeno 10-20 punti rispetto alle aziende familiari quotate sugli altri mercati Euronext;
- **la familiarità del CdA:** le aziende familiari quotate alla Borsa di Milano hanno, in media, il 22% di consiglieri familiari nel board, un dato inferiore a quello delle aziende quotate in Portogallo (27,8%) e Francia (29,6%). La maggiore apertura verso i non familiari delle aziende familiari italiane si conferma osservando la percentuale di aziende con un CdA composto "a maggioranza" da non familiari (pari al 93,3%, contro il 75,8% in Portogallo e il 78,8% in Francia).

Venendo alla realtà dell'impresa familiare italiana, invece, l'Osservatorio AUB dedica un approfondimento specifico anche agli assetti di governance delle aziende quotate alla Borsa di Milano, attraverso l'analisi delle 445 "relazioni sulla corporate governance" rilasciate dalle sopracitate aziende in almeno uno degli anni che va dal 2014 al 2021, allo scopo di monitorare l'evoluzione di alcuni indicatori di corporate governance; tale attività ha prodotto questi risultati:

- **il controllo familiare riduce la dimensione del CdA:** le aziende familiari hanno, nel 2021, un numero di consiglieri inferiore del 20% circa rispetto alle aziende non familiari;
- **Le imprese familiari hanno un CdA che rimane in carica per un numero maggiore di anni** (nel 35% per più di 6 anni, contro circa l'11% nelle aziende non familiari);
- **L'anzianità di servizio del Presidente e del CEO nelle aziende familiari è più elevata**, rispettivamente, del 64% e del 29% rispetto alle imprese non familiari (10,7 anni vs 6,5 quella del Presidente, e 8,9 vs 6,9 quella del CEO);
- **Il controllo familiare non influenza l'età media del Presidente** (che è particolarmente alta): la carica di Presidente è ricoperta da una persona ultra-settantenne in circa 1 caso su 4, senza particolari differenze tra aziende familiari e non familiari;
- **Le aziende familiari hanno leader più giovani:** i CEO delle aziende familiari con meno di 50 anni sono il 27%, un dato superiore di 5 punti rispetto a quello delle aziende non familiari;
- **Le aziende familiari hanno una incidenza più elevata di consiglieri esecutivi** (29% vs 20% nel 2021), e una percentuale quasi doppia di imprese con un Presidente esecutivo (71,0% vs 38,0%), anche se il dato mostra un calo negli ultimi anni (-11% in otto anni);
- **La figura del LID è più diffusa nelle aziende familiari** (34,0% vs 15,0%), anche per la numerosa presenza di Presidenti familiari (circa 2 su 3);
- **La percentuale di consiglieri indipendenti** è inferiore di circa 18 punti nelle aziende familiari (37,4% vs 55,9%);
- Nel periodo 2014-2021 è stabile sia l'incidenza dei leader familiari (pari al 43% circa) che dei consiglieri familiari (pari al 24% circa).

Ebbene, partendo dai risultati del predetto osservatorio, si è deciso di approfondire il rapporto tra impresa familiare e tematiche ESG usando come presupposto proprio gli assetti di governance delle imprese familiari quotate.

Obiettivo del paper. In base al suesposto background teorico ed ai dati raccolti dal XIV Osservatorio AIDAF, il presente lavoro si focalizza sul rapporto tra impresa familiare e tematiche ESG. Nello specifico, si è deciso di incentrare la ricerca principalmente sul fattore governance al fine di dimostrare quanto questo influisca direttamente sulle performance ESG di un'impresa familiare.

Ebbene, il terzo dei fattori ESG riguarda temi strategici e decisivi per lo sviluppo e la sopravvivenza di un'impresa quali l'etica e la trasparenza, le policy e le procedure di controllo e nel caso delle società per azioni i diritti degli azionisti, la composizione, l'indipendenza e la remunerazione del consiglio di amministrazione.

D'altronde, mai come in questo periodo storico, la sostenibilità assume a componente fondamentale delle linee guida strategiche di un'impresa con l'obiettivo di generare benessere collettivo e limitare l'impatto sul pianeta, indirizzando il focus non solo sulle performance economiche ma anche verso quelle sociali e ambientali.

A tale scopo, come tema di governance posto alla base del presente lavoro si è deciso di selezionare la presenza di membri della famiglia proprietaria all'interno dei consigli di amministrazione e, di conseguenza, sono stati analizzati nel dettaglio gli assetti di governance di 50 imprese familiari europee quotate in borsa.

L'obiettivo di questo lavoro, pertanto, è di approfondire quale sia la relazione tra presenza della famiglia proprietaria all'interno del consiglio di amministrazione e performance ESG.

Da ciò discende la seguente research question: la presenza della famiglia proprietaria all'interno del consiglio di amministrazione produce migliori performance ESG?

Metodologia. La metodologia di ricerca utilizza nel presente studio è di tipo misto, ovvero prevede la combinazione e l'integrazione di metodi di ricerca sia qualitativi che quantitativi (Creswell & Plano Clark, 2011).

Secondo Reilly e Jones (2017), il metodo misto offre prospettive diverse ma comunicanti tra loro, utili ad esplorare contesti unici e fornire dati essenziali a descrivere un universo specifico come l'impresa familiare, eterogenea per natura e fondata sulla complessa relazione tra sistemi diversi e complessi come la famiglia e l'impresa.

Una volta selezionato l'approccio quali-quantitativo, si è deciso di selezionare quale campione di riferimento su cui effettuare l'indagine 50 imprese familiari europee quotate in borsa (tra cui 7 italiane); tali imprese sono state individuate tramite la banca dati "Refinitiv".

Il suddetto campione vede al suo interno imprese familiari provenienti da 14 diverse nazioni europee, fondate principalmente tra la seconda metà dell'800 e la prima metà del '900.

La prima fase della ricerca è stata di tipo qualitativo.

Questa fase dell'indagine effettuata sui singoli siti web delle rispettive imprese (principalmente nelle sezioni riportanti la storia dell'azienda) oltre che sulle pagine internet dei principali organi di informazione dei paesi di appartenenza delle singole imprese, è stata finalizzata ad individuare le famiglie proprietarie di ognuna delle imprese rientranti nel campione ed i rispettivi alberi genealogici.

Tale minuziosa attività di identificazione, dapprima della famiglia e poi dei suoi esponenti, è stata fondamentale e prodromica alla fase successiva, ovvero quella quantitativa.

Il primo step della suddetta fase, infatti, è consistito nella catalogazione e suddivisione delle 50 imprese per paese di provenienza, anno di fondazione, forma di governo e classificazione merceologica.

Successivamente, si è proceduto a scaricare dai singoli siti web delle 50 imprese i rispettivi Report Annuali rilasciati nelle annualità 2018, 2019, 2020, 2021 che hanno costituito il range temporale intorno al quale delimitare la presente indagine.

Una volta scaricati i 200 report, sono state analizzate le singole sezioni riferite alla governance al fine di individuare le identità di ognuno dei componenti dei board per ciascuno dei 4 anni selezionati.

Fatto questo, i nominativi dei singoli componenti suddivisi per anno sono stati sistematizzati insieme ai dati aziendali precedentemente catalogati.

Infine, grazie ai risultati raccolti dall'indagine qualitativa, le singole identità sono state triangolate allo scopo di individuare quali tra i componenti dei rispettivi consigli di amministrazione facessero parte della famiglia proprietaria.

Pertanto, l'indagine quali-quantitativa ha prodotto due principali risultati preliminari: il primo riguardante l'appartenenza, o meno, dei 50 CEO alla famiglia; il secondo, quello decisivo ai fini del presente studio, relativo al numero di componenti del consiglio di amministrazione facenti parte della famiglia proprietaria.

Proprio i dati relativi a questo secondo risultato hanno poi prodotto la successiva analisi univariata, utilizzata per misurare la media delle performance ESG delle imprese familiari che hanno almeno un membro della famiglia all'interno del board e quella delle imprese familiari che non hanno alcuna presenza della famiglia proprietaria all'interno del board.

Risultati. Per quanto attiene ai risultati preliminari derivanti dall'indagine quali-quantitativa, il presente studio ha prodotto due differenti categorie di risultati.

La prima è quella relativa all'appartenenza dei CEO alla famiglia proprietaria: in 29 casi su 50 il CEO fa parte della famiglia proprietaria, a dimostrazione di come, nonostante i rapidi e continui cambiamenti nei mercati e la crescente professionalizzazione delle imprese, nella maggior parte dei casi la famiglia preferisca ancora condurre in prima persona l'impresa che possiede.

La seconda categoria di risultati preliminari riguarda la presenza di membri della famiglia all'interno del board.

Nella fattispecie, in 49 casi su 50 almeno un membro della famiglia proprietaria ha fatto parte del consiglio di amministrazione in ognuno dei 4 anni oggetti di indagine; allo stesso tempo, nell'unico caso in cui non è stata riscontrata presenza familiare all'interno del board, tale dato si è ripetuto in ognuno degli anni indagati.

Sul punto è interessante notare come in molti casi è stato rilevato un cambiamento del numero dei membri nel corso degli anni, a testimonianza di come questo dato rifletta anche l'evoluzione della famiglia e non solo dell'impresa, aumentando in caso di ingresso in azienda delle nuove generazioni e diminuendo quando un esponente della generazione al comando decide di farsi da parte.

Tale dato conferma la tendenza per la quale se la famiglia può in alcuni casi rinunciare al ruolo di CEO preferendo un manager esterno è quasi impossibile che questa rinunci a sedersi all'interno del consiglio di amministrazione.

Venendo, invece, ai risultati dell'analisi univariata (racchiusi nella successiva Tab.1) si evince come ci siano delle sostanziali differenze tra le performance ESG delle imprese familiari che hanno membri familiari all'interno del consiglio di amministrazione e quelle che non ne hanno.

La tabella, infatti, presenta le medie ottenute grazie al T-test di tutte le variabili selezionate (ESG, Governance, Environmental e Social), calcolate separatamente ed in funzione dei due sopracitati gruppo di imprese.

La colonna “Significant”, invece, indica la rilevanza statistica del coefficiente ottenuto dall’analisi univariata.

Tab. 1: Risultati analisi univariata: differenza delle medie nel T-test

VARIABILI	IMPRESE MEMBRI FAMILIARI PRESENTI NEL BOARD	IMPRESE MEMBRI FAMILIARI NON PRESENTI NEL BOARD	T- STATISTICS	SIGNIFICANT
ESG PERFORMANCE	60.43636	45.6475	-1.5627	-
GOVERNANCE PERFORMANCE	50.3105	28.8575	-1.9419	**
ENVIRONMENTAL PERFORMANCE	61.70256	40.41	-1.8086	*
SOCIAL PERFORMANCE	67.7886	63.905	-0.3644	-

Fonte: elaborazione propria

Ebbene, come si evince dalla tabella, i due gruppi di imprese mostrano differenze significative in tutte le fattispecie analizzate.

Il punteggio medio relativo alle performance ESG delle imprese familiari che hanno membri della famiglia proprietaria all’interno del consiglio di amministrazione è significativamente superiore rispetto alle imprese che non ne hanno.

Tale andamento è confermato anche dai risultati delle variabili analizzate singolarmente (governance, environmental e social): soprattutto nei casi delle performance relative al fattore governance (alla base del presente lavoro) ed a quello environmental, le imprese familiari con membri della famiglia all’interno del board presentano uno score significativamente superiore rispetto alle altre.

Nel complesso, tali risultati mostrano l’esistenza di differenze statisticamente significative in merito alle performance ESG tra i due gruppi di imprese familiari, a dimostrazione che le imprese familiari che hanno membri della famiglia proprietaria all’interno del consiglio di amministrazione producono performance ESG nettamente superiori rispetto a quelle che non ne hanno.

Pertanto, in riferimento alla domanda di ricerca ed alla luce dei susposti risultati, questo studio può confermare che la presenza della famiglia proprietaria all’interno del consiglio di amministrazione produce migliori performance ESG.

Limiti della ricerca. Nonostante la minuziosa indagine condotta sulle imprese rientranti nel campione, questo studio non è privo di limitazioni.

Il limite più significativo di questo lavoro è rappresentato proprio dalla parzialità del campione esaminato. Sebbene il campione d’imprese studiato presenti una certa varietà, tale da attenuare il rischio di distorsioni prodotte dall’appartenenza ad un unico settore e/o classe dimensionale, l’estensione dell’indagine non costituisce un mezzo sufficiente per poter ritenere generalizzabili i risultati della ricerca. Infatti, sono state indagate solo 50 tra le imprese familiari europee quotate in borsa quando la totalità del campione si avvicina alle 100 unità e, tra queste 50 solo una non ha membri familiari all’interno del board.

Altro limite è rappresentato dalla modalità prettamente randomica con la quale si è deciso di selezionare le 50 imprese che hanno costituito il campione oggetto del presente studio.

Infine, in questo lavoro si è deciso di segnalare solo l’appartenenza o meno alla famiglia proprietaria dei membri del consiglio di amministrazione senza evidenziarne fattori quali genere, livello di istruzione ed eventuale grado di indipendenza che rappresentano ulteriori discriminanti rientranti nel “fattore governance” all’interno del contesto di attuazione di tematiche ESG da parte di un’impresa familiare.

Ulteriori studi sono già programmati per colmare tali lacune, completare l’analisi del campione sia dal punto di vista numerico che qualitativo e rafforzare i risultati dell’indagine.

Implicazioni manageriali. I risultati del presente studio offrono spunti interessanti anche sotto il punto di vista delle implicazioni pratiche.

La relazione positiva riscontrata tra presenza della famiglia proprietaria nel consiglio di amministrazione e miglioramento delle performance ESG può produrre un duplice nonché decisivo risultato: spingere le imprese familiari, restie sul punto per definizione, a modernizzare ed implementare le proprie strutture di governance (oltre che esserne parte integrante) in funzione della costante e continua ricerca di miglioramento dei propri risultati in tema di sostenibilità e, di conseguenza, permettere anche agli altri due fattori ESG, ovvero quello ambientale e sociale di essere “trainati” dalla spinta del fattore governance e permettere all’impresa familiare di raggiungere gli obiettivi di sostenibilità prefissati su tutti i fronti.

Il presente lavoro si concentra sulle imprese familiari quotate, tanto strutturate sotto il punto di vista della governance aziendale quanto fortemente attente alla sostenibilità. Pertanto, a differenza di quelle non quotate in borsa, tali imprese non solo sono più propense ad adottare comportamenti sostenibili ma soprattutto hanno la necessità di divulgare all’esterno tale attività in modo corretto e trasparente attraverso le comunicazioni non finanziarie e, nella fattispecie, attraverso la rendicontazione ESG.

D’altronde, per loro natura le imprese familiari sono mediamente più attente a quali il rapporto con il territorio di appartenenza, il rapporto umano con tutti gli stakeholders, il benessere di dipendenti e fornitori oltre che la tutela dell’ambiente.

Il vero salto di qualità risiede, quindi, nell'andare oltre gli obblighi di compliance o il reporting normativo, strutturando un approccio strategico ai temi ESG, al fine di renderlo sempre più sistemico e condiviso.

Le imprese familiari, infatti, possono svolgere un ruolo chiave nella transizione verso la sostenibilità poiché dispongono del potenziale, delle risorse e della posizione di mercato necessarie per guidare ed indirizzare tale trasformazione nei molteplici mercati di riferimento.

Tale posizione privilegiata è dovuta ai molteplici e peculiari vantaggi distintivi che differenziano l'impresa familiare da tutte le altre tipologie di impresa; queste, infatti, essendo principalmente guidate da valori emozionali ed immateriali piuttosto che dalla spasmodica ricerca del profitto hanno una visione a lungo termine finalizzata a proteggere e salvaguardare l'impresa per le generazioni familiari future.

Pertanto, se insieme all'instimabile patrimonio di valori familiari ed imprenditoriali venisse tramandata ai successori anche una concreta e continua attenzione alla sostenibilità, per l'importanza che l'impresa familiare ricopre nei sistemi economici di tutto il mondo, la trasformazione sostenibile avverrebbe in modo molto più veloce e diffuso.

Di conseguenza, alla luce dei risultati del presente studio, tale scenario è più facile che si realizzi con membri della famiglia proprietaria a ricoprire posizioni apicali all'interno della governance aziendale.

Originalità del paper. *L'originalità di questo lavoro risiede nel trattare un tema, tanto specifico quanto in continuo sviluppo, come quello delle tematiche ESG non da un punto vista etico o sociale ma focalizzando l'attenzione sugli assetti di governance delle imprese familiari che, a differenza delle altre tipologie di imprese, sono meno strutturati e standardizzati.*

Nello specifico, questo lavoro intende analizzare l'esistenza di una relazione positiva tra la presenza della famiglia al comando dell'impresa e l'incremento di performance ESG a dimostrazione di come il "fattore governance" sia capace di fare da traino anche nei confronti degli altri due.

Alla luce di tutto quanto susposto, i risultati preliminari, oltre a quelli attesi da un ampliamento delle analisi finalizzato a consolidare l'indagine, indicano l'effettiva sussistenza di una relazione positiva tra l'adozione di specifici strumenti di governance e le performance ESG di un'impresa familiare.

Parole chiave: *Impresa familiare; ESG; Corporate Governance; ESG Performance.*

Ecosistema delle Farmacie: una classificazione delle nuove tipologie[♦]

GIULIA NEVI* LUCA DEZI[•]

Inquadramento della ricerca. Durante la pandemia, le farmacie hanno svolto un ruolo centrale, sia nella prevenzione che nel trattamento e nell'educazione del pubblico sulla prevenzione delle infezioni e sulla gestione delle malattie (Lui et al. 2020). Nei Paesi più colpiti dalla pandemia, per mantenere il distanziamento sociale ed evitare il contagio tra le persone, le istituzioni mediche hanno avviato la prescrizione di farmaci online, servizi di consulenza da remoto e consegna di farmaci direttamente a casa. Tornare ad una nuova normalità non è affatto rasserenante e confortante e d'altra parte neanche possibile, le imprese di farmacia lo sanno bene: esiste una farmacia prima e dopo il Covid-19. I cambiamenti e le accelerazioni sul versante tecnologico e su quello normativo, pensiamo allo sviluppo dei vaccini, hanno trasformato l'intero settore sanitario (Patanwala et al. 2022). Il comparto delle farmacie retail è uno dei punti di snodo fondamentali nell'ecosistema sanitario. Globalmente il settore da qui al 2030 vedrà un tasso di crescita annuale composto (CAGR) del 4,7%, le farmacie retail fisiche sono quelle che ancora hanno la maggior parte dei ricavi, il 56,5%. La pandemia ha aumentato la diffusione delle piattaforme online, ma come rilevato da McKinsey (2021) il settore cresce ma più lentamente rispetto ad altri. I trend di crescita appaiono nel complesso molto positivi tanto che ci si aspetta un CAGR per il 2023-2027 del 14,3% (Statista). Le farmacie, inoltre, devono fare i conti con una crescente competizione determinata dalla digitalizzazione (Levaggi et al. 2009) così come dal rafforzamento delle grandi catene e da un'utenza con bisogni differenziati, più attenta alla salute e dove l'invecchiamento della popolazione porta a dover rispondere ad un crescente bisogno di farmaci (Precedence Research 2022). In generale la farmacia è un centro sanitario polifunzionale che sempre di più si sta slegando dalla pura rivendita di prodotti farmaceutici (Federfarma 2022). La trasformazione digitale sta cambiando tutto il settore sanitario, l'industria farmaceutica non è estranea a questo fenomeno tanto che si parla di un Pharma 4.0 (Saha et al. 2022). Le farmacie sono un modello interessante da analizzare anche per capire come la digitalizzazione le stia trasformando a livello di impresa (Peltoniemi et al. 2021) quanto di capacità dinamiche (Okano et al. 2021). Sulla base di tali considerazioni il presente studio mira a classificare le tipologie di farmacie presenti sulla base del criterio di mercato. Nel prossimo paragrafo si procederà con il background teorico per poi procedere con la presentazione della metodologia impiegata nel terzo paragrafo e nel quarto paragrafo proseguire con una discussione dei risultati e la presentazione della classificazione attuata e infine procedendo alle conclusioni e le riflessioni sulle limitazioni e le future ricerche di questo progetto.

Il settore delle farmacie: normativa e digitalizzazione. Il settore delle farmacie retail è un settore peculiare, poiché la farmacia ha una duplice natura, una di supporto allo Stato e una legata alla ricerca del profitto. Il settore a livello globale risulta regolato, gli stessi punti vendita per operare sono sottoposti a registrazioni e licenze (Lluch e Kanavos 2010). Le farmacie già da qualche tempo stanno sperimentando un cambio nel loro modello di business, ciò a causa anche del cambio di equilibrio tra le forze competitive dovuto alla liberalizzazione del settore in alcune nazioni e l'entrata in campo di grandi catene. La liberalizzazione del settore è un fattore molto rilevante, come è emerso in Lluch e Kanavos (2010), ad esempio nel Regno Unito fino ad ora aveva sempre funzionato il meccanismo che il medico prescrive il farmaco e il farmacista opera come distributore, ma nell'ultimo decennio il farmacista sta perdendo il suo potere. Le motivazioni addotte all'apertura del settore sono state che una maggiore liberalizzazione avrebbe portato ad un più elevato dinamismo competitivo. Come emerso dall'analisi dei due studiosi, tuttavia, non è così facile e anche una nazione apparentemente più liberalizzata quale il Regno Unito, alla luce dei fatti, evidenzia che il settore e la rivendita dei farmaci rimane regolato e che le farmacie restano una tra le realtà più normative, con notevoli barriere all'entrata sul mercato e dove i prezzi di alcuni prodotti lasciano poco margine di azione al farmacista (Holdford 2018). Dove sia la soluzione, come sempre nel mezzo, nel trovare un bilanciamento tra liberalizzazione nella diffusione e deregolamentazione nei requisiti richiesti per aprire una farmacia in modo da incentivare la competizione, ma anche evitando che si presenti il caso di oligopoli, i quali potrebbero influenzare un mercato di beni primari, i farmaci, e derive lesive della salute stessa delle persone.

Le imprese di farmacia retail finora sono state per lo più indagate con la lente della medicina cui spesso vengono affiancate (Noorgard et al. 2019) per lo più valutando i rapporti con i diversi stakeholders (Ryan et al. 2018; Taylor et

al. 2021), o a livello del ruolo del farmacista (Holdford et al. 2017; Koehler et al. 2022) adottare una lente manageriale potrebbe aiutare a livello strategico tali attività.

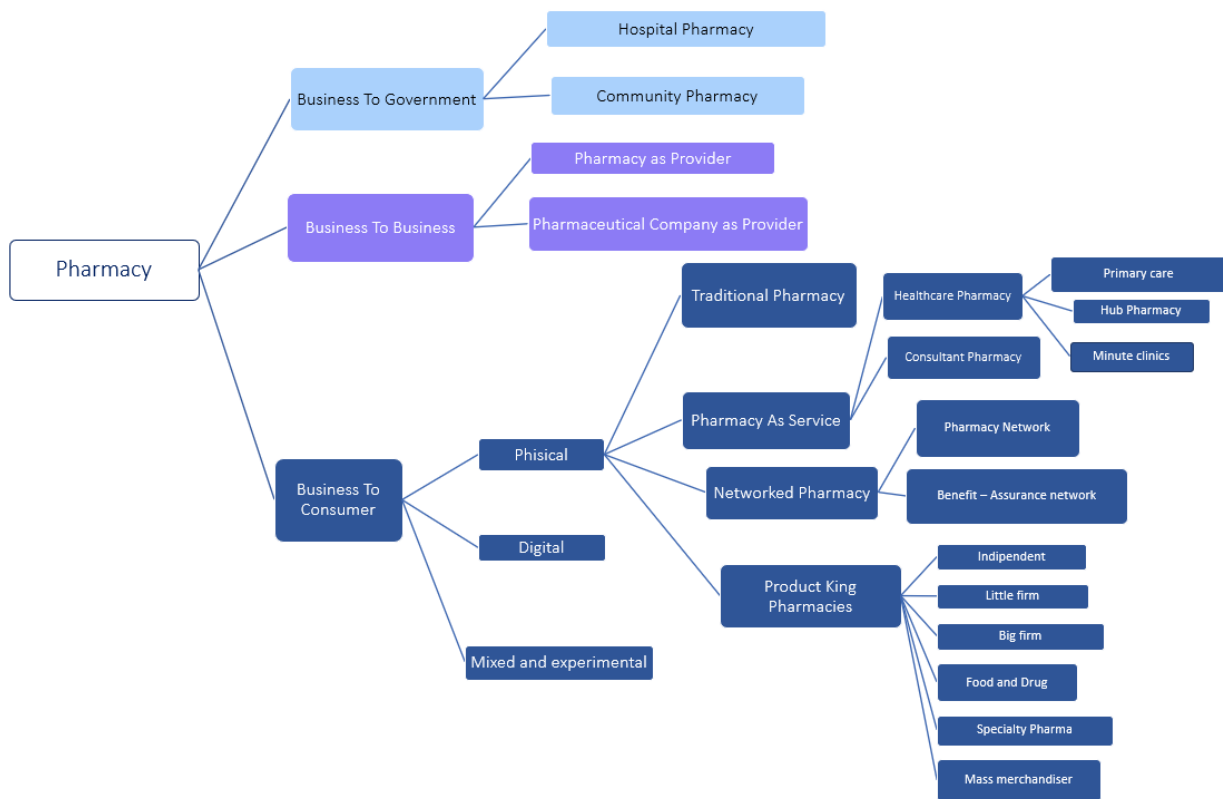

Obiettivo del paper. Il proposito di questo paper è di definire una prima classificazione delle diverse imprese di farmacia a livello internazionale basata sul criterio del “mercato” e del “canale” se digitale, fisico o ibrido, tale tipologia ci si auspica possa portare in studi futuri a definire meglio quello che è il nuovo ecosistema delle farmacie ed enucleare le caratteristiche di ognuna di esse e le possibilità nelle loro mani di creare un vantaggio competitivo. Lo scopo della classificazione è quello di ordinare i sistemi in modo ordinato, utilizzando un criterio specifico (Coccia, 2004) in questo caso il mercato di riferimento delle farmacie.

Metodologia. Il presente lavoro è consapevole della complessità metodologica che richiede operare una classificazione che porti ad una tassonomia o tipologia (Nickerson et al. 2013). Al fine di non scadere nella semplicità metodologica e di svilire concetti complessi, attualmente frequentemente usati in maniera non consona, si è deciso di operare una prima classificazione delle imprese farmacie distinguendo sulla base di un unico criterio classificatorio ossia il mercato di riferimento e il modo di reazione ad esso come recentemente svolto da Hemphill (2021), ma distinguendosi da esso per focalizzarsi in maniera chiara su tre diversi canali e aprendo l'indagine al segmento online. Il principale metodo di indagine è di natura qualitativa. All'analisi della letteratura presente sul tema delle farmacie, dei loro mercati e modelli di business si è unita un'analisi di casi di dati secondari soprattutto riguardo le farmacie digitali dove i confini dell'indagine sono stati estesi individuando casi reali afferenti alle tipologie individuate a livello internazionale trovando validazione e riferimenti al mondo empirico. Nella classificazione secondo il criterio di mercato e del canale si è proceduto attraverso una codifica dei dati seguendo il metodo dell'open coding di Gioia et al. (2012) seguendo l'esempio di Leemann and Kanbach (2021) che, partendo dall'analisi della literature, sono arrivati ad una tassonomia su tre livelli delle dynamic capabilities. Il primo passo è consistito, così, in un'analisi su software EBSCO secondo le seguenti keyword di ricerca “pharmac* AND taxonom*” e si è ristretto il campo all'abstract contributi accademici in lingua inglese sottoposti a processo di peer-review. L'indagine ha portato a 67 risultati sono stati esclusi però gli studi che rimanevano eccessivamente medici e legati all'educazione del farmacista che anche ad una lettura dell'abstract sono apparsi non pertinenti la ricerca (Gallagher 2011; Nazar et al. 2021) dall'indagine sono stati selezionati tre contributi (Jambulingam et al 2005; Martins and Queiro 2015; Doucette et al. 2023) si è unita a questa ricerca una seconda stringa di ricerca relativa a “pharmacy AND typolog*” sono emersi 36 contributi, dalla lettura degli abstract ci si è resi conto che la maggior parte dei paper non era altresì adeguato per l'analisi poiché afferente a temi strettamente medici o a focus chimico-farmaceutici: come tipologia di vaccini, contraccezione, modalità di prescrizione di farmacie e tecnologie a supporto o sul ruolo del farmacista e delle relazioni, il contributo di maggior rilievo è emerso essere quello di Policarpo et al. (2019), considerando il ruolo che il canale ha nella creazione di valore e il criterio di selezione si è inoltre inserita una terza stringa che indagasse a livello di business model: “pharmacy AND business model” da cui su 121 contributi sono stati estratti 11 contributi utili (Harris et al. 2008; Feletto et al. 2010; Elrod et al. 2013; Heinson and Flessa 2013; Singleton and Nissen 2014; Bacci et al. 2016; Rosenthal et al. 2017; Holdford 2018; Pontinha et al. 2021; Hohmeier et al. 2022; Tran 2022) dalla stringa “business model AND pharmacy AND online” sono stati selezionati 8 paper. Successivo step ha visto la rimozione dei duplicati tra le tre stringhe e l'analisi dei contributi. Non tutti i contributi ad una prima lettura sono apparsi utili per l'obiettivo di ricerca. Ad esempio Rosenthal et al. (2016) si focalizzano sul modello di pagamento dei servizi se fee-for-service o pay for performance applicabile in generale all'intera impresa di farmacia e più che altro al modello di costi e revenue dei business model, non danno informazioni riguardo l'organizzazione e l'articolazione di una farmacia. Bacci et al. (2016) si focalizzano sulla rilevanza di attuare collaborazioni tra farmacie e dunque a livello di partnership, ma poco arricchiscono in merito alle diverse forme di farmacie esistenti. Pontinha et al. (2021), invece, si focalizzano su uno specifico servizio che le farmacie possono offrire ossia i Point of Care Testing e attraverso l'analisi della letteratura evidenziano che tali sistemi possono essere utili sebbene ancora poco si conosca in termini di vantaggi e svantaggi dovuti alla loro implementazione. Infine, sulla base della classificazione creata si è chiesta la validazione a esperti e studiosi del settore sanitario.

Risultati. Sulla base della rassegna della letteratura condotta emerge che in passato le farmacie sono state indagate in base al numero di punti vendita: indipendenti se solo uno; piccole compagnie, quelle con più di quattro e meno di dieci punti vendita, grandi compagnie se più di dieci; “food and drug combo” che sono punti vendita con internamente una farmacia e “mass merchandiser” ossia i negozi retail che vendono anche prodotti farmaceutici o affini e le farmacie ospedaliere; altre indagini si sono invece focalizzate sul mix di prodotti che vendono (Chase 1978). Jambulingam et al. (2005) hanno fornito una tassonomia delle diverse imprese di farmacie basata sull'orientamento imprenditoriale di chi guida tali imprese e dalle risorse intangibili ad essa legate: innovatività – proattività- autonomia – competizione – presa di rischio - motivazione. Nonostante la scarsa applicazione (Holdford 2018), stanno aumentando gli studi che indagano le farmacie retail in ottica di business model. Feletto et al (2010) si focalizzano sulla flessibilità organizzativa dei loro modelli di business. Gli autori individuano quattro tipi di flessibilità organizzativa: “steady state”, tipica delle farmacie tradizionali e quelle di comunali; una flessibilità operativa tipica delle cosiddette networked e delle farmacie focalizzate sul prodotto; una flessibilità strutturale tipica di farmacie invece concentrate sui servizi; una flessibilità strategica solitamente posseduta da farmacie a più forte leva commerciale ossia le farmacie incentrate sui prodotti e quelle centrate sui servizi. Essi evidenziano che la flessibilità determina l'emergere dei precedenti quattro modelli di business, tuttavia, evidenziano che nuovi modelli di business possono essere in realtà insiti in questi quattro individuati. Tuttavia, da tali modelli il settore si è molto digitalizzato, sia a causa di fattori condizionali: il Covid-19, che ha imposto una comunicazione tempestiva dei positivi e ha ampliato la digitalizzazione

sul nodo farmacia – Stato/Regioni (Hemphill 2021) nonostante la digitalizzazione del settore fosse già in atto da prima della pandemia e dovuto anche a necessità interne e allo sfruttare le opportunità offerte dai nuovi strumenti digitali come una migliore gestione dei processi e l'arrivo di nuovi software, robot e strumenti tecnologici che hanno permesso di ottimizzare e automatizzare alcuni processi delle farmacie retail (Spiro 2018). Hemphill (2021) distingue tra farmacie “grocery”, farmacie indipendenti, sistemi di grandi retail proprietari e “payer-owned mail order” come Amazon. Sulla base delle evidenze presenti in letteratura e delle condizioni fattuali del contesto contemporaneo si è proceduto a classificare le farmacie secondo tre diversi mercati (Fig.1), sebbene vale l'assunto, ormai comune, che i confini tra i mercati sono più fumosi che nel passato e ciò vale anche per le farmacie, ad esempio le farmacie comunali possono servire tanto il mercato derivante dalle prescrizioni e su mandato dello Stato (Heinson and Flessa 2013; Singleton and Nissen 2014) quanto il settore retail puro dei consumatori, attraverso ad esempio i prodotti da banco. I mercati individuati sono dunque tre, il settore government, il settore business ed il settore consumer, la classificazione opera a livello macro. Per quanto un focus su una singola nazione appare interessante tuttavia prescinderebbe dall'intento di classificare, inoltre la normativa da sempre influenza le forme e le tipologie di impresa, canali e modelli di business così come le strategie tuttavia una classificazione vorrebbe trascendere da tale dimensione paese e consentire una prima generale classificazione dei modelli presenti ad oggi e del criterio adottato ai fini poi di approfondire la ricerca attraverso ulteriori indagini come ad esempio svolto in Holland and Gutierrez-Leefmans (2018).

Fig.1: Classificazione Farmacie – Mercato B2G - B2B - B2C

Fonte: Elaborazione degli autori

Il primo mercato e criterio fa riferimento allo Stato, qui sono presenti essenzialmente due macro-tipologie di farmacie: le farmacie comunali o anche dette Pharmaceutical Benefit Scheme (Singleton and Nissen 2014) e le farmacie ospedaliere interne (Harris et al. 2008) o che forniscono prodotti ai pazienti in dimissione o con patologie croniche (Holdford 2018; Koehler et al. 2022; Tran 2022). Entrambe, si concentrano sul percepire l'individuo essenzialmente come paziente e solo indirettamente come cliente. Le prime sono solitamente delegate dallo Stato a fornire medicinali con prescrizioni o farmaci speciali, così come servizi di supporto ai pazienti dimessi o in condizioni di fragilità. Le seconde sono interne all'ospedale, riforniscono i singoli reparti e ragionano in termini di quasi mercato. Il secondo canale rappresenta invece l'insieme dei rapporti Business to Business. Con la crescente digitalizzazione del settore Miller et al. (2021) individuano come si possano riscontrare due diverse tipologie di mercato, il mercato dei rapporti business to business dove essenzialmente le farmacie operano come provider e fornitrici di altri punti farmaceutici (<https://saveo.in/>; <https://www.pipelinepharma.com/>; <https://medimny.com/>) accanto alle tradizionali case farmaceutiche. Il terzo ed ultimo mercato consiste nel settore consumer, qui le tipologie sono molto più numerose. Rispetto alle precedenti classificazioni si è deciso di distinguere in termini di punto vendita se fisico o digitale. Il primo, il canale fisico, è il settore cui si è di soliti più portati a pensare quando si pensa alla farmacia, una farmacia di

quartiere o rurale, dove il legame con il territorio è fondamentale (Holdford). La seconda tipologia consiste in quella individuata da Feletto et al. (2018) così come da Holdford (2018) di una *networked pharmacy* dove la tecnologia è una leva chiave nel consentire al network di funzionare. Si tratta infatti di farmacie che operano in maniera interconnessa, spesso poiché a proprietà condivisa, tuttavia, ognuna può avere personali brand e punti di forza determinati dalla diversa utenza che serve (Feletto et al. 2018); oppure si tratta di farmacie che operano in forma di network poiché afferenti ad assicurazioni sanitarie, per quest'ultime il legame con pazienti assicurati rimane sia un elemento positivo che negativo (Holdford 2018). Si tratta di farmacie che in questo modo fronteggiano la concorrenza: organizzandosi tra loro, preferendo acquistare una farmacia competitor in modo da evitare inserimenti esterni ed essendo pronte a correre il rischio di essere esse stesse la principale concorrenza, contando sui clienti delle assicurazioni. Rispetto, però, alla tipologia offerta in Feletto et al. (2010) ci sentiamo di aggiornarla inserendo le farmacie *as service* in senso ampio, dove la servitizzazione e l'elemento dei servizi è principale fonte di trasformazione del settore ad oggi (Holdford 2018; Schommer et al. 2019; Tran 2022).

Sebbene i servizi offerti possano essere svariati, considerata la letteratura presente si è deciso di articolare tale elemento in diverse tipologie principali: la *Healthcare Pharmacy*, una farmacia primo punto di cura, prevenzione e diagnosi (Feletto et al. 2018). Essa si può articolare in *Minute clinics*, piccole cliniche con punti di rivendita farmaceutica (Hemphill 2021) o in *Hub* (Holdford 2018). In secondo le farmacie tradizionali, che hanno ampliato l'offerta con i servizi e dove tali restano in gran parte erogati da personale interno appositamente formato, si pensi ai tamponi per la rilevazione del Covid-19, ai vaccini antinfluenzali o al caso della misurazione dell'elettrocardiogramma (Martins and Queiros 2015; Policarpo et al. 2018) e dove le strategie adottate in alcuni sono del tipo *loss leader* (Elrod et al. 2013). Infine, abbiamo le imprese di farmacia dove il prodotto è il vero protagonista, sono le *Product King Pharmacy* che restano *dispensing only pharmacy* (Elrod et al. 2013). Si tratta di farmacie che fanno fortemente leva sui prodotti offerti o perché li producono internamente o perché hanno una grande dimensione, solitamente le grandi catene, ad esempio CVS and Walgreens (Hemphill 2021) che gli consente di effettuare sconti e promozioni. Le *Product King* possono essere farmacie e store unici, ma anche farmacie inserite all'interno di punti vendita della GDO o di prodotti simil farmaceutici rivenduti sempre in questi ultimi punti di vendita. A livello di prodotto non si possono poi tralasciare le *Specialty Phama*, ossia farmacie che possono vendere prodotti o ad alto costo o complessità o contatto, si pensi a farmaci su specifiche molecole o ai farmaci orfani. Tali tipologie di farmacie possono acquisire quattro specifici modelli di business: essere esperte in ricerca di composti per così brevettarli; puntare sulla distribuzione di specialità medicinali a un numero limitato di clienti, "di nicchia"; o secondo un modello basato sullo sfruttare un specifico know-how nella tecnologia di consegna ed infine quelle che operano con una logica di portafoglio gestendo specifiche malattie o, di nuovo, sostanze (Ku 2015). Per ciò che attiene la presente classificazione è il fatto di essere una delle prime che classifica le diverse tipologie di farmacie sui loro tre principali mercati di sbocco: *Business to Government*; *Business to Business*; *Business to Consumer*. Si può così distinguere così tra farmacie pure e ibride (Miller et al. 2021). Ciò che vale per l'offline ancor più vale per l'online, per tale settore le normative determinano differenze importanti sulle diverse tipologie di farmacie. Possiamo distinguere per le farmacie puramente online tra; le *single site*, dove si tratta di siti di farmacie fisiche che operano esclusivamente online, vi sono poi i *marketplace* sia dei grandi colossi dell'e-commerce sia piattaforme specializzate. Sicuramente in tal senso studi più approfonditi che puntino a classificare le farmacie online sono assenti. Come precedentemente ribadito, e come ogni classificazione, la presente si prefigge di dare ordine ai modelli di imprese presenti in funzione del mercato, non si esclude che vi possono essere variazioni e integrazioni tra diversi mercati sia verticali che orizzontali (Schommer et al. 2019) così come modelli ancora in sperimentazione, tra essi di primo interesse appare il modello delle *membership-pharmacy* (<https://www.goodshephealth.com/>) trattato in Hohmeier et al. (2022). Tuttavia, sulla base delle argomentazioni finora esposte, si è costruita una classificazione delle diverse imprese farmacia attualmente attive. Tra le peculiarità della classificazione (Fig.1) vi è la presa in considerazione dello scenario digitale e delle nuove tipologie e modelli di business nati in seguito alla *digital transformation*, fenomeno ricordiamo avviato già ben prima della pandemia, ma che di certo quest'ultima ha accelerato. Ad oggi non è peraltro escluso che un'impresa che opera su uno specifico mercato non possa operare anche in un altro, è il caso esemplare delle Farmacie comunali che operano sia in rapporto con il settore pubblico sia con il consumatore retail. Future evoluzioni del settore consisteranno in un'ancor più crescente sfumatura dei confini a livello di mercato o in una crescente specializzazione. Non sarà da escludere che potranno nascere modelli nuovi come le farmacie consultant, dove il focus potrà essere sul settore benessere in generale o dove gli stessi professionisti del settore medico che decideranno di adottare internamente ai loro hub un servizio di farmacia. La sperimentazione in termini di tipologie e di modelli di business è molto dinamica (Policarpo et al. 2019), se si volesse usare lo strumento del *business model canva* ci si accorgerebbe che la sperimentazione è attiva su tutte i nove blocchi dello strumento: dai pagamenti (Rosenthal et al. 2016), al delivery (Martins and Queiros 2015) fino alle relazioni (Bacci et al. 2016). Grande assente in generale per ogni paper analizzato è il tema della sostenibilità, traslata solamente a livello di profit e non in termini di rispetto per l'ambiente e sociale, dato il ruolo e i comparti cui si connettono le farmacie: il sanitario ed il chimico-farmaceutico.

Implicazioni manageriali. Una simile classificazione consente di mettere ordine nel sistema aprendo nuove possibilità per una regolamentazione più semplice o dove ad una riduzione di vincoli consenta però un mantenimento di controlli su un mercato quale quello del farmaco molto delicato. Inoltre, costituisce un primo ri-ordine di una tipologia di impresa sino a pochi anni fa considerata unicamente ancillare al sistema sanitario. Di fronte all'arrivo delle grandi catene conoscere come è composto il sistema permette di poter cogliere eventuali elementi hardware e software che potrebbero necessitare e le diverse relazioni di business che si possono avviare.

Originalità del paper. *In letteratura è assente una classificazione che tenga in conto come le imprese farmacie sono cambiate e si sono articolate soprattutto in seguito alla digitalizzazione del settore, un elemento interessante perché alcune forme di esse operano spesso in quasi mercato comprendere le tipologie esistenti, le loro articolazioni a seconda del canale e i possibili sbocchi sul mercato nonché le tipologie in sviluppo, come le Membership Pharmacy, è quanto mai interessante per mappare il sistema, comprendere possibili esiti strategici e nuovi modelli di business e avere una comprensione dei percorsi di sviluppo intrapresi. Future ricerche potranno approfondire questo primo studio teorico indagando e clusterizzando tale classificazione con analisi approfondite e comparative tra diverse nazioni.*

The role of strategic communication in driving marketing-decision making

ALESSIA ANZIVINO* LALA HU* MIRKO OLIVIERI[▲]

Framing of the research.

Strategic communication in academic literature

The recent disruptions such as the Covid-19 pandemic and major social movements like Black Lives Matter have increased the relevance of strategic communication, which shapes how firms are perceived by publics and affect consumers' behavior towards their offerings. Over the last decades, the academic literature has begun to focus on the topic of strategic communication (Argenti, 2017; Holtzhausen and Zerfass, 2015; Macnamara, 2018; Sandhu, 2009; Zerfass and Huck, 2007) as the omnidirectional diachronic ongoing process of meaning construction (van Ruler, 2018), emphasizing the role of communication departments in complex organizations and, in particular, the importance of communication alignment between organizational objectives, vision, brand and identity (Botan, 2018). Indeed, strategic communication is an “emerging field of knowledge bridging established research fields such as public relations, organizational communication and marketing communications” (Falkheimer and Heide, 2022, p. 15), also defined as an emerging interdisciplinary paradigm (Werder et al., 2018). In this vein, Heide et al. (2018) interpret strategic communication as a discipline that embraces complexity and interdisciplinarity with the aim of fully grasping the different nuances of the organization, without neglecting strategy, orientation, and organizational objectives.

One of the first definitions of strategic communication by Hallahan et al. (2007) interprets the concept of strategic communication as the purposeful use of communication by an organization to fulfill its mission. However, this definition has been superseded by other interpretations of the concept, that focus in more detail on how strategic communication can support the organization in fulfilling its mission (Volk and Zerfass, 2018). In this vein, strategic communication has been defined as an overall strategy to improve the strategic positioning of the organization (Argenti et al., 2005). Zerfass et al. (2018, p. 493) define strategic communication as “the purposeful use of communication by an organization or other entity to engage in conversations of strategic significance to its goals”. In this definition, therefore, strategic communication refers to both messaging and listening activities, including dialogues with stakeholders, social media monitoring, information from employees, etc. In other words, this new role of communication is considered strategic when it becomes substantial or significant for the development, the growth, the identity or the survival of the organization (Zerfass et al., 2018). Indeed, according to this perspective, strategic communication offers a concrete contribution to the decision-making organizational process in an evolving business context (Invernizzi et al., 2012), as it represents a critical organizational management process (Romenti and Invernizzi, 2011; Falkheimer, 2014).

In general terms, according to Volk and Zerfass (2018), the common thread of strategic communication studies is the emphasis on the notion of “purposeful”, “intentional” or “objectives-driven”. Falkheimer et al. (2017), for example, argued this concept is key for the development of effective business strategies, as strategic communication can contribute to business success. To achieve this business aim, Argenti et al. (2005) showed that strategic communication requires an integrated and multilevel approach – according to this framework, each communication function achieves specific objectives through the most appropriate channels and the most effective methods.

Invernizzi and Romenti (2015), in particular, identified four contributions of strategic communication for the organizations, namely “alignment role”, “energizing role”, “visionary role” and “constitutive role”. More specifically, the two authors interpreted strategic communication as a support to the organization to achieve alignment with external expectations, and in particular, as a support for monitoring the activities and the organizational context, capable of providing key inputs to align corporate strategies with stakeholder' expectations and ensure the organization survival and legitimacy. Indeed, according to this perspective, strategic communication lies at the intersection of management strategy and communication (Thomas and Stephens, 2014). More specifically,

Jarzabkowski et al. (2007) identified a link between discourse and the social practice of strategy, defining this practice as a set of interactions and negotiations of multiple actors that they draw upon in accomplishing that activity.

In addition, recent academic studies highlighted that strategic communication is not managed only internally by the organization, but, for the achievement of its strategic objectives, it also includes external actors and practices, such as the so-called “strategic social media influencer communication”. Indeed, according to Enke and Borchers (2019), strategic social media influencer communication is assuming an increasingly key role both in strategic communication studies and in business practices. Social media influencers represent third-party actors who have a considerable influence on organizational stakeholders, through the production and distribution of content and interaction with stakeholders (Freberg et al., 2011). Hence, in this perspective, strategic social media communication is conceptualized as the strategic use of communication in which influencers, on the one hand, perform activities of strategic relevance to organizational goals, on the other hand, influencers take an active part in interactive processes on topics relevant to the organization, adopting a moderating role (Enke and Borchers, 2019).

More in general, strategic communication has a multidirectional and complex nature which must be managed in harmony with the organizational context (O’Connor and Shumate, 2018). In this perspective, strategic communication involves the interconnection of organizations, messages, and stakeholders, and plays a key role in creating and maintaining business relationships between the parties (Knudsen and Lemmergaard, 2014; Merz et al., 2009). Indeed, recent strategic communication studies adopted a multidimensional network perspective, which allows scholars to analyze the diverse types of networks that strategic communication helps to create, maintain, and dissolve. In this regard, O’Connor and Shumate (2018, p. 400) reveal that “both the network strategies created, and the outcomes of those strategies are described in network terms”. According to the two scholars, in particular, as the affiliation network around an organization increases, so does the number of actors who share the organization’s message. In summary, three factors determine the results of a company’s engagement efforts: (1) the prior state of the affiliate network, (2) the effectiveness of the organization’s network strategies, and (3) the effects of the strategies network of other organizational actors (O’Connor and Shumate, 2018). In addition, a study by Young and Pieterse (2015) showed that strategic communication professionals should also leverage the capital that derives from the composition and structure of the interpersonal network to facilitate information flows in networks. It is believed that networks are beneficial to access unique and non-redundant sources of information.

Purpose of the paper. Given this scenario and considering also the complex and multidimensional nature of strategic communication, it is necessary to reconsider its role in driving innovative business decisions. We pose the following research question:

RQ. How does strategic communication drive decision-making processes in marketing?

Specifically, this research aims to investigate the role of strategic communication in companies from different industries and to explore how corporate communication could drive companies’ activities and impact innovative business decisions considering the transformations in nowadays society.

Methodology. Due to the exploratory objective of this paper and following previous studies on strategic communication (e.g., Besley et al., 2016; Birá et al., 2018; Nothhaft, 2016; Rudeloff et al., 2022), the researchers opted for a qualitative methodology. Specifically, researchers conducted 22 semi-structured interviews in the years 2020-21, which were the first years following Covid-19 pandemic and the murder of George Floyd in May 2020, which increased awareness towards the Black Lives Matter movement at global level. The interviews were carried out via phone or MS Teams, with key informants of companies in Italy operating in diversified industries (e.g., food, fashion, services), holding the role of marketing and communication managers. Researchers ensured the heterogeneity of the sample to gain a multi-sided perspective of observations and generate a context-specific understanding of the phenomena.

For this study, researchers have chosen to adopt the abductive approach, a non-linear research process that continuously compares reality and theory. Theory and data are matched, and the theoretical framework is modified based on empirical findings derived from participant observations and interviews, after which the new framework becomes a useful guide for data analysis (Dubois and Gadde, 2002). Semi-structured interviews were taped by the researchers who conducted the interviews. Registrations were then transcribed and analyzed through a coding process and content analysis (Neumann, 1997) performed by the researchers also involved the interpretation process. Indeed, following the Corbin and Strauss approach (1990), researchers opted for an open, axial, and selective coding strategy. In this process, the researchers (1) labeled key points as codes; (2) grouped these codes based on thematic similarities and developed categories; and, finally, (3) researchers noted the relationships between categories and sub-categories which emerged from the overall analysis.

To increase the robustness of the study, as recommended by Yin (2013), the collected data were triangulated with those derived from the analysis of secondary data (e.g., reports, data of communication campaigns, corporate websites’ analysis, etc.). The data were collected in parallel, and the various sets of results were interpreted concurrently to draw valid conclusions regarding the research problem.

Preliminary findings. Preliminary findings of this research have shown the critical and strategic role of corporate communication in driving decision-making processes in marketing.

Specifically:

- From our analysis emerged that the global visions of marketing managers and those of communication managers are not always aligned within the company and this leads to tensions in the management of relations with the market and also in the development of innovative business solutions.

- In line with some latest research, from our analysis emerge that the role of strategic social media influencer communication is also becoming increasingly important in the aftermath of the pandemic.
- Data analysis has shown that in some companies the function of communication is mainly one of “aligning” (Invernizzi and Romenti, 2015), which facilitates relations with stakeholders and reduces information asymmetries.
- Some interviewees have emphasized that internally, corporate communication plays a crucial role in creating relationships between people with diverse backgrounds and cultures.
- Data analysis also shows that companies, through appropriate strategic communication processes, developing new offerings (Durmusoglu et al., 2022) considering the diverse targets of consumers, succeed in making their brands more inclusive and acceptable. Moreover, companies indirectly generate value for the brand by strengthening its identity (Anzivino, 2021).
- The initial results of the analysis also reveal the critical role of corporate communication management as one of the drivers for the development and consolidation of market relations and its multidirectional and multidimensional nature that should be managed in harmony with internal and external organizational context (O’Connor and Shumate, 2018).
- Furthermore, this research confirms that strategic communication covers a crucial role in helping firms to successfully address societal challenges (Colleoni et al., 2022). For example, it emerged that strategic communication drives business decisions about diversity, equity and inclusion topics including gender (Cewart and Wagner, 2021; Zayer et al., 2019) or ethnicity (Peñaloza, 2018; Strebinger et al., 2018).
- This study confirms that there is the need for more research on the role of practitioners in making decisions about diversity and inclusion (Windels, 2016).

Research limitations. Concerning the limitations, the study adopts a qualitative approach, thereby limiting the generalizability of its results. Future research has the potential to go into greater depth in countries other than Italy and investigate the potential of strategic communication in driving innovative business decisions in each specific sector. Moreover, it could be interesting to extend data collection and conduct a longitudinal and quantitative analysis to understand effects in consumer behavior.

Managerial implications. This study presents a series of practical implications for companies operating in different sectors. Communication managers should embrace processes of meaning-making that go beyond the transmission of messages and deal also with the measurement of behavioral outcomes that are aligned with the strategic goals of the communicative entity and the public interest.

For example, from this analysis it emerged that companies should focus on experiences that create value by proactively exploiting the consumers’ cultural differences. In this way, on the one hand, social inclusion of consumers is generated; on the other hand, companies manage to make their brands more inclusive through multicultural or cross-cultural marketing and communication policies. Diverse and inclusive portrayals in advertising might lead to positive social effects by reducing stereotypes and prejudices in society (Eisend et al., 2023).

In conclusion, through concrete actions and company policies, marketing and corporate communication professionals can support effective marketing strategies in multicultural contexts. To date, companies involved in the study seem not to have fully recognized the specific needs and requirements of heterogeneous targets – both consumers from the international markets where they operate and consumers of the same market with different cultural backgrounds, which should be considered in the development of companies’ marketing and communication strategies (Crick et al., 2020; Oliveira et al., 2023).

Originality of the paper. At the theoretical level, this study responds to the need for more empirical research in the field of strategic communication (Falkheimer, 2014), and, in particular, it highlights the role of strategic communication in driving innovative business decisions through the creation and maintenance of valuable relationships with key stakeholders and heterogeneous consumers. Moreover, in this study we attempted to answer the call for more studies that consider advertisers’ perspective on diversity attributes (Eisend et al., 2023) by providing an empirical study on how these elements are addressed by companies operating in Italy.

Keywords: strategic communication; decision making; market relations; diversity & equity inclusion

Strategic communication as a tool for managing ICT and cybersecurity crises: an exploratory study

DANIELA CORSARO* MARTINA FRIZZO*

Framing of the research. *Strategic communication plays a crucial role in the management of organizations (Falkheimer, 2014). Both C-level executives and academic scholars recognize its impact on a company's reputation and relationships, as well as on sales, core operations, efficiency, and growth (Hallahan, 2004; Hallahan et al., 2007). Strategic communication goes beyond the crafting of captivating messages to attract customers. Instead, it entails the purposeful and planned communication on the part of an organization to achieve specific goals and objectives (Hallahan et al., 2007).*

Due to its fundamental role, management scholars have started to include the strategic communication perspective in their areas of interest. Strategic communication is also recognized as fundamental in the management of extraordinary situations (Coombs, 2007), as it supports continuous improvement and change management (Invernizzi, Romenti & Fumagalli, 2012) while protecting organizational reputation as an intangible asset (Contractor, 2000; Dean & Kretschmer, 2007; Gardberg & Fombrun, 2006; Kaplan & Norton, 2004; Louma-aho et al., 2012; Petrick et al., 1999). Organizational crises, identified as extraordinary negative situations, are becoming increasingly part of the normality in the current uncertain business environment. Therefore, communication practices are widely applied in the management of organizational crises with the purpose of preventing them, or of lessening the reputational, financial, operational, and relational impact of such events while increasing the efficiency of management processes (Coombs, 2015). This because strategic communication practices applied to management of organizational crises address the perceptual nature of disruptions. Promptly reacting to a crisis is fundamental for both damage containment and narrative control of the content that stakeholders, online users, and media share with the wider public (Pearson & Clair, 1998). Most crises offer different interpretations, and, for successful crisis management, it is pivotal that the prevailing and most accepted interpretation of the situation is the one with the lowest reputational impact on the organization (Coombs, 2015). Therefore, one of the reasons why communication is so relevant for crisis management defines also the first basic principle of crisis management: crises are perceptual and understanding the nature of their perception on the part of stakeholders is a basic step in developing an effective crisis response (Coombs and Holladay, 1996).

The role of strategic communication in business management and in the management of organizational crises has been widely discussed in the academic literature. Scholars contributed to the definition of crisis typologies (Gundel, 2005; Taleb, 2007; Weiner, 1995; Coombs et al., 1995) as well as strategic crisis responses based on the type of disruption, and on other factors such as the prior reputation of the company and its previous crisis history (Coombs, 2007). However, there seems to be a gap open in the academic literature to further investigate the role of strategic communication in specific case of ICT and cybersecurity crises.

Crisis management is not an alone-standing function in an organization; it rather collects various efforts from a variety of different teams and departments. Crisis management involves, among others, decision-making, environmental monitoring, risk management and communication (Coombs, 2015). For this reason, streamlining internal processes and implementing effective communication flows inside and outside the organization is essential to ensure crisis preparedness and prompt reaction capabilities (Coombs, 2015).

The uncertainty created by the new digital paradigm is an extremely interesting topic to approach from the communication perspective. Since communication is a tool used to help manage activities within an organization, by understanding how communication can influence perceptions and behaviors of different stakeholders, companies can use it strategically to achieve their crisis management and communication goals. This paper approaches the role of strategic communication for crisis management by focusing on a specific crisis typology, that of ICT and cybersecurity crises. These are crises that generate as a consequence of the damage to a company's ICT, including infrastructure, devices, software and data (Brooks et al., 2018). These crises can be both accidental or malicious, and they include various types of disruptions, such as unauthorized access to data or devices, theft of data or devices, data leaking, misuse or loss, damage to infrastructure, systems and data, ransomware attacks, and double ransomware attacks (Brooks et al, 2018).

Managing and successfully resolving organizational crises is a high-investment and complex activity for business leaders, especially because these extraordinary events usually carry high uncertainty (Burnett, 1998), leaving organizations with limited knowledge and control over the outcome of their efforts (Coombs, 2015). In regard to this, the classification of crisis events into flexible typologies is beneficial for the orientation of decision making as well as management and communication efforts (Coombs, 1998), allowing crisis managers and communication professionals to navigate complexity and organize the information necessary for crisis response (Burnett, 1998) and is a first step to contain a crisis (Gundel, 2005).

It has now become pivotal for organizations to take into account the role of safety and security concerns of users and customers, as well as the consequences of potential ICT incidents or cybersecurity breaches. With the increasing number of cyber-attacks and data leaks in recent years, businesses must ensure that they have proper security measures in place to protect their data and information. This not only protects the organization's reputation and financial wellbeing, but it also safeguards the privacy of its users and customers. Communication plays a crucial role in informing stakeholders about security measures and policies, creating awareness of potential risks, and responding effectively in the event of a crisis. Based on the current state of the art of strategic and crisis communication literature, this research hypothesizes that by prioritizing security concerns and implementing effective communication strategies, organizations may mitigate the risks associated with cybersecurity incidents and build trust with their stakeholders.

In this regard, scholars have highlighted how organizational crises may trigger emotional reactions on the part of different stakeholders. Strong emotional reactions may contribute to higher responsibility attributions to the organization, increasing the reputational damage suffered (Coombs, 2007). As a solution, organizations should constantly communicate with their stakeholders, in order to understand and contain problematic emotions such as panic, aggressiveness or despise that could contribute to damaging the organization's reputation and bottom line (Kasperson et al., 1988). Because ICT and cybersecurity crises often involve the leak or theft of users' personal information, which has been recognized as a threat to personal safety and identity, this activity is particularly relevant to make sure that stakeholders do not lose trust in organizations suffering from similar disruptions (Vilić, 2019).

Connected to the prevention and management of stakeholders' reactions, the Crisis and Emergency Risk Communication framework (CERC) (Reynolds & Seeger, 2005) is particularly useful to understand the importance of using preventive risk communication as well as emergency risk communication to inform and instruct stakeholders on the potential risks and on the actions to take to face a disruption (Panagiotopoulos et al., 2016). This may contain the frustration that comes with a lack of information on the events and on the appropriate behavior to adopt.

The role of strategic communication in crisis management has become increasingly important as organizations face greater exposure to public scrutiny, driven by technological advancements and heightened expectations of social responsibility and sustainability commitments. Additionally, the expanding prevalence of digital technologies and interconnectedness has made disruptions in ICT and cybersecurity increasingly pertinent to organizations.

Purpose of the paper. *The purpose of this research is to close the gap found in the literature concerning the application of strategic communication in the specific case of ICT and cybersecurity crises by investigating the main challenges that these disruptions pose to crisis communication and management, in order to outline the role of communication in enabling the management of security concerns, but also to define the most relevant strategic communication practices and tactics that organizations can use to implement crisis prevention and preparation (Coombs, 2015), as expressed by the following research questions:*

- 1. What are the main challenges faced by organizations in managing ICT and cybersecurity threats and crises?*
- 2. How can strategic communication be leveraged to mitigate the risks and complexity associated with ICT and cybersecurity crises and threats? Which are the specific crisis communication best practices that can help organizations navigate these challenges effectively?*

Cybersecurity crises have received increasing attention from managers, as they pose significant threats to organization's ability to perform their core operations and they may cause the loss or damage or important organizational assets. Moreover, they may harm a company's reputation (Coombs, 2007) while also leading to complex legal implications. However, the knowledge and awareness about them is still low across sectors (Vilić, 2019). In regard to this, scholars have acknowledged how, in the contemporary business environment, there is no security without cybersecurity (Brooks et al., 2018), making it even more urgent for organizations to invest in the development of the necessary skills to face cybersecurity threats.

Methodology. *This study adopts a qualitative research approach, using semi-structured interviews as the primary data collection method. The full sample is selected using a purposive sampling method and it will comprise of 20 communication management professionals and IT/cybersecurity managers working for organizations that have suffered ICT or cybersecurity crises in the past, or consultants working for firms that specialize in crisis management and communication or in cybersecurity. This type of purposive sampling is relevant for a research investigating the role of strategic communication in the management of cybersecurity crises because, by selecting participants who have experience with ICT and cybersecurity, or consultants working in crisis management and communication or cybersecurity consulting firms, the researcher can ensure that the participants have relevant expertise and insights into the research topic. This can increase the validity and reliability of the study's findings.*

The research is still ongoing, and, at the current time, 5 interviews have already been conducted allowing to draw a preliminary analysis of the results, which already shows the emergence of specific patterns and thematic areas. The interviews were and will be conducted face-to-face or virtually, audio-recorded, and transcribed verbatim for analysis. Thematic analysis is used to identify common themes and patterns across the data, and information was and will be

coded in order to identify the most recurring strategic communication practices and suggestions, as well as challenges, applied to the management of ICT and cybersecurity disruptions.

Results (preliminary). Although the research is still ongoing, initial findings reveal the strategies and practices that organizations can adopt to communicate effectively during similar crises, and the challenges they face in doing so. The study also highlights the importance of preparedness and proactive communication in mitigating the reputational impact of security breaches on organizations.

First, this paragraph proceeds to present the findings related to the specific challenges posed by ICT and cybersecurity disruptions to organizations, then it discusses the strategic communication approaches and practices that may support the management and communication of these events. Lastly, a summary table is presented, to provide an overview on how different best practices could be applied to the resolution of specific challenges.

Our ongoing research indicates that organizations face a variety of challenges when dealing with cybersecurity crises, and these challenges are intrinsic to their nature. Participants in our study have highlighted that there is a lack of awareness of the importance of cybersecurity incidents beyond cyberattacks, which is consistent with previous classifications of ICT disruptions that were generally associated with malevolent events (Coombs, 2015). However, our preliminary findings suggest that other types of cybersecurity incidents, such as data mismanagement or system malfunctions, can be just as damaging to organizations, despite receiving less attention.

In addition, our study participants have identified several other challenges, including a high level of complexity of ICT and cybersecurity threats caused by their extremely technical nature and the high uncertainty of their potential outcomes. Moreover, participants in the study mention a generally low level of ICT and cybersecurity crisis preparedness across industries, with the main exceptions being the financial, banking and the high-tech industries. Connected to this, the preliminary results of the research identify a relevant preparedness gap between large organizations and small and medium enterprises (SMEs).

Another challenge posed by ICT and cybersecurity threats to organizations is the lack of a security culture across organizations and industries, which weakens the ability of many companies to implement crisis prevention and preparation. As a result, organizations do not make the appropriate investments in technology/tools, people skills, and procedures' implementation that are necessary to face these disruptions. According to the participants, there is also a language and expertise barrier between the technical departments (including IT and cybersecurity) and the managerial functions (including leadership and crisis and communication management).

An additional challenge relates to the legal implications of cybersecurity and ICT security disruptions, including the financial repercussions that follow when personal data of users owned or stored by organizations are compromised, stolen, or unrightfully accessed.

Participants in the research identify as a challenge the difficulty of risk assessment and impact evaluation when it comes to cybersecurity crises. To this regard, organizations seem to have underdeveloped risk assessment capabilities that may not be suitable to identify the hidden risks and costs of such events and to translate them into quantifiable reputational damage. Moreover, cybersecurity incidents may have long-term consequences that are extremely difficult to predict. Lastly, the prioritization processes concerning technical cybersecurity crisis management (including, for example, system hardening), are usually mis-aligned with those of the crisis communication function, which is concerned with the gathering and analysis of critical information that needs to be promptly communicated with the purpose of ensuring minimal reputational damage.

The research participants have emphasized an intriguing issue regarding the significance of public statistics concerning ICT and cybersecurity incidents. It has been noted that many organizations tend to conceal such incidents whenever possible, with the aim of avoiding public scrutiny and consequences. This tendency is facilitated by the imperceptible nature of most cybersecurity issues, which can often go undetected even by organizations. In some cases, these issues are not purposefully hidden, but they are not recognized by the company that becomes an unaware victim. In both situations, the lack of transparency makes it difficult to generate accurate public statistics on the prevalence, impact, and characteristics of ICT and cybersecurity threats. Consequently, the models used by organizations for risk assessment and impact evaluation are prone to bias, as they heavily rely on industry statistics for their accuracy. This issue has serious implications, as it hinders the ability of organizations to accurately assess risks and make informed decisions about cybersecurity policies and practices.

The preliminary results of the research shed light on how communication activities may support organizations in facing the specific challenges posed by ICT and cybersecurity crises.

Participants in our research mention the importance of delivering training programs to employees. These should not be limited to the best practices to ensure protection against external attacks, such as changing passwords often, establishing a secure connection, or recognizing phishing and pharming campaigns. The trainings should rather involve other topics, including secure data management to avoid human errors leading to loss or damage of assets, and legal requirements of data protection. Moreover, experts mention the use of risk communication as proposed by the CERC framework (Reynolds & Seeger, 2005), in order to keep stakeholders' (including employees, customers and users) awareness on cyber risks high. This involves the communication of the organization's current efforts in ICT and cybersecurity, and precise directions on how stakeholders can contribute to ensure safety.

Another point raised in the initial results of the research, concerns opening a channel for continuous feedback from various stakeholders that the company can use to inform its crisis management and communication plans and implement real-time action to address potential vulnerabilities as they arise. This way, planning becomes a flexible and live activity to ensure the antifragility of the organization (Taleb, 2012).

In order to address the low level of preparedness of most organizations, experts suggest the promotion of security through communication campaigns, especially on the part of larger organizations with resources available. This way, not only users but also smaller organizations without the appropriate knowledge may become aware of the specific risks and may be pushed towards taking action. This entails the opening of communication flows within the industry according to a collaborative attitude and an ecosystem approach to information sharing. Moreover, experts underline the importance of transparency as the only way to correctly inform public statistics on cyber risks and their impact, so that other organizations may become more sensitive to the pervasiveness of such threats.

In order to promote a security culture within an organization, initial results mention internal awareness campaigns that may provide guidance to employees and align the leadership and the technical teams on the importance of ICT and cybersecurity. Additionally, continuous monitoring of employees' and users' concerns may shed light on their information needs and provide data to the organization on how to lead the way a set itself as a point of reference for cybersecurity implementation. The adoption of negotiation strategies and empathetic communication has also been identified as pivotal to address the lack of investments in ICT security and cybersecurity, since the dominant coalition (the leadership) is often more concerned with financial matters and resists to requests of investment in activities of which it does not see the short-term benefits (Coombs, 2015). To this regard, Coombs (2015) mentions the importance of understanding the dominant coalition's background and concerns, in order to adapt the communication and frame the messages in the most convincing way possible.

The language and expertise barrier between IT and cybersecurity professionals and crisis communicators is an important challenge that organizations need to face to tackle ICT and cybersecurity disruptions. In addition to the development of training programs for non-IT employees, experts suggest the importance of training technical professionals in the importance of crisis communication practices, so that they may become increasingly aware of the prioritization processes outside their department. Moreover, the development of a common language around cybersecurity (Brooks et al., 2018) and the adoption of specific communication templates and dashboards that are easily understood by the different functional teams, are fundamental steps in addressing mis-communication and aligning priorities.

Legal implications are impossible to ignore, and, for this reason, organizations should foster transparency in the collaboration with public institutions and control agencies, as well as in the communication with their stakeholders. Transparency does not only prevent or lessen the impact of legal liability but may also increase stakeholders' trust in the good faith of the organization therefore lowering the attribution of responsibility for the crisis (Coombs & Holladay, 1996; Coombs, 2007). In order to address the difficulties in carrying out risk assessment and impact evaluation, participants to our study suggest that the best practices and tactics above will naturally contribute to the problem, by addressing all the inefficient practices and attitudes that prevent organizations from successfully managing cybersecurity threats and crises.

Tab. 1: Challenges of ICT and cybersecurity crises and strategic communication practices to manage them

Challenge	Strategic communication
High level of complexity caused by their extremely technical nature and the high uncertainty of their potential outcomes	Training programs for employees; risk communication as a reputation shield; continuous feedback mechanisms to inform antifragile plans
General low level of preparedness across industries and preparedness gap between large organizations and SMEs	Committing to the promotion of security through communication campaigns; implementation of communication flows within and across industries according to an ecosystem approach to information; commitment to transparency to inform statistics
Lack of a security culture across organizations and industries	Promotion of security through awareness campaigns both internally and externally; fostering direct communication with stakeholders to understand their concerns and information needs
Lack of investments in technology/tools, people skills, and procedures' implementation that are necessary to face cybersecurity disruptions	Adoption of negotiation strategies and empathetic communication on the part of IT/cybersecurity professionals for the communication with leaders and decision makers
Language and expertise barrier between the technical departments and the managerial/communication functions	Development of a common language around cybersecurity and adoption of strategic tools and dashboards to align understanding, activities and priorities
Legal implications of cybersecurity and ICT security disruptions	Fostering transparency and implementing risk communication to prevent liability
Difficulty of risk assessment and impact evaluation (mis-aligned prioritization processes, hidden risks and costs, biased statistics)	All of the above

Research limitations. *This study is still under development and does not benefit from a complete set for results. Future emerging insights may undermine the frame presented in this abstract. Moreover, the study concentrates on a limited sample size, collecting data from a specific group of participants with relevant expertise in crisis communication, ICT, and cybersecurity management. While this group may provide valuable insights, the findings may lack different perspectives of other organizational functions, such as that of C-level executives, but also that of users*

and external stakeholders. Additionally, the study relies on semi-structured interviews to collect data from participants. The accuracy and reliability of the data collected may be limited by the participants' willingness to disclose information, and by their own perception of their experiences, as well as contaminated by the researcher's interpretation.

The study relies on participants who are located within specific geographical locations, particularly Europe and the United States. Increasing the scope of the research to other countries, industries and cultures may provide support and verification of the results emerging from this exploratory study.

Finally, further research could address the lack of quantitative data by integrating the qualitative results with a quantitative survey to analyze users' behaviors and concerns regarding ICT and cybersecurity disruptions.

Managerial implications. The results of this research on the specific role of strategic communication in managing cybersecurity crises can be important for organizations in several ways. Firstly, the study highlights the challenges that organizations face when preparing for or managing a cybersecurity crisis, such as a lack of acknowledgement of the importance of ICT and cybersecurity incidents, a high level of complexity due to their technical nature, and a low level of preparedness across industries. This contributes to a more complete definition of their nature as operational liabilities and reputational threats. Moreover, the research promotes awareness around cybersecurity threats other than cyberattacks, such as data loss or system damage, leading to compromising important assets. This is a significant challenge as other types of cybersecurity incidents may be as harmful to organizations as cyberattacks, while receiving much less attention. By understanding these challenges, as well as the legal implications of ICT and cybersecurity disruptions and the difficulties that companies may face in implementing risk assessment and impact evaluation, organizations can take steps to adopt a new approach built around transparency, collaboration and security commitment, to mitigate cybersecurity crises' impact and become a point of reference for users and other companies.

Second, the study identifies not only a general approach, but also specific best practices for strategic and crisis communication that organizations can adopt to face the challenges posed by cybersecurity. For instance, organizations can provide training programs to employees to ensure not only protection against external attacks, but also secure data management. This can be done while the company communicates their current efforts in information security and cybersecurity to stakeholders, with the purpose of increasing trust and opening communication channels for continuous feedback from customers and employees to inform their antifragile plans and enable real-time action. These practices can help organizations to improve their security culture and preparedness, enhance transparency in public statistics on cyber risks and their impact, and align their leadership and technical teams on the importance of ICT protection and cybersecurity.

Overall, the study emphasizes the importance of preparedness and proactive communication in mitigating the impact of cybersecurity crises on organizations. By adopting the best practices identified in the study, organizations can enhance their ability to prevent, detect, respond to, and recover from ICT and cybersecurity incidents, and thereby protect their reputation and other tangible and intangible assets.

Originality of the paper. The study contributes to the existing literature on strategic communication and crisis management by exploring the specific role of communication practices in preventing and managing ICT and cybersecurity crises. More specifically, this research proposal seeks to investigate how strategic communication can support organizations in navigating the complexity of cybersecurity disruptions within a business environment filled with uncertainty. By emphasizing the role of communication in addressing these risks, the study contributes to the broader understanding of the importance of communication in risk management and crisis response.

While exploring the experiences of communication professionals, IT managers, and executives, this paper expands debate on crisis management and communication by better framing ICT and cybersecurity crises as an independent crisis typology with peculiar characteristics, such as their contagious nature and their ability to silently expand across different departments.

This research provides a first attempt to set the foundations for the development of a new approach to the internal management of cybersecurity matters that involves multiple functions and that revolves around a common language and mutual understanding of different priorities.

Another purpose of this theoretical contribution is that of strengthening the connection between management literature and strategic communication research, which becomes particularly evident in times of crisis, when reputational and financial negative consequences are almost always inseparable.

Overall, this study provides valuable insights into the challenges of managing ICT and cybersecurity crises and highlights the importance of strategic communication in mitigating these risks. The findings can inform the development of more effective crisis communication strategies and contribute to the broader academic literature on risk management and crisis response, while also raising awareness of the internal communication and management challenges that similar disruptions may trigger.

How does the accent impact on the radio advertising? The case of typical products

ORONZO TRIO* RAFFAELE CAMPO* PAOLA SCORRANO* ANTONIO IAZZI**

Research framework. *Radio advertising is one of the alternatives available to companies in the context of the communication mix by which communicate to the market, promote one's offer, strengthen the brand and, more generally, transfer news and information to the public.*

In the competition with other media and devices, radio exploits its strengths, among which the advantage of a more effective segmentation of the target audience, specifically in the case of local radios addressing the audience of a specific geographical area and the "increased frequency", that is the repetitiveness of the message which allows it to remain imprinted in the mind, especially if associated with an effective and captivating backing track for the listener. Furthermore, radio "confers memory impact on the audience", exhibits a "long-lasting memory" (Kwon et al., 2018), creates bonds of trust and a sense of intimacy and fidelity with listeners, and tends to be cheaper than television as well as being more easily measurable in the results of advertising investments.

In the face of these strengths, there are also disadvantages. Firstly, the radio presents the risk of a more frequent zapping of the listeners with the airing of advertising and the consequent interruption of the music which causes lower listening fidelity.

Radio, compared to other media, does not allow the listener or advertiser to be able to reuse the message for future references, as case of press or web.

Another critical issue for the effectiveness of radio advertising is the distraction of the listener, who generally, in addition to listening to the radio, is simultaneously engaged in other activities (working, driving, reading) and may not be paying attention to the advertising message, therefore by not memorizing it or by not "keeping" it.

The effectiveness of radio advertising depends on numerous factors, including (i) creativity, i.e. the ability to find new solutions to old problems, (ii) the announce read live (or recorded) by the presenter, (iii) sing & sell, i.e. the musical content of the spot, (iv) the testimonial, (v) slice of life, i.e. the story, in a few seconds, of everyday life situations and (vi) the announcer's voice (Erguven, 2015).

The voice influences attitudes and perceptions on the quality and characteristics of the product, even in the absence of images, thus forcing advertisers to concentrate their efforts on identifying the voice most consistent with the characteristics and content of the message.

Psychology and marketing literature has focused on some specific aspects of the voice, studying in particular the way it impacts on consumer reactions to ads. Some of the most important factors are accent, speech rate and vocal pitch which cause different reactions based on the importance attributed by the listeners, the gender of the announcer and the gender of the listeners (Morales et al., 2012; Apple et al., 1979; Street et al., 1983; Chattopadhyay et al., 2003; Crystal, 2008; Scherer, 1979; Dahl, 2010; Addington, 1968).

It has been demonstrated that listeners prefer products advertised by a speaker with a standard accent, that accents influence how well listeners remember the ad information and that speech rate impacts on persuasiveness of an ad advertisement, that men who speak faster are judged to be more competent, socially attractive, truthful and persuasive than are men who speak more slowly.

Differences in tone of voice are also important: "lower (higher) auditory pitch used in marketing communications cues perceptions of larger (smaller) physical size in the associated product" (Lowe & Haws, 2017), ads narrated by announcers with lower pitched voice are more effective than the same ads spoken by an announcer with a higher pitched voice.

Voice quality and gender voice play an important role too.

The personality inferences that listeners make based on hearing different voice qualities have a great importance in determining the listeners reactions. When a listener hears a voice that has qualities associated with higher levels of educations or status, the listeners are likely to believe that the speaker is high status or well educated.

Therefore, voice qualities are interpreted differently according to the gender because the reactions to a male or female voice are different (Wiener & Chartrand, 2014; Perona & Barbeito, 2008; Furnham and Paltzer, 2010; Martin-Santana et. Al, 2017).

As stated by Wiener & Chartrand (2014), if the ad is aimed at a female audience and has a female announcer, it would be more effective if the speaker does not have a creaky voice. If the announcer is male, it would be beneficial for him to have a creaky voice.

In countries where there is similarity in the use of male voices in radio commercials, it has been shown that low voices are considered more serious, believable, confident and powerful than high voices which are instead considered sweet, familiar and cheerful (Perona & Barbeito, 2008). Furthermore, it may also be due to a belief that because male voices are generally deeper, they sound more commanding, convincing, and persuasive than female voices. (Furnham and Paltzer, 2010).

Martin-Santana et. Al (2017) demonstrated that the prevalence of the male voice in some markets, such as the Spanish one, is neither justified in terms of effectiveness with non-gender-image products. They argue that to attract the listener's attention, increase audience awareness of the product or brand, and improve awareness, the advertiser should use low-pitched voices, which increase recall levels.

If the advertiser's goal is to create or improve public attitudes towards the product or brand, he would use the low-pitched female voice for its greater ability to change attitudes, particularly for those who.

A further factor which affects the effectiveness of the message and, in particular, directs the attitude of the listener, is the credibility of the source and, therefore, of the announcer. The latter can be analyzed along two components: cognitive and affective.

The former includes reliability and competence, while the latter is identified with attractiveness.

Expertise is "the ability of a communicator to be perceived as a source of valid statements based on his level of education, his own competence and educational background, which allow him to pass certain messages into a valid way. Reliability is the level of acceptance of the communicator and of the transmitted message, that is, listeners believe that the source can be trusted to provide objective and accurate information. Attractiveness is the level of physical attractiveness given to the source by the listener and, to a lesser extent, the emotional attractiveness of the source (Bearden & Netemeyer, 1999).

An important variable for the impact on advertising effectiveness is represented by the type of presenter used in the production of the message.

We can distinguish the endorser into famous and not famous or we can carry out a more detailed analysis which leads us to distinguish according to whether he is a celebrity, a consumer, an expert professional or an employee of the company.

The literature has paid great attention to the relevance of these figures with reference to means other than the radio which has instead received less space from researchers (Mittelstaedt et al, 2000). What emerges in literature analysis is that the absence of images in the radio causes the latter to use celebrities to a less predominant extent than in the context of television which, based on the notoriety of the testimonial, can determine success of the brand, in particular where there is congruence between endorsers of the personality of a brand (Fleck et. Al., 2012).

A well-known and authoritative testimonial can give the message greater effectiveness since the listener, perceiving him for these characteristics as a reliable and therefore sincere person, shows himself well disposed towards the product/service and attentive to the suggestions contained in the commercial and to the description that the announcer himself does. This leads to prefer the use of the pronoun "I" by the latter which shows an involvement towards the product, a real conviction about its qualities and performance.

However, if this is true in the case of television advertising, where the visual elements reinforce the effectiveness of the message when conveyed by a celebrity, in the case of radio, where there is a lack of these elements, a different situation occurs since this medium is more inclined to make use of voices that represent low-profile personalities to the detriment of celebrities who star in advertising in other media. Instead, there is a prevalence of the voices of the Presenter and the Company's employee and also of voices of real people (Perellò Oliver et al., 2018)

The accent plays a key role in qualifying the voice of the speaker during the transmission of the message. Since there are no images, the voice can suggest his appearance and personal characteristics (Krauss et al., 2002); it acts like a salient vocal cue, transmitting minimal information about them and influence social responses (Sebastian & Ryan, 1985).

Since accent affects listeners' impressions of speakers, selecting the right spokesperson to transmit a message is a complex decision that implies evaluating a series of key qualities, such credibility and attractiveness (Heaton & Nygaard, 2011; Stafford et al., 2002) .

Advertisers need to consider the different reactions of listeners when hearing different accents, depending on whether the speaker has a Standard Accent or a Local Accent. The first describes forms that are generally accepted by the majority of the society and provides no obvious indication to the speaker's geographic or social background, while the Local Accent is almost the opposite.

For example, it has been shown that a standard English accent exerts a particular influence on the perception of source credibility compared to the local accent which is associated with a negative social stereotype and decreases perceived trust and similarity, which results in an erosion of the credibility of the spokesperson and the failure to achieve the desired behaviors (Lalwani et al., 2005; Deshields et al., 1997; Deshields & De Los Santos, 2000; Stafford et al., 2002; Reinares-Lara et al., 2016).

Purpose of the paper. The aim of the research is to investigate the potential of radio communication for typical local products. Starting from the significant potential of those goods, from the deep roots in the territory of origin and from the possibilities offered by radio advertising, we will analyze the ways in which it can help strengthen the link between products and consumers who live in the same territory.

The typical products are characterized by a close link with the territory of origin. In addition to stimulating the need for direct knowledge of places, they can become goods whose value transcends their intrinsic utility, since they determine complementary effects related to the sensations (Schmitt, 1999) that they are able to generate.

For this reason, it is necessary to use communication formulas that make them recognizable, so as to achieve notoriety, create value for businesses and their local area of origin. For example, typical agri-food productions have an identity - and in strategic terms can be defined as "uniqueness" - deriving from certain factors, tangible and intangible, such as (Altili 2010; D'Amico, 2004 and 2002; Carboni and Quaglia, 2001): traditions, uses, customs, history, culture, soil and climatic conditions, landscape and production methods consolidated over time.

In this sense, being able to link these products to the tourist potential (where present) of their territories of origin can be a useful strategy to corroborate their reputation. It is the cognitive potential naturally present in typical products, in order to make them part of a whole, through targeted and coordinated experiential marketing actions, useful for communicating the brand-territory union, thus contributing to the creation of a competitive advantage for such productions and for their places of origin. To succeed in such intent, it is essential that companies experience their territories as an indispensable asset for the mutual development and therefore adopt a perspective that connotes them as well-established businesses.

All the above factors represent the heritage of a territory, intended as productive field (Baccarani and Golinelli, 2011), as much as the link between the product and place of origin (Fait, 2010; Fait and Trio, 2011; Maizza and Iazzi, 2011; Maizza et al., 2013; Scroll, 2013; Scorrano et al., 2013; Fait et al., 2014; Iaia et al., 2016). The latter is to be found in those characteristic elements of a product, which come from specific production area and, therefore, cannot be replicated or "exported" to other contexts (Mastroberardino, 2004; Maizza et al., 2003). The brand-territory bond, therefore, manifests itself in that unicum that is created in the mind of the consumer, for that generates and increases the notoriety of both; this, until the land becomes synonymous of its own products and becomes a loyal brand itself, creating value for a plurality of subjects (it is sufficient to think, for example, of the wines produced in Chianti, Bordeaux, Montalcino, etc.).

Methodology. The purpose of the research is twofold. The first is to ascertain what choices businesses producing typical local products make on the use of radio as a means of promoting their commercial offerings.

To this end, in-depth interviews is going to be conducted with entrepreneurs and managers in order to analyze: (i) the communication policies they have adopted and those that they propose to employ in the coming year in perspective; (ii) their attitude and propensity toward the radio medium; (iii) delve into which channel is considered most consistent with their target market; (iv) analyze the type of message considered most relevant; and (v) learn about preferences for the speaker's voice and accent (SA or LA).

The second objective concerns consumer attitudes towards radio advertising and the impact of the accent of the speaker's voice. For this purpose, a random sample of listeners will be involved to listening to two commercial advertising a typical local product, one with SA and another with LA.

On the one hand, speaker credibility will be measured using expertise and trustworthiness as variables; on the other hand, the cognitive level, affective level, and conative level of the listener's response will be analysed through a test.

Results. Since this is an ongoing study, results are not ready yet. Researchers are going to collect them.

Research limitations. A limitation of the research is represented by the use of a single factor of the speaker's voice (the accent) without considering the influence that other elements can exert, such as- for example- the tone, the reading speed, the gender of the speaker.

The significance of the results regarding the credibility of the latter and the listener's response could therefore be consequently limited. Another limit could concern the type of sample involved in the research which is made up solely of listeners living in the same area where the advertised products are produced.

Managerial implications. The research would have interesting managerial implications for managers and businesses, particularly those that produce typical local products.

The results of the study, in fact, may make it possible to obtain useful indications concerning the attitude and response of consumers to a radio commercial using a voice with local accent, as opposed to another with standard accent, in the promotion of a typical product of their region of residence.

This will help guide business choices regarding radio communication and learn which tools and modes of communication are most relevant and present the greatest opportunities for success in dealing with the market.

Originality of the paper. The originality of this research is represented by the choice to cross a topic which is typical of psychology applied to marketing to a local context such as the Apulian one and, specifically, to a particular typology of products, the typical ones.

Keywords: radio, voice, consumers, advertising, typical products

Unleashing the potential of social media: an investigation into antecedents and opportunities of entrepreneurial intent

AUGUSTO BARGONI* CHIARA GIACHINO* RADA GUTULEAC[▲] CIRO TROISE**

Framing of the research. *The emergence of multi-sided digital platforms in the 21st century has significantly transformed the way individuals interact and organizations engage with their target audience (Troise and Camilleri, 2021). In light of these technological advancements, which continue to reshape the individuals' perception of entrepreneurial opportunities, a novel approach in examining entrepreneurial intent and behaviour is expected.*

This fact embossed the importance for entrepreneurship scholars (Park et al., 2017; Nambisan, 2017; Leftheriotis and Giannakos, 2014) to provide a practical definition of social media entrepreneurship by emphasizing the scarcity of resources available to those venturing into new business ventures, as well as the process of opportunity recognition and evaluation.

Traditionally, media entrepreneurship refers to the strategic usage of a small firm's limited resources to pursue identified profit potential in a particular niche market (Khajeheian and Arbatani, 2011). In the same vein, Gustafsson and Saud Khan (2017) refer to social media entrepreneurship as the practice of identifying, evaluating and seizing lucrative opportunities via social media platforms. In other terms, a process of leveraging social media platforms to identify and capitalize on potential business opportunities.

Beyond the individuals' pursuit of opportunities, previous research has identified the cost-effectiveness of social media as a significant antecedent in its adoption and implementation (Odoom et al., 2017). In fact, technological advancements and the widespread use of social media have significantly reduced the costs incurred in engaging with existing and potential customers (Alalwan, 2018). In addition, social media provides a platform for collaborative content sharing, enabling companies to reach a wider audience without being limited by geographical, cultural, and professional barriers (Kwon et al., 2021). As a result, this collaborative potential and wider content capability have become an effective means to engage with the diverse customer base, ultimately leading to increased cost-effectiveness.

Furthermore, established entrepreneurs underestimate the potential benefits of social media when determining whether to integrate it into their business strategies (Gavino et al., 2019). However, this narrow focus on established entrepreneurs ignores individuals in the pre-launch stage of the entrepreneurial process. In contrast to Gavino et al.'s (2019) findings, social behavior theories propose that entrepreneurs utilize social media and networking sites to cultivate social connections (Turan and Kara, 2018).

Grounded on the research propositions by Olanrewaju et al. (2020), which encourage scholars to advance the discourse on social media-opportunity recognition and explore how platform capabilities and individual characteristics interact to support the entrepreneur opportunity recognition process, our aim is to investigate the antecedents that lead to entrepreneurship intent in digital platforms, specifically social media.

Theoretical background and Hypotheses development. *The emergence of Internet-based social media as a medium of interaction, information, and knowledge sharing has facilitated companies to effectively communicate with hundreds, if not thousands, of customers regarding their products and services (Lee and Cho, 2020). In turn, customers now easily share their thoughts, feedback, and perceptions with others (Alsubagh, 2015), establishing a two-way communication channel that allows companies to gain benefits in terms of customer satisfaction, networking and increased sales (Ramanathan et al., 2017). In fact, when people base their purchase decisions on advertising or experts' advice, they increasingly rely on feedback and opinions posted on digital platforms. In other words, satisfied customers, besides repurchasing products and services, increase their positive online word-of-mouth to others (Eelen et al., 2017). Accordingly, the allure of social media platforms is closely related to the possibility to approach the entrepreneurial endeavor with a customer-centric orientation (Li et al., 2021).*

In addition, the viewpoints expressed by other individuals on social networks have a significant influence on entrepreneurs' decisions to leverage social media (Turan and Kara, 2018). Via social media, entrepreneurs receive advice from mentors or industry experts, emotional support from peers facing the same challenges and confirmation of decisions through customer feedback. Such support is particularly crucial in the early stages of entrepreneurship where there is a need for information and support on setting up (Olanrewaju et al., 2020). Thus, social determinants significantly influence an entrepreneur's perception of social media usage. In consumer behavior models, social influences are important components in influencing customers' perception, and ultimately, their purchase intention (Turan and Kara, 2018). According to the two scholars, social influences, particularly in responding to social pressure, might impact an entrepreneur's intentions to utilize social media. In other terms, social influences refer to the impact of social factors such as social norms, social support, and social pressure on the attitudes of entrepreneurs, especially aspirational ones, towards using social media for entrepreneurial purposes.

Taken together, our research aims to investigate how the antecedents of entrepreneurial intent in social media and the intention to leverage social media for entrepreneurial purposes are related. Therefore, we propose:

Hypothesis 1 - *Aspirational entrepreneurs' attitude towards intention to use social media for entrepreneurial purposes will be positively influenced by cost effectiveness (H1_a), perceived usefulness (H1_b), customer centricity (H1_c), and social influences (H1_d).*

The ability to recognize opportunities is an important piece in the puzzle of creating a venture. Both academics and practitioners have explored social media and entrepreneurship by highlighting the importance of opportunity recognition and opportunity discovery (Olanrewaju et al., 2020; Park et al., 2017). The dominant discourse around opportunities has been influenced by the dichotomy of this definition (Alvarez and Barney, 2007). Opportunities are concrete, tangible realities, which exist "out there" waiting to be found (Short et al., 2010). They are regarded as a part of the environment, resulting from a combination of the entrepreneur's resources and environmental factors such as technological developments, consumer needs, and market environment (Edelman and Yli-Renko, 2010). While another prevalent view posits that "opportunities are made, not found" and emerge through the actions taken by entrepreneurs in contact with their environment during the entrepreneurial process (Ardichvilli et al., 2013: 106).

The emergence of social media has played a critical role in facilitating the creation of opportunities. According to Park et al., (2017), social media adoption has become timesaving in identifying and developing entrepreneurial opportunities. In fact, entrepreneurs leverage social media to gather data and information resources to uncover potential prospects (Zhao et al., 2022). Among other advantages, both online communication and social media have facilitated to implementation of different marketing strategies with lower effort and cost (Barile et al., 2021). The progress of technology, accompanied by the growth of an extensive virtual community, has provided extensive prospects for the activities. These include the ability to specifically aim for, entice, and cultivate connections with customers, as well as communicate brand strategies while incurring reduced expenses (Barbu et al., 2021). Although previous research has focused on the relationship between entrepreneurial orientation and business performance, Lechner and colleagues (2006) argued that social media plays a crucial role in the development of entrepreneurial capabilities, as it facilitates gaining knowledge and fosters relationships with established companies. Building on this statement, we propose:

Hypothesis 2 - *Social media use positively moderates the relationship between cost effectiveness (H2_a), perceived usefulness (H2_b), customer centricity (H2_c), and social influence (H2_d) towards the intention to use social media for entrepreneurial purposes*

Entrepreneurs expect performance whether using of social media. In this vein, Turan and Kara (2018) have emphasized the significance of performance expectancy, which refers to entrepreneurs' perception regarding the value of social media in improving business performance, including effectiveness, achieved outcome, and task accomplishment (Venkatesh et al., 2003). Alalwan (2018) echoed this notion by emphasizing the importance of social media as a platform for advertising and promotion. They observed that individuals are more prone to adopt new technologies if they perceive them as beneficial, profitable and time-saving. Accordingly, we hypothesize the following:

Hypothesis 3 - *Performance expectancy use positively moderates the relationship between cost effectiveness (H3_a), perceived usefulness (H3_b), customer centricity (H3_c), and social influence (H3_d) towards the intention to use social media for entrepreneurial purposes*

According to prior research (Unal and Uzun, 2021; Chatterjee and Kar, 2020), individuals are more prone to accept and utilize technology if they perceive it as effortless. Conversely, if the technology system is perceived to be complex and requires more effort, it is likely to be avoided (Rugambwa, 2009). The effort expectancy construct captures an aspiring entrepreneur's perception of how easy or difficult it is to use social media and whether they possess the necessary knowledge and skills to use it effectively. In other words, entrepreneurs are more likely to adopt social media if they perceive it as user-friendly and if they feel confident in their ability to use it (Unal and Uzun, 2021). Therefore, since perceived ease of use is a critical factor in determining an entrepreneur's intention to use social media to enhance their business performance, we hypothesize that:

Hypothesis 4 - Effort expectancy use positively moderates the relationship between cost-effectiveness ($H4_a$), perceived usefulness ($H4_b$), customer centricity ($H4_c$) and social influence ($H4_d$) towards the intention to use social media for entrepreneurial purposes

Purpose of the paper. Our research intends to investigate the relationship between the antecedents of entrepreneurship intent on digital platforms, specifically social media, and the individual's entrepreneurial intent to utilize social media for entrepreneurial purposes. By analyzing a specific group of individuals who have expressed the intention in starting an entrepreneurial activity but have not yet taken action, and by leveraging quantitative research methods, we aim to identify the determinants that drive entrepreneurial intent on social media. More specifically, we will examine through empirical evidence how platform capabilities interact with individuals' personal traits to encourage the entrepreneur's recognition of opportunities.

Methodology. To test our research hypotheses, we leverage the Structural Equation Modelling (SEM) method, analyzing data gathered from 359 respondents using prolific (Palan and Schitter, 2018). We conducted a pre-screening process to include only participants who explicitly expressed the intention to start an entrepreneurial venture.

According to Byrne (2012), SEM allows the researcher to simultaneously test numerous interrelated connections between observable variables (indicators) and non-observable variables (latent constructs) that can be targeted in the first phase of SEM measurement model (CFA). Furthermore, SEM validates the relationships between the latent constructs, which are targeted in the second phase of SEM structural model analyses. Furthermore, the scholar may investigate all the issue with the validity and reliability of constructs for each factor separately (Kline, 2015; Anderson and Gerbing, 1988).

The measuring constructs were adapted from extant research: cost effectiveness (e.g., "Social media platforms can be helpful to cut down cost on marketing communications"), perceived usefulness (e.g., "Using social media can be helpful to increase the possibilities of new business partnerships"), customer centricity (e.g., "Through social media I could easily meet customers to realize their current and potential needs for new products), social influence (e.g., "Peers are helpful in the use of online social media"), social media use (e.g., "Social media is a helpful platform to start a new business"), performance expectancy (e.g., "Using social media could enable to accomplish my tasks more quickly), effort expectancy (e.g., "I am skillful at using online social media"), and intention to use social media for entrepreneurial purposes (e.g., "I intend to use social networks in setting up a business").

To measure the items in the questionnaire we drew on a Likert scale where 1 = "Strongly disagree" and 5 = "Strongly agree". Through a factorial and reliability analysis, all factors were able to have Cronbach alpha's above the threshold recommended by Nunnally (1978).

Results. Sample characteristics

According to our findings, slightly more than half of the 359 respondents were women with 57.7%, while 40.9% were men, and the remaining 1.4 % preferred not to disclose their gender. Most of the respondents were in their 30s with an average age of 34.6 years. According to the number of platforms used for leisure, 1.1% reported using no social media, 68% use 1 to 3, 28.7% use 4 to 6 and 2.2% use 7 or more. At now, 52.9% of respondents reported employing social media for business, with Facebook and Instagram topping the list. The average amount of hours that the respondents spend navigating social media is 12.2 hours.

Results

In our investigation, during the initial phase of SEM, the reliability and validity were all tested. Then, the second phase aimed to verify the hypotheses.

The structural model was tested in the second part of the study to validate the conceptual model and investigate the main research hypotheses. The software utilized for this purpose was IBM ILOG SPSS v.25.

As for the main research hypothesis, except for $H1d$ ($IU <- SI$), $H2$ ($IU <- SMU$), $H3a$ ($IU <- CE_PE$) and $H4d$ ($IU <- SI_EE$), the rest of the research hypotheses were refused.

Aspirational entrepreneurs' attitudes towards intention to use social media for entrepreneurial purposes will be positively influenced by social influences ($b = \text{estimate} = .870$, $p < 0.001$).

Social media use positively moderates the relationship between the antecedents of entrepreneurial intent in social media towards the intention to use social media for entrepreneurial purposes ($b = 1.063$, $p < 0.001$). Hence, the positive relationship between the antecedents of entrepreneurial intent in social media and intention to use social media for entrepreneurial purposes is stronger when social media use is high.

Performance expectancy use positively moderates the relationship between cost-effectiveness and the intention to use social media for entrepreneurial purposes ($b = .219$; $p = p < 0.001$). In other words, the relationship between cost-effectiveness and intention to use social media for entrepreneurial purposes is stronger when performance expectancy use is high.

Effort expectancy use positively moderates the relationship between social influence and the intention to use social media for entrepreneurial purposes ($b = -.139$, $p < 0.05$).

In addition, our analysis reveals that individuals' entrepreneurial intent is mostly influenced by social influence and the ability to use social media use. The stronger the individual's beliefs about the personal and social desirability of doing something and whether they have the necessary skills and abilities (control) for it, the greater the likelihood they will use social media to create new business ventures.

Research limitations. *Our study neglected to consider the influence of cultural factors on aspiring entrepreneurs' decisions between personal and corporate social network platforms. Further research could investigate how cultural variations affect individuals' social media entrepreneurial purpose. Cultural factors, such as individualism, collectivism, power distance, and uncertainty avoidance, can affect individuals' attitudes and behaviors towards entrepreneurship (Hofstede and Bond, 1984). Future investigations could involve cross-cultural studies that compare the attitudes and behaviors of aspirational entrepreneurs in different cultural contexts. In addition, future research could validate our findings by expanding the sample in terms of nationality, age, and occupation.*

While our research did not discriminate between different social media platforms, future lines of research might consider investigating the impact of different digital platforms on encouraging entrepreneurial intention. Specifically, researchers could explore how different social media platforms, such as Instagram, Facebook, or LinkedIn, affect individuals' entrepreneurial motivations and intentions.

Managerial implications. *Our findings provide insights for both social media managers and digital platforms on boosting the likelihood of aspirational entrepreneurs creating businesses, as well as guidelines for public and private organizations interested in nurturing entrepreneurial aspirations.*

Recognizing the features of social media platforms that inspire entrepreneurial purpose could be important for public and private organizations in fostering a culture of entrepreneurship, encouraging individuals' entrepreneurial spirit, and creating the optimal environment for socioeconomic growth. This requires promoting a supportive community through networking events, incubator programs, and mentorship opportunities.

Moreover, public and private organizations could create an environment conducive to socio-economic development, which may include policies and initiatives that support entrepreneurship, such as access to capital, tax incentives, grants, and other forms of financial support. In addition, organizations could provide support and guidance to aspirational entrepreneurs by connecting them with mentors, advisors, and investors.

Given the significant correlation between social influence and the intention to employ social media for commercial purposes, launching an entrepreneurial endeavor as well as using social media is strongly affected by other people's opinions. From a psychological perspective, organizations may leverage the power of social influence to encourage entrepreneurship by creating a positive narrative around entrepreneurial activity and sharing success stories, which could help to overcome the fear of failure and inspire individuals to launch their entrepreneurial endeavors.

Our research further found the moderating role of performance expectancy on the relationship between cost effectiveness and the intention to use social media for business purposes and moderating effect of effort expectancy in moderating the relationship between social influence and the intention to use social media for business purposes. As social media continues to gain popularity, aspirational entrepreneurs recognize the significance of serving as facilitators in cultivating relationships with both their current and potential customers. By utilizing social media platforms, entrepreneurs could gain valuable insights into their competitors' approaches, attitudes, and customers' feedback to enhance their competitive advantage.

Finally, entrepreneurs that grasp the benefits associated with social media may create successful customer relationship management strategies and concentrate on customer-centric initiatives, which will enhance efficiency in their entrepreneurial pursuits.

Originality of the paper. *Our study contributes to the investigation of the antecedents of entrepreneurial intent in the context of social media by integrating insights from both entrepreneurship and social media studies (Barile et al., 2021; Alalwan, 2018; Turan and Kara, 2018). Specifically, we identify the determinants that individuals who intend to start an entrepreneurial venture on digital platforms value. While previous research has focused on investigating scenarios of established business ventures (Chatterjee and Kar, 2020), multinational companies (Fraccastoro et al., 2021) or small and medium-sized enterprises (Pentina et al., 2012), this study differs by highlighting the role of social influence and the ability to use social media as determinants of entrepreneurial intent in aspirational entrepreneurs. Additionally, the study identifies the moderating role of performance expectancy in strengthening the relationship between cost reduction, as an antecedent of social media use, and the intention to use social media for business purposes.*

This research contributes to the body of knowledge on transformational entrepreneurship by providing a different perspective on the role played by digital platforms, specifically social media, in fostering entrepreneurial intent.

Finally, our findings offer managerial implications for aspirational entrepreneurs, policymakers, and academics, providing insights into how social media can be leveraged to enhance entrepreneurial intent and socio-economic development.

Keywords: *social media entrepreneurship; transformational entrepreneurship; entrepreneurial intent; digital platforms; social media*

When, Where and What of Corporate Purpose: a bibliometric analysis using VOSviewer

MARTINA TAFURO* ANDREA PICCALUGA*

Framing of the research. *It is argued that we are currently experiencing a “syndemic” crisis, considering the interaction among the social, economic and environmental dimensions that characterize a variety of global challenges (Horton, 2020), Consequently, an integrated approach is required, with the involvement of many different parties, including companies. In fact, the rising of a number of global challenges (e.g., pandemics, climate change, inequality) prompts for a new role of the business in society (Schlag and Melé, 2020), Confirming that, purpose-driven companies – but all companies more in general – are expected to increasingly manage problems and act with a global and integral vision, cooperating with institutions and communities in the pursuit of the common good and in safeguarding common goods (Albareda and Sison, 2020), Although on purpose-driven companies there is not a unique definition, by them we refer to such companies whose members are inspired by a corporate purpose, which is itself able to respond to specific societal needs (Quinn and Thakor, 2018; Rey et al., 2019), Nevertheless, purpose-driven companies are key to drive transformative innovation needed to address climate change and other societal issues (Henderson, 2021),*

Consequently, among the many recent academic contributions aimed to rediscover companies’ alternative routes from more than profit’s maximization, there is also a re-conceptualization of corporate purpose (Porter and Kramer, 2011; Mayer et al., 2017), Purpose is more and more regarded as the key to deal with the complex world we face today, “where strategy is ever changing and few decisions are obviously right or wrong” (Craig and Snook, 2014, p. 4), For these reasons, far from being exhaustively condensed, the topic of the nature, antecedents and consequences of corporate purpose has acquired a new wave of interest both for practitioners and scholars (Mayer, 2021), There is still need of research on the role of companies in the contemporary and in the future of society (Mayer et al., 2017), and contributions that underline the importance of purpose in orienting companies in that sense are at the early stage (Mayer, 2021), In fact, a variety of questions are rising “about what purpose means, how it is implemented, and how it gains legitimacy and credibility” (Mayer, 2021, p. 898),

Purpose of the paper. *Since its origins, the conceptualization of corporate purpose placed in difficulty management scholars, causing problems in exploring what is purpose, from what data it can be identified and what are relationship between purpose and other organizational features (Warriner, 1965), The ambiguity of the concept of corporate purpose is recognized also in practitioners-oriented debate. For instance, the concept is still equivocal and misunderstood, although “setting, communicating, and delivering an organization’s purpose is at the heart of governance” (Hurth, 2017, p. 4), George et al. (2021) proposed a definition of purpose in for-profit firms as “the essence of an organization’s existence by explaining what value it seeks to create for its stakeholders” (p. 7), However, the authors stressed overriding responsibility of scholars to commit our scarce resources to a research and education agenda that acknowledges the wide role of firms in society and to speak for those stakeholders whose voices otherwise risk being unheard (George et al., 2021),*

The aim of this research is to outline “when” and “where” corporate purpose is framed and “what” are the main topics to which it is addressed, contributing to actual debate by highlighting some possible horizons for future research with a bibliometric analysis on the literature. More concretely, the bibliometric analysis involves exploration of three main areas: (1) “when”, that highlights the time trend of publications on corporate purpose; (2) “where”, that shows the main outlets that welcome research and stimulate debate in the literature on corporate purpose; (3) “what”, that presents and discuss main topics related to corporate purpose research.

Methodology. *According with the end of the research, we performed a keywords-based search in Scopus and Web of Science databases, based on the terms: “organization* purpose*”, “business* purpose*”, “corporat* purpose*”, “firm* purpose*” and “compan* purpose*” in the abstract. After removing non-English documents, and limited the research in the management area, a final sample of 741 publications has been disclosed. We use this sample for the first part of the analysis aimed to explore the “when” of corporate purpose.*

Then, we selected 100 contributions to review, among which 20 were chosen using snowball sampling approach, for a more in-depth analysis of the “where” and “what”. The exclusion/inclusion criterion was aimed to concentrate efforts only on publications where corporate purpose represented the main topic of the study and the term was treated

non in a trivial way. Accordingly, we performed a bibliometric analysis for two main reasons: first, studies based on retrieved data are considered more relevant than subjective researcher's interpretation and second bibliometric methods help to obtain clear overview of the debate on a specific topic (Zupic and Čater, 2015). In addition, we used VOSviewer software (van Eck and Waltman, 2010) to generate, visualize and analyse trends and networks in research outlets. Out of a total of 2350 cited sources from the 100 contributions selected (including journals, proceedings, books, manuals, newspapers, and websites), we removed and/or manually repurposed 167 sources that were not appropriate (e.g., typos) for the analysis, leaving a sample of 2183 cited sources. First, we implemented a co-citation analysis of the main research outlets "where" there are publications on corporate purpose. The overall co-citation is done two by two, analysing two sources that are both cited by the same contribution. Then, we performed a keywords co-occurrence analysis, setting the minimum threshold of word frequency statistics as 2, based on keywords that occur at least once. We obtained the map in the Figure 3, in order to show and discuss "what" are the critical leading related topics connected to corporate purpose.

Results.

When of Corporate Purpose

The Figure 1 depicts "when" corporate purpose is framed from 1965 to 2022. The first publication by Warriner, titled "The problem of Organizational Purpose" dates back to 1965. Among most cited and seminal articles, Bartlett and Ghoshal (1994) pushed managers to think on a clear definition of corporate purpose with a perspective inside the organization, in order to give a meaning for working to employees. The number of publications seems to be stagnated until 2010, when there has been an exponential increase, as shown in Figure 1. However, considering most cited articles (i.e., Gartenberg, 2019; Mayer, 2021), scholars' perspective on the topic of corporate purpose seems to change toward a more outside the organization oriented one. For instance, Mayer (2021) argued that the underpinnings to the renovate attention on the topic is due to the changing in companies and market nature that push for the potential role of corporate purpose in promoting better social outcomes.

Fig. 1: Number of contributions on Corporate Purpose per year based on 741 publications

Source: Authors' elaboration

Where of Corporate Purpose

We implemented a co-citation analysis (Figure 2) among the sample of 2183 cited sources, based on the sample of 100 contributions selected for a more in-depth analysis, using the software VOSviewer to visualize the relationships between the most important research outlets "where" corporate purpose is framed. It seems quite clear that the concept of corporate purpose has spread into the language of multiple research outlets. In fact, most articles were published in journals focused on different areas, including mainly business ethics (e.g., Abela, 2001; Sison, 2007; Bhattacharya et al., 2022) and strategy (e.g., Bartlett and Ghoshal, 1994; Collins and Porras, 1996; Craig and Snook, 2014). Moreover, the analysis allows to visualize (Figure 2) journals with the larger number of citations, that are displayed with a stronger hint of yellow: *Journal of Business Ethics* is the most cited, followed by *Academy of Management Review*. The density visualization in the Figure 2 highlights also the relatedness among journals that is stronger the closer journals are located to each other. For instance, it is possible to identify two main clusters: *Journal of Business Ethics* that seems to be more related to *Harvard Business Review*; and the same for the relationship between *Academy of Management Review*, *Academy of Management Journal* and *Organization Science*.

Fig. 2: Co-citation analysis with cited sources on Corporate Purpose

Source: VOSviewer (version 1.6.18)

What of Corporate Purpose

We performed a keyword co-occurrence analysis that can be observed in the comprehensive map below (Figure 3). The label and rim size of an item is determined by the weight of each keyword and each circle represents a node. The higher the weight of a keyword, the larger the article label and circle are (van Eck and Waltman, 2010). Overall, the keyword “corporate social responsibility” had the largest node and the highest frequency, followed by “sustainability”. The connection among nodes represents their co-occurrence relationships, according to which, different research clusters are formed and displayed with different colors. We analysed each cluster, in order to depict “what” are the main topics to which corporate purpose is addressed.

- **Cluster 1: common good, corporate social responsibility, mission**

The first cluster includes and strictly relates common good and purpose, with corporate social responsibility and mission. For instance, many authors, contributing to Humanistic Management theory, stress the fact that purpose contributes to the common good through the material and moral development of people at work (Sison, 2007). The final purpose of business organization is to serve the societal common good and satisfy the need of people living in the place where the firm operates (Melè and Schlag, 2015). The main idea is to consider the purpose of the firm as common good (Naughton et al., 1995), recognising the connection among the good of the firm and the good of the entire society, since the fact that firms are “community of persons” (Melè and Schlag, 2015). This perspective implies managerial actions, by impacting on corporate social responsibility issues and mission statement (i.e., Alegre et al., 2018). Confirming that “purpose provides a clear definition of the firm’s intent, creates the ability for stakeholders to identify with, and be inspired by, the firm’s mission, vision, and values, and establishes actionable pathways and an aspirational outcome for the firm’s actions” (George et al., 2021, p. 7).

- **Cluster 2: climate change, capitalism, sustainability, corporate strategy**

The second cluster welcomes contributions that confirm the positive impact of purpose in facing nowadays environmental crisis toward a corporate strategy that recognises the need for companies to be sustainable. In line with these considerations, Gartenberg et al. (2019) confirms that purpose impacts on strategy implementation and suggests that employees with strong beliefs in the purpose of their organization achieve better performance. Social and environmental crisis caused the proliferation of corporate purpose statements. Purpose has been considered more and more as a crucial organization feature toward sustainability, which includes ESG (environmental, social and governance) dimensions and it is becoming an integrated component of purpose in the for-profit enterprise (George et al., 2021). George and Schillebeeckx (2022) suggest that corporate purpose can be strategic to deal with “geopolitical, organizational and market tensions induced by the pandemic, climate change and digitization” and it can be a factor that preserves companies’ advantage.

- **Cluster 3: benefit corporation, corporate governance, theory of the firm**

The third cluster collects contributions around benefit corporation (B-Corps) phenomenon, as concrete entities that combine the goal of profit with a social-oriented purpose attested by a legal tool, causing change in the corporate governance setting of the company (Hurt 2017; Mayer, 2021). It means also rethinking the traditional theory of the firm toward a re-conceptualization of the organizational purpose. For instance, Mion and Adauí (2020) confirm that B-Corps pursue benefit in a responsible, sustainable, and transparent way and considering diverse stakeholders.

- **Cluster 4: creating shared value, hybrid organizations, corporate objectives**

The fourth cluster relates with the perspective of redefining corporate objectives, intending purpose as corporate objectives and goals (Bartlett and Ghoshal, 1994), as creating shared value (Porter and Kramer, 2011), It permits the setting up of organizations that have a dual purpose, generating both social and economic value (Alter, 2007), To better understand this cluster, Lankoski and Smith (2018) offer a useful range of companies on the base of their objective, with a comprehensive classification on objective functions that goes beyond the dualism profit maximization/something different. In particular, the authors assemble the corporate possible objectives into five group, “based on the centrality of social welfare: (1) entirely absent from the objective function, (2) a process characteristic, (3) one of the end objectives, (4) the only end objective, adjusted by profit as a process characteristic, and (5) the only variable in the objective function” (p. 248), Among the third group, hybrid organizations allow their members to practice more of their internally held ideals and feel a common sense of organizational purpose (Gumusay et al., 2020),

- **Cluster 5: transformation, leadership, ethics**

The fifth cluster collects contributions based on the concept of transformational leadership and the role of leaders in defining corporate purpose. For instance, Craig and Snook (2014) argue that leaders’ most important role is to be executives of the organization’s purpose. Henderson (2021) confirms that transformational leaders have a powerful core set of ideological values: they are exceptional to balance social and financial responsibilities, catching new opportunities in the market thanks to an authentic corporate purpose. Kempster (2011) gives a comprehensive overview on how leadership and purpose are tied, since the fact that “leadership discourse could be framed as fulfilling a societal purpose in that it provides a connection beyond the organizational boundaries and is ‘good for collective human wellbeing” (p. 325),

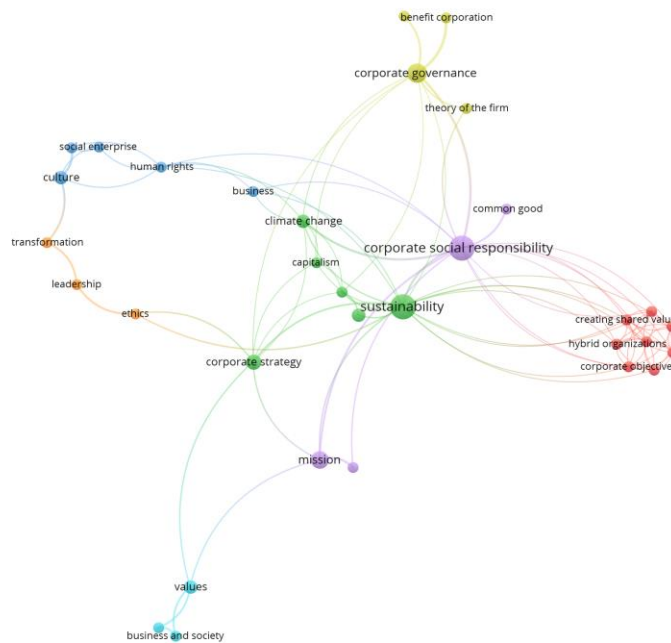

- **Cluster 6: social enterprise, culture, human rights, business**

The sixth cluster includes contributions that recognise that conceptualizing corporate purpose means building a common business culture. For instance, purpose has a particularly effective driving role in orienting sustainability behaviour of employee at work since it is an inspiring and collective call to ethical actions, rather than a generic guideline on how to behave (Bhattacharya et al., 2022),

- **Cluster 7: values, business and society**

The seventh cluster considers core values as drivers and intrinsic components of corporate purpose. For instance, Hollensbe et al. (2014) argue that, unless businesses have be seen more as ‘consumer of trust’ rather than ‘generator of trust’, values (i.e., dignity, solidarity, reciprocity) may help businesses to achieve purpose. Moreover, companies that have a strong set of core values and a fixed core purpose are more prompt to adapt in a changing world and to solve problems innovatively (Collins and Porras, 1996),

Avenues for Future Research

There is still need of research to be done in order to better understand the results of the literature and the practice actions that might be observed among companies in the market to formulate and realize corporate purpose. Both increased attention on the topic along time (Figure 1) and the top quoted journal “where” it is framed (Figure 2) represents relevant results for feeding reasons in dealing with research on corporate purpose. For guidance in future

research, Table 1 presents a series of questions that can be explored by both scholars and practitioners, starting from “what” are the critical leading related topics to which it is addressed (Figure 3),

Tab. 1: Future research directions on Corporate Purpose

<i>Cluster and Potential Frameworks</i>	<i>Keywords</i>	<i>Questions</i>
Cluster 1 <i>Humanistic Management</i> <i>Business ethics</i> <i>CSR</i>	<i>common good, corporate social responsibility, mission</i>	<i>What is degree of “fuzziness” among common good and corporate purpose? Does formalizing a clear and cascaded purpose make corporate social responsibility actions more effective?</i>
Cluster 2 <i>Strategy</i> <i>Sustainability</i> <i>Communication</i>	<i>climate change, capitalism, sustainability, corporate strategy</i>	<i>Does the presence of a corporate purpose that reflects a company’s commitment to sustainability (often branded as greenwashing) enhance trust with stakeholders? What are the consequences of purpose on corporate strategy?</i>
Cluster 3 <i>Governance</i> <i>Institutional isomorphism</i> <i>Public goods</i>	<i>benefit corporation, corporate governance, theory of the firm</i>	<i>What is the role of corporate governance, related to benefit corporations, in achieving social impacts? How to create the organizational structures and governance routines that can contribute to the social impact?</i>
Cluster 4 <i>Goal-setting</i> <i>Agency</i>	<i>creating shared value, hybrid organizations, corporate objectives</i>	<i>How does defining a clear corporate purpose influence short- and long-term goals in an organization? How to help managers in moving beyond traditional corporate social responsibility approach to a shared value one?</i>
Cluster 5 <i>Leadership</i> <i>Motivation</i>	<i>transformation, leadership, ethics</i>	<i>How purposeful leadership occurs in practice, promoting ethical practice inside and outside the organization? How do ethical motivation of leaders guide the formalization of purpose in firms?</i>
Cluster 6 <i>Information asymmetry</i> <i>Equity and Justice</i>	<i>social enterprise, culture, human rights, business</i>	<i>What are internal and external factors that affect the formation and the evolution of a common culture socially oriented in social enterprises? Can the presence of purpose in the organization accelerate the processes of work democratization?</i>
Cluster 7 <i>Values, norms and ethics</i> <i>Expectation</i> <i>Trust</i>	<i>values, business and society</i>	<i>How do individual values affect the formation of corporate purpose? What are the societal expectation and attitudes on corporate purpose?</i>

Research limitations. This study has some limitations, which open horizons for future research. First, it relies primarily on data retrieved from Scopus and Web of Science, so the limitations of databases may also apply to the study per se. In addition, bibliometric analysis involves technical decisions such as the selection of language and fields of inquiry, which may exclude relevant contributions to the analysis. Furthermore, the bibliometric approach provides an analysis that is eminently descriptive and may lack a content analysis to increase explanatory power and provide deeper analysis of results and implications.

Managerial implications. The conceptualization of corporate purpose is practitioners’ oriented. The “Statement on the Purpose of a Corporation” signed by US Business Roundtable (2019) and the report “Principles for Purposeful Business” published by The British Academy are examples of the current managerial debate on the future of business. Consequently, this research may help leaders to direct the definition and the action related to their companies’ purpose, taking into consideration the corporate features, strategy and values to which it is addressed.

Originality of the paper. The research contributes to management and business ethics literatures on the concept of corporate purpose. The keyword analysis is an effective method to identify hot issues and research frontiers on the topic and specially to map out the complexity of issues and declinations involving corporate purpose. The overall bibliometric analysis allows to provide insights into the state of the art of the concept of corporate purpose in the management field, by identifying when, where it is framed and what are key topics to which it refers.

Keywords: corporate purpose; bibliometric analysis; VOS viewer; business ethics; business in society

Allocazione di risorse, governance e risultati della cooperazione: coopetition versus cooperazione nell'industria del vino

ANNA MINÀ* CHRISTIAN LECHNER* LEONARDO CORBO*

Inquadramento della ricerca. Tradizionalmente, gli studi di strategia hanno identificato la competizione come la principale forma di interazione interimpresa che consente di ottenere, sia benefici strutturali a livello di settore o infra-settoriale (Porter, 1980), sia benefici in termini di maggiori risorse e competenze necessarie per perseguire vantaggi competitivi differenziali rispetto alle altre imprese rivali (Barney, 1991). Conseguentemente, gli studi di strategia hanno considerato la cooperazione interimpresa, sia implicitamente o esplicitamente, come una forma di collusione che indebolisce i benefici della concorrenza e, quindi, riduce il benessere economico (Hoffman et al., 2018). Anche se le imprese hanno riconosciuto un'utilità nella cooperazione interimpresa tesa al perseguimento di un obiettivo specifico, gli studi di strategia hanno principalmente considerato la competizione e la cooperazione quali modalità di interazione separate e indipendenti, e dunque, difficilmente conciliabili (Hoffmann et al., 2018: 3034).

Il crescente numero di imprese coinvolte in relazioni interimpresa - anche tra imprese rivali (Hamel, 1991; Brandenburger e Nalebuff, 2021) - ha portato all'attenzione degli studiosi il fenomeno della simultanea cooperazione e competizione, noto anche come coopetition (Hoffman et al., 2018). Seguendo questa prospettiva, le imprese dovrebbero imparare, non solo ad operare in un ambiente competitivo e ostile, ma anche a essere in grado di cooperare con altre imprese, incluso coloro che, per diversi aspetti, potrebbero essere concorrenti (Lorange e Roos, 1991: 25).

Le risorse e le capacità dei partner sono un "must-have" (Wagner et al., 2011: 30) per le quali le imprese considerano la scelta di avviare una strategia cooperativa. Segue come i partner rivali valutano la scelta di cooperare come un'opportunità per acquisire competenze e sviluppare conoscenze (Hoffmann et al., 2018), dove le tensioni legate all'opportunità dei rivali e all'interesse a ottenere benefici privati possono condizionare l'esito della stessa relazione interimpresa (cfr. Kale et al., 2000; Khanna et al., 1998).

Obiettivi. Al di là dei benefici derivanti dalla cooperazione tra imprese, anche in competizione tra loro, gli studi management sul tema della coopetition suggeriscono che la cooperazione con un rivale è molto più frequente della cooperazione con un partner o con impresa con cui non si sperimentano situazioni di rivalità (Minà e Dagnino, 2022). Tuttavia, nonostante la letteratura sia crescente sul tema, non sono ancora chiare le motivazioni che spingono le imprese a cooperare con i rivali (scelta cooperativa) oppure a cooperare con imprese non rivali (scelta puramente cooperativa).

Pertanto, si vuole indagare in che modo e a quali condizioni ciascuna di queste scelte di governance e di allocazione di risorse ad esse collegate, abbiano un effetto sui risultati della cooperazione.

Sulla base di tre casi di studio storici e longitudinali nel settore del vino, lo studio intende proporre un modello di confronto tra le modalità di governance cooperativa esclusiva e non esclusiva e modello di governance cooperativa in regioni vinicole rinomate e non rinomate in Italia.

Metodologia. La natura esplorativa della ricerca richiede un'analisi qualitativa tramite lo studio un caso studio (Yin, 2009). Conformemente a quanto già presente in letteratura sulle alleanze cooperative, (Gnyawali et al., 2008), questo studio muove dal metodo di ricerca à la Eisenhardt (1989, 2021) e sviluppa un caso polare delle cooperative nel settore vitivinicolo teso a comprendere le scelte di governance e di allocazione delle risorse in coopetition.

Tre motivazioni principali supportano la scelta metodologica. In primo luogo, il metodo dei casi consente di approfondire studi e ricerche che si trovano nelle fasi iniziali di indagine (Gibbert et al., 2008). In secondo luogo, il metodo dei casi studio è indicato per lo sviluppo di analisi longitudinali (Eisenhardt, 1989, 2021), in questo modo è possibile cogliere, sia lo sviluppo del fenomeno, sia i nessi causali, ad oggi non esplorati, che intercorrono fra essi. Questo aspetto è di particolare importanza per questa ricerca che esplora in che modo le scelte di cooperazione tra imprese rivali si sviluppano rispetto alla pura cooperazione. In terzo luogo, l'analisi qualitativa dei casi studio è preferibile quando le indagini sono collegate alle circostanze che si sviluppano simultaneamente un contesto di vita reale (Leonard-Barton, 1990) che rende difficile, sia definire chiaramente il legame tra il fenomeno e il contesto nel

email: leonardo.corbo@unibo.it

quale esso si manifesta e si sviluppa, sia isolare gli elementi del contesto che possono influenzare l'evoluzione del fenomeno oggetto di studio.

Nello specifico, lo studio muove da due casi polari: una cooperativa esclusiva e una cooperativa non esclusiva al fine di comprendere in che modo i soci decidono di conferire uva alla cooperativa e come le due modalità di governance incentivano i suoi soci a puntare al miglioramento continuo della qualità delle proprie risorse (specificatamente uva). La raccolta dei dati dei due casi studio è avvenuta tramite interviste ai soci delle cooperative e ai consigli di amministrazione delle cooperative. Questa prima ondata di interviste ha sottolineato il rilievo del territorio e il ruolo che la reputation della regione vinicola gioca nella percezione dei consumatori. Segue come la scelta delle forme di governance richiede un secondo livello di analisi dei casi di studio condotta attraverso una seconda tornata di interviste. Poiché la prima ondata consisteva nel confronto di una cooperativa esclusiva con una cooperativa non esclusiva, entrambe provenienti da regioni rinomate, la seconda ondata consiste nel confronto della cooperativa non esclusiva della rinomata regione vinicola (con ulteriori interviste) con un'altra cooperativa non esclusiva di una regione vinicola meno conosciuta.

Risultati. Studi sulla cooperazione adottano una visione relativamente favorevole dei benefici sottesi alla strategia cooperativa secondo cui la condivisione delle risorse ad opera delle imprese che collaborano genera vantaggi reciproci per tutti i partner coinvolti nella relazione (Lechner et al., 2019). Lo studio in parola intende sfidare questa posizione predominante in letteratura suggerendo che il bias di avversione alla perdita che può emergere nelle collaborazioni orientate all'opportunità può indurre i partner a comportamenti cooperativi meno vantaggiosi (Kahneman e Tversky, 1979; Kahneman e Tversky, 1992).

L'analisi dei casi oggetto di studio suggerisce che, rispetto alla pura cooperazione, la coesistenza ha un esito nettamente negativo sull'esito collaborativo. Nelle cooperative non esclusive, i soci tendono a conservare l'uva della migliore qualità per produrre il proprio vino mentre danno l'uva di qualità inferiore alla cooperativa. Sebbene questo comportamento non possa essere ricollegato a imbrogli o violazioni contrattuali in senso di costo di transazione (Williamson 1975, 1979), suggerisce che la realizzazione di benefici privati prevale sullo sviluppo di benefici comuni.

Al fine di evitare che i risultati potrebbero essere distorti poiché i casi studiati provengono da regioni considerate di alta qualità per la vinificazione e quindi i produttori di vino possono già beneficiare di vantaggi comuni che non richiedono sforzi di collaborazione, lo studio prevede il confronto tra il caso della cooperativa non esclusiva di una rinomata regione vinicola con una cooperativa non esclusiva di una meno rinomata regione vinicola. In questo modo è possibile comprendere se il contesto condiziona il comportamento dei soci delle cooperative vitivinicole. L'analisi qualitativa delle interviste condotte durante le due ondate di studio consente di evidenziare che non necessariamente la cooperazione è preferibile alla pura cooperazione e vice versa. Fattori contestuali o di opportunità/necessità sottesa alla cooperazione consentono di chiarire la scelta tra le due governance mode.

Questo studio si propone di fornire tre principali contributi teorici. In primo luogo, il lavoro intende estendere la teoria esistente sulle relazioni interimpresa introducendo la teoria dell'avversione alla perdita alla situazione della cooperazione e al modo in cui questo pregiudizio influenza l'allocazione delle risorse. In secondo luogo, il lavoro consente di approfondire se il valore esogeno di una risorsa detenuta da un'impresa condiziona il grado di cooperazione tra le imprese rivali. Di fatti, gli studi sulla cooperazione largamente ignorano il valore della risorsa e che ruolo gioca nella parte cooperativa della relazione cooperativa. In terzo luogo, la considerazione congiunta dei primi due contributi favorisce una comprensione più dettagliata delle motivazioni sottese scelta di una strategia cooperativa. In questa prospettiva, l'articolo fornisce ulteriori spunti che estendono gli studi attuali sulle teorie della cooperazione.

Limiti della ricerca. Questa ricerca si basa su tre casi di studio qualitativo nel settore vitivinicolo, dunque, l'estendibilità dei risultati appare, in prima essere limitata. In tale prospettiva, la specificità del tipo di risorse coinvolte nelle relazioni tra aziende vitivinicole potrebbe generare comportamenti e scelte strategiche diverse in ambiti ad esempio fortemente tecnologici. In secondo luogo, i rapporti di cooperazione esplorati in questo studio si focalizzano su un tipo particolare di relazione basato sulla membership, in questo caso le cooperative. Benché potenzialmente le dinamiche membership-based si estendono a diversi settori (si pensi al cibo piuttosto che al commercio più in generale), è possibile che le scelte di governance identificate in questo studio non siano esplorabili in settori lontani da logiche simili a quelle delle cooperative.

Implicazioni teoriche e pratiche. Nonostante queste limitazioni, le implicazioni sottese allo studio sono estendibili oltre i confini del contesto analizzato. L'inquadramento teorico che intende esplorare le decisioni di allocazione delle risorse sotto diverse modalità di governance interimpresa apre ad implicazioni sulle scelte di governance e di modalità gestionali sull'allocazione delle risorse. In particolare, il lavoro esamina come i membri prendono decisioni sull'allocazione di risorse simili che differiscono per il loro livello di qualità e complementarità con le altre risorse da combinare. Le opzioni sono: uso proprietario o uso collaborativo e queste opzioni sono condizionate dalla modalità di governance. Questa impostazione è tipica di altri fenomeni rilevanti sia a livello pubblico che privato, istituzionale. Si considerino, a titolo di esempio, i differenti regimi di proprietà intellettuale che disciplinano le invenzioni universitarie. Nei paesi nei quali è ammesso il 'professor privilege' la proprietà intellettuale è riconosciuta, in primo luogo, al professore e successivamente all'istituzione. In questo contesto, i ricercatori possono decidere - ogni volta che viene realizzata un'invenzione - se sfruttare in proprio lo specifico brevetto o concederlo al patent pool di ateneo (Martinez e Sterzi, 2021). I meccanismi di governance appropriati sono quindi rilevanti e ci sono prove aneddotiche di università europee che hanno sciolto i loro pool di brevetti sotto il regime di privilegio dei professori. A livello micro, la decisione di allocazione può essere applicata anche alle alleanze di R&S tra concorrenti. Sebbene le questioni di governance siano state affrontate in letteratura (Walter et al., 2015), una questione che non è stata studiata in modo specifico

riguarda la modalità di allocazione delle risorse (star scientists vs. ricercatori junior). Pertanto, la ricerca è solo un primo passo di una questione rilevante per le relazioni cooperative in cui le decisioni di allocazione delle risorse vengono prese in forme differenti di governance.

Originalità del lavoro. La letteratura esistente muove dall'idea che, attraverso la coopetition, imprese concorrenti condividono risorse di valore, capaci di generare sia benefici comuni sia benefici privati (Gnyawali e Madhavan 2001). Le risorse sono di valore se consentono alle imprese di cogliere opportunità o di difendersi dalle minacce provenienti dal contesto competitivo (Barney, 1991). La condivisione di risorse di valore può avere fundamentalmente due scopi per generare benefici comuni: sfruttare opportunità comuni o difendersi da minacce comuni. Ad esempio, da un lato, nel settore vitivinicolo, i produttori di vino australiani hanno sviluppato delle alleanze per fronteggiare insieme le sfide sottese alle minacce dovute al cambiamento climatico (Crick, 2018). Dall'altro lato, lo sviluppo di etichette regionali come forma di cooperazione impatta sulla vendita di vino dei singoli produttori e crea benefici per quest'ultimi che possono, dunque, sfruttare un'opportunità condivisa con altri produttori (Bruwer e Johnson, 2010).

Tuttavia, la letteratura esistente sulla coopetition non affronta la distinzione tra i questi motivi degli sforzi collaborativi e come potrebbero condizionare le decisioni di allocazione delle risorse delle imprese coinvolte. Secondo la teoria del bias di avversione alla perdita (Kahneman e Tversky, 1979; Kahneman e Tversky, 1992), gli individui sono molto più motivati all'azione per paura di subire perdite e per i benefici potenziali che ne possono derivare. Se si applica questa teoria agli studi sulla cooperazione, si potrebbe desumere che, i partner di una collaborazione interimpresa siano più motivati a contribuire a collaborazioni che hanno come oggetto condiviso quello di affrontare minacce comuni piuttosto che l'obiettivo di sfruttare opportunità comuni. Muovendo da queste premesse, non risulta chiaro in che modo le imprese prendano decisioni in merito all'allocazione delle risorse laddove la motivazione principale sottesa alla cooperazione sia quella di cogliere un'opportunità comune. Nel contesto oggetto di indagine, i produttori di vino devono decidere come allocare risorse simili e complementari (uva) per scopi propri (produrre il proprio vino) o comuni (cedendo uva alla cooperativa). La domanda non considera solo la quantità, ma anche la qualità delle risorse da destinare.

Questo lavoro sostiene che queste decisioni poste in essere delle imprese partner siano condizionate, sia dal contesto, sia dai meccanismi di governance. Il contesto può essere caratterizzato dalla notorietà della regione dove risiedono i viticoltori e la cooperativa. I meccanismi di governance sono le regole che definiscono come i soci devono allocare le risorse alla cooperativa. La modalità di governance di più alto livello della cooperativa porta a due forme di governance: cooperative esclusive e cooperative non esclusive. Nella cooperativa non esclusiva, i produttori di vino possono destinare parte della loro produzione di uva alla cooperativa e parte alla produzione del proprio vino. In questo caso, la cooperativa stabiliva solitamente importi minimi per i soci. Questa modalità di governance porta a una situazione di coopetizione. In regime di cooperazione esclusiva, i soci sono tenuti a conferire alla cooperativa tutte le loro uve (ovvero eliminazione della concorrenza e pura collaborazione). Segue la domanda di ricerca: in che modo le modalità di governance e le decisioni di allocazione delle risorse condizionano la realizzazione di benefici condivisi?

Parole chiave: cooperazione; coopetizione, settore vitivinicolo, cooperative, governance

How Exogenous Shocks Affect the Evolution of Public-Private Partnerships for R&I: An Analysis of EU R&I Collaborative Healthcare Projects

GABRIELLA LEVANTI* JELENA MAZAJ*
ARABELLA MOCCIARO LI DESTRI^ MICHELE TUMMINELLO**

Framing of the research. *Management literature on innovation processes widely acknowledges the critical role of collaboration among a variety of heterogeneous actors to improve the performance of innovative processes (Ahuja, 2020; Balland, Boschma, and Ravet, 2019; Dagnino et al., 2015; Freeman, 1991; Pelacho et al., 2020; Powell et al., 2005; Schilling and Phelps, 2007). At the same time, it is acknowledged that innovation processes are often triggered by exogenous shocks that create new opportunities for business and society (Mention, Ferreira, and Torkkeli, 2020; Ucaktürk, Bekmezci, and Ucaktürk, 2011). Exogeneous shocks, such as financial crises, natural disasters, accidents, plague outbreaks, and so on, push firms and institutions to generate innovative solutions, reflect on process improvement, as well as implement learning processes in order to cope with the adverse consequences they generate) and reduce their economic and social impact. In addition, coping with the multi-faceted interdependent challenges engendered by shocks is usually extremely resource and effort demanding. This situation increases the need to collaborate among private and public organizations and institutions to put together the required resources and capabilities, accelerate the discovery of ad hoc innovative solutions, share the risk, and minimize costs.*

The formation of public-private partnerships (PPPs) for R&I is seen as an effective and efficient option to foster and manage cooperation between public and private organizations that aim to address the challenges originated by exogenous shocks (Burnett, 1998; Pauchant and Mitroff, 1994). These multi-member partnerships are based on the awareness that some challenges necessitate the potential of actors' heterogeneity and diversity of capabilities interaction and complex organizational structures to handle and overcome emerging issues. These forms of partnerships may include alliances, contractual and cooperative agreements, collaborative activities, and other collaboration forms for R&I activity (Hodge and Greve, 2007), as well as sustainable social and economic development (Brown, 1991). The PPPs combine the strengths of private actors (innovation potential, technical skills, and knowledge) and the power of public actors (social responsibility, local knowledge, and skills) (Roehrich, Lewis, and George, 2014). In particular, the potential of PPPs is based on their capacity to: (i) provide effective instruments to develop innovative solutions for global challenges; (ii) re-think business processes with key stakeholders, and give voice to informal actors.

The potential of PPPs is particularly relevant in the healthcare sector (De Vruueh, de Vliieger, and Crommelin. 2019; Kostyaney et al., 2016; Nikolic and Maikiskch, 2006). The healthcare sector is characterized by high social relevance and impact of the long-term provision of publicly beneficial services. The pharmaceutical part of this industry is usually marked by extraordinarily high R&D expenditures, extended timelines for new product development, increased marketing costs, and very high profits (Bierly and Coombs, 2004). In a healthcare crisis setting such as a pandemic, the PPPs may: (i) address the financial and risk aspects connected with the challenges posed by the crisis (Casady and Baxter, 2020; De Vruuej et al., 2019); (ii) support flexibility in management and efficiency in supply chains (De Vruuej et al., 2019); and (iii) maintain more effective information exchange between actors (Casady and Baxter, 2020). Katz et al. (2018) point out that the PPPs' potential is rooted in their capabilities to: a) build trust (Bierly and Coombs, 2004; Bstieler, 2006; Mention et al., 2020) and lines of communication; b) recognize unique resources and skills and include the actors that control or own these resources and skills in the partnership; c) smooth knowledge integration through established networks protocols, and information sharing infrastructure.

Although extant literature recognizes the critical role of the PPPs as an inter-organizational structure to face crises, especially in the healthcare sector. Still, no single formula exists for successful cooperation and the division of responsibilities between partners. Further research is needed to depict a comprehensive framework regarding this phenomenon, aimed to answer the following questions, partly promoted by Hodge and Greve (2007): What can be learned from the history of these partnerships, what is new about their origins, structures, dynamics, and performance? How do exogenous shocks affect the evolution of PPPs for R&I?

Purpose of the paper. The paper seeks to answer the previous research questions by applying concepts developed in the literature that scrutinize the dynamics of complex network formation and evolution (Miller and Page, 2007, Newman, Watts, and Barabási 2013), as well as the specific role of systemic exogenous shocks in affecting these dynamics.

Several studies highlighted that internal and external shocks might engender radical transformation in social structure and inter-organizational networks (Corbo, Corrado, and Ferriani, 2016) and may determine path dependence in the underlying processes (Page, 2006). Accordingly, it is critical to distinguish between endogenous and exogenous shocks¹ in order to scrutinize the functioning of complex networks and how diverse organizations self-organize versus external factors (Sornette et al., 2004). Widmaier, Blyth, and Seabrooke (2007) state that an exogenous shock creates shifts in both the economic structures and the distribution of capabilities, and questions the “roles of agency, uncertainty, and ideas in advancing change” (Widmaier et al., 2007, p. 748). An exogenous shock may modify a complex network structure by impacting the rules of affiliation and of tie formation (Powell et al., 2005). Gulati and Gargiulo (1999) and Madhavan, Koka, and Prescott (1998), Corbo, Corrado, and Ferriani (2016) underline that external crises may foster network reproduction and open new paths for transformation. Moreover, these authors state that an external shock engenders a blended logic of tie creation and stimulates the clustering tendency of a network. Also, Sornette et al. (2004) underline that a shock may lead to a similar power-law within a system. Independently from the specific way change is considered, it is critical to understand that crises offer opportunities for change by allowing social agents to explain events and encourage innovation, particularly at the policy level (Widmaier et al., 2007). Liebowitz and Margolis (1995) underline that external shocks may force unknown parameters, shaping a path-dependent logic between actors. Thus “some initial endowment alone could never tell us very much about the eventual path of real economies over time (Liebowitz and Margolis, 1995, p. 223)”. Finally, an exogenous shock creates acceleration processes in national and international collaboration regarding the uptake of innovation, product design, and new business models (Swaites et al., 2020).

To examine the impact of external shocks on the evolution of a specific type of collaborative inter-organizational network (i.e., the PPPs for R&I), we concentrate on EU R&I collaborative healthcare projects and investigate the history dependencies within them and how an exogenous shock, such as COVID-19, fosters the evolution of the complex R&I networks. Specifically, the study’s empirical setting focuses on the R&I networks associated with the healthcare sector, which were funded by the EU’s two most recent R&I framework programs: the EU 7th Framework Program (FP7) and the EU 8th Framework Program, known as Horizon 2020 (H2020). In these framework programs, the EU acts as a public actor, favoring and spurring cooperation between heterogeneous knowledge actors (i.e., private for-profit companies such as pharmaceutical firms and SMEs, higher educational institutions, public institutions, research organizations, non-governmental organizations, and so on) aiming to boost innovations supported by various policy actions. In addition, among the collaborative health projects of H2020, we identify and analyze the COVID-19 calls, to point out the differences that characterize the formation and evolution of these specific projects.

Methodology. The data relating to the two R&I networks linked to the healthcare sector in the FP7 and H2020, as well as the partners belonging to them, is downloaded from the CORDIS - Community Research and Development Information Service - website in July 2020. This portal is an open-access repository to communicate and disseminate information on EU-funded research projects and their results. In total, data of 2087 EU-funded projects are involved in this study. The size of the partnership (network), funding period, and duration varied in terms of the calls. The FP7 group includes 1004 projects developed in the period 2008-2021 with an average duration of 47 months (min. 11 - max. 104) and 3629 actors involved. The H2020 group encompasses 1044 projects, and the covered period is 2014 - 2026, with an average duration of 36 months (min. 1 - max. 101). The group of EU R&I COVID-19 calls of the H2020 originates from the sum of: (i) the H2020 COVID-19 projects, this sub-group includes 33 projects covered by the period: 2020 - 2025, with the average duration of 25 months (min. 11 - max. 59), and involved 271 organizations; and (ii) the Innovative Medicines Initiative (IMI2) projects, this sub-group encompasses 6 projects, the covered period is 2020 - 2025 with an average duration of 32 months (min. 14 - max. 59), and 67 organizations are involved. Accordingly, we were able to analyze two types of network evolution: (a) history dependencies between the actors of the FP7 healthcare and H2020 healthcare projects; and (b) history dependencies between the actors of the H2020 healthcare projects and specific EU R&I COVID calls.

Network analysis, as a multidisciplinary research approach (Barabási et al., 2002; Newman, 2001, Tumminello et al., 2010), was chosen to scrutinize the dataset previously described due to its efficiency in the representation of social structures and the contextualization of the behavior of actors involved in the selected projects/communities. An in-depth analysis of the projects helps us to understand if, under an emergency state, organizations are more likely to create a

¹ “Exogenous peaks occur abruptly and are followed by a power-law relaxation, while endogenous sales peaks occur after a progressively accelerating power-law growth followed by an approximately symmetrical power-law relaxation which is slower than for exogenous peaks” (Sornette et al., 2004, p. 228701-1).

link based on past experiences, trust, reputation, resource specialization, or other factors that significantly impact the establishment of links between two (or more) organizations. More in detail, we first provide an overview of R&I partnerships by looking at the system as a bipartite network of institutions and projects, in which a link is set between an institution and a project if the institution participated in the project (Asratian, Denley and Haggkvist, 1998; Tumminello et al., 2011). This part of the study concentrates on evaluating institutional overlap between single projects, intending to study cooperation patterns and the lock-in phenomenon. After listing all single partners in the mentioned EU-funded projects, we construct a table with institutional overlaps that enables us to scrutinize the persistence of partnership composition across programs (i.e., between FP7 healthcare projects and H2020 healthcare projects, and between H2020 healthcare projects and the specific COVID-19 healthcare projects in H2020). We concentrate the analysis on the number of persistent project-partners across two programs. Accordingly, our interest focused on projects with a minimum of 2 actors. Indeed, projects with only one actor do not provide information about cooperation evolution. Instead, they indicate an actor's participation in multiple EU framework programs. To deepen our understanding of the process of partnership formation, we perform community detection and evaluate the modularity (Newman, 2001) associated with the determined partitions of both R&I networks. The modularity of network structure weighs the internal strength of the division of a network into communities with respect to inter-community connectivity.

In addition, following Tumminello et al. (2011), we scrutinize three specific COVID-19 projects to better understand the network's evolution by means of the identification of the attributes shared by the actors belonging to the same community.

Results. Our preliminary results indicate that the EU R&I healthcare projects show two typical patterns of aggregation under an exogenous shock: (i) strong lock-in effects; and (ii) highly innovative partnerships. The conducted analysis demonstrates that even under exogenous changes, some partnerships in the EU R&I healthcare networks, even large ones, persist over time. Comparing the partnerships of the 997 FP7 projects with at least two partners and the ones of the 684 H2020 projects with at least two partners, we observe that 22,535 partnership intersections include at least two institutions. On the other hand, 596 partnership intersections with at least two partners resulted from the comparison of the 684 H2020 projects with at least two partners and the 39 specific COVID-19 healthcare projects involving at least two partners. Accordingly, strong lock-in effects across programs exist, particularly in the verge between FP7 and H2020. This favors the network's stability and conservative behavior of actors in healthcare R&I projects. In our understanding, such behavior is firmly linked to characteristics such as trust, specialization, infrastructure endowment, professional links, and other resources owned by the actors, that induce the sector's traditional actors to group together to form (reliable) clusters of excellence. Additionally, more extreme cases are visible in different frames: network openness to new cooperation in the specific COVID-19 calls and strong lock-in in the H2020 program, representing a systems' path dependence. However, milder lock-in effects are also apparent among COVID-19 initiatives. Such path dependence is based, partly, on IMI clusters. This can be evaluated positively, as the IMI initiative can be positioned as a collaboration incentive towards more robust link creation between healthcare companies, previously competitors and now partners, and direct stakeholders, such as patient groups.

At the same time, the list of actors participating in the EU framework programs is changing remarkably. As expected, the strong mobilization of the classical EU healthcare actors has been observed. However, partnerships among them tended to change with respect to previous programs as forced by urgency. More generally, it appears that the COVID-19 response demanded such expertise, facilities, and means that the paradigms of mutual trust and adaptation, as incentives to re-propose already tested collaborations, deteriorated in favor of other paradigms' fitness, reputation, and selection (of the fittest). The mentioned classical actors represented by the solid geographical clusters within the EU do not leave leading positions in the sector. During COVID-19, they are more open to closer and faster cooperation than ever. However, they do not appear in the same collaborations as before. Moreover, the performed analysis demonstrates a worldwide openness to finding common innovative solutions for the outbreak, mobilizing resources for welfare purposes, and scale-up medical capacity for treatment and testing. Indeed, the United States of America, China, and Canada demonstrated significant involvement in the COVID-19 calls. Their participation in the EU calls indicates the tendency to collaboratively respond to an exogenous shock, reducing competition and increasing the trust among the partners through lock-in at the local and global levels.

The analysis of the three most significant COVID-19 initiatives demonstrates a strong dependence on the overall R&I network. The newly created COVID-19 partnerships can be understood as a knowledge selection from the previous collaboration of the H2020 communities. Unlike what happened in previous programs, the leading positions are taken by private (for-profit) companies. Almost in all cases, the participation of these companies in the COVID-19 R&I actions is based on their own funds, without EU contribution. This result may be due to the perception that such an unprecedented global mobilization of governments and institutions may lower the risk of investing in basic research. Having specific knowledge and infrastructure that permits them to take part in these actions, the private companies accept high R&D expenditures, knowing that a winning result can guarantee their financial sustainability for decades (Bierly and Joseph, 2004).

Finally, it was noticed that under urgency conditions policymakers demonstrate flexibility and adaptability of the funding rules to solutions for a global pandemic response. The COVID-19 projects are characterized by a shorter evaluation period, an increased mobilization of both private and public funds, a proactive start of the actions, and a shorter life span of the proposals.

Research limitations. *The study has several limitations. The first limitation is linked to the construction of the dataset. The data on non-funded projects is not presented in the dataset, as this information is not accessible to third parties due to the EU data protection law. Such information would undoubtedly allow a better representation of the healthcare R&I network formation and its evolution; as well as it would clarify the role of other “worldwide big innovators”, like the Russian Federation, which does not appear in the COVID-19 dataset. The second limitation is linked to the research method applied. In this work, no qualitative approach was used. We believe that panel interviews with the coordinators of the proposals (both funded and not funded) would enrich scholars’ understanding of the project formation logic and collect tacit knowledge regarding R&I networks’ evolution. This would support the systemization of research knowledge on the role of informal mechanisms (such as trust) followed by network actors. To conclude, we should recognize that the scope of the present research does not overcome the specific EU-funded healthcare R&I field considered. Accordingly, future studies are needed to validate the current results when considering different frameworks.*

Managerial implications. *In the past, the healthcare sector was described by long innovation processes, testing, and standardization procedures (Bierly and Coombs, 2004). Today, we can state that the pandemic has changed such dynamics. New partnerships and business models are under development, potentially bringing forth specific knowledge on innovation development, supporting the fight against the pandemic, and reformulating the working framework in the healthcare sector (Swaithe et al., 2020). As an R&I policy tool, the PPPs should demonstrate capacities and potential for innovation to overcome socioeconomic crises that appeared due to various external conditions. These external shocks call for a mobilization of knowledge, resources, and skills belonging to heterogeneous actors to develop the products and services that are necessary to tackle the challenges that originated from the shocks.*

From the managerial point of view, understanding the PPP potential and the different logic underlying partnership formation under the pressure of an exogenous shock may support firms, especially SMEs, in selecting and managing the “right” collaboration opportunity. This knowledge supports firms in the creation of new inter-organizational paths to strategic partners and key stakeholders that enable the development of new product and service offerings. At the same time, firms became aware of the need to balance the innovation potential of collaboration activities and risk-sharing with “old” or totally “new” partners.

This work has implications also for policymakers. The EU R&I framework programs are powerful instruments to support new policy directions (for example, Sustainable Development Goals), especially in situations of crises. The study underlines the need for simplified and fast procedures to guarantee the creation of collaborations to achieve specific goals. It also shows that balancing “classical” actors, “middle-class innovators,” and newcomers is essential to develop sustainable innovation. This balance can be stimulated by applying updates to the R&I projects’ selection criteria, for example, based on the blind review of the proposals.

Originality of the paper. *The path dependence literature in social studies is based on mathematical literature of nonlinear dynamic models, also known as chaos or complexity models, for which a key finding is “sensitive dependence on initial conditions ...and with an outcome a property of lock-in by historical events” (Liebowitz and Margolis, 1995, p. 206). Some specific research fields point out that, for example, “path dependence arises specifically because of powerful network effects and high switching costs” (Aghion et al., 2019). According to them, the economic theory proposes that a pathway will be selected depending on the innovation process’s initial conditions. Vergne and Durand (2010) underline that path dependence provides information but does not predict causes of continuous persistence in organizational capabilities. Furthermore, recent research on network formation in R&D found that endogenous factors predominate over exogenous mechanisms in the formation of networks (Tomasello et al., 2014).*

To the best of our knowledge, management research has not yet provided an in-depth empirical analysis of the contribution of inter-organizational history dependencies under exogenous shock. Our study provides such an enrichment. Additionally, the words of Foss (2020) support our empirical and theoretical contribution. The author states that the “pandemic presents not only a unique test-bed for examining existing principles of organizational design but might also stimulate new theory related to the temporal dimension of organization design and the influence of path-dependence” (Foss, 2020, p. 270).

L'investimento in *corporate heritage* delle imprese familiari

GIORGIA MARIA D'ALLURA* FABIO QUARATO• GIOVANNI BATTISTA DAGNINO▲
ELISABETTA MERLO** MARIO PERUGINI**

Obiettivi. *Le imprese familiari si distinguono per la presenza della famiglia nella proprietà e nel management. L'ingresso di tale presenza resta l'obiettivo degli studiosi di family business che, attraverso l'uso di approccio teorici di natura neoclassica come l'agency theory e le successive estensioni come upper echelons e stewardship theory, e quelli riferibili agli studi di strategic management come la teoria delle risorse, hanno come obiettivi corroborare la relazione esistente tra proprietà e comportamenti strategici. L'obiettivo consiste nell'individuazione degli antecedenti ascrivibili alla famiglia in grado di spiegare i risultati delle imprese familiari. In questo percorso di studi, Gómez-Mejía, Haynes, Nuñez-Nickel, Jacobson, e Moyano-Fuentes (2007) hanno contribuito definendo il concetto di "utilità non economica" che la famiglia riceve dal possesso e gestione dell'attività imprenditoriale. Tale teorizzazione è nota come Socioemotional Wealth (SEW). L'idea fondativa è che le famiglie hanno l'obiettivo di preservare o incrementare il loro ritorno socio emotivo dalla gestione dell'impresa, tralasciando gli obiettivi di massimizzare i loro ritorni finanziari (Gómez-Mejía, Cruz, Berrone, and DeCastro, 2011). In aggiunta a questa proposta, Miller and Le Breton-Miller (2014) avanzano l'ipotesi che occorre distinguere fra famiglie con "restricted" SEW e famiglie con "extended" SEW. Nel caso di famiglie con una "restricted" SEW, gli stakeholder principali sono esclusivamente i componenti della famiglia e l'impresa presenta obiettivi di breve termine. Famiglie con una "restricted" SEW hanno, ad esempio, come priorità di garantire un lavoro permanente a tutti component della famiglia e di avere accesso diretto alle risorse dell'impresa. Al contrario, le famiglie con un "estende" SEW sono intrinsecamente motivate dal desiderio di costruire e sviluppare il successo delle generazioni successive e hanno principalmente un orientamento di lungo termine. A nostra conoscenza, non vi sono studi che abbiano cercato di collegare la visione della SEW agli investimenti delle imprese familiari in corporate heritage. Pertanto, ci si chiede: qual è il legame tra il coinvolgimento delle famiglie nella governance dell'impresa e gli investimenti delle imprese familiari in corporate heritage?*

In questo lavoro, adottiamo la "extended" SEW. Inoltre, consideriamo che, nel contesto delle imprese familiari, un concetto rilevante sta emergendo ultimamente come asset strategico: quello di corporate heritage. La corporate heritage si riferisce essenzialmente ai "tratti e agli aspetti di un'organizzazione che collegano il suo passato, il suo presente e il suo futuro in modo significativo e rilevante" (Burghausen e Balmer, 2014). Consideriamo questi tratti della corporate heritage quali asset strategici delle imprese familiari che, a seconda del diverso coinvolgimento della famiglia nella proprietà, nella governance e nella gestione dell'impresa, presentano condizioni favorevoli per generare e diffondere un "brand di famiglia". Il brand di famiglia può a sua volta contribuire a sviluppare capitale sociale delle imprese (Dyer, 2006). In questo studio si sviluppa la "extended" SEW in quanto crediamo che l'importanza degli obiettivi non economici o delle motivazioni incentrate sulle necessità della famiglia (ad esempio, Beckhard e Dyer, 1983; Newbert e Craig, 2017) siano direttamente riconducibili alla presenza di un amministratore delegato familiare o non familiare e alla composizione dei consigli di amministrazione delle imprese familiari (D'Allura, 2019).

Il contributo di questo lavoro è triplice. In primo luogo, esso è una delle prime indagini con un focus specifico che fa progredire la letteratura sulla corporate heritage, mostrando i forti legami con il coinvolgimento della famiglia all'interno delle aziende familiari. In particolare, si evidenzia che le imprese utilizzano strategicamente il passato (Wadhvani e Bucheli, 2014) e la loro storia (Argyres et al., 2020) o la loro corporate heritage per poter preservare la loro brand identity e rafforzare la loro legittimità nei confronti di clienti e partner. Tale approfondimento sulla corporate heritage diviene particolarmente importante per le imprese familiari che hanno la necessità di perpetuare i propri valori da una generazione all'altra, mantenendo al contempo flessibilità per essere in grado di adattarsi nel tempo e di essere adattabili sul mercato (Sasaki et al., 2020).

In secondo luogo, questo studio fornisce una misura della corporate heritage utilizzando un indice composito, considerando molteplici variabili che ne racchiudono le componenti chiave (cfr. Burghausen e Balmer, 2014); ovvero, l'indice di "corporate heritage". Questo indice funge da variabile dipendente nella parte quantitativa della ricerca.

Infine, lo studio adotta un approccio metodologico quali-quantitativo originale nella ricerca sulle imprese familiari ("mixed method"). L'utilizzo di un approccio misto o ibrido sembra vantaggioso in tale contesto poiché l'uso di metodi quantitativi e qualitativi integrati può consentire una comprensione più raffinata dei problemi di ricerca e dei fenomeni complessi (Creswell e Plano Clark, 2011), permettendo di combinare metodi di processo e metodi statici in un unico studio. Questa condizione è confermata dagli studi sulla corporate heritage nelle imprese familiari. Nello specifico, l'indagine è stata condotta sul settore della moda in Italia.

Metodologia. Per convalidare il nostro quadro di riferimento, abbiamo svolto sia analisi quantitative che qualitative sui dati delle aziende appartenenti al settore della moda. Abbiamo scelto di utilizzare un approccio di ricerca con metodi misti. La ricerca con "mixed method" è "l'uso combinato di metodi quantitativi e qualitativi all'interno di un singolo studio" (Molina-Azorin, 2016). Questo tipo di ricerca è cresciuto rapidamente nell'ultimo decennio sia nelle ricerche di strategic management (Molina-Azorin, 2011; 2016) sia di family business (Micelotta et al., 2020). Come riportano Evert et al. (2016) nella loro review di 465 articoli empirici su temi legati alle imprese familiari pubblicati tra il 1988 e il 2014, il 7,75% del campione totale, ovvero 36 articoli, sono stati classificati come contributi che hanno adottato "mixed methods".

Quattro ragioni fondamentali hanno spinto a scegliere questo tipo di strategia di ricerca: a) l'uso sapiente di un approccio combinato di tecniche quantitative e qualitative può consentire una comprensione più raffinata dei problemi di ricerca e fenomeni complessi piuttosto che l'uso di un approccio puramente quantitativo o qualitativo (Creswell e Plano Clark, 2011). Questa condizione è confermata nel caso del presente lavoro che studia la corporate heritage nelle imprese familiari. Infatti, questo fenomeno complesso (la corporate heritage) ha ricevuto attenzione soltanto di superficie nell'ambito della letteratura sulle imprese familiari; b) la facilitazione dell'integrazione delle caratteristiche statiche e di processo. Se la ricerca quantitativa esamina principalmente le caratteristiche statiche e le regolarità di un fenomeno, la ricerca qualitativa si concentra maggiormente sugli aspetti di processo (Bryman e Bell, 2007).

Questa condizione è corroborata altresì nel contesto di questo studio poiché, utilizzando una strategia di ricerca ibrida, siamo in grado di combinare caratteristiche statiche e di processo nello studio della relazione tra patrimonio aziendale e imprese familiari, abbinando i risultati empirici di un'ampia banca dati con lo studio diretto e approfondito di due casi dell'industria della moda. Infine, c) i due metodi possono essere combinati in modo produttivo nei casi in cui l'obiettivo è di migliorare la validità di nuove misure attraverso la triangolazione e/o di generare la comprensione dei meccanismi alla base dei risultati quantitativi in un territorio almeno parzialmente nuovo (Edmondson e McManus, 2007). In questo caso, infatti, utilizziamo una nuova misura di corporate heritage applicata al contesto delle imprese familiari (il Corporate Heritage Index, riportato di seguito).

Infine, il team di ricerca che ha progettato e realizzato il presente lavoro è composto da un numero equilibrato di studiosi che hanno sviluppato nel tempo una varietà di capacità di ricerca, ottenendo una formazione metodologica approfondita nella ricerca qualitativa, quantitativa e/o con metodi misti. Questa molteplicità dei background ricerca si rivela particolarmente utile e proficua allorché si tratta di condurre un'indagine con metodi misti. Inoltre, abbiamo osservato che i risultati della letteratura mostrano che gli articoli che adottano "mixed methods" tendono a ricevere in media più citazioni rispetto alle ricerche monometriche (Molina-Azorin, 2012). In effetti, la media delle citazioni ricevute per ogni anno e la somma cumulativa delle citazioni sono entrambe più alte per gli articoli che riportano studi che utilizzano metodi misti piuttosto che per gli studi un unico metodo (Molina-Azorin, 2016).

In questo studio, abbiamo deciso di iniziare presentando e analizzando i dati quantitativi (vedi Tab. 1), per poi passare a quelli qualitativi. Il nostro intento è innanzitutto di testare le variabili con un campione ampio e successivamente di approfondirle con l'indagine di due casi studio nella fase qualitativa (Molina-Azorin, 2016). Inoltre, seguendo le indicazioni di Morse (1991), abbiamo scelto di non selezionare un metodo dominante, ma di assegnare la stessa priorità a entrambi i due metodi di indagine, quantitativo e qualitativo. Infine, nello svolgimento della ricerca abbiamo adottato un disegno esplicativo che si colloca nel quadro di Creswell e Plano Clark (2011) e Molina-Azorin (2016). Si tratta di un disegno di ricerca che distingue due fasi. La prima consiste nella raccolta di dati quantitativi e poi nella raccolta di dati qualitativi per sostenere e spiegare i risultati quantitativi ottenuti. Abbiamo quindi iniziato con la raccolta e l'analisi dei dati quantitativi. È seguita la fase qualitativa, progettata esplicitamente per analizzare più approfonditamente i risultati della fase quantitativa. "La logica di questo approccio è che i dati e i risultati quantitativi forniscono un quadro generale del problema della ricerca, ma è necessaria un'analisi più approfondita attraverso la raccolta di dati qualitativi per perfezionare, estendere o spiegare il quadro generale" (Molina-Azorin, 2016: p.343). Pertanto, la fase qualitativa risulta particolarmente utile per convalidare il processo di selezione delle variabili utilizzate nella fase quantitativa.

Risultati. Nella tabella 2 si riportano i risultati principali dell'analisi qualitativa dei casi Ferragamo e Gucci che sono collegati con i risultati della parte quantitativa. L'analisi comparata dei due casi permette di confermare l'importanza delle sei dimensioni usate per la costruzione dell'indice di Corporate Heritage (Tabella 3)

Tab. 2: L'evoluzione storica e la corporate heritage: una comparazione tra Ferragamo e Gucci

Ferragamo		Gucci	
Fattori chiave	Attività di Corporate heritage	Fattori chiave	Attività di Corporate heritage
Fase fondativa: 1928-1960		Fase fondativa: 1921-1954	
1928: Fondazione	1950s: il fondatore crea l'archivio storico, che include 258 brevetti registrati e i relativi materiali di supporto (prototipo di scarpe, bozzetti, foto, adv, marchio)	1921: Fondazione; produzione di valigie di lusso	
Transizione dalla produzione artigianale a quella manifatturiera		Early 1950s: diversificazione di prodotto: produzione di accessori in pelle	
1960: Morte del fondatore		1954: morte del fondatore. Tre dei suoi figli, Rodolfo Gucci, Vasco Gucci, and Aldo Gucci, diventano azionisti con quote pari della proprietà dell'impresa	
Seconda generazione: 1960-2005		Seconda generazione: 1954-1983	
Produzione in outsourcing ma processo decisionale centralizzato	1985: Primo Evento per celebrare il Fondatore. 1995: Apertura del Museo Ferragamo per commemorare la storia del fondatore e il suo ruolo nella storia contemporanea del settore scarpe.	Early 1970s: internazionalizzazione (Europa, Stati Uniti e Asia)	
Transizione dal mono al multi brand.		1979: creazione della linea Gucci Accessories Collection (diverso target rispetto al precedente)	
Internazionalizzazione attraverso la creazione di un network distributivo globale		Terza generazione: 1984-1993	
		Overlicensing e declino delle performance Lotte intestine in famiglia 1987: Investcorp acquisisce il 50% delle azioni di Gucci 1993: Maurizio Gucci, nipote del fondatore, si dimette da presidente.	

Separazione tra proprietà e controllo: 2006-in corso		Separazione tra proprietà e controllo: 1994-in corso	
2006: Michele Norda diventa CEO	Dal 2006: "Ferragamo Creations" (riedizioni annuali di scarpe e borse storiche, in serie limitate e numerate)	1995: Gucci Group NV diventa una società quotata in borsa	2006: Frida Giannini riorganizza l'archivio storico di Gucci
2011: Salvatore Ferragamo Spa diventa una società quotata in borsa	2007: Varina, replica dell'icona Vara creata da Fiamma Ferragamo nel 1978	1999: LVMH (Louis Vuitton Moët Hennessey) acquisisce il 34,4% delle azioni Gucci e, in risposta, Gucci forma un'alleanza strategica con PPR (Pinault-Printemps-Redoute); LVMH contesta la legalità dell'alleanza; e Gucci acquisisce Yves Saint Laurent.	2008: Nasce la collezione "Flora" di borse colorate, ispirata al foulard di Grace Kelly degli anni '60
	2008: celebrazione dell'80esimo anniversario della Fondazione Ferragamo.	2001: PPR group (ora Kering) prende il controllo proprietario di Gucci	2011: Apre a Firenze il Museo Gucci, disegnato da Giannini, nell'ambito di una più ampia serie di iniziative intraprese per celebrare il 90° anniversario della fondazione Gucci
	2013: Il progetto l'Icona (produzione di modelli Vara personalizzati) festeggia i 35 anni di Vara		2014: Viene lanciato GucciMuseo.com per consentire a un pubblico globale online di visitare il Gucci Museo.
	2013: La famiglia Ferragamo crea la Fondazione Salvatore Ferragamo per promuovere la conoscenza di Salvatore Ferragamo e del suo lavoro.		2021: La collezione Aria di Gucci, progettata dall'attuale direttore creativo Alessandro Michele per celebrare il 100° anniversario della fondazione Guccio e il patrimonio Gucci.

Fondazione	Incentrato sulla promozione della conoscenza di Salvatore Ferragamo e del suo lavoro	Nessuno

Nel caso di Ferragamo, tra il 1928 e il 1960 il fondatore dell'azienda ha svolto un ruolo decisivo nella costituzione dell'archivio storico e nella selezione della memoria - invenzioni e innovazioni tecnologiche, di prodotto e di marketing che ne sono derivate - da conservare e trasmettere. Dopo la morte del fondatore, la famiglia svolge un ruolo decisivo nella conservazione e nell'istituzionalizzazione del patrimonio aziendale. La famiglia, tuttavia, si è occupata del patrimonio aziendale principalmente come mezzo per perseguire scopi autocelebrativi. Con l'insediamento di un amministratore delegato non familiare nel 2006, la corporate heritage, incentrata sull'immagine iconica del fondatore, inizia a essere considerata quale asset strategico per consentire la penetrazione nei mercati esteri, in particolare nei Paesi emergenti. Il caso Gucci mostra livelli diversi di impegno nei confronti della propria corporate heritage sotto diversi assetti proprietari. Gucci e il suo marchio hanno infatti vissuto momenti particolarmente turbolenti tra la fine degli anni Ottanta e l'inizio degli anni Novanta. Gli effetti negativi dell'eccessiva concessione di licenze e delle lotte intestine alla famiglia Gucci hanno minacciato drammaticamente la posizione di mercato dell'azienda contribuendo all'esaurimento del patrimonio e del prestigio del marchio. Da quando, nel 1995, Gucci è diventata una società quotata in borsa, l'obiettivo principale dei top manager - in primis l'amministratore delegato Domenico De Sole e il direttore creativo Tom Ford - è stato quello di reinventare l'azienda attorno ad un moderno brand di lusso. Essi sono riusciti nell'intento riprendendo il controllo della complessa struttura di licenze e di distribuzione di Gucci. È interessante notare che un chiaro impegno verso l'accumulo e lo sviluppo del patrimonio aziendale di Gucci è emerso soltanto dall'inizio degli anni 2000, quando il gruppo familiare francese Pinault-Printemps-Redoute ha assunto il controllo di Gucci.

L'analisi presentata conduce a sostenere l'esistenza di una relazione diretta e significativa fra la presenza di un amministratore delegato familiare e l'investimento in corporate heritage, e suggerisce che tale relazione è moderata dal livello di coinvolgimento della famiglia nella proprietà e nel consiglio di amministrazione. A nostra conoscenza, questo lavoro è il primo che analizza questa relazione, fornendo così prove empiriche a sostegno dell'argomentazione che le priorità della SEW sono dei predittori delle decisioni e dei risultati delle imprese familiari. In base a ricerche precedenti, questo risultato supporta l'idea che l'effetto del coinvolgimento della famiglia sulla performance di un'impresa familiare sia complesso e articolato piuttosto che diretto e lineare (Chrisman, Chua, Pearson e Barnett, 2012; De Massis et al., 2013).

Limiti della ricerca. Come ogni altro studio, anche questo non è esente da limitazioni. In primo luogo, siamo consapevoli che i nostri dati si riferiscono a un solo Paese e a un solo settore. Di conseguenza, il campione è di dimensioni relativamente modeste e composto da imprese familiari italiane che operano nel settore della moda. Pertanto, i risultati potrebbero non essere facilmente generalizzabili alle imprese familiari che operano in altri Paesi e in altri settori. Questa condizione potrebbe essere ancora valida se utilizziamo la fase qualitativa per convalidare il processo di selezione delle variabili utilizzate nella fase quantitativa. Pur riconoscendo che diversi studi precedenti si sono basati su dati relativi a un solo Paese per indagare le logiche di SEW nelle imprese familiari (ad esempio, Gómez-Mejía et al., 2007), incoraggiamo tuttavia le ricerche future a estendere il loro monitoraggio a più Paesi per analizzare le scelte relative alla corporate heritage. Ulteriori ricerche potrebbero dare ulteriore linfa alla generalizzazione dei risultati, ad esempio estendendoli ad altri settori, come ad esempio quello farmaceutico, ingegneristico e automobilistico, che comprendono un gran numero di aziende B2B medio grandi.

In secondo luogo, ci siamo concentrati sull'impatto dei CEO familiari e del coinvolgimento della famiglia nella proprietà dell'impresa e nel consiglio di amministrazione, fornendo evidenze empiriche di queste relazioni. Ciononostante, gli sforzi futuri degli studiosi potrebbero esplorare altre misure di SEW, considerando l'inclusione di altre proxy del controllo familiare e dell'influenza sulle scelte strategiche.

In terzo luogo, nello studio del CEO e del consiglio di amministrazione delle imprese familiari ci siamo concentrati principalmente sulle differenze tra membri della famiglia e non (amministratori delegati e membri del consiglio di amministrazione), senza prendere in considerazione altre differenze rilevanti che possono esistere all'interno del consiglio di amministrazione. Le ricerche future potrebbero aprire la "scatola nera" dei processi consiliari (Zattoni et al., 2015), andando oltre la semplice dicotomia amministratori familiari vs. amministratori non familiari per concentrarsi su questioni relative ai "micro-processi", come il modo in cui viene raggiunto il consenso all'interno del consiglio e come questo processo di costruzione del consenso può eventualmente cambiare nel corso del ciclo di vita dell'azienda e del suo consiglio di amministrazione.

Infine, un limite di questo lavoro riguarda la natura dell'analisi qualitativa condotta, che adotta i canoni dell'analisi documentale e utilizza dati secondari per giungere alle sue conclusioni. Per questo motivo, si promuove la realizzazione di ulteriori studi empirici basati, non soltanto su dati documentali, ma anche su dati primari derivati da interviste ai presidenti, ai membri del consiglio di amministrazione e agli amministratori delegati delle imprese familiari, che potrebbero fornire ulteriori prove recenti e rilevanti in questa importante direzione di indagine.

Implicazioni pratiche. Tre sono le principali implicazioni di questo lavoro per le imprese familiari. In primo luogo, i nostri risultati indicano che il controllo familiare ha un effetto diretto sull'investimento in corporate heritage, tanto che la performance dell'impresa è più bassa quando la proprietà familiare è interamente concentrata nelle mani della famiglia di controllo, mentre aumenta quando l'azionariato diventa più aperto ad investitori non familiari. Questo studio rivela anche che la presenza di un amministratore delegato familiare può essere dannosa o vantaggiosa per l'investimento in corporate heritage, a seconda del grado di coinvolgimento della famiglia nella proprietà e nel consiglio di amministrazione, perché questo dipende dalla tipologia di SEW ("extended" vs "restricted"). Sorprendentemente, si riscontra un effetto negativo dei CEO familiari sugli investimenti in corporate heritage nel caso di un elevato coinvolgimento della famiglia. Questa condizione supporta l'idea che gli amministratori delegati familiari possano esercitare la loro influenza in modo differente a seconda del grado di coinvolgimento della famiglia; ad esempio, possono essere buoni "stewards" dell'impresa e rivelare la presenza di una "extended SEW" o, al contrario, possono essere cattivi "stewards" e rivelare la presenza di una "restricted SEW".

In secondo luogo, lo studio offre un contributo alla visione della SEW per quanto riguarda gli esiti e i risultati delle famiglie. Infatti, sviluppiamo l'idea che, nelle imprese familiari, le scelte decisionali dell'amministratore delegato (della famiglia) si basino sulla doppia considerazione di perdite e guadagni per quanto in relazione alla SEW della famiglia di controllo (Gomez-Mejía et al., 2007). L'investimento in corporate heritage dovrebbe essere visto come un potenziale guadagno da parte di un CEO familiare, a causa della sua importanza per la conservazione della SEW della famiglia di controllo, e come una potenziale perdita da parte di un CEO non familiare, a causa del suo costo e del suo impatto sulla performance finanziaria a breve termine dell'impresa. Inoltre, in prospettiva comportamentale sappiamo che, se la salvaguardia della SEW da parte delle famiglie non fosse allineata con gli interessi dei proprietari, le imprese familiari potrebbero non investire molte risorse in iniziative che non sono in grado di migliorare la loro performance. L'esempio tipico è relativo agli investimenti in CSR e alla performance. A nostra conoscenza, nessuno studio precedente ha affrontato la relazione tra il coinvolgimento della famiglia e l'investimento in corporate heritage adottando la prospettiva della SEW e, allo stesso modo, nessuna ricerca precedente ha esaminato il ruolo svolto da un amministratore delegato familiare su tale decisione strategica. Le imprese familiari risultano, pertanto, interessate ai nostri risultati su questo aspetto e, seguendo la nostra traccia, possono assumere delle scelte coerenti su quanto sottolineato.

In terzo luogo, i risultati mostrano che, sebbene l'investimento in corporate heritage contribuisca a costruire la legittimità di un'impresa con gli stakeholder interni ed esterni, collegando le preoccupazioni e gli interessi contemporanei dei clienti e degli stakeholder al passato, al presente e al futuro dell'impresa (Balmer, 2011), la misura in cui le imprese familiari investono effettivamente in corporate heritage dipende da com'è percepita dal CEO della famiglia l'importanza di preservare la SEW. In effetti, questa ricerca fornisce un primo punto di riferimento suggerendo che il diverso grado di investimento delle imprese familiari in corporate heritage può essere collegato al livello di coinvolgimento della famiglia nella proprietà e nel consiglio di amministrazione, oltre che al fatto che le famiglie controllanti e i CEO (di famiglia) non condividono necessariamente la stessa visione della SEW ("extended"

vs. “restricted”). Più specificamente, il presente lavoro contribuisce a spiegare il livello di investimento delle imprese familiari in corporate heritage identificando il ruolo svolto dal CEO della famiglia. Le scelte dell'impresa familiare in questa direzione possono tenere, pertanto, conto dei risultati del nostro lavoro.

Originalità dello studio. Questo studio contribuisce al filone di ricerca interessato all'accumulo e all'utilizzo della corporate heritage delle imprese. Si tratta a evidenza di un primo sforzo in tale direzione, costruito sull'idea che la storia dovrebbe ispirare il successo delle imprese familiari qualora la famiglia è in grado di gestirla e di investire su di essa. In particolare, gli studiosi di marketing si sono concentrati sulla corporate heritage intesa come risorsa strategica. Hanno mostrato come i manager utilizzano questa risorsa a livello aziendale e di brand di prodotto per influenzare le percezioni dei consumatori (Balmer, 2011). Sebbene un numero crescente di ricerche si concentri sull'importanza della corporate heritage, l'argomento manca ancora di chiarezza concettuale e di una direzione chiara per la sua operazionalizzazione. Tale mancanza di chiarezza concettuale conduce a problemi di misurazione della validità del costruito, della validità della conclusione statistica e della validità interna (MacKenzie, 2003). Lo studio in discorso affronta questa lacuna proponendo un indice composito di corporate heritage (CH), che misura l'accumulo e lo sfruttamento della corporate heritage. I nostri risultati fanno anche luce sulle varie dimensioni della corporate heritage e mostrano come le imprese familiari possono impegnarsi in misura differente nell'effettuare investimenti in corporate heritage.

Infine, questo studio contribuisce a far avanzare la nostra comprensione della eterogeneità delle imprese familiari mostrando come la complessità degli effetti dei CEO familiari sia una delle fonti di take eterogeneità. Poiché diversi studi hanno indagato la relazione fra l'eterogeneità della governance e il processo decisionale delle imprese familiari, rivelando evidenze empiriche contrastanti, molti studiosi hanno sollecitato studi sull'eterogeneità dell'influsso della governance familiare sul comportamento delle famiglie imprenditoriali (D'Allura, 2019; Daspit et al., 2018). Questo lavoro risponde a tale richiesta mostrando che la presenza dell'amministratore delegato familiare costituisce di norma un fattore rilevante per comprendere l'eterogeneità delle decisioni e dei risultati delle imprese familiari, considerando la decisione strategica di investire in corporate heritage come uno di questi. Infatti, i risultati dello studio aiutano a conciliare le evidenze contrastanti emerse da studi precedenti: in presenza di un preciso livello di coinvolgimento della famiglia nella proprietà e/o nel consiglio di amministrazione, un amministratore delegato familiare può creare condizioni facilitanti per conseguire una maggiore redditività rispetto a un amministratore delegato non familiare. Di conseguenza, secondo Bauweraerts et al. (2021), tali risultati mettono in discussione il falso mito o tradizionale preconcetto che l'inserimento di un amministratore delegato esterno in un'impresa familiare sia di per sé una condizione favorevole. In particolare, lo studio contribuisce al dibattito che lega il comportamento e i risultati delle imprese familiari all'influsso del CEO familiare, mostrando come una visione SEW ristretta o estesa del CEO familiare sia collegata a differenti livelli di coinvolgimento della famiglia nella proprietà e nella governance dell'impresa (come, ad esempio, nel consiglio di amministrazione) (Le Breton-Miller e Miller, 2018).

Parole chiave: corporate heritage, proprietà familiare, ceo, storia

How companies navigate circular economy paradoxes: an organizational perspective

NATALIA MARZIA GUSMEROTTI* DUCCIO TOSI* FRANCESCO TESTA[▲]

Framing of the research. Companies operate in highly complex environments in which they are often faced with contradictory demands simultaneously (Smith and Lewis, 2011). Indeed, companies must concurrently address economic, environmental, and social goals, collaborate with other actors and maintain their own identity, create value for themselves and the community, or be innovative and conservative (van Bommel, 2018). Smith and Lewis (2011) framed tensions (or paradoxes) within four categories: learning, organizing, belonging and performing paradoxes. Each category is related to core organizing elements concerning knowledge, processes, identity and goals, respectively.

Some authors have analyzed these tensions with specific reference to corporate sustainability (Hahn et al., 2015; Slawinski and Bansal, 2015). Indeed, the integration of corporate sustainability within organizational strategies and dynamics is a source of tensions between desirable but, at the same time, contradictory interrelated aspects (Hahn et al., 2018). For instance, competing tensions may occur between values and identities concerning social and environmental issues (i.e., belonging tensions), between the adoption of sustainable business models and the maintenance of existing routines and systems (i.e., learning tensions), between the integration and structural separation of sustainability activities (i.e., organizing tensions), or between the pursuit of competing sustainability issues (i.e., performing tensions) (Hahn et al., 2018).

As stated by some authors, these types of tensions are also experienced by firms that adopt circular economy practices (Daddi et al., 2018; De Angelis, 2021; Corsini et al., 2022). For instance, the implementation of circular economy actions can create conflicting effects such as the adoption of better resources from an environmental perspective and the associated increase in costs (e.g., for research and development or testing) (De Angelis, 2021). This contradictory aspect is embodied in the tension (performing) between the pursuit of short-term gains and long-term prosperity (Slawinski and Bansal, 2015). Moreover, effectively implementing circular practices often requires collaboration with other companies in the value chain and projection into the broader social-ecological system in which companies operate, at the expense of maintaining a well-defined identity and independence (Geissdoerfer et al., 2018). This necessary projection aimed at integrating circular economy principles can create a tension (belonging) between the desire to emancipate itself as a “stand-alone” company and the recognition of being part of a larger system (De Angelis, 2021). The adoption of circular practices can also rise belonging tensions between the pursuit of the organization’s self-interest and that of the community (Geissdoerfer et al., 2018). The need to collaborate with other companies in the value chain for successful implementation of circular practices can then bring up organizing tensions between collaborative and competitive dynamics (Xiao et al., 2019). In addition, companies that adopt (or intend to adopt) circular economy actions may experience tensions (learning) due to the need to innovate (e.g., business model) while relying on existing capabilities and knowledge (van Bommel, 2018).

To manage these tensions, companies can take different approaches. In their literature review, Van der Byl and Slawinski (2015) identified four different types of approaches: win-win, trade-off, integrative, and paradox. The first two approaches are characterized by eliminating tensions through the alignment of sustainability elements (win-win approach) or the choice of one element over another (trade-off approach). The integrative approach entails managing tensions by balancing the elements of sustainability. Finally, the paradox approach involves the recognition, acceptance, and dynamic incorporation of tensions within business decisions and strategies (Ivory and Brooks, 2018). Therefore, the paradox approach assumes a dynamic equilibrium model. Studies have shown that when actors are able to dynamically cope with paradoxes, they can simultaneously achieve desirable outcomes from different perspectives (Kim et al., 2019; Sharma and Jaiswal, 2018). Indeed, according to Smith (2014), the long-term performance of firms depends on their ability to concurrently cope with conflicting demands and alternatives on ongoing basis. Two pathways have been identified in the literature to navigate for managing tensions through a paradoxical lens: acceptance of paradox and paradoxical resolution (Smith and Lewis, 2011; Ivory and Brooks, 2018). Acceptance of paradox is the recognition of conflicts, ambiguities, and contradictions as normal elements of business life (Smith and

Lewis, 2011). This pathway is necessary for companies to become aware of the inevitability and persistence of paradoxes and to consciously live with them. Paradoxical resolution consists of “purposeful iterations between alternatives in order to ensure simultaneous attention to them over time” (Smith and Lewis 2011, p. 392). Thus, this pathway concerns the dynamic shift of decisions between conflicting options as part of a broad, long-term pattern (Kim et al., 2019). Ivory and Brooks (2018) proposed a framework to explain how strategic agility and, in particular, the meta-capabilities that comprise it (i.e., strategic sensitivity, collective commitment and resource fluidity) can enable the company to virtuously navigate these paradox pathways within corporate sustainability. In doing so, the authors also identified organizational processes and practices for each meta-capability that contributes to the management of corporate sustainability with a paradoxical lens. Drawing on the paradox theory and based on this framework, the present research empirically analyzes the effects of contextual organizational factors in leading to the acceptance and resolution of paradoxes that companies experience in adopting circular economy actions. Specifically, we examine the role of cognitive diversity, organizational design, supply-chain management, reward/incentive structure, and experimentation and dialogue space in triggering the recognition and acceptance of circular economy paradoxes and stimulating their resolution.

Hypotheses

How companies deal with the ambiguities inherent in corporate sustainability is related to the cognitive frame of decision makers (Hahn et al., 2014). In particular, the cognitive homogeneity of decision makers can create excessive consolidation of existing routines at the expense of broader, ambivalent interpretations of the conflicting aspects inherent in sustainability (Hahn and Aragon-Correa, 2015). Conversely, cognitive diversity makes existing ambiguities more likely to be considered in strategic decisions (Hahn et al., 2014). Companies that promote and pursue cognitive diversity equip themselves with leaders and organizational members with a variety of backgrounds, expertise, skills, and worldviews. When companies have a diversity of knowledge and skills internally, they are more strategically sensitive to broad issues, reduce the risk of “groupthink”, and interpret trends and dynamics of the external environment more mindfully (Ivory and Brooks, 2018). Cognitive diversity thus contributes to the emergence and recognition of the existence of different perspectives and viewpoints, thereby leading to acceptance of paradox. Accordingly, we posit the following hypothesis:

H1: Cognitive diversity positively influences the acceptance of circular economy paradoxes.

Circular economy practices in most cases involve close collaboration with other actors in the value chain (Genovese et al., 2017). This collaboration, however, as stated above, can be a source of tensions due to the simultaneous desire to maintain a well-defined identity and independence and the need to be part of a larger system (De Angelis, 2021), or the need to create value for themselves and the community at the same time (Geissdoerfer et al., 2018). Therefore, supply chain management, intended as the set of practices, goals, risks, and assets shared with supply chain actors (Cao and Zhang, 2011), involves the emergence of tensions that companies must recognize and accept in order to establish beneficial collaboration. Furthermore, in the context of the circular economy, supply chain management involves the development of important relational and coordinative capacities with other actors (Genovese et al., 2017). This fosters a thorough understanding of existing resources, awareness of the risks associated with the provision and use of tangible and intangible resources, and the ability to influence rapid and effective resource redistribution (Cao and Zhang, 2011). Since the ability to reallocate resources in a timely and informed manner is critical for managers to dynamically shift decisions and strategies, supply chain management contributes to the resolution of paradoxes (Xiao et al., 2019). Based on these considerations, the following hypotheses:

H2: Supply chain management positively influences the acceptance of circular economy paradoxes.

H3: Supply chain management positively influences the resolution of circular economy paradoxes.

To properly embrace the principles of sustainability and circular economy, companies must also set up an organizational design consistent with such a purpose (Hahn et al., 2015). Organizational design consists of the set of structural features of the firm that define how goals are set, how decisions are made, and how roles are allocated and designed (Burton et al. 2011). As indicated by Hahn and Aragon-Correa (2015), organizational designs that involve flexible, decentralized, open and participatory structures are more likely to incorporate sustainability, as it is based on an open-systems approach. However, structuring such organizational designs can create tensions between the need to have a well-defined decision-making process based on hierarchical scale and, at the same time, have more fluid corporate architectures (Hahn et al., 2015). Therefore, creating an organizational design that adequately incorporates the open-systems approach underlying corporate sustainability and circular economy, implies accepting these tensions. In addition, the implementation of more fluid, open and horizontal organizational architectures facilitates heterogeneity of interpretations with respect to sustainability and the ability to readily reconfigure the business system and routines, thus enabling greater dynamism in changing strategies and decisions on an ongoing basis. As such, organizational design contributes to the resolution of paradoxes (Ivory and Brooks, 2018). We thus offer the following hypothesis:

H4: Organizational design positively influences the acceptance of circular economy paradoxes.

H5: Organizational design positively influences the resolution of circular economy paradoxes.

Clearly, accepting tensions, rather than avoiding or eliminating them, implies a greater propensity to proactively confront them and to “become comfortable with the disquiet they provoke” (Miron-Spektor et al., 2018, p.11). So, companies that reach the step of accepting tensions tend not to feel threatened by the paradoxes that inevitably arise in approaching sustainability and the circular economy, but to explore them and continuously seek creative and effective solutions to manage them (Hahn et al., 2015). Acceptance of tensions, therefore, enables the firm to recognize polarities constructively, process them, and exploit them productively and dynamically for the benefit of organizational action (Smith and Lewis, 2011). Accordingly, the following hypothesis:

H6: Acceptance of circular economy paradoxes positively influences the resolution of circular economy paradoxes.

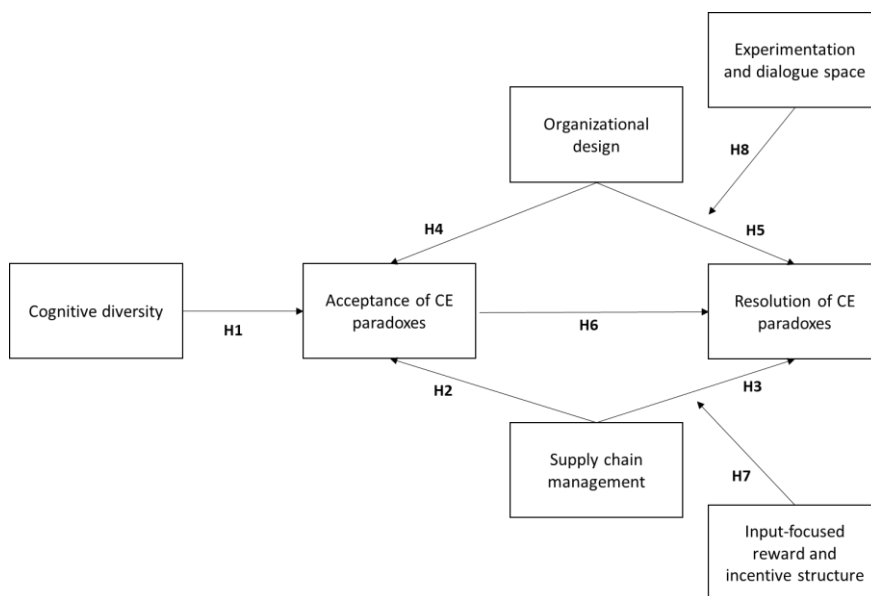

Conflicts and inconsistencies can also arise with reference to the relationship between formal and informal corporate systems (Hahn et al., 2015). In particular, this occurs when there is a mismatch between the two types of systems. Indeed, as noted by Epstein et al. (2015), even when informal systems are oriented toward and promote sustainability, if formal incentive systems are linked only to financial-economic performance, discrepancies emerge. So, formal reward and incentive systems play an important role with respect to sustainability and circular economy practices. Reward and incentive mechanisms serve both to motivate individuals’ behaviors and to indirectly communicate organizational priorities (Ivory and Brooks, 2018). When companies construct these mechanisms not on the basis of outputs, such as the financial ones, but on the basis of inputs that take into account sustainability aspects, such as the procurement from sustainable suppliers, they help to boost the emphasis on effective and sustainable supply chain management and avoid triggering linear behaviors that are solely linked to the achievement of short-term economic goals (Ivory and Brooks, 2018). Therefore, reward and incentive structures characterized by a focus on inputs increase the effectiveness that supply chain management has on the resolution of circular economy paradoxes. Therefore, the following hypothesis:

H7: Input-focused reward and incentive structure positively moderates the relationship between supply chain management and resolution of circular economy paradoxes.

Since sustainability is rooted in an open-system approach (Hahn and Tampe, 2020), companies adopting circular economy practices should create a context consistent with this approach that allows and encourages the emergence of diverse perspectives and interpretations (Bianchi and Testa, 2022). This is possible when organizational members are encouraged to express opinions, to experiment ideas and practices, to make suggestions, and to communicate with each other (Hahn et al., 2014). Therefore, a business context characterized by an experimentation and dialogue space based on free and open debate and that accepts heterogeneity of interpretations increases the effectiveness of participatory, decentralized and open organizational design in resolving circular economy paradoxes by stimulating new and innovative responses to sustainability issues (Hahn and Aragon-Correa, 2015). Thus, we posit the following hypothesis:

H8: Experimentation and dialogue space positively moderates the relationship between organizational design and resolution of circular economy paradoxes.

Fig. 1: Hypothesized model

Methodology.

Sample and data collection

Hypotheses were tested on a sample of Italian manufacturing companies. Data were collected by means of a questionnaire that was submitted by a commercial data provider to a representative sample of small, medium and large Italian manufacturing companies. In designing the questionnaire, several procedural remedies were adopted to minimize bias that can affect survey-based research, such as common method bias and social desirability bias (Podsakoff et al., 2003). Data were collected during June 2022. At the end of the data collection period, the final sample consisted in 303 completed questionnaires. Table 1 shows the sample breakdown in terms of manufacturing sector, role of respondents, numbers of employees and year of company birth.

Tab. 1: Sample breakdown in terms of manufacturing sector, role of respondents, numbers of employees and year of company birth

Manufacturing sector	% of companies in the sample	Number of employees	% of companies in the sample by number of employees	Role of respondents	% of the role of respondents in the sample	Year of company birth	% of companies in the sample by year of birth
Construction	19%	< 25	19%	President	13%	1950 or before	7,9%
Chemical Industry	8%	26 - 50	8%	Vice president	5%	1950 – 1959	3,0%
Pharmaceutical Industry	17%	51 - 100	17%	Chief executive officer	8%	1960 – 1969	7,6%
Food Industry	12%	101 - 250	12%	General manager	14%	1970 – 1979	16,5%
Clothing, textile or related industry	12%	251 - 500	12%	Chief operating officer	27%	1980 – 1989	15,5%
Wood and furniture industry	9%	> 500	9%	Finance director	6%	1990 – 1999	17,5%
Paper and related products industry	5%			Director of services	4%	2000 – 2005	14,2%
Other in the manufacturing sector	19%			Manager	24%	2006 – 2010	8,6%
						2011 – 2015	5,0%
						2016 – 2020	4,0%
						2021 – 2022	0,3%

Measurements

Most measures utilized in the study were developed based on already validated psychometric scales. Measurement scales were then adapted to the context of the study in close collaboration with managers, representative of Industrial Associations and academics. Both 5-point and 7-point Likert scales were used.

In order to measure acceptance and resolution of circular economy paradoxes we relied on the measurement scales developed by Miron-Spektor et al. (2018). In particular, we modeled the scales named by the authors “Experiencing tensions” and “Types of tensions” to adapt them to the conflicts that companies experience in implementing circular economy practices, in order to capture the propensity of companies to recognize these tensions as inescapable elements of corporate action and to address them dynamically, iteratively and creatively. Four items were developed for acceptance of circular economy paradoxes and five items for resolution of circular economy paradoxes.

To measure cognitive diversity, we used the scale validated by Van der Vegt and Janssen (2003). We then asked respondents to assess to what extent they believe that company managers differ in their way of thinking, in how they viewed the world, and in their beliefs about what is right and wrong. Four items were developed for this purpose.

Supply chain management was evaluated based on the scales proposed by Cao and Zhang (2011) to measure supply chain collaboration. Specifically, the authors considered this construct as second-order, thus developing specific scales for each first-order construct that forms it. In order to use a single measurement scale to assess supply chain management, we aggregated items related to decision synchronization, incentive alignment and resource sharing, resulting in a scale of ten items.

To measure organizational design, we referred to the theoretical framework of Ivory and Brooks (2018) together with the scale developed by Perez-Valls et al. (2016). Accordingly, the measure used in this study incorporates five items related to horizontality of decision making, decentralization in goal setting, fluidity of organizational structure, and flexibility in resource deployment and role design.

The measure for experimentation and dialogue space was developed based on the scales validated by Arnold et al. (2000) and Alegre and Chiva (2008). Specifically, we relied on both scales to obtain a broader measure aimed at

capturing the encouragement of organizational members to express ideas and suggestions, the listening to everyone's opinions, and the incentive for dialogue and mutual communication. Eight items were then implemented for this purpose.

Regarding the input-focused reward and incentive structure, we started from the emerging literature on procurement practices and technology use in the circular economy field (Gusmerotti et al., 2019). Then, in collaboration with managers and experts, we declined these practices in the form of input-focused incentive mechanisms. The measurement scale so developed incorporates four items on aspects regarding incentive structures that range from the rewards of procurement from local and sustainable suppliers, to rewards for the use of resource-efficient technologies.

Finally, two company level variables were accounted as control variables in the study. Specifically, company age and company size (in terms of employees). Both variables were measured by means of a multiple-choice question.

Results.

Assessment of the measurement model

The CFA confirms the unidimensionality of the seven constructs, indicating that the measurement items load consistently on seven distinct factors, with factor loadings ranging from 0.61 to 0.80 and uniqueness values less than 0.49. Robustness and validity checks confirm the good fit of the model: both the comparative fit index (CFI) and the Tucker-Lewis index (TLI) are 0.96 (above the threshold of 0.90); the root-mean-square error of approximation (RMSEA) is 0.034, well below the threshold of 0.08; the chi-square adjusted for degrees of freedom (χ^2/df) is 1.35, considerably below the threshold of 3.0.

Regarding convergent validity, all observed variables are significantly related to their latent construct ($p < 0.001$) and all regression coefficients are greater than 0.05. In addition, to assess the amount of total variance explained by each construct, we calculated the average variance extracted (AVE). All constructs show an AVE that meets the threshold of 0.5 (Hair et al., 2010), with only two exceptions represented by acceptance and resolution of circular economy paradoxes (0.46 and 0.49, respectively). Therefore, we calculated composite reliability (CR) for all constructs and saw that all latent variables show CR values ranging from a minimum of 0.77 to a maximum of 0.93, far above the recommended threshold of 0.6. So, the convergent validity of the latent constructs can be considered satisfactory.

The reliability and internal consistency of each latent construct were evaluated by calculating Chronbach's alpha and Raykov's reliability coefficients. All values are above the recommended threshold of 0.7 (Hair et al., 2010).

Regarding discriminant validity, the squared correlations between latent variables are all below the 0.5 threshold, showing that items that do not belong to the same construct are only weakly correlated with each other. In addition, discriminant validity was determined by evaluating Maximum Shared Variance (MSV) and Average Shared Squared Variance (ASV). Both were found to be lower than the average variance extracted (AVE) for all constructs (Hair et al., 2010). Finally, as a further confirmation of discriminant validity, we calculated the heterotrait-monotrait ratio of correlations (HTMT). None of the HTMT criteria violates the recommended threshold of 0.85 (Henseler, 2015).

Therefore, these analyses provide no evidence of reliability and validity violations.

Common method bias analysis

Although we reduced the risk of common method variance by introducing several procedural remedies during survey design, this is a cross sectional study based on self-reported data and in which all variables were measured using the same source. Therefore, it could produce biased results. To test this issue, we performed two statistical tests. First, we tested whether common method variance affects our data by performing Harman's single-factor post-hoc test. This test showed that the largest factor accounts for 36% of the variance, and seven factors emerged with eigenvalues greater than 1. Therefore, common method variance is not a problem.

In addition, we further tested for common method variance by analyzing a common method factor (Podsakoff et al., 2003). We found that, on average, the variance explained by the observed latent constructs is 54% greater than the variance explained by the common method factor. Based on this analysis, common method bias is not a problem in our study.

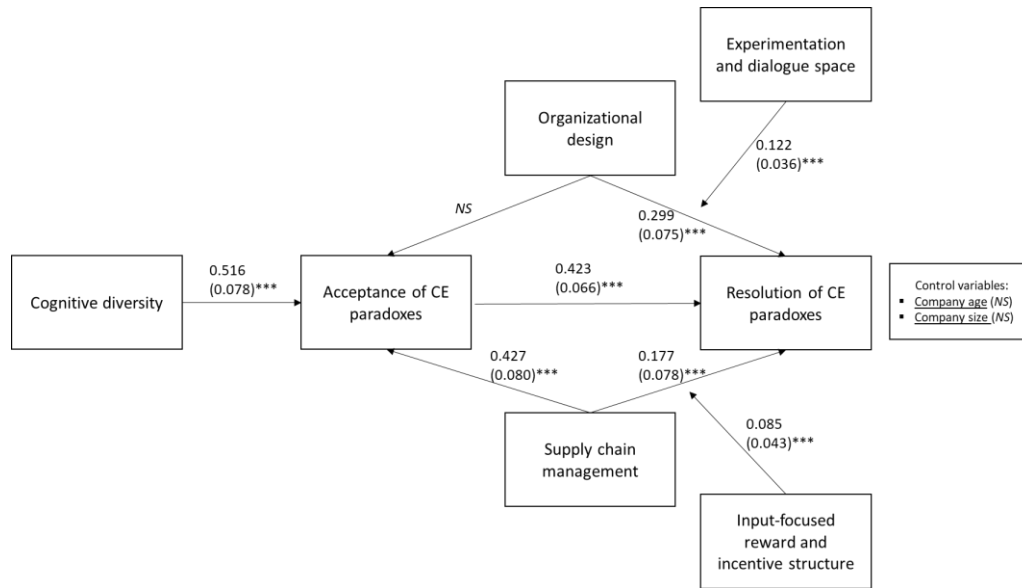

Testing hypothesis

Hypotheses 1 through 6 were tested by means of a structural equation model (SEM) (Fornell and Larcker, 1981). The model exhibits a good fit: CFI and TLI amount to 0.97 and 0.96, respectively; RMSEA is 0.035; the χ^2/df ratio is 1.372.

SEM results (β coefficients, standard errors and statistical significance) are shown in Figure 2.

Moderations (hypotheses 7 and 8) were tested by means of two hierarchical regressions (Frazier et al., 2004). The results are displayed in Figure 2.

Fig. 2: Results of the model. Standard errors are in parenthesis. *** $p < 0.05$; NS, not significant

Research limitations. Exploring the limitations of the present study helps identifying avenues for future research. First, the study focuses on a limited set of variables that do not necessarily take into account all the significant factors that influence the acceptance and the resolution of circular economy paradoxes. From an organizational perspective, future studies could focus on investigating other factors such as organizational learning and adaptation or organizational slack (Ivory and Brooks, 2018).

Second, the study builds upon a unique source of data. Despite procedural remedies have been adopted to reduce potential social desirability bias, respondents' tendency to overestimate certain aspects of their organizational context could result in an overestimation bias. Future studies should therefore attempt at triangulating the results by combining diverse data collection methods, or by combining diverse sources within the same organization.

Managerial implications. The findings of the study provide implications for management. In the first place, in order to accept and acknowledge the tensions that inevitably arise in the implementation of circular economy practices, the study highlights the relevance of creating a business environment characterized by a diversity of experiences, skills, and viewpoints (Hahn et al., 2014). To this end, companies and managers should orient the selection and training processes of organizational members toward enhancing cognitive diversity.

Second, our findings show that collaboration with supply chain actors is a key determinant in both the acceptance and resolution of circular economy tensions. Therefore, in order for companies to consciously live with these tensions and exploit them productively, they should pay attention to managing their relationships with supply chain actors.

Third, given the importance of organizational design in structuring a flexible context capable of accommodating different interpretations regarding sustainability issues and fostering dynamic strategic changes (Hahn and Aragon-Correa, 2015), managers should engage in building horizontal structures and decentralized decision-making processes, for example, by distributing responsibilities among multiple roles and business units.

Fourth, as shown by the results of the study, to increase the effectiveness of organizational design in the resolution of circular economy paradoxes, managers should stimulate the emergence of suggestions and opinions from various organizational members and facilitate communication and interchange between areas, for instance, by organizing informal meetings among individuals from different business units.

Fifth, as suggested by our study, in order for supply chain management to further contribute to the company's ability to meet competing goals and demands in the context of circular economy, managers should implement incentive systems based on inputs, such as rewarding purchasing from suppliers who adopt circular economy principles.

Originality of the paper. Most of the literature on the topic of tensions inherent in corporate sustainability is conceptual (Van der Byl and Slawinski, 2015). The few empirical studies on this issue have mainly focused on identifying the types of paradoxes that companies and individuals experience when confronted with sustainability issues and how they handle them. For example, Van Bommel (2018) examined the tensions that arise in implementing sustainable business models and how companies approach them. Slawinski and Bansal (2015) analyzed how companies respond to the climate change issue and attend to the intertemporal tensions between the short and long-term underlying corporate sustainability. Bianchi and Testa (2021), through a longitudinal qualitative study, explored how cognitive frames influence the companies' responses to the tensions inherent in sustainability in an evolutionary perspective. Moreover, few studies examined tensions with specific reference to the circular economy. Among them, De Angelis (2021) conducted conceptual research aimed at identifying, from a business model perspective, the typology of organizational tensions in circular economy implementation. Another study conducted by Daddi et al. (2019), through a multiple case study approach, investigated the paradoxes related to circular practices that paper, textile, and leather firms may encounter in the performance of their activities and analyzed the strategies adopted to cope with these

paradoxes. However, to the best of our knowledge, no empirical study has focused on investigating the contextual organizational factors that can stimulate the pathways of acceptance and resolution of circular economy paradoxes. Therefore, our study represents the first attempt to empirically test the organizational-level drivers of acceptance and resolution of tensions by companies adopting circular economy actions.

Measuring circular economy in SMEs: a systematic review previously not needed

CHIARA COLAMARTINO* LAVINIA CONCA* PIERLUIGI TOMA[▲]

Abstract

The circular economy (CE) discussion is increasingly widespread in all sectors. Implementing laws to protect natural resources and adopting practices closer to the 2030 Agenda of Sustainable Development Goals (SDGs) is essential and worrying for companies that have to realign products to government requests. Companies of all sizes and in every state have been forced to review production processes by adopting an economic model based on reuse, recycling, etc. Through a bibliometric analysis, this work aims to demonstrate that for small and medium enterprises (SMEs) there are no standardized and shared measures and/or questionnaires to measure sustainable practices based on the circular economy, unlike listed companies. In principle, the researchers submitted questionnaires to company managers asking them to define their sustainable commitment and the CE practices adopted through a Likert scale. Therefore, from the consultation of the literature, it appears necessary to identify some indicators for SMEs to improve communication and information on the processes and changes taking place towards the CE by companies. This work demonstrates that the efforts made by companies aimed at aligning their activities according to the principles of the CE would be more effective only with the support of the institutional factor. Particularly, the novelty of this work consists in proposing a unique theoretical perspective that all companies can exploit to disseminate the steps towards the CE.

Framing of the research. *In the continuing discussion on the circular economy, all sectors are concerned about revising their production processes and realigning products to the demands of governments. Indeed, it is becoming increasingly widespread at the decision-making level to implement laws to protect natural resources and adopt practices closer to the 2030 Agenda of the Sustainable Development Goals (SDGs). Companies of all sizes and in every European state were forced to revisit production processes, raw materials applied to finished products, and packaging greener than in the past. This process transformation has resulted in the migration from a linear economy to a Circular Economy (CE).*

Purpose of the paper. *Large enterprises and listed companies receive ratings or scores set by Bloomberg, Refinitiv etc. Instead, small and medium-sized enterprises (SMEs) do not dispose of visible results and measures of their changes, in relation to the indicators that characterize the CE in its entirety. However, they concentrate efforts on improving their productivity chains by reducing material use and frequently resorting to recycling. The interest in CE measures in these firms results mainly because they globally represent the backbone of the economy (Yumar et al., 2020). The literature review highlights the need to adopt a unified instrument for calculating a CE indicator across all dimensions of companies. Specifically, many scholars implemented theories and tips to adopt measures of CE (Edwin Cheng et al., 2022; Liu et al., 2022). The aim of our work is to propose a specific literature review in order to bear on particular techniques and indicators for measuring CE practices in each firm. By questioning “Is there a unique indicator to measure CE in SMEs?”, the novelty of this work consists in capturing the most widely applied measurement methods and proposing a univocal perspective that all companies can exploit. A univocal approach also implies a deeper involvement of SMEs on the topic of the CE: indeed, constituting the majority of the entrepreneurial structure, SMEs also require a method of measuring the CE.*

Methodology. *According to the directions of Donthu et al. (2021), a multistage literature review was performed in order to best address the research question. First, we provide an overview of the journals in the Descriptive section, by focusing on the topic, emerging trends and research fields. Second, we purpose a thematic analysis with remarkable insight into the methods and variables utilised to measure the CE in companies.*

In order to obtain the first generic database for our research, the keywords “SMEs” AND “circular economy” AND “waste” AND “innovation” AND “indicator” were searched in the Scopus Database, which represents the hugest

e-mail: pierluigi.toma@unisalento.it

database of peer-reviewed literature (Chadegani et al., 2013; Paes et al., 2019). We decided to include papers published in the period 2018 and 2023, due to the greater concentration underlined by Dominko et al. (2022). By integrating new articles, we focused on the latest publications that are closer to the recent challenges in management. We excluded papers in some unrelated subject areas, such as “Psychology”, “Arts and Humanities”, “Pharmacology, Toxicology, Pharmaceutics” and “Biochemistry, Genetics and Molecular Biology”. Moreover, we filtered “articles”, excluding “reviews” and “articles in press”. This first analysis revealed 1005 papers.

In order to concentrate the research on the management field, we filtered the Scopus category, by selecting “Business, Management, and Accounting” and we obtained 469 papers. Data were collected on 06 February 2023.

We operated via Bibliometrix R-package (Aria and Cuccurullo, 2017), considering that Scopus offers compatible metadata for bibliometric analysis software. A descriptive analysis was conducted on this restricted sample, using Bibliometrix.

A thematic analysis was applied to discover the variables and methods used, subsequent to the descriptive analysis of the sample referring to the “Business, Management, and Accounting” area. The authors jointly agreed on the exclusion of the articles, following a precise collection of information on all articles in the sample: particularly, before the exclusion, all abstracts of selected articles were examined.

Subsequently, the papers that seemed most suitable for a more accurate review were ranked. The authors, the research aim, methods and insights or implications were explored.

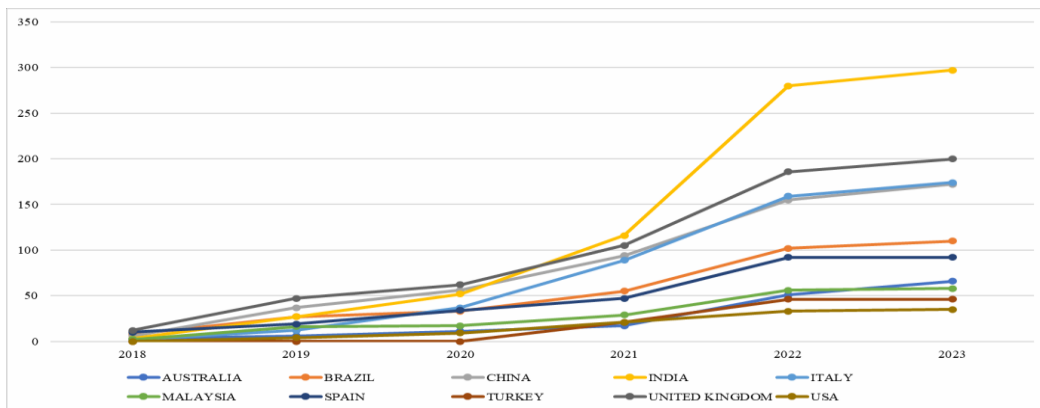

The 23 articles excluded were not referring to techniques for measuring the CE but rather focused on analyses towards a more circular supply chain in firms and the reasons for switching to the CE.

Results.

1. Descriptive Analysis

The sample referring to the “Business, Management, and Accounting” area counted 469 papers. The Top 10 most published countries are Australia, Brazil, China, India, Italy, Malaysia, Spain, Turkey, the United Kingdom, USA. Figure 1 shows an intensifying publication by India from 2021, followed by the United Kingdom.

Fig. 1: Top 10 most published countries

Journal of Cleaner Production dominates the list of the discovered journals, taking the centre stage across the timeframe examined with the highest number of annual occurrences, depicted on the vertical axis of Figure 2. The reason for this broad dominance is inherent in the journal’s interest in topics, such as waste management. Similarly to the former, Business Strategy and the Environment holds a preponderant role.

Fig. 2: The timeframe examined with the highest number of annual occurrences

Among the most cited articles (Figure 3) is the paper by Prieto-Sandoval et al. (2018), published in the Journal of Cleaner Production, elaborating on a systematic literature review, that identified the main concepts and determinants of CE.

Fig. 3: The most cited articles

Before proceeding with the thematic analysis, it was useful to focus on the Authors’ keywords to grasp the direction of the papers. Figure 4 shows the most used words in the research area covered by this study, based on the font size. Therefore, Figure 4 reveals that within the “Sustainable development” and referring to the “SMEs” theme, we found the “Circular Economy” and all related topics. In support of our analysis, it is evident that words such as “indicator” and/or “variables” are not mentioned in the figure obtained through the bibliometrics analysis.

Fig. 4: Word Cloud Map created with Authors’ keywords.

2. Thematic Analysis.

By systematically reviewing 469 academic research articles, interesting and significant analyses and themes were identified in this research area. These show indicators to define and evaluate the CE, circular business models and use cases and their barriers, different geographical areas and industrial sectors of application of the CE. The collection of information about the management of the CE and its evaluation in SMEs prevails through case studies (including Multiple Case Studies) and/or questionnaires/surveys administered to managers or company owners.

Most of the literature got interested in exploring, testing and measuring CE. Specifically, Agudo et al. (2023) adopted a Factor Analysis in their study for the creation of circular value in the context of a CE related to companies

that produce child seats. The retrieval of data and the extrapolation of information on the management of waste and related waste and, therefore, on the circularity of child seats, were obtained by means of email surveys.

Agyabeng et al. (2023) used partial least square structural equation modelling (PLS-SEM) through SmartPLS to analyse survey data gathered from 122 managers of SMEs in Ghana in the manufacturing sector. The measurement items used are Supply chain ethical leadership, Circular supply chain practices, corporate sustainability performance, External environmental orientation and Internal environmental orientation.

Munodawafa et al. (2022) through a literature review and qualitative interviews identified three dimensions of eco-innovation capabilities (Product Service Stewardship, Prevention of environmental pollution and Commitment to sustainable development). Exploratory and confirmatory factor analysis was applied to data collected by Malaysian Oil and Gas Equipment and Services (OGSE) company operators.

Choudhary et al. (2022) retrieved data thanks to 305 responses through an online questionnaire administered to executives working in the middle or senior management of SMEs. The part related to the measurement of the items and the CE of plastics has been adapted from the existing literature and has been modified to fit the context of the research. All the constructs were reflective in nature and were measured on a 7-point Likert scale anchored with 1 intended as “strongly disagree” to 7 corresponding to “strongly agree”.

Galatti et al. (2022) prepared a Likert-scale questionnaire to identify potential indicators to measure social aspects of CE in the textile and fashion sector. The social dimension of the CE and the social aspects of labour practices and decent work were divided into the following topics within the questionnaire: employment, labour/management relations, occupational health and safety, training and education, diversity and equal opportunity, and fair distribution of income.

Costa et al. (2022) adopted an online questionnaire to the Portuguese hotel industry obtaining 1407 hits in terms of response. The questionnaire comprises 20 questions, spread across seven sections: i) Accommodation Profile; ii) CE Awareness; iii) EC Challenges; iv) CE Enablers; v) CE Attitude; vi) CE Benefits; vii) CE and the Organizational Performance. The application and relevance of the CE concept, within the group of interviewees, were measured with a Likert scale in most of the questions and two open-ended questions, which were analyzed using content analysis.

Lehmann et al. (2022) have identified two dimensions, such as environmental degradation and resource efficiency, on the basis of the CE, using Eurostat and United Nations data from 28 European countries in the period 2011-2017. Through the dynamic panel models, they assessed the impact that investment, human capital, innovation and previous levels of circularity had on each dimension of the CE identified, comparing their impacts on both two dimensions.

Rodríguez-González et al. (2022) focused on the study of how green strategies (GBS) and eco-innovation (EI). This analysis was carried out via an empirical study on a sample of 460 companies in the automotive sector through questionnaires. To measure EI, an adaptation was made to the scale proposed by Doran and Ryan (2012) and Segarra-Oña et al. (2011) considering five items: “Focuses its investments mainly on EI activities”, “Increases awareness towards EI”, “Has a distribution of information on EI”, “Has constant training on EI”, “Participate in or develop R&D projects in EI”. While, to measure sustainable performance, an adaptation to the scale proposed by Gadenne et al. (2009) was measured through five items: “It significantly reduced environmental accidents”, “It significantly reduced energy consumption costs”, “Waste treatment significantly decreased”, “Waste dumping significantly decreased”, “Significantly reduced fines for environmental incidents”.

Liu et al., (2022) used the fundamental principles needed to establish a CE framework, as tabulated by the Ellen MacArthur Foundation (EMF, 2020), in order to empirically investigate the impacts of Covid-19 on the use of technological innovation and CE practices on organizational performance. Their aim was to comply with the unavailability of a typical consensus questionnaire and standards to measure industrial and economic activities related to CE and technological innovation. Within the framework of CE practices, it appears conservation and growth of natural resources, human capital, optimization of resource allocation and efficiency of industrial processes, that were introduced in the questionnaire sent to 480 manufacturing companies.

Dey et al. (2022) examined the adoption of CE in European SMEs (France, Greece, Spain and the United Kingdom) using a mixed methods approach (survey, interviews, case studies) to collect data from around 100 SMEs in each country. With regard to the circular economy, they analyze the areas relating to Design, Procurement, Production, Distribution, Usage/consumption, Reverse Logistics linked to Energy efficiency, Resource efficiency and Waste reduction.

Yu et al. (2022) investigated the manufacturing firms of Zhejiang Province, China. The survey was carried out through a telephone and e-mail survey and retrieved 308 valid questionnaires. All survey metrics were rated using a 7-point Likert scale. First, the authors focused on green design, measured via seven elements, mainly including reducing the use of hazardous raw materials, improving the use of materials, designing for recycling and reuse of products, etc. Second, concerning the recovery of investments, the drivers set was mainly composed of the sale of excess inventory and scrap, the recycling of reusable materials, etc. Finally, the environmental performance was estimated with environmental improvement in various aspects, such as the discharge of solid waste and wastewater, the use of toxic and harmful substances, the occurrence of environmental accidents, etc.

Roos Lindgreen et al. (2022) conducted a survey getting 155 responses and held 43 by Dutch and Italian companies active in the CE. The goal was to explore the use of sustainability assessment approaches and the use of CE; study the process of developing evaluation approaches; to find out the benefits and barriers to CE assessment. The analysis was conducted by measuring the following indicators used by the authors: Carbon footprint, Ecological footprint, Product environmental, Environmental life cycle assessment, Life cycle costing, Material flow analysis, Social life cycle assessment, Water footprint, Environmental accounting, GRI standards, Tailor-made circularity indicators based on a

life cycle approach, Tailor-made circularity indicators based on direct impact, Tailor-made sustainability indicators based on direct impact, Tailor-made sustainability indicators based on a life cycle approach, Single indicators Material Circularity Indicator, Material durability, Recycled content, Recycling rate, Time for disassembly, Volume of non-renewable resources not extracted, Volume of virgin material production prevented and Volume of waste diverted from landfill.

Darmandieu et al. (2022) investigated whether circularity in production processes can generate a reduction in the production costs of companies and the conditions that determine the intensity of this reduction. Data on 13,117 SMEs from the Flash Eurobarometer 2017 were implemented. The variables used to examine circularity were as follows: Reduction of production costs, Respondents to the Flash Barometer survey were asked, "What impact have resource efficiency actions taken on manufacturing costs over the past two years?". They recorded the responses as follows: "Significantly increased" was assigned the value 1; "Slightly increased" value 2; "Unmodified" the value 3; "Slightly decreased" value 4; "Significantly decreased" value 5. Referring to circularity in processes, it was created a variable in two steps. In the first stage, they used Eurobarometer information to perform a cluster analysis. Respondents to the Flash Eurobarometer survey were asked: "What actions is your company taking to be more resource efficient?" Seven practices were evaluated: "Water saving", "Energy saving", "Use predominantly of renewable energy (e.g. own production via solar panels, etc.)", "Material saving", "Waste minimisation", "Selling the waste material to another company" and "Recycling, reusing material or waste within the company". Finally, they recoded the answers via a dummy variable with a value of 1 if the company had implemented the practice, or 0 otherwise.

Bag et al. (2022) explored enablers in the context of the contribution of SMEs to the CE. They used a survey to collect data from 240 worker in SMEs of South Africa. They focused on the following characteristics: The company is dedicated to reducing the consumption of raw materials and energy; The company initiatively enhances the energy efficiency of production equipment; Product packaging materials are used repeatedly; Waste produced in the manufacturing process is recycled; Waste products from consumers are recycled; Waste and garbage are used after reprocessing to manufacture new products.

Portillo-Tarragona et al. (2022) offered valuable novel insights into the explanatory capabilities of accounting, which could integrate the measurement and valuation of related intangibles and firm-specific potentials in an environmental management framework. The authors used a model of the cause-and-effect relationship between circular patents held by firms and their capabilities, through a PLS-SEM. The chosen sample counted 120,406 patents from 2,216 Spanish companies, integrating patent types that could foster the sharing economy and CE, as well as patents on waste and other green patents.

Khandelwal and Singh (2022) focused on the factors related to green production in Indian SMEs and studied companies' attitudes towards green practices. Basically, with a survey conducted in the managerial area of SMEs, it emerged that firms were oriented to energy efficiency, water saving, green action, and waste management.

Henry et al. (2022) started with an explanatory scenario concerning the motivation behind the entrepreneurs; indeed, they want to conceptualize the archetype of a "grassroots" circular entrepreneur based on a theoretical framework and direct interviews with these actors. They analysed entrepreneurial identity and its CE motivations. Through a survey of 57 entrepreneurs in Europe and Australia, pieces of evidence arise a new category of sustainability-focused entrepreneurs, oriented to the CE. In the broad meaning of the term "circular economy", the visions of the entrepreneurs interviewed focus on the protection of the individual and the related social aspects.

Soh and Wong (2021) tested whether the relationship between companies' innovative eco-design capabilities and sustainable competitive advantage was positively moderated by customer involvement. They elaborated on the relationship between innovative eco-design capabilities and environmental performance to understand whether it was mediated by sustainable competitive advantage. After interviewing Chinese manufacturing companies, 216 questionnaires were analysed using SmartPLS software. Exploitation of innovative ecoproduct design capabilities and customer involvement, Sustainable competitive advantage, Environmental - Social - Financial performances were identified among the questionnaire sources. The results stated that the transition to the CE could be made with customer involvement and the exploitation of innovative eco-design capabilities for a sustainable competitive advantage. The authors emphasised the role of international and local advocacy groups and governments, which should continuously engage and educate on sustainability performance.

Van Langen et al. (2021) examined CE literature and collected the opinions of three different categories in Italy: Researchers, Economists and Administrators. With 122 responses, half of the respondents in the administrators' group consider the "recycling phase" and "eco-industrial parks and smart cities" among the most CE critical aspects. The economists' group attaches more importance to "sustainable supply chains", the "recycling phase" and "new business models". Emerged that society was far from achieving the goals of CE and that the action should be forced by policymakers and economic actors. Concerning the policy instruments and other CE measures, it needed to implement items, such as "investment in research to promote innovation/circular technology" and "investment in adequate circular infrastructure (to promote ease of transport, storage, marketing ...)"; "the creation of adequate circular infrastructure"; "the creation of take-back networks and markets (new financial instruments, ethical finance, etc.)"; "the adoption of a circular economy"; "the adoption of broad and long-term innovative policies at the national level" and "the promotion of research and implementation of circular product design".

Marín-Vinuesa et al. (2021) showed the need to measure CE, emphasising the complexity of finding a clear indicator. It is proposed to measure patents related to CE. A model of cause-and-effect relationships between CE-related patents and firm capabilities was defined within the theoretical framework of dynamic capabilities. This study

analyses a sample of 2,216 Spanish companies holding 120,406 patents using PLS-SEM. They emphasised the importance of firms' innovation capacity related to patenting, collaborative innovation, persistence in patenting or the ability to collaborate with research institutes.

As a result of an extensive literature review on the conceptual framework of the Circularity Measurement Toolkit, (CMT) Garza-Reyes et al. (2019) enabled the assessment of the degree of circularity in manufacturing SMEs. Existing studies in the literature provided the basis for the suggested toolkit by defining different types of circular practices. They provided the development of a conceptual framework for the proposed CMT, its verification and its validation with a Delphi study, subsequent to a systematic literature review to identify gaps.

Paes et al. (2019) investigated the steps made and further action achievable regarding the connections between CE and bio-waste management in the context of environmental sustainability. They performed a literature review and then created a swot analysis to examine CE in the context of organic waste. The business environment and public policies for CE could create various possibilities to increase the efficiency of industrial processes and reduce the consumption of natural resources. The authors traced the importance of government support, which has been insufficient so far.

Zhu et al. (2019) chose to investigate China's small farms to understand their steps towards CE. Specifically, they interviewed the working staff and the farmers and they discovered not only the many benefits from a financial point of view but also the benefits to the entire neighbouring community, which benefited from the clean air. The authors highlighted how government intervention gains significance in emerging economies under the form of subsidies. For validating CE instruments, the government must ensure that there is a good willingness to act on the entrepreneurial part.

Research limitations. The major limitation of this first bibliometric analysis consists in exclusively consulting articles published in the Scopus subject area 'Business, Management and Accounting' in the recent time horizon (2018 - 2023). However, this study represents the first working step to subsequently integrate the results from the Web of Science database. Applying similar methods, it is intended to carry out these research criteria in Web of Science to enrich this work. In addition, this first proof can be completed with the analysis of references and citation indexes, authors and relevant institutions involved in the publishing process, among other useful information.

Managerial implications. From the literature consultation, it appears necessary to identify some indicators for SMEs, to improve communication of the processes and changes occurring towards CE. This initial work-in-progress denotes a large part of the literature willing to align policymakers and governments and the lack of unique CE indicators. Indeed, a standard indicator incorporating the entire CE dimensions is still in its infancy, as is the CE principles adoption in SMEs (Rittershaus et al., 2023). However, it emerges the essential government role in the ecological transition, by providing also considerable economic support to SMEs, often lacking sufficient sources to adapt to sustainable standards. For instance, on the waste management side, governments could count the expenses that firms undertake to deliver special waste. Referring to CE innovation practices, governments could request companies' data on renewable energy consumption or the amount for publishing or acquiring green patents (Marín-Vinuesa et al., 2021; Portillo-Tarragona et al., 2022). The government's intention might include measuring the most eco-efficient solutions adopted in the companies' supply chain (material, energy and water reduction), and assessing sustainable efforts also via the reduction of environmental emissions. Consequently, a specified survey with these types of information could be submitted to companies (Liu et al., 2022), combined with other financial documents typically required.

Originality of the paper. The novelty of this work-in-progress concerns the application of two steps of literature review, first descriptive and then thematic, in order to deeply explore the state of the art. These two stages permitted to design and suggest a new insight, including the excellent progress reported by researchers in recent years. The bibliometric literature review highlighted the need for a standardised indicator for practical CE in SMEs, similar to a score produced by Bloomberg or Refinitiv for listed companies. This preliminary work proposes the implementation of a questionnaire to quantify the efforts of SMEs towards CE. The essentiality of government action in unifying CE assessments for all companies, including SMEs, has been learnt from the literature.

Keywords: Circular economy (CE); CE indicators; CE measurement; standard survey; SMEs.

What Is Circular Economy?

Could it be the more the merrier in a B Corp? A Spatial Error Model

CHIARA COLAMARTINO* PIERLUIGI TOMA*

Abstract

Considering the spread of B Corp certification and its success among stakeholders, particularly consumers, this project aims to assess the steps implemented by Italian companies, by exploring the sides of the workers and governance. The aim of this work-in-progress consists into test if the relationship between the overall score produced by B Lab and the number of employees can be influenced by the geographical location of the firms. This project seeks to analyse 121 B Corp firms located in Italy. Ordinary Least Square (OLS) and Spatial Error (SE) models were implemented in the analysis for the year 2019. This work reveals some spatial clustering in the residuals. This first research draft aims to provide the basis for appropriate reflections that could prove useful for managerial decisions. Indeed, if geographical location affects the relationship between the B Corp score and the organisational standards of firms, a twofold purpose of the work is suggested. First, firms that are not yet B Corp would benefit greatly by learning from neighbouring firms that have already achieved certification. Second, companies that still exhibit low B Corp scores can be inspired and replicate the successful organisation of neighbouring B Corp companies with high scores.

Framing of the research. The Sustainable Development Goals (SDGs) cover several directions. Besides focusing on the environment and the protection of land and resources, it seeks to achieve social goals such as inclusion and respect for the individual. This topic is of particular interest to companies, as they are the places where the culture of respect can be spread, without neglecting economic goals. In this regard, B Lab outlines a series of indicators that take into account all dimensions of the company, which are candidates as B Corp firms. It is precisely B Lab the institution that issues the certification, after a meticulous examination of the companies' performance and scores. Companies must be aligned with performance standards regarding five areas (Governance, Workers, Community, Environment, and Customers), respecting legal requirements, the consideration of all stakeholders in decision-making must be incorporated into the company's guidelines and subscribing to the B Lab term sheet and the Declaration of Interdependence, and also paying the yearly certification charge. The last point is a commitment to maintaining standards and embodies the seriousness of the certification received.

Purpose of the paper. Considering the spread of this certification and its success among stakeholders, particularly consumers, this project aims to assess the steps implemented by Italian companies, by exploring the sides of the workers and governance. Furthermore, to improve comprehension of the phenomenon behind the spread of these certifications, this project intends to investigate the relationship between the score obtained by B Lab and the consideration of the human and innovation factor in the company. This investigation is restricted to Italian B Corp companies. Because of the different cultural scenarios that may concern the geographical positioning of the analysed companies, a geospatial analysis will be performed. Particularly, it is questioned if the relationship between the overall score produced by B Lab and the number of employees can be influenced by the geographical location of the firms. The exploration intends to comprehend if the score assigned by B Lab is influenced by the number of employees of the analysed B Corp firms and if this relationship depends on the geographic location of the firms. Principally, the aim of this work-in-progress consists into test whether the relationship one chooses to investigate is also affected by a spatial dependence of the observations. The first underlying connection emphasises the strength of a working team composed of a larger number of workers. This relationship is controlled also by the number of managers and board members. Indeed, in successful sustainable projects, several decision-makers are involved, who have the opportunity to express their views and share their visions with others. Specifically, analyses of social psychology have shown in the literature that large groups, such as the workers' team and board, demonstrate a better capacity for resolution, and a greater number of critical judgements and perspectives on a given issue (Harrison, 1999; Haleblan and Finkelstein, 1993).

Furthermore, Wiersema and Bantel (1992) refer to manager traits and the role of manager culture in the decision-making process. Thus, considering the similarities between neighbour firms, it can be relevant to explore if the relationship could be affected by the positions of the observations. For this purpose, spatial econometrics permits the detection of spatial effects in regression analysis.

Methodology. *To demonstrate the research question, this work-in-progress seeks to analyse 121 B Corp firms located in Italy. The list of firms was collected from the B Lab databases available on Data World. Consequently, these firms have been retrieved on AIDA (Analisi Informatizzata delle Aziende Italiane) from Bureau van Dijk resources. From the exploration of AIDA, company composition data could be extrapolated to obtain the constitutive side of managers, board and employees. Data was collected for the period 2015-2020.*

An initial exploration of the collected data was carried out through Tableau software, which made it possible to show the location of the analysed firms. Subsequently, an Ordinary Least Square (OLS) and a Spatial Error (SE) model were implemented by Stata software. This type of simultaneous autoregressive model was selected to consider the slight but significant clustering of the residuals (Houlden et al., 2021). This procedure permits comprehending insights into the residual distribution. In order to consider the significant clustering of residuals by capturing a single model for the entire sample, this technique assumes that the residuals, rather than the structures of the data variables, are influenced by their neighbours (Golgher and Voss, 2016). For the creation of this peculiar residual distribution, spatial econometrics enables the use of geo-coded data to obtain information on the dependence of observations on their geographical location. It requires longitude and latitude data, that have transformed into X and Y coordinates, relating to the location of the observations. In this work-in-progress, the distance matrix was calculated with the distance between B Corp firms. In order to measure the position of all analysed firms, these coordinates were collected for each observation, by considering the corporate headquarters.

In the construction of the OLS model, the literature review allowed the addition of specified variables that could be included in this draft. A primary focus on the study of Ardito et al. (2021) enabled the investigation of an already explored relationship between gender diversity on boards of directors. According to the logical idea of Ardito et al. (2021), the score given by B Lab to the certified B Corp was handpicked as a dependent variable in this work-in-progress, in light of the overview that the score performs towards the different parameters concerning the Environment, Workers, Customers, Community, and Governance. Overall B Corp Score assigned to each company by B Lab was obtained from the dataset extracted from Dataworld. These scores represent an effective benchmarking tool because they compare companies with high performance on various aspects of economic, social and environmental sustainability (Honeyman & Jana, 2019; Carvalho, 2021). The process of accreditation begins with a period of self-assessment for the firm. The B Corp Effect Assessment questionnaire allows all organizations to benefit from an assessment of their business's sustainability in terms of governance, economic outcomes, environmental performance, and social impact. The questionnaire automatically produces a score ranging from 0 to 200: organizations that achieve a minimum of 80 points have the option to go to the next level (B Lab). The upcoming level is a call conference with a member of the B Lab team aimed at verifying and deepening specific areas of the questionnaire. Before receiving the final green light, it is normally asked to provide any papers that may certify and validate the self-declared assertions in the questionnaire (B Lab, Impact Assessment).

The selection to integrate into this work-in-progress the overall score B Corp allows for all the factors that constitute this score, ranging from an organisation's contribution to the economic and social well-being of the communities in which it operates up to the overall mission, ethics, accountability and transparency in social and environmental issues (Ardito et al., 2021).

The score produced by B Lab is not based on profit and loss account observations or data made public by the company through financial statements. The score is created on the basis of a declaration submitted by the company when applying for certification. For these reasons, the variables chosen as independent and control variables were obtained from public financial statements and they refer to the management decision of the company. Thus, for the selection of the independent variable, it was ranked the number of employees. As key organizational information, the number of employees represents stands out as one of the most powerful stakeholders, capable of ensuring better performance in terms of employee well-being, as reported by Ardito et al. (2021). Specifically, the number of employees is considered to test workforce and motivation, as drivers in sustainability-oriented companies, such as B Corp.

Moreover, by exploiting some suggestions that appeared in Arend (2014) and Ardito et al. (2021), this work-in-progress proposes to test as control variables the number of members composing the management team and board of directors, to elaborate on the further possibility that could be influenced the B Corp's overall score. Thus, control variables were represented by the average age of managers and the board, a dummy indicating whether the company has collected patent rights, and the percentage of women on the board or among managers. These chosen variables aim to intercept and communicate the optimal directions for companies not yet B Corp, which intend to move towards this type of certification.

The need to include a variable connected to innovation, such as the detention of patent rights, may become a relevant point in the debate on the orientation towards innovative actions. This variable may affect the recognition of the B Corp, as underlined by Ardito et al. (2021) and it may influence environmental innovation (Haščič, and Migotto, 2015).

The average age of managers was chosen as a control variable, by questioning if the higher value for average age corresponds lower value for the overall score. Indeed, managers' and directors' backgrounds represent a significant role in explaining performance variations between businesses. Their personalities, values, expertise, and experiences cover a significant impact on how they think and make decisions (Hambrick & Mason, 1984; Hambrick, 2007).

Referring to the percentage of women on board and among managers, this control variable intends to measure if the woman's presence could contribute to the enhancement of the overall score. The variable is recurrently detected in the literature in testing related theories on board diversity and firm performance (Rose, 2007). Furthermore, including this

variable is connected with the fact that it is better to have female directors when aiming for an overall improvement in Corporate Social Responsibility (CSR) performance (Ardito et al., 2021). Similarly, considering that CSR goals are embedded in the standards that a B Corp should contain, we choose to include it in the analysis to test how much the presence of women on the board may have affected an overall B Corp score.

Results. From the first exploration of the position of considered Italian B Corp firms via Tableau software, it appears that the majority of B Corps is located in the Central North. Through the inclusion of a density map relating to the higher overall B Corp score, it is possible to obtain a primary geographical distribution of the observations. The average B Corp score is higher in areas of the map where the colour is more saturated. However, considering the descriptive statistics on the entire sample, the average overall B Corp score is 90 points, the minimum is 80 and the maximum is given as 148.

The OLS and SE models focused only on the year 2019 because it was found to be the most inclusive year of observations and the firms reported no significant changes in previous years, both in terms of overall B Corp score (dependent variable) and for the independent variables included in the model. For the baseline and OLS models, Moran's I test was examined to reveal the existence of global spatial autocorrelation. The global Moran's I statistic essentially compares the actual value of each individual's residuals with a weighted matrix of neighbours and generates a value for the overall geographical clustering of the model's performance. Moreover, it was used to quantify the spatial autocorrelation of the residual error components (Moran, 1950). The value of each residue is therefore compared to that of its closest neighbours to get a clustering value for each place by means of nearby Moran's I. (Moran, 1950). The values for both measures range from -1 (clusters of dissimilar values) to 1 (clusters of similar values), with 0 denoting no autocorrelation. Moran's I index was calculated for the year 2019, reporting a significant level of autocorrelation. In this first proof, Moran's I test may permit an explanation of a significant positive spatial autocorrelation among the regression residuals, thus suggesting a re-formalization of all the results previously obtained with OLS and a redefinition of the model. This procedure appears to be the most commonly used specification test for spatial autocorrelation (Anselin, 2022; Arbia, 2014), derived from a statistic developed by Moran (1950) as a two-dimensional analogue of a test for correlation of univariate time series (Cliff and Ord, 1975).

The value of this index permits it to move forward in the exploration of the SE model. Indeed, the SE approach includes the spatial autocorrelation structure into a linear model and adds λ as an autoregressive parameter to account for these patterns. This term is accomplished using a spatial weights matrix, in which each location's nearest neighbours and the weight assigned to each neighbour based on their closeness are specified. A variance-covariance matrix built using the spatial weights matrix is then used to describe the spatial dependency of a place. In the model computed, λ and its likelihood ratio illustrate a significant value, respecting the acceptable range. This value implies some spatial clustering in the residuals, which could be driven by underlying random processes and thus could be effectively captured by an SE model.

Research limitations. The main limitation highlighted in this first draft, which intends to be completed and improved, is the lack of several variables that allow for a better understanding of B Corp governance. As it turns out in other works that have chosen to examine relations related to board composition and the inclusiveness of women in the decision-making process, the consultation of a more extensive database could consider further control variables that would better test the research. For the same reason, consulting other databases at the European level would allow the analysis to be extended beyond Italy. This last point would be interesting in light of the different socio-economic cultures that characterise the European continent.

As outlined by B Lab Impact Assessment, the overall score is created based on evaluations expressed by the organisation towards the company requesting certification. This score is made up of several factors, obtained from a survey that B Lab. This characteristic could trigger objections about the scoring's impartiality and the sense of comparing it with factual variables from the business statement.

By including control variables that can report more on the sustainable aspect of the company, all factors affecting the B Corp's assessment can be included.

An important limitation emerges also in the choice of measuring innovation through the company's entitlement. For while this remains one of the few elements to test a firm's attitude to invest and publish its know-how, thereby making innovation available to other firms, it also becomes a limiting measure available only for some firms. Furthermore, understanding innovation from a broader perspective might be useful to assess the progress made by individual companies in revolutionising governance, thus noting the changes that have occurred over the years. This first project step aims to better explain the relationships in the future, by integrating also a distinction regarding the industry sector of the analysed companies. Another interesting point could arise from the different B Corp firms' sizes. Improving the analysis of the geographical dependence with these differentiations may also offer other practical insights. It was decided to limit the period of analysis to the time frame 2015-2020, focusing the SE analysis on 2019. A more comprehensive subsequent analysis could cover the years 2019-2022 in order to better capture the governance changes following the Covid-19 pandemic and the war.

In recent years, other Italian companies have obtained B Corp certification, demonstrating that interest in this topic is growing. In a second phase of the work, it may be interesting to also include new Italian B Corp entries, in order to test which changes have been made in governance to enable compliance with B Corp standards. In a subsequent phase, the sustainability report of firms might also be considered, in case it is publicly disclosed by the firm, in order to examine its relation to the steps taken by the firm towards the realisation of the 2030 Agenda goals.

Notwithstanding the underlining numerous limitations related to variables and sample division, this first research draft aims to provide the basis for appropriate reflections that could prove useful for managerial decisions.

Managerial implications. By overcoming limitations and incorporating suggested changes, a completed version of this work-in-progress could represent a view to providing managerial advice. Spatial Econometrics can reveal aspects related to the culture of a given territory. Indeed, it could summarise reasonably the cultural characteristics and phenomena that have taken place in a specific territory. By detecting similarities between neighbouring B Corp companies, managers and decision-makers of companies wishing to become certified may observe the behaviour of their neighbours in order to draw examples from them. This work-in-progress could offer a view referring to the potential of workers' teams in a more sustainable context of firms. In particular, the contribution of the team members might serve to create a meaningful impact and might attempt to achieve the desired inclusion within the working environment. To not let industrialisation, deprive the need for human presence, but rather support the work of qualified employees, this research project strives to emphasise the importance of human experience in production processes.

Originality of the paper. This work stands in the broad discussion that has been growing in recent times on B Corp firms. In particular, by orienting the focus towards the customer, it is the first stakeholder the business strives to satisfy in terms of the green trust (Bhattacharya and Korschun, 2008). This primary stakeholder shows a growing increasingly trusting in businesses that adopt environmentally friendly practices (Krause, 1993). Consequently, companies are increasingly using tactics geared at green certifications recognized at the European but also worldwide levels, in order to accomplish these aims (Cronin et al., 2011). As a result, the incorporation of environmentally friendly manufacturing practices and design into a company's product strategy is guided by a set of certifications (Szabo and Webster, 2020). However, the most controversial question is whether a company can convince customers through third-party certification. For these reasons, this work-in-progress wanted to focus on the company's strategy of applying as a B Corp. This type of certification allows for an adjustment and improvement of internal performance (Honeyman and Jana, 2019), but it also has very good consequences for external actors. Investigating the behaviour of already B Corp certified companies and their organisational practices could be a key element for companies wishing to apply for the same certification. If geographical location affects the relationship between the B Corp score and the organisational standards of firms, a twofold purpose of the work is suggested. First, firms that are not yet B Corp would benefit greatly by learning from neighbouring firms that have already achieved certification. Second, companies that still exhibit low B Corp scores can be inspired and replicate the successful organisation of neighbouring B Corp companies with high scores.

Building an Organizational Sustainable Identity: An Exploratory Analysis of Brazilian Coffee Producers

MARCO BALZANO* YULIIA KYRDODA* DONATA VIANELLI[▲]

Framing of the research. *In recent years, the importance of environmental issues to practitioners and academics has grown, reflecting their essential role in sustainable development. Sustainability has emerged as a critical topic of concern for individuals, organizations, and nations worldwide, with sustainable development being seen as a means of achieving economic, social, and environmental well-being for present and future generations (Fuente et al., 2022; George and Schillebeeckx, 2022; Vasileiou et al., 2022). The concept of sustainable development is multidimensional, involving the interplay between economic, social, and environmental considerations (Vervaal et al., 2022). Economic dimensions refer to the ability of an economy to grow sustainably and equitably, without degrading the natural resource base or compromising future generations' ability to meet their needs (Luo and Zheng, 2013). Social dimensions of sustainable development encompass the well-being of individuals and communities, including access to basic needs such as food, water, and healthcare, and social equity and justice (Sancha et al., 2015). Environmental dimensions focus on protecting natural resources, reducing pollution, mitigating climate change, and preserving biodiversity, among other issues (Lopes de Sousa Jabbour et al., 2017; Simpson et al., 2007).*

Environmental issues are widely recognized as intertwined with economic and social factors, thereby necessitating a multidisciplinary approach that leverages the specialized knowledge of practitioners and academics across diverse fields. Thus, an understanding of sustainable development and its three dimensions is crucial for policy-makers, business leaders, and researchers alike to ensure a sustainable future (Silvestre and Țircă, 2019). Besides, there is growing evidence that sustainability pathways can bring benefits not only to economies and the achievement of societal outcomes but also to firms. In particular, by integrating sustainability into their operations and business models, firms can gain a competitive advantage by reducing their environmental impact, increasing efficiency, and enhancing their reputation and brand value (Carter et al., 2021; Casidy and Lie, 2023; Gupta and Kumar, 2013; Kiefhaber et al., 2020).

Firms that implement sustainable practices can improve their supply chain management and reduce waste, which can translate into cost savings and improved efficiency (Le et al., 2022). Furthermore, firms that adopt sustainability strategies can enhance their reputation and brand value by demonstrating a commitment to environmental and social responsibility. This, in turn, can lead to increased customer loyalty and stakeholder support (Baumgartner and Rauter, 2017). The integration of sustainability into business strategy can drive innovation as firms seek to develop new products and services that meet changing consumer preferences and societal needs (Zhang et al., 2022). As a consequence, the firm can obtain the creation of new markets and revenue streams, as well as improvements in organizational performance (Aman and Seuring, 2022; Fuente et al., 2022; Keränen et al., 2023; López et al., 2023; Wood et al., 2021). Among performance implications, Aman and Seuring (2022) observed that sustainable approaches have tangible effects on focal firms' operational performance, which covers a range of critical factors like cost reduction, speed, time, and flexibility. Broccardo and Zicari (2020) conducted a study that showed the advantages of implementing a sustainable strategy for improving profitability. The positive effect was more pronounced for larger firms than for small and medium-sized ones. It is likely that larger firms have greater resources to devote to social and environmental initiatives. Thus, firm size has an impact on sustainability implementations and related performance implications.

As Keränen et al. (2023) suggested, the concept of sustainability is connected with the organizational identity literature. In this perspective, organizational identity literature provides a useful framework for thinking about how sustainability can be incorporated into an organization's identity, values, and purpose, and for understanding the factors that can support or hinder the effective implementation of sustainability practices within an organization. Drawing on organizational identity theory (Albert et al., 2000; Gioia et al., 2013; Sasaki et al., 2020), organizational identity is viewed as a combination of centrality, distinctiveness and temporal continuity. Haslam et al. (2017) proposed

three different perspectives for viewing organizational identity. First, organizational identity represents a social construction that emerges from collective sensemaking processes to give meaning to shared experiences and to answer the core question of "who we are as an organization". Second, merging with social identity theory (Ashforth and Mael, 1989), it is seen as a part of social identity, where the understanding of "who one is" relates to the ability to identify oneself as a member of a particular organization. Thus, organizational identity becomes a tool for determining organizational behavior. Third, the view of organizational identity as a social actor is framed within the institutional theory (Zhao et al., 2017), where it includes external legitimation claims and behavioral commitments that determine the characteristics of an organization.

The formation of organizational identity is a process that entails a series of distinct stages. According to Gioia et al. (2010), such formation of an organization's identity is dynamic as it is shaped by the interactions between its members and external stakeholders. This process can be broadly classified into eight distinct stages, each of which plays a crucial role in shaping the identity of the organization. The first four stages of the identity formation process involve the articulation of the organization's vision, the exploration of potential meanings and values, the experience of contrasting perspectives, and the convergence towards a shared and consensual identity. These initial stages serve as a foundation for the subsequent recurrent actions that influence the ongoing evolution of the organization's identity. The following four stages - negotiating identity claims, attaining optimal distinctiveness, performing liminal actions, and assimilating legitimizing feedback - represent key processes that occur throughout the identity formation process. Negotiating identity claims involves reconciling conflicting views and opinions while attaining optimal distinctiveness involves balancing the organization's need for uniqueness with its need to conform to accepted norms and expectations. Performing liminal actions involves exploring new and potentially transformative experiences while assimilating legitimizing feedback involves seeking and incorporating external validation and recognition. Together, these eight stages represent a comprehensive framework for understanding the complex and multifaceted process of organizational identity formation.

The current trend toward sustainable business practices has led to the evolution of organizational identity, with an increasing emphasis on the integration of environmental considerations (Simões and Sebastiani, 2017). However, despite the growing attention paid to this subject, there is limited empirical evidence available. Some scholars have highlighted the crucial role of entrepreneurs in promoting sustainable development within the business context. For instance, Wry and York (2017) established a link between role identities and opportunity recognition, demonstrating that the more identities a founder displays, the higher the likelihood of achieving both commercial and social objectives. Similarly, York et al. (2016) proposed a hybrid founder identity that incorporates both environmental and commercial considerations, seeing identity as the motivator for the development of sustainable practices. The research findings indicated that entrepreneurs' attitudes toward sustainability are shaped by self-selection.

Moreover, scholars have contributed to the research on organizational sustainable identity and green organizational identity highlighting the importance of interpreting the reality of a business and its context in shaping the identity of the organization (Chang and Chen, 2013; Chen, 2011; Cornelissen et al., 2021; Frostenson et al., 2022). These studies have contributed to the development of a better understanding of the formation of organizational identity, its relationship to sustainability, and its impact on innovation and performance outcomes. For example, Frostenson et al. (2022) argued that organizational sustainable identity is more of a social construct. The authors proposed that the sustainability identity of an organization is developed through the interpretation of the reality of its business and the context in which it operates. The discourse and sensemaking within the firm contribute to the construction of a specific organizational sustainability identity, which is shaped by the beliefs about the sustainability of organizational members and communication with customers. A study conducted by Cornelissen et al. (2021), examined the formation of hybrid organizational identity among social firms. The authors proposed that this process is akin to character formation, as the leaders and members of the organization experiment with provisional identities to create an integrated hybrid organization. This process involves two interrelated parts: first, figuring out who they are in terms of their dual mission and organizational character, and second, the collective meaning of "what we are doing" in terms of product and social impact strategies.

Regarding green organizational identity, Chen (2011) defined such a concept as an interpretive scheme used to frame the behavior of an organization's members in view of a sustainable approach. The analysis of the relationships between environmental organizational culture and environmental leadership as antecedents of green organizational identity and green competitive advantage as an outcome was examined by Chen (2011). It was found that both antecedents are positively associated with green organizational identity and green competitive advantage, respectively. Following this line of research, Chang and Chen (2013) noted that green organizational identity positively affects green innovation performance, with environmental commitment and organizational legitimacy mediating this relationship. In line, several researchers (Soewarno et al., 2019; Song and Yu, 2018) explored the mediating effect of green organizational identity within green innovation strategy- green innovation relationships in different research settings. In particular, the findings of Song and Yu (2018) claimed that green innovation strategy is positively related to green organizational identity, which consequently positively affects green innovation. Similar results were obtained by Soewarno et al. (2019). Additionally, the analysis of Soewarno et al. (2019) extended a mediation research model by including environmental organizational legitimacy. The results revealed that stronger legitimacy would lead to better green innovation performance and gain more social support.

Purpose of the paper. This study is part of a wider and still ongoing research that bridges organizational identity theory literature (Albert et al., 2000; Gioia et al., 2013; Haslam et al., 2017) with the sustainable concept (Kieffhaber et

al., 2020; Verwaal et al., 2022) to advance our understanding of the organizational pathways to building organizational sustainable identity. We analyze organizational sustainable identity as a social construct that frames organizational behavior by introducing relevant norms and values toward maintaining sustainable development. We argue that by implementing economic-, social- and environmental-based mechanisms, firms shape organizational identity towards a sustainable one. Thus, the purpose of this study is to explore key pathways leading to the creation of an organizational sustainable identity. The findings are based on a qualitative analysis of 26 Brazilian firms operating in the food industry. The model comes from an exploratory analysis of in-depth semi-structured interviews on the pathways for developing organizational identity integrating sustainable aspects. Thus, we propose an exploratory framework related to the formation of an organizational sustainable identity.

Methodology. *The study follows a qualitative approach which allows analyzing how a sustainable identity can be built into organizations. In detail, we adopt the narrative inquiry approach (Balzano and Vianelli, 2022; Bloom et al., 2021; Paschen and Ison, 2014).*

Consistently with Riessman's guidelines (2008), the analysis phases include attending, telling, transcribing, analyzing, and reading. Thus, initially, we build a framework to have a comprehensive image of the theoretical background and familiarize ourselves with the research context. Then, we proceed with data collection. We framed the study within organizational identity theory, assuming that identity is built on personal and collective narratives that are used for sense-making and understanding values and ethics (Humphreys and Brown, 2002). In this view, sustainability is seen as a collective construct that provides the environmentally oriented character of an organization's actions. Based on the literature review, sustainable practices exposed three aspects which were covered in our interview protocol: economic, social, and environmental. All the interviews were recorded with the interviewee's permission and lasted from 45 to 90 minutes. In the transcribing phase, we completed line-by-line coding, which allows for building narrative maps and structures. The procedure was conducted by two researchers independently; thus, we obtained an acceptable level of intercoder reliability (O'Connor and Joffe, 2020). Next, we grouped codes into logical categories which reflect the apparent themes. This step facilitates patterns' visualization for proposing the final model. Lastly, we review the obtained evidence together with external readers in order to ensure a holistic and coherent presentation of the research findings.

The primary data consists of 26 semi-structured narrative interviews conducted with managing directors and founders of purposefully selected case firms. Purposive sampling, in this case, is relevant as all units of the analysis share the same characteristics in terms of environmental conditions and regulatory requirements (Sohns et al., 2023). The case selection is based on such criteria: first, performing sustainable practices by the firm. Next, firm size - only SMEs have been included, and industry - the analysis focuses on the food sector, particularly coffee producers.

To maintain respondent confidentiality, we assigned a random code for each interviewee (A1, A2, etc.), which is aside from cited quotes.

Results. *The qualitative analysis revealed distinct patterns in the interplay between organizational identity and sustainability, demonstrating the integration of environmental approaches into the construction of organizational identity. Through an analysis of interview data, we identified patterns where participants discussed their perceptions of and implemented practices toward sustainability. We utilized second-order labeling to capture quotes that exemplified the shared perspectives among participants. Here we report some representative quotes that inspired our analysis. For instance, the following quote, "When we started our path in sustainability, we were attracted by the premium", represents the theme of sustainability-related economic incentives. Another manager framed sustainability as a matter of lifestyle, with its roots originating in the sphere of personal values, "We are always worried about sustainability, especially my father [prior firm owner]. We have been reforestation for 15 years. We care about the ecological system that provides the fauna ecological corridors between the forest areas and the water source as lakes and rivers".*

The analysis identified three mechanisms through which firms can transform their identity into a sustainable one. For instance, the economic aspect involves offering premium prices that align with the organization's commercial objectives. As one respondent noted, "some buyers pay a little bit more, as a premium. But in general, it is more related to the proximity of us to the buyers from the external market."

The social aspect, on the other hand, entails treating employees fairly. One interviewee stated that "we help each other. I have the machinery to help them (workers), and they work for me sometimes. We pay a good price for the service provided. It is not a registered relationship, but it is a very fair relationship. We don't exploit each other. It is very natural."

Finally, the environmental aspect involves implementing sustainable activities and practices such as preserving nature, improving soil conditions, and saving water resources. As one participant mentioned, "We also try to decrease the use of chemicals and use more biological inputs. It is not easy, but with good consultancy and good workers, it is possible to do so." Another respondent stated that "We consider the preservation of the forest and water resources. In the past, it was not preserved. In 2013 and 2014, we had a drought in our region, so we started to worry about it.

Based on the empirical findings in Fig. 1, we propose our exploratory model.

Fig. 1: An exploratory model of an organizational sustainable identity formation

As Fig. 1 shows, through our analysis, we have identified a range of motivating factors that prompt managers to develop a sustainable organizational identity. These factors are often grounded in personal values, intrinsic motivation, environmental concerns, and financial rewards. Interestingly, the adoption of sustainable practices is often supported by external stakeholders such as suppliers or clients, which facilitates the translation of these motivating factors into tangible actions. For instance, one of the respondents said: “In 2019, we met a person from [name of an organization that provides technical support and courses for farmers]. He appreciated our coffee and suggested us to invest in sustainable farming, which, in turn, would help to sell coffee for a higher price”. Another interviewee mentioned, “We had some visits of exporter firms around here. Also, cooperatives and coffee buyers facilitate the transition to more sustainable way of production. They offer technical support and a small premium per bag of coffee”. Sustainable actions align with the three subdimensions of sustainability, namely economic, environmental, and social, resulting in the positioning of themselves as sustainable one and building favorable reputations. One manager said, “We try to keep our farm organized and clean, to give a good image and have a good reputation nearby. So, when someone comes here, they will see that we follow a sustainable path. We also try to identify the physical structure like the chemical room, signals communicating that we do not allow to hunt or fish in our land”. In this perspective, organizations can develop an integrated sustainable identity that reflects their commitment to long-term sustainability practices. For example, one participant stated, “In general, a sustainable approach could be beneficial as it helps to keep the farm organized, workers are treated fairly as they are registered, and also it makes our country a better place.” Such a strategic approach can help organizations achieve not only their environmental and social goals but also attain sustainable economic growth over time, building an organizational sustainable identity.

Research limitations. While this study provides novel insights, it is important to acknowledge a number of limitations. The complexity of organizational sustainable identity presents a challenge to achieving a comprehensive understanding of all its aspects, which in turn limits the generalizability of our findings. Additionally, our focus on SMEs in our case selection may not extend to larger firms, and the sampling may not represent all industries and regions, which further restricts the applicability of our findings. To overcome these limitations, future research could incorporate comparative studies in different countries and industries, as well as consider longitudinal studies to examine the evolving nature of these phenomena over time. Furthermore, to address the aforementioned limitations and further enhance our understanding of organizational sustainable identity, future research could explore alternative methodological approaches that account for the complexity and nuances of this concept. For instance, adopting a mixed-methods approach or utilizing alternative data collection methods could provide a more comprehensive and accurate understanding of organizational sustainable identity. Additionally, examining the impact of contextual factors such as national culture, industry-specific regulations, and market conditions could shed light on how these factors shape the development of sustainable identity in organizations.

Managerial implications. The results of this study offer valuable insights for managers on how to establish a sustainable organizational identity. Specifically, the study highlights the importance of taking actions to improve the environmental aspect, promote fair employment practices, and treat workers ethically. These practices not only demonstrate a commitment to sustainability but could potentially contribute to better performance outcomes, such as increased financial rewards and higher customer engagement. By positioning themselves as a sustainably oriented firm, organizations can differentiate their products from competitors, and leverage this identity as a marketing tool to maintain relationships with stakeholders.

Originality of the paper. Our analysis provides an exploratory model for understanding the process of creating a sustainable identity within an organization. By applying organizational identity theory, we have incorporated mechanisms of sustainability to examine the experiences and practices adopted by firms striving for environmental stability. This framework helps to illuminate the pathways that organizations can take to establish a sustainable identity and lays the foundation for future research in this area. Building on these exploratory insights, organizations could develop more effective strategies for promoting sustainable practices and driving long-term success.

The entrepreneurial capabilities-resilience-recovery path: A dynamic view on small cafés and restaurants facing the pandemic[♦]

ELISA MARTINELLI^{*} ELENA SARTI^{*}

Framing of the research. *Exogenous unexpected events (such as economic crises, and human and natural disasters) are constantly increasing in frequency and magnitude, causing important threats to business performance (Castro and Zermeno, 2020; Linnenluecke, 2017). To avoid negative effects, businesses should engage in dynamic adaptive strategies aimed at building resilience to recover and continue to generate revenues. To explain the reason why some businesses are able to face critical events better than others, extant literature has identified resilience as the ability to not only survive, but to be able to thrive through times of adversity (McManus et al., 2008). This literature evidence that business resilience is concerned - among others - with the business size and the sector. From the former viewpoint, small businesses are less able to display robustness and resilience capacity; from the latter perspective, manufacturing displays superior resilience capacity in the long-run compared to the services sector (Pearson et al., 2011). Within the latter, food and beverage (F&B) service activities □□defined as being “concerned with the provision of food and drink ready for immediate consumption” (Cousins et al., 2014, p. 6) □□have been the most impacted by the pandemic together with tourism. The sector was in good health and showed positive growth rates before the spread of the pandemic. However, FIFE (2022) estimates that in the period 2020-2021, 45,000 companies operating in the sector went out of business, with 23 billion euro of consumption which are still missing in comparison with the pre-covid period (2019), about a quarter of the total. The impact on revenues was even stronger, equal to - 34.4 billion in 2020, and - 10 billion in the first quarter of 2021, with a sharp drop in employees in public establishments, especially in central Italy, equal to -27.6%. Within the F&B sector, particular importance at the national level is played by cafés and restaurants. These businesses temporarily ceased operations during the lockdowns and had to heavily redefine their business models and operations e.g., they started to provide takeaway and receive orders online or via phone for delivery services (Dedeoğlu and Boğan, 2021) all along the pandemic spread period; this put seriously at risk their survival, also considering their mainly nature as micro and small businesses.*

Some studies have evidenced the role of resources and capabilities, especially when they are dynamic, to feed resilience (Battisti and Deakins, 2017; Martinelli et al., 2018); however, this literature is still in development. In small companies where there is only one decision-maker which is the entrepreneur, the latter individually develop and applies DCs to sense and seize opportunities, face threats, and evaluate and prescribe changes in the configuration of resources (Teece, 2014).

Purpose of the paper. *This research aims at exploring if those small businesses operating as being resilient as driven by dynamic capabilities show performance and recovery’s capacities in relation to a specific kind of natural disaster biological that is: the Covid-19 pandemic. This analysis is performed focusing on cafés and restaurants, business activities particularly affected by the pandemic spread. Understanding the factors driving resilience and verifying the subsequent effect on business performance compared to the pre-covid situation is key to fostering academic knowledge on the topic and help small F&B entrepreneurs to understand how to behave and what factors manage to improve their resilience capacity. And this is easier when there is evidence of a positive impact that being resilient can have on performance in comparison to the pre-pandemic situation.*

Whenever unpredictable and unexpected events occur, the Dynamic Capabilities (DC) view allows the reconfiguration of existing resources and capabilities, so that enterprises can maintain a competitive advantage. Therefore, given the extremely negative impact of the pandemic on cafés and restaurants, especially for the small enterprises, we believe that the DC perspective is particularly suitable for studying the entrepreneurial ability to renew and reconfigure resources (Helfat and Peteraf, 2009; Teece 2007). DC is generally defined as the ability of an organization to intentionally create, add or change its resource base (Helfat and Peteraf, 2009). Therefore, DCs provide a suitable framework for the analysis of value creation and business continuity in turbulent and dynamic environments (Teece 2007), also and above all in the case of small entrepreneurs facing natural disasters. Indeed, in these contexts, DCs allow for the reconfiguration of resources and capabilities for the

[♦] This study is part of a wider research project funded by Centro Documentazione Sisma – Comune di Mirandola

purposes of sustainable competitive advantage (Teece, 2007). Entrepreneurial capabilities are of paramount importance when small businesses are concerned as they drive the small entrepreneur to deal more effectively with the changes that occur in a dynamic environment. In agreement with Woldesenbet et al. (2012), entrepreneurial capabilities can be considered as inherently dynamic, as they interact in subtle and complex ways with the environment. In this sense, DCs and entrepreneurial capabilities coexist in supporting environmental changes, given that «it would be difficult to delineate where an entrepreneurial capability ends and a dynamic capability begins» (Woldesenbet et al., 2012, p. 495). Our model considers two meta-DCs (Battisti and Deakins, 2017; Makkonen et al., 2014), namely: 1) "regenerative abilities" consisting in the ability to intervene on the basis of existing resources in order to modify it with planned and intentional acts (reconfiguration), in order to make it suitable for a new situation (leveraging); 2) "renewal capabilities", dynamic capabilities aimed at changing the resource base, with particular reference to the entrepreneur's ability to read the market and consequent positioning in order to exploit the emerging opportunities (sensing and seizing).

Competencies in one period can increase the likelihood of dealing with future challenging situations (Sutcliffe and Vogus, 2007). The second construct of interest is composed by the dimensions of sensing & seizing in the context of dynamic capabilities. Sensing includes 'identification, development, codevelopment and assessment of technological opportunities in relationship to customer needs', whilst seizing involves the 'mobilization of resources to address needs and opportunities, and to capture value from doing so (Teece, 2014, 332). Thus, sensing refers to the capacity of continuously analyse the surrounding environment, collecting information from it (such as market trends, best practices, competitor's activities). Seizing, instead, refers to the development and selection of opportunities for the business, considering strengths and weaknesses of the environment (Teece, 2007). The link between entrepreneurial capabilities and resilience has been supported by Manfield and Newey (2017); we can therefore postulate the following hypotheses.

H1: Resources Exploitation exerts a positive and direct effect on entrepreneurial resilience. H2: Sensing and seizing exerts a positive and direct effect on entrepreneurial resilience.

We make use of the measurement scale for Resilience proposed by Kantur and İşeri-Say (2015) and, in particular, we look at two relevant dimensions, such as:

- Robustness: capacity of resilience, thus the robustness of the entrepreneurial project and of those resources and competences employed in developing the business;
- Agility: adaptation capacity and flexibility of entrepreneurial pathways.

The ability to properly answer to negative exogenous event through reorganisation strategies is a key point stressed, among others, by Comfort (1994). In particular, the two dimensions of Robustness and Agility highlight the capacity to convert challenges into opportunities, in a bounce-forward process, as also underlined by Martinelli and Tagliacuzzi (2018).

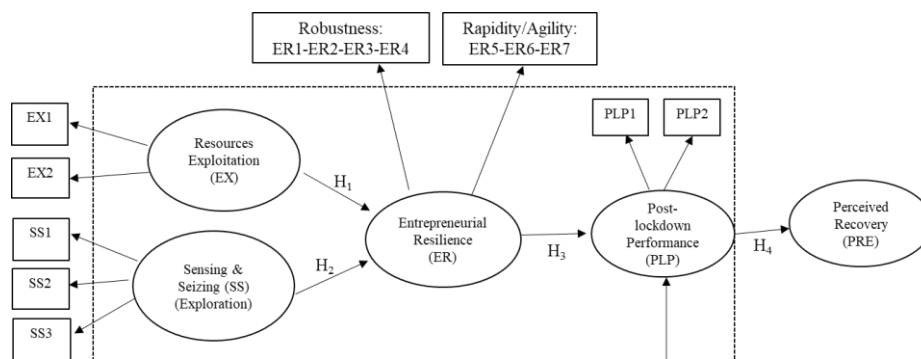

Accordingly, we expect that those firms who displayed higher levels of resilience also reported a good economic performance with respect to the pre-Covid-19 condition and perceived their business situation as recovered.

Tognazzo et al. (2016) and de Vries and Hamilton (2021) evidenced a positive relationship between a resilient firm and its profitability. Therefore, we postulate the subsequent hypotheses:

H3: Entrepreneurial resilience exerts a positive and direct effect on post-lockdown performance. H4: Post-lockdown performance exerts a positive and direct effect on perceived recovery.

Here below Figure 1 displays the interactions put into play among the variables of interest

Figure 1. Graphical representation of the research model and its hypotheses

Note: To render the path diagram more evident, we omit the measurement errors in the figure. Observed variables (i.e., indicators) are represented by rectangles, whereas latent constructs are displayed in ellipses.

Methodology. A structured questionnaire designed to minimize biases was administered F2F to a sample of small traditional F&B entrepreneurs in October-November 2020, in a period in which people felt a sense of relative safety thanks to the reduction of contagious during summer. That was a time in which cafés and restaurants were back in activities and had a lot of customers. The investigation took place in four districts

(Mirandola, Concordia, Carpi, San Felice sul Panaro) of the Province of Modena (Italy) by a number of trained interviewers. The sample is composed by 139 entrepreneurs, aged 46 on average and mainly male (64%), 51% of which own a high-school degree. The interviewees declared an average number of employees equals to 5; average sales accounting for almost €253.900,00 and a long experience in running their own business (more than 16 years, on average). The average surface of the cafés/restaurant accounts for 138 square meters.

In order to analyse the effect of the pandemic on entrepreneurial resilience considering the role played by dynamic capabilities, a Partial least squares structural equation modelling (PLS-SEM) was performed.

More specifically, four latent concepts - named Sensing and Seizing (SS), Exploitation (EX), Entrepreneurial Resilience (ER) and Post Lockdown Performance (PLP) - were constructed starting from the reference literature with perceptive measures collected through the survey. In fact, structured questionnaire includes questions about entrepreneurial resilience, in accordance with the formulation by Kantur and İşeri-Say (2012, 2015), as well as on dynamic capabilities, whether innovative or adaptive (Kump et al., 2019; Verreyne et al., 2016).

Finally, the questionnaire also includes a specific section on the comparison between the actual and the pre-covid-19 performance conditions with indicators measuring profitability and sales volume together with a synthetic self-assessment of the level of recovery perceived by the enquired entrepreneurs. Psychometric measures were used to assess post-lockdown performance and recovery, as they are considered equivalent to using financial and operational performance indicators and may be recommended if archival data are not available, and depending on the peculiarities of the empirical context (Vij and Bedi, 2016). Actually, the small entrepreneurs operating in the sector under observation are usually unwilling to share their balance data. All the main variables included in the questionnaire and employed in the empirical model are listed in Table 1.

Tab. 1: Indicators for each latent construct and final outcome

Items for Resources Exploitation (EX)	
EX1	- Current resources are able to support the positive trend of my activity in the long run (rec_1)
EX2	- In my activity there are enough resources to face emergencies (e24_3)
Seven-point Linkert-scale ranging from 1 (fully disagree) to 7 (fully agree).	
Items for Sensing & Seizing (SS)	
SS1	- I always catch new business opportunities (dc_ss3)
SS2	- I am able to use my capabilities to achieve new and different goals (dc_lev2)
SS3	- I try to offer new dishes/services to my clients (dc_kc2)
Seven-point Linkert-scale ranging from 1 (fully disagree) to 7 (fully agree).	
Items for Entrepreneurial Resilience (ER)	
ER1 Robustness	- I try to give continuity to my business (rob1)
ER2 Robustness	- My activity can identify different solutions to solve problems (rob2)
ER3 Robustness	- My activity can stay on the market also during difficult conditions (rob3)
ER4 Robustness	- My activity does not give up and follows its pathway (rob4)
ER5 Rapidity/Agility	- My activity rapidly takes actions when needed (rap1)
ER6 Rapidity/Agility	- My activity can generate opportunities also from unfavourable circumstances (rap2)
ER7 Rapidity/Agility	- My activity can rapidly take adequate actions when needed (rap3)
Seven-point Linkert-scale ranging from 1 (fully disagree) to 7 (fully agree).	
Items for Post-lockdown Performance (PLP)	
PLP1	- Volume sales (eco1), pre- and post-lockdown comparison
PLP2	- Marginality (eco2), pre- and post-lockdown comparison
Seven-point Linkert-scale ranging from 1 (very much lower) to 7 (very much higher).	
Perceived Recovery (PRE)	
PRE	- Current perception of recovery (c19new)
Seven-point Linkert-scale ranging from 1 (very much worse) to 7 (very much better) compared to the situation prior to Covid-19	

Source: authors' elaboration.

The empirical model analyses the impact of Sensing & Seizing (SS), i.e., the exploration dimension, and Exploitation of available and new resources (EX) on Entrepreneurial Resilience (ER). Subsequently, we also check how Entrepreneurial Resilience (ER) impacts performance (PRE), making a comparison with the economic condition prior to the Covid-19 versus the situation at the time of the survey and the self-assessed recovery perception.

We thus assume that all these four constructs are latent (and thus not directly observable) and we employ a Partial least squares structural equation model (PLS-SEM) that allows for a limited sample size and explores the predictive relationships between the different constructs (Hair et al., 2017a; Hair et al. 2017b).

The model is composed by two parts: the measurement (or outer) one and the structural (or inner) one. The first displays the relations between the latent variables and their indicators (i.e., manifested variables listed in Table 1), whereas the second part shows the relations between the latent variables themselves.

More specifically, the measurement part is represented by all arrows displayed in Figure 1, except the ones in the dashed-line box. The indicators are associated to their latent construct through their loadings (i.e., λ_{11} , λ_{12} , λ_{13} , λ_{24} , λ_{25} , etc.). The structural part, instead (in the dashed-line box in Figure 1) is represented by two exogenous latent variables, named Sensing & Seizing (SS) and Exploitation (EX), whilst the others two are endogenous latent variables, named Entrepreneurial Resilience (ER) and Perceived Recovery (PRE).

This empirical strategy can be interpreted as an advanced multivariate technique performing two analyses at one go: the structural one similar to a regression model and a measurement one in line with a factor or a principal components analysis (Venturini and Mehmetoglu, 2019). As PLS-SEM is a distribution-free method, we rely on the nonparametric bootstrap (Venturini and Mehmetoglu, 2019; Davison and Hinkley, 1997).

Results. Results clearly show the importance of developing adaptive processes aimed at valorising a resilient-type of response to adverse exogenous events. In such a way, negative economic consequences derived from a negative shock can be prevented through a dynamic adaptive strategy.

In the measurement model, all individual items included in the model show acceptable reliability. Despite two of them display a loading slightly under the threshold, we do believe it is important to keep them as the overall reliability and internal consistency are confirmed. In addition, we would like our model being coherent with the theoretical framework behind the concept of organizational resilience as developed by Kantur and İşeri-Say (2015).

Therefore, looking at the measures of internal consistency reliability, Cronbach’s alpha exceeds the threshold of 0.6 denoting a good level of internal consistency of the chosen indicators. In addition, Composite Reliability (ρ_C) is above 0.7 and below 0.951 confirming “satisfactory to good” reliability levels (Hair et al., 2017a). For what concerns the reliability coefficient (ρ_A), it is also displays expected values between the Cronbach’s alpha (lower bound) and the Composite Reliability (upper bound).

Switching to the structural part of the model, for all the latent constructs the convergence validity is assessed by the Average Variance Extracted (AVE) across all items associated with a latent construct (AVE measures the level of variance captured by a construct versus the level due to measurement error). The AVE is higher than the recommendation of 0.5 for all constructs, meaning that they explain more than 50% of the variance of their items (Hair et al., 2017a, 2017b).

Table 3 shows the structural model evaluation and hypotheses testing.

More specifically, resources Exploitation (EX) is profitable for enhancing entrepreneurial resilience (ER), and this is also true for the sensing & seizing (SS) aspects concerning the dynamic capabilities involved (Teece, 2007 and 2014). The higher the entrepreneurial resilience capacity of C&R entrepreneur, the higher the performance after the first lockdown and subsequently also the recovery perception. This is consistent with what has been formulated by Martinelli and Tagliazucchi (2018).

Tab. 2: Structural Model and path model results

	Entrepreneurial Resilience (ER)	Post-lockdown Performance (PLP)	Perceived Recovery (PRE)	AVE
Entrepreneurial Resilience (ER)		H3: 0.354*** ER → RE		0.529
Resources Exploitation (EX)	H1: 0.435*** EX → ER			0.709
Sensing & Seizing (SS)	H2: 0.224** SS → ER			0.615
Post-lockdown Performance (PLP)			H4: 0.606*** PLP → PRE	0.903

*** p<0.01, ** p<0.05, * p<0.1

The recovery after an unpredictable and disruptive event, such as a pandemic, can be achieved through the efficient exploitation of available and new resources, as well as sensing and seizing capacities. This investment in different adaptive strategies related to some key dimensions is profitable to learn how to face subsequent negative events. In this vein, unpredictable shocks become an opportunity to change towards the better, recalling Kantur and İşeri-Say (2012), as well as an opportunity to adapt in order to easily face other events in the future. The final goal is to reach a positive and stable economic condition in terms of durable revenues and marginality and recover.

Finally, for what concerns control variables, we do control for the surface of the building in which the economic activity is performed, the year in which the activity has begun, entrepreneur’s age, gender and level of education. The statistically significant control variables are: C&R facilities surface (lower is the surface and better we expect to be the post-lockdown performance in terms of marginality and sales); entrepreneur’s age with a negative and significant sign; and entrepreneur’s education level (higher levels are profitable to foster post-lockdown economic performance and the perception of recovery).

Research limitations. Finally, some limitations of the study may be mentioned. They especially lie on the limited sample of reference which is however mainly due to the availability of the owners to be interviewed. Furthermore, we considered two main kinds of DCs, while others important DCs components (e.g., learning) may play a role. The proposed model does also not include the psychological resilience of the entrepreneur, even if this can be the case in the small businesses surveyed (Tagliacruzchi et al., 2023). Actually, we are currently repeating the survey on a larger sample of small service businesses, but at the same time we are aiming at involving again the entrepreneurs surveyed in the current study in order to look at the phenomenon in a longitudinal way and in a post-disaster situation. Last but not least, recent works evidenced that resilience can also have negative effects: Hartmann et al. (2022) highlight that entrepreneurs who are able to cope with difficult situations may underestimate future challenges, leading to an increased likelihood of failure. Further studies should explore these effects too.

Managerial implications. The increasing exposure of small businesses - especially those operating in traditional services sectors - to disruptive unpredictable events calls for an in-depth analysis of the drivers and dimensions of entrepreneurial resilience that can help in facing extreme outcomes. To survive and persevere, small service enterprises must engage in new dynamic and adaptive strategies able to feed their resilience capacity in order to respond to critical events.

Our results contribute to the literature on DC's, resilience and small entrepreneurship confirming the positive link between entrepreneurial resilience and performance also in the traditional food and beverage sector, extending the evidence already proved in other contexts such as the retailing one (Tagliacruzchi et al., 2023; Martinelli and Tagliacruzchi, 2018). Moreover, our results support a dynamic view of resilience (Martinelli et al., 2018) as able to produce positive effects on performance even in a limited extent of time. Results can also envisage the acknowledgement that the identification of resilient practices today, may represent a preventive strategy to cope with future and frequent expected crises. A deeper knowledge on the effects of the pandemic on performance and feeling of recovery, also considering that the pandemic last longer than other crises, can enable small service entrepreneurs to better rely and higher invest in their resilience capacity to face crises investing in their capabilities to explore business and market opportunities but also to exploit their resources to feed resilience capacity. This consists in being robust and committed to their own development path, while behaving and operating in rapid way. To ensure preparedness, small entrepreneurs operating in the F&B sector should develop a solid and sound entrepreneurial project from the very beginning of their venue, getting the best from their agile nature (Kelliher and Reindl, 2009). Moreover, small facilities in terms of sqm can be less costly to manage and enable better performances and more agile recovery.

Additionally, our findings can give guidance to policy makers in supporting small entrepreneurs operating in service sectors. In fact, the study of the resilience capacity of small business is crucial to understand how entrepreneurs can ensure the survival of their businesses during the crisis. However, profitability can be developed if policy makers can support the development of DCs, engaging in institutional initiatives addressed at strengthen entrepreneurs' awareness of the need to build a robust enterprise development path able to feed performance and lead to recovery in case of adverse events. Associations of entrepreneurs (like FIPE or similar) and public authorities responsible for local and national economic development may be crucial in supporting resilient entrepreneurs' behaviours. They should support young entrepreneurs, rendering them sensible to the importance of education and arrange for learning initiatives. These efforts can drive a change in the entrepreneurial approach from survival to dynamic adaptation to changing circumstances avoiding small business failure, and promoting small business success.

Originality of the paper. Small businesses operating in the services sector play a fundamental economic and social role (Halkos et al., 2018) but show a high vulnerability rate to a variety of risks, including natural disasters (Torres et al., 2019, Branicki et al., 2017). Although several works have tried to propose important factors for the development of resilience in both organizational and entrepreneurial domains (Castro and Zermeño, 2020), further knowledge on the factors contributing to the development of resilience is required (Duchek S., 2018); this, especially to understand the path to performance and recovery after an exogenous shock (Liu et al., 2013; Battisti and Deakins, 2017). Furthermore, despite the importance of the topic, resilience has been little researched (Duchek, 2018), even if the pandemic has stimulated academics in this direction. The lack of research on entrepreneurship and resilience is also highlighted by Korber and McNaughton (2018) and especially strong when SMEs are involved; as a matter of fact, surveys on the factors that drive small entrepreneurs to survive and be resilient after natural disasters lack (Torres et al., 2019). Additionally, our study is an explorative effort to go into this direction and contribute to close these gaps. In so doing, our study contributes to the literature on micro- and small-enterprises as well as on DCs.

The contribution of digital technologies to the sustainability of companies: a multiple case study approach among the mechanical industry

GIUSEPPE LANFRANCHI* FABRIZIO CESARONI* AUGUSTO D'AMICO[♠]

Framing of the research. *The companies' digitalization process did not start recently. In fact, it began several years ago with the renewal of their production processes.*

The digital transformation of business models is transforming consumer preferences and consumption as industries introduce digital technologies to increase their competitiveness in order to change customer relationships, internal processes and value propositions. (Bednarčíková and Repiská, 2021)

Digitalization refers to the integration of digital technologies in various aspects of society, including business, government, education, and healthcare. When adopting a digitalization process, companies use digital technologies to transform and optimize processes, increase efficiency, and create new value for customers and stakeholders (Westerman et al., 2014). This transformation is driven by the increasing availability and affordability of digital technologies, such as the internet, mobile devices, cloud computing, artificial intelligence, and the Internet of Things (IoT) (Bughin et al., 2018). The digitalization of society is seen as a key driver of innovation and growth, as it also creates new opportunities for businesses to develop and market products and services, and for governments to deliver services more efficiently. (Manyika et al., 2015).

Digitalization has significant social and environmental implications (Bednarčíková and Repiská, 2021), and various organizations in the world (e.g.: OECD, UN, EU) have considered the need for institutions and practices in the field of sustainable management.

From the merger between the digital and the environmental transition of the companies, the research is currently developing a new concept: the digital green transformation.

Digital green transformation is a rapidly growing area of research and innovation. It involves the application of digital technologies such as artificial intelligence, the internet of things (IoT), big data analytics, 3d printing, augmented reality to help tackle environmental and social challenges, including climate change, resource depletion, and social inequality. (Mele, Rizzi, Tucci, 2018)

Furthermore, sustainability has become a critical issue for firms across various industries in recent years, and a growing body of literature has explored the benefits and challenges of sustainable business practices. According to Atasoy et al. (2020), sustainability involves meeting the needs of the present without compromising the ability of future generations to meet their own needs. Firms that adopt sustainable practices are often viewed as responsible and ethical, which can enhance their reputation and increase customer loyalty (Schaltegger and Wagner, 2011). However, implementing sustainable practices can be complex and costly, requiring significant investments in technology, employee training, and process redesign (Van der Byl and Slawinski, 2015).

Despite these challenges, firms that prioritize sustainability can enjoy numerous benefits, including cost savings, increased efficiency, and improved competitiveness (Elkington, 1997). For instance, implementing sustainable supply chain practices can lead to reduced material and energy consumption, resulting in lower costs and increased efficiency (Seuring and Müller, 2008). Additionally, sustainability can create new market opportunities for firms that offer environmentally friendly products and services, as consumers increasingly prioritize sustainability in their purchasing decisions (Hassini et al., 2012). Sustainability is also becoming increasingly important for firms' long-term viability, as governments and other stakeholders are pressuring firms to address social and environmental issues (Schaltegger and Wagner, 2011). Firms that fail to adopt sustainable practices risk damaging their reputation and losing market share, as consumers and investors demand greater social and environmental responsibility (Sawhney and Ebrahim, 2020).

However, achieving better sustainability performance through the use of digital technologies also presents some challenges. One of the main concerns is the potential for increased energy consumption and environmental impact

associated with the production and disposal of electronic devices and equipment required for digital technologies. Additionally, the use of digital technologies may result in increased data privacy and security risks, as well as ethical concerns related to the collection and use of personal data. Furthermore, the adoption of digital technologies may lead to job displacement or a mismatch between available skills and the changing demands of the labor market. These challenges highlight the need for a balanced approach to the adoption and implementation of digital technologies for sustainability, which takes into account economic, social, and environmental factors, as well as the potential risks and trade-offs associated with their use. It is important for companies to engage in open and transparent dialogue with stakeholders, such as employees, customers, and local communities, to address these challenges and ensure that the benefits of digital technologies for sustainability are realized in a responsible and ethical manner. (Bakici et al., 2013; UNIDO, 2019; Yang et al., 2020).

However, it should also be noted that the literature highlights the enormous potential of digital technologies in terms of environmental impact. According to Pappas, Mikalef, Giannakos, Krogstie, digital technologies can also help to increase social and economic sustainability by facilitating more equitable access to resources and opportunities. For instance, blockchain can help increase transparency and accountability in supply chains, ensuring fair treatment of workers and responsible sourcing of materials. Paradoxically, one of the most significant benefits of this intersection is that it has the potential to significantly reduce the environmental impact of human activities. Digital technologies can help optimize resource use, increase energy efficiency, reduce waste, and provide more accurate data for decision-making. (Chandra, Guha, Gupta, Haldar, 2018)

For this reason, studying the connection between DTs and sustainability is essential because it can provide valuable insights and solutions to some of the most pressing challenges facing companies today. It can help us identify and evaluate the potential benefits and risks of digital technologies and develop strategies for their responsible use. It can also inform the design and development of new digital technologies that are optimized for sustainability, and help us understand how these technologies can be integrated into existing systems and infrastructures. (Silva, Pinheiro, Figueiredo, Ferraz, Tribolet, 2019)

Despite this potential, companies may not fully understand the opportunities and benefits those digital technologies can offer in terms of promoting sustainability. (Jäger-Waldau, 2016; GeSI, 2018). For this reason, a significant number of DT initiatives fail due to companies' lack of understanding of the value offered by these technologies (Tabrizi et al., 2021).

In this regard, it is interesting to note how the literature is divided on the ease of adoption and the success of digital technologies in relation to the size of the enterprise. On the one hand, the OECD states that the adoption of digital technologies in the industry has been uneven across enterprises of different sizes: large enterprises have been early adopters of digital technologies, small and medium-sized enterprises (SMEs) have been slower to embrace these technologies due to factors such as lack of resources, expertise, and access to financing (OECD, 2018).

There are also several empirical studies that support the OECD's thesis, for example, a study by Yin et al. (2019) found that lack of resources and resistance to change were major barriers to digital adoption among SMEs in China. Another study by Marston et al. (2016) identified fear of security risks and lack of awareness as key barriers to digital adoption among SMEs in the UK.

On the other hand, is it possible to find in literature academic publications that suggest that small enterprises may be more agile and faster while adopting digital technologies compared to larger enterprises. For example, a study by Gubik et al. (2019) found that small and medium-sized enterprises (SMEs) in Hungary are more likely to adopt digital technologies compared to large enterprises due to their higher flexibility and ability to adapt to changes. Similarly, a study by Järvenpää et al. (2018) found that SMEs in Finland were more active in adopting digital technologies compared to larger firms due to their higher risk-taking propensity and entrepreneurial orientation.

This contrast has created a digital divide between large and small enterprises, with potential implications for productivity, competitiveness, and job creation, even in literature.

Furthermore, the impact of digital technologies in different industries must also be analyzed; academic literature suggests that the adoption of digital technologies in the industry has been uneven across different sectors. For instance, the mechanical industry has been relatively slow in embracing digital technologies due to various barriers, including the lack of skills and resources (Chen et al., 2020). In contrast, the service sector has been more open to adopting digital technologies, particularly in areas such as e-commerce, customer relationship management, and online marketing (Sánchez-Peinado and Fuentes-Fuentes, 2019). The construction industry has also been identified as a sector with slower adoption due to its unique characteristics, such as fragmentation and project-based nature (Gimpelj and Pšeničný, 2021).

These findings suggest that the adoption of digital technologies is context-specific and varies across industries, highlighting the need for tailored strategies for each industry.

However, it should be noted that academic literature on this topic is still relatively scarce, and there is a need for further research to deepen our understanding of the factors that influence the adoption of digital technologies in different industries. While some studies have highlighted specific barriers to adoption in certain industries, more research is needed to explore the context-specific factors that shape the adoption and diffusion of digital technologies across industries and regions. Therefore, further investigation is needed to advance our understanding of the drivers and barriers to digital adoption in different sectors, as well as the implications for firm performance, competitiveness, and innovation. Moreover, it is crucial for companies to approach DT development and implementation with a broad business strategy that considers the long-term implications and potential benefits: companies cannot ignore social

issues, and carrying out corporate social responsibility activities is essential (Lichtenthaler, 2016). By incorporating DT initiatives into a broader strategy that considers social and environmental concerns, companies can improve their chances of success and enhance their sustainability efforts.

This study examines the relationship between the subject of digitalization, namely digital technologies (DTs) and the green transition with the aim of understanding how DTs can contribute to sustainability and meet the United Nations' Sustainable Development Goals (SDGs).

Purpose of the paper. The purpose of this paper is to explore the relationship between digital technologies (DTs) and sustainable development goals (SDGs) in the Italian corporate landscape. The study investigates the degree of digitalization within companies to understand whether DTs can promote an ecological transition toward sustainability, in line with the SDGs of the United Nations.

The study draws on the literature related to digital technologies, their potential impact on business operations, and the increasing focus on sustainability in the industry. The research also takes into account the limited research on the intersection of digital technologies and sustainability in the mechanical industry. By addressing this gap in the literature, the study provides important insights into the potential of digital technologies for promoting sustainable practices and improving overall business performance in this industry.

In addition to evaluating the potential for companies to rely on digital technologies to optimize their activities and assessing the positive impact of such technologies on the ecosystem, the paper aims to contribute to the literature by providing a deeper understanding of the challenges and opportunities associated with digitalization in the mechanical industry. By identifying the most promising digital technologies in the context of sustainability and examining the managerial implications of their implementation, this paper aims to offer insights and recommendations for industry practitioners and researchers seeking to leverage digital technologies to achieve sustainable outcomes and embrace the digital green transformation. (Ferrari, & Tartiu, 2020)

Methodology. We analyzed the degree of digitalization in the Italian corporate landscape and the potential of DTs to act as a keystone for ecological transition with a special focus on the mechanical industry. The aforesaid industry which includes manufacturing of machines, equipment, and parts, has been one of the key drivers of economic growth and technological advancement worldwide. According to a report by the World Economic Forum, the global manufacturing industry is undergoing a Fourth Industrial Revolution, characterized by the integration of advanced digital technologies such as the Internet of Things, artificial intelligence, and robotics (WEF, 2018).

Furthermore, the mechanical industry is one of the largest and most important industries in Italy, representing around 30% of the country's manufacturing sector and contributing significantly to the national economy (D'Alessandro and Nuccio, 2019). This industry is composed of a diverse range of sectors, including machinery, equipment, and components production, as well as aerospace and defense (Istat, 2019). The mechanical industry in Italy faces various challenges, including the need to keep up with digitalization trends and improve productivity (D'Alessandro and Nuccio, 2019). The industry has also been impacted by the COVID-19 pandemic, leading to a decline in production and revenues in 2020 (Mastrapasqua and Zaroni, 2021). Despite these difficulties, the mechanical industry in Italy has strengths in terms of innovation and technological advancement, with many companies investing in research and development to stay competitive (Istat, 2019).

In particular, we analyzed the digital green transformation process of two companies, one operating in the mechanical engineering sector and the other in the steel industry, both have been active in the Italian market for several decades. The mechanical engineering company specializes in the production of high-quality components and machines for various industries, such as automotive and aerospace. The company has a strong reputation for its technological capabilities and commitment to innovation. On the other hand, the steel company is a leader in the production and distribution of steel products, with a wide range of applications in different sectors. The company has developed a comprehensive supply chain and logistics network, allowing it to provide customized solutions and services to its clients. Both companies have been adapting to the challenges of digital transformation, investing in advanced technologies and exploring new business models to improve their competitiveness in the global market.

The research methodology used in this study is a qualitative multiple case study approach, which aimed to explore the use of digital technologies in the mechanical industry. The study involved conducting in-depth interviews with key figures such as the Chief Innovation Officer, the Chief Sustainability Officer, the Chief Technology Officer and a few project leaders directly involved in the application of digital technologies for sustainability purposes. This approach has been widely used in previous research to gather rich and detailed insights from key stakeholders within an organization (Eisenhardt, 1989; Patton, 2002). By engaging with a variety of individuals within the company, this study will be able to capture a diverse range of perspectives and experiences related to the use of digital technologies for sustainable practices. In several companies within the industry. The qualitative data collected from the interviews were analyzed through content analysis to identify common themes and patterns related to the research questions.

Results. The intended outcome of this study was to assess the extent to which companies can rely on digital technologies to optimize their activities and how these technologies can have a positive impact on the ecosystem.

The findings of the study were interesting and provided many insights for reflection; the interviews revealed multiple insights into the challenges faced by the companies. They discussed their innovative and highly technological projects, as well as the difficulties they are facing in achieving them. Additionally, the results demonstrated the contribution of digital technologies in terms of environmental sustainability compared to other types of solutions. One of the main themes was that of skills, and the companies highlighted that they are currently adopting a hybrid form of innovation, partly with internal resources and partly with external partners. However, the delicacy of operating with

external partners in such cutting-edge and critical matters was also highlighted. In this regard, all companies agreed that the solution lies in finding the right balance between external and internal resources. Moreover, the different degree of pervasiveness of digital technologies with respect to the products developed by the companies was also noticeable. In fact, on some products, DTs are essential, while on others, their application is challenging.

We have also gained a comprehensive understanding of their level of knowledge of digital technologies and which ones they believe have the greatest impact in the mechanical engineering industry.

In conclusion, one limitation highlighted by the analyses is related to the obsolescence of production plants. Especially in large companies, plant conversions take time, and to achieve sustainability, 100% of the equipment must be converted. However, it has been proven that new equipment has all integrated digital technologies, and the results are evident in terms of positive environmental impact.

Research limitations. It's important to acknowledge the limitations of our research and analysis. Firstly, the cultural context: our study was conducted in an Italian market which may limit the generalizability of our findings to other cultures or societies. For example, the attitudes, beliefs, and values of the participants may be influenced by their cultural background, which may not be representative of other cultures. Additionally, the focus of our research was on companies operating in the mechanical engineering industry, which may not be representative of other industries. Furthermore, our sample consisted mainly of large companies, and therefore our findings may not be generalizable to small or medium-sized enterprises. It's important to recognize that our study was qualitative in nature, meaning that we explored the why and how behind the adoption of digital technologies, but we did not examine the impact on performance in detail. To fully understand the impact of digital technologies on company performance, further quantitative and comparative studies are necessary, both within and across industries and technologies.

Managerial implications. If digital technologies are found to positively impact sustainability, this could have significant managerial implications for companies. For example, it is crucial for managers to update their skills and knowledge and to hire employees with the relevant expertise. This is particularly important given the rapid pace of technological change, which requires companies to continuously adapt and learn new skills (Reeves et al., 2017). For example, companies may need to hire data scientists and analysts to effectively collect and analyze data generated by digital technologies, or invest in training programs for existing employees to develop new digital skills (Cusumano et al., 2017). Additionally, this transition would require rethinking existing business models and integrating new sustainable practices into corporate operations. The success of digital technologies in promoting corporate sustainability could result in new business opportunities, as companies that adopt and implement these technologies successfully may gain a competitive edge in the market. (Lopes et al., 2019). Companies must carefully weigh the long-term costs and benefits associated with adopting digital technologies and consider the potential trade-offs between economic, social, and environmental factors. Companies need to ensure that the adoption of digital technologies does not compromise customer data privacy, and they must comply with regulations governing data protection and sustainability reporting. Additionally, there is a need to address ethical concerns such as the impact of digital technologies on employment and inequality. Moreover, the potential for digital technologies to increase resource efficiency and reduce carbon emissions must not lead to complacency in reducing overall consumption and promoting circular economy models. Companies must balance their efforts to reduce environmental impact with the need to create economic value and meet customer demands. For this reason, it is essential for companies to take a strategic approach that involves integrating digital technologies into a broader sustainability strategy to achieve meaningful and lasting impacts. In conclusion, engaging with stakeholders, such as employees, customers, suppliers, and other external actors, is critical for the development and implementation of digital technologies for sustainability. It is worth noting that the successful implementation of digital technologies for sustainability also requires a commitment to continuous learning and improvement. This includes regularly reviewing and updating sustainability strategies and monitoring the effectiveness of digital technologies in achieving sustainability goals. Finally, the process of transitioning to digital technologies in large, established companies is often constrained by the obsolescence of their existing production facilities. In many cases, these companies must first convert their aging equipment, use it until it is fully depreciated, and then invest in newer, more sustainable machinery. This process can take a significant amount of time and resources, and may limit the speed at which these companies can adopt digital technologies. It is likely that the transition to digital technologies will need to be gradual, and that opportunities to do so will arise primarily during the process of equipment replacement and facility modernization. However, it is important to note that this process presents an opportunity for companies to invest in more sustainable and efficient production practices, which can have significant benefits in the long term.

Originality of the paper. The original contribution of this paper lies in its analysis of the impact of digital technologies on competencies and resources within the context of the Italian mechanical industry. This industry is significant for the Italian economy and has a considerable environmental impact. Previous research has mainly focused on the application of digital technologies in the production process and their economic benefits, neglecting their effects on competencies and resources. This paper addresses this gap in the literature by exploring how digital technologies impact the development of competencies and the allocation of resources in the metalworking industry. Specifically, the study sheds light on the hybrid approach to innovation, whereby firms use both internal and external resources to drive innovation, and the delicate balance that firms must strike when working with external partners. The paper also highlights the different degrees of pervasiveness of digital technologies across different products, and the challenges associated with transitioning to more sustainable machinery due to the obsolescence of existing production plants. Overall, this paper provides a unique perspective on the impact of digital technologies on competencies and resources

within the Italian metalworking industry, offering insights that have important implications for firms operating in this sector. In conclusion, the solidity of this study is strengthened by the contribution of prestigious companies, providing a comprehensive overview of the investments that mechanical companies should focus on in the future to transform what was once seen as a limitation (environmental responsibility) into a great opportunity.

Mapping the Environmental Incubators Ecosystem of Climate Tech Ventures in Europe

STEFANO ROMITO* VALENTINA MASERETTI[▲] CLODIA VURRO[•]

Framing of the research. *Tackling grand environmental challenges such rising sea levels, drought and extreme weather, soil degradation or collapsing food systems will require an immense effort to invent, refine, and deploy technologies aimed at reaching these objectives (UNFCCC, 2018). Historically, small and new established ventures have played an important role in promoting technological innovation, often leading to the introduction of paradigm-shifting technologies, which change in the way we live. These ventures, however, face many challenges in maturing to a point where they survive and have positive social, environmental and economic impacts. A weak entrepreneurial support system which does not offer linkages to appropriate technology markets and financial support for entrepreneurial activities have often been proposed as one of the main causes of green ventures failure (Volkman et al., 2021; Theodoraki et al., 2022; van Rijnsoever, 2022)*

Among the different actors populating the ecosystem aimed at supporting the development of ventures with the potential to create a positive impact on society, environmental incubators have the potential to play a multidimensional role in supporting climate-resilient and low-emission technologies to be developed, accepted and used by society (UNFCCC, 2018). Environmental incubators, defined as any sort of environment designed to support ventures that aim to introduce a positive environmental impact, are created for hatching ventures by providing financial and nonfinancial support with the goal of fostering tenants' hybrid objectives (Hirschmann and Moritz, 2022). These incubators call for innovation in environmental specific topics such as waste management, hydrogen development or the promotion of smart mobility services. Given their increased level of specialization, they provide tenants with access to the more diverse information and to the network of contacts they need to recognize and capitalize on eco-friendly opportunities (Millette et al., 2020).

The few studies on the relationship between environmental incubators and performance of the tenants are mixed. For instance, the benchmarking study carried out by the European commission (2002) is a clear evidence of the fundamental role played by incubators for sustaining entrepreneurship and innovation especially in those fields requiring cutting-edge solutions such as climate change. The study shows that the survival rate of tenants was significantly higher than those off-incubation respectively 80-90% against 30-50% over a period of 5 years. Relatedly, a recent study by Sansone et al. (2020) focused on the Italian context, found no difference in term of subsequent performance for ventures included in an incubator interested in supporting firms aimed at eliciting a positive societal change vis-à-vis those include in programs promoted by traditional business incubators.

Importantly, much of the research has treated environmental incubators as largely homogenous in their business models, in the admission criteria and in the typologies of services offered to tenants. In doing so, it has considered the potential treatment effect along only one or two dimensions, ignoring the significant variation in incubators along multiple design features. However, heterogeneity is one of the distinctive traits of these actors. For instance, variation has been observed in the type of service offered by these incubators (Sansone et al., 2020), finding an increased propensity to offer, among others, services related to support the tenants in measuring their impact and training activities related to business ethics and social responsibility. In addition, heterogeneity has been observed in the selection criteria adopted to assess ventures to be included in the incubation programs (Hirschmann et al., 2022). Such heterogeneity is likely to be salient both for understanding their impact on and across ventures and their differentiated role in the ecosystem in which they operate (Woolley and MacGregor, 2022).

Purpose of the paper. *In this paper we seek to fill this gap by mapping the landscape of European incubators and analysing variations in their critical design features. In so doing, our work highlights potential fruitful avenues for broader research community interested in a set of key questions: how do environmental incubators program vary? The goal of this paper is thus to provide a broader and deeper understanding of environmental incubator programs and*

their features, and to set forth a research agenda that leverages environmental incubators as laboratory to explore the development of green ventures and technological solutions aimed at tackling environmental grand challenges.

Methodology. We deployed a qualitative and quantitative cross-sectional research approach for analysing environmental incubators placed in Europe with programs that include ventures dealing with climate-tech solutions. To do so, we relied on a list of green incubators active in 2022 provided by NetZero Insights, a data provider specialized in mapping the ecosystem supporting environmental ventures. The list is available on NetZero website, and it is constantly updated in order to support climate founders to keep track of relevant open incubation opportunities. The initial list has been downloaded in May 2022 and enclosed a sample of 101 European incubators and their 135 programs aimed at promoting green ventures. After having downloaded the list, we checked the quality of information provided by the platform in order to exclude incubators which do not fulfil our requirements. In particular, we verified if incubators are headquartered in Europe (even if operating on a global scale) and proposed incubation programs focused on supporting the development of green ventures. After the initial check we did not eliminate any incubators enclosed in the starting list.

To retrieve information about incubators and programs carried out, we content-analysed websites and sustainability reports. The collected information about incubators and their programs has been independently assessed by researchers and clustered at the incubator or program level. Specifically, at the incubator level we collected data about: the foundation year of each organization, the legal form adopted, the presence of a sustainability or impact report; the headquarter country(ies); the market scope, which can vary along four dimensions: regional, national, European or global level; incubator portfolio, which count the number of ventures belonging to the current portfolio of the incubator; and source of revenues, which refers to the to the origin of incubator resources whether external such as “Corporate Sponsorship”, “Government”, “VC Fund “ and “University Based” or internal like “Fundraised Fee”, “Office Space Renting”, “Participating Fee”, or both.

At the program level, we assessed the number of selected ventures, which stands for the maximum number of firms that will be allowed to participate to each incubator program per session; the program(s) duration (measured in month); if the incubator requires a stake to their tenants in return for the service offered; the presence of financial contributions, which is a dummy variable that takes value 1 if the program provides financial contributions to the tenants under the nature of grant, best-in-class award or venture capital investment. With respect to this latter variable, we also collected more details about the type of contribution and the amount of this contribution (where the currency was different from EUR, the current currency conversion rate is applied updated to 1st November 2022).

In addition to these variables, we collected data about the sectors in which the program is specialized; the phase of intervention, which is a variable that assesses the stage of maturity of the ventures and ranges from “Early” phase, in which tenants are still defining their business model, to “Mature” phase; the activities and services offered by each program, which include an assessment of all the services provided by the program. With respect to services and activities offered, we first collected rough data about every type of service offered and subsequently each researcher independently aggregated these raw data into clusters. Table 1 reports, for each cluster an example of the services aggregated. Similarly, we retrieved information about the selection criteria, which incorporates all the requirements ventures must meet to be eligible for the program. With respect to respect to the selection criteria adopted, we first collected rough data about every type of selection criteria used and subsequently each researcher aggregated raw data into clusters. Table 2 reports, for each cluster identified, an example of the criteria aggregated.

Following the exploratory nature of the study, we mobilized the descriptive statistics for summarizing the data in one-way comparisons as well as combining the variables for cross comparisons.

Results. We find several patterns characterizing the current landscape of European incubators and their design features in sustaining ventures and we hope as well to provide guideposts for future research, policymakers, and practitioners.

Firstly, we analyse geographical distribution, maturity and main operating sectors of environmental incubators. With respect to geographical distribution, our data presented in Table 3 shows that environmental incubators are evenly spread across Europe with a peak concentration in Spain, Germany, United Kingdom, and Italy. These results

are consistent with those observed in previous literature focused on traditional incubators and with the notion that concept of business incubation in Europe appeared earlier in countries such as United Kingdom, Germany, and France (Aernoudt, 2004). We grouped the HQ Country based on the classification provided by United Nations Statistics Department (1970).

Tab. 3: Incubators geographical distribution across European regions and Countries

		Frequency	Percentage
Eastern Europe	Bulgaria (1) Hungary (3) Poland (1) Romania (1) Ukraine (1)	7	6.63%
Northern Europe	Denmark (3) Estonia (1) Finland (1) Ireland (1) Latvia (3) Lithuania (1) Norway (3) Sweden (5) UK (10)	28	29.70%
Southern Europe	Croatia (1) Cyprus (2) Greece (1) Italy (7) Portugal (4) Spain (14)	29	28.71%
Western Europe	Austria (1) Belgium (2) France (5) Germany (11) Netherlands (5) Switzerland (5)	29	28.71%
Multiple HQ		8	7.92%

Similarly, our data confirms that the incubators aimed at supporting ventures with a social or an environmental purpose is a relatively new phenomenon (Hirschmann et al., 2022; Grilli and Marzano, 2023). Our sample population, in fact, is mainly composed by young organizations: 84,16% of incubators was founded within the last decade and the 47.52% in the last five years. Interestingly, only the 20.8% of the incubators publish a sustainability or an impact report in which are summarized the results of its activities. The environmental incubators mostly intervene in Carbon Reduction, Agri Food, Mobility, and Energy. Environmental incubator can either be publicly or privately funded (Hirschmann et al., 2022). Public sources such as government grants aims to boost the ecosystems encouraging the birth of enterprises for solving societal problems (Surana et al., 2020). Governmental sponsored environmental incubators represents the 38.61% of the incubators in our sample, while the other mainly rely on private sponsorships, often supported by well-established corporations which tend to engage with incubators as source of learning and for arranging potential valuable alliances.

The second step of the analysis regards the assessment of the key design choices related to cohorts of incubates, including the selection criteria adopted, the average duration of the program and the size of the cohort of the ventures included in each program. Our data indicate that the 54.5% of environmental incubators have a predefined number of seats available per program, equal on average to 15, while the remaining part does not report limits in the number of ventures accepted in each program. The reported duration of each program is, on average 5 months. With respect to the stage of maturity, the 57.43% of environmental incubators select early-stage ventures, while the 26.7% of the total do not poses acceptance conditions based on the stage of development, incubating ventures at any stage of maturity. On average, environmental incubators take into account two criteria when evaluating ventures to be selected. Among the most frequent selected criteria adopted, we identified: (1) the characteristics of the entrepreneurial team, which comprehend the embedded skills, abilities, experience, and motivations of the working team (47.5%); (2) the program sustainability, which regards the fit between the venture and the area of intervention of the incubation program (39.6%) and; (3) the scaling potential, which relates to the market growth possibilities of the venture (37.6%). Interestingly, only the 25.7% of the incubators indicates explicitly as a selection criterion an assessment of the potential capacity of the venture to generate a tangible environmental impact for society.

Incubators may provide capital provision to participating ventures; the financial contribution varies for amount, typology, and source. Half of the incubators in the sample population entails the provision of funding, and some of those (43%) ask for equity stake in return. The widely varying amount as well as the percentage of equity stake ranging across programs and are generally meant for sustaining business growth. The convertible loan works well as financial

instrument for the specificity of the incubator - incubatee agreement. The array of offering, described as design features depends on the design choices made by each incubator for each program. The cluster of services may vary substantially, it can be even customized according to peculiar requests. In the European environmental incubator landscape, almost all incubators provide more than one service with an average of about 4 services provided. Among the most offered, we find (1) managerial training, (2) networking, (3) coaching and mentoring, (4) fundraising support, and (5) office space. The latter might have been affected by the switch towards virtual and blended modalities of work more and more adopted since the pandemic.

The third phase of the analysis, which is in a preliminary phase, is concerned with the identification of the relevant patterns based on specific environmental incubators' characteristics. Following Woolley and MacGregor (2022), who studied traditional incubators effectiveness based on sponsorship types, we firstly distinguished incubators based on the presence of funding at the governmental level. Our preliminary results reveal that, on average, governmental sponsored environmental incubators tend to be more locally focused as compared to those not supported by governmental funding. As reported in Table 4, in fact, the former type of environmental incubators has a narrower market scope focusing mainly at regional (10.26%) or national level (41.06%); on contrary, the majority of environmental incubators which do not rely on governmental support is mostly focused at European (24.19%) or global level (51.61%).

Tab. 4: Environmental incubators market scope based on the presence of governmental sponsorship

	Governmental sponsored environmental incubators			
	NO		YES	
	N	%	N	%
Regional	2	3.23%	4	10.26%
National	13	20.97%	16	41.03%
European	15	24.19%	11	28.21%
Global	32	51.61%	8	20.51%
Total	62		39	

Additionally, while the two types of incubators tend, on average, to admit the same number of ventures in their programs (15 on average), their programs tend to differ substantially in term of duration and typology of services offered. Specifically, the average duration of program offered by governmental sponsored environmental incubators is 6 months, 2 months longer than those proposed by incubators not supported by governmental funding. With respect to the type of service offered, our preliminary results point to a different orientation among the types of incubators. In particular, recipients of government sponsorship tend to focus more their attention on offering managerial training (100%) and coaching (95.6%), while those not receiving this type of support put more emphasis on networking activities (92.1%) and fund-raising support (87.1%).

Taken together, our preliminary results suggest the existence of differences among environmental incubators based on the financial support received by external sources. Similarly, other dimension will be investigated in order to assess the presence of similarities and dissimilarities between environmental incubators according to different dimension such as the region of HQ or the typology of services offered.

Research limitations. Our research presents several limitations, most of them related to its current stage of development. In fact, although preliminary data presented suggests the presence of substantial heterogeneity among environmental incubators based on the presence of governmental sponsorship, additional analyses are required to fully understand variations in environmental incubators critical design features. For these reasons, data will be further analyses in order to identify patterns and trends across European incubators. For instance, additional information can be provide to study incubators based on their geography, the type of services offered, or whether they require equity. In doing so, our research will provide a more nuanced view of the European landscape, informing researchers, entrepreneurial teams and institutions.

More in general, our analysis is focused only on one of the actors supporting the environmental ventures ecosystem. However, we note that it is important to recognize that environmental incubators are only one of many types of intermediaries that are emerging and may exist in a country. Cataloguing the vast number of programs, as well as creating taxonomy of entrepreneurship and innovation programs that allows us to compare across different types of action supporting the development of environmental ventures and green technologies, is another important endeavour. Once we have a catalogue of programs in a region and a way of comparing programs with one another, it becomes possible to systematically understand how the spatial distribution of entrepreneurship support programs alters the likelihood of entrepreneurial entry, the probability of success conditional on entry, and the fate of regional innovation ecosystems.

Managerial implications. From a managerial point of view, our preliminary results have important implications for environmental ventures and public institutions. First, data reveal the existence of distinctive of environmental incubators designs, which might prioritize different objectives and, consequently, different types of ventures. Hence, to increase the chance to be selected by an incubation program and from benefit type of services offered, environmental ventures have to extensively search for the best-fitting program/incubator being aware of all the trade-off they can face in term of service offered vis-as-vis request from the incubator in term of equity. Similarly, policymakers that support environmental incubators should also be aware of the heterogeneity of such incubators in terms of objectives, service

offered and requests in order to define supporting criteria that are in line with the overall policymaker objectives, which are typically different from those of other corporate sponsors.

Originality of the paper. *To the best of our knowledge, this paper represents the first attempt to systematically map the environmental incubators ecosystem at the European level. Results presented shed further light on the critical design features of environmental incubator and how these features vary according to key dimensions such as the presence of public funding. Since the nascent phenomenon, the work contributes to broaden the knowledge of the field in addition to having managerial and institutional implications.*

Digital transformation and value creation: the case for agri-food sector

RICKY CELENTA* ROSANGELA FEOLA* ROBERTO PARENTE* MASSIMILIANO VESCI**

Framing of the research. *Digital entrepreneurship represents a critical pillar for digital economic development (Shen et al., 2018; Elia et al., 2020) and it represents an emerging topic of research (Dong, 2019; Nambisan, 2017). Davidson and Vaast (2010) define digital entrepreneurship as “the pursuit of opportunities based on the use of digital media and other information and communication technologies”.*

Understanding the means of digital entrepreneurship is important for all, because digital entrepreneurs with new ways of doing business are having an enormous effect on the whole world, especially from the last decade. The development of digital technologies represents one of the most important and impactful technology trends in recent years. The development of digital technologies, such as cloud computing, Big Data Analytics, Artificial Intelligence, 3D printing, and blockchain, has stimulated a growing debate about how new and innovative entrepreneurial activities can be stimulated. Companies are being called upon to rethink the way they operate to cope with the fast-changing environment and to be able to seize the countless business opportunities that digitization offers (Porter & Heppelmann, 2015; Brehmer et al., 2018).

Digital entrepreneurs rely upon the characteristics of digital media and IT to pursue opportunities. In doing so, they exacerbate changes in the competitive landscape, as they attempt to seize the opportunities and thereby potentially further the creative destruction process of the digital economy” (p. 2). The European Commission (2015) sustains that digital entrepreneurship creates “new business opportunities and accelerates the transformation of the existing businesses, through the development and smart use of novel digital technologies, to increase growth and create employment”. In the context of digital entrepreneurship, scholars suggest that digital technologies represent external enablers of new ventures able to be used by entrepreneurial agents to create new forms of value for people and society (Davidsson, 2015; Davidsson et al., 2018). In fact, the increasing pace of technological innovation has generated radical changes in the increasingly complex economic and social system in which companies operate. Digital technologies permeate every sector, and companies cannot ignore the impact of digital technologies within their businesses. At the same time, these changes require management scholars to analyze the impact that digitization can have at the level of the individual company, the sector, the ecosystem, and the social context (Genco, 2017). In this scenario, some scholars (Bharadway, 2013, p. 472) highlighted how businesses should “adapt their business infrastructure to the new digital era” especially, have to adapt their value chains to the digital context (Porter and Heppelmann, 2015). In this increasingly complex and technological context, management scholars have the task of understanding future scenarios and guiding corporate decision-makers toward the adoption of a systemic approach (Golinelli, 2000) based on achieving systemic balance in business-environment relationships (Golinelli, 2000; Genco, 2012).

The research agenda on digital business and digital entrepreneurship is growing, becoming an important reference point for the analysis of social challenges and problems (Raja, 2016; Yu et al., 2019; Tsatsou, 2021).

Purpose of the paper. *Despite the increased interest in research in the field of digital transformation and digital entrepreneurship, today its impact on society and economic systems is not yet much studied.*

In particular, it has been highlighted that the diffusion of digital technologies is supporting the implementation of new ways of doing business, because they offer companies the opportunity to innovate at various levels of the value creation process, thus also changing the relationships between all actors in the value chain (Arnold et al., 2016; Rachinger et al., 2018). The fast evolution of digital technologies has radically changed the essence of value creation and value appropriation process (Caputo et al., 2019), with a shift from the classical static, vertically and integrated model to a more loosely coupled networks Pagani (2013).

In this context, starting from the suggestions of some scholars that consider digital technologies as external enablers of new ventures able to be used by entrepreneurial agents to create new forms of value for people and society (Davidsson, 2015; Davidsson et al., 2018), in our study we aim to analyze how digital technology and digital ventures

based on these technologies can impact the process of value creation and distribution into value chain and economic sectors.

In particular, we focus on a specific kind of digital technology, blockchain, whose potential for the creation of entrepreneurial “opportunities that enhance social and economic wellbeing for disenfranchised members of society,” has been showed by some authors (George et al., 2012, p. 663). We consider the application of blockchain technology in the agricultural sector where the role of this technology has been highlighted but as showed by some scholars (Demestichas et al., 2020) its impact on the redefinition of the value distribution chain has received limited attention and further research are necessary.

The study aims to answer to the following research question: *Can the blockchain technology impact the value chain of the agricultural sector?*

Especially we want to highlight how the application of digital technologies in the traceability of agri-food supply chain can support the generation and distribution of value for all the actors involved in the chain, and how can support the economics and social development of the territory and rural areas.

In the last decades, the agri-food sector is experiencing, as a result of the digital revolution, a growing motion of continuous innovation. Wanting to focus attention on the AgriTech phenomenon, understood as a term that encompasses the application of digital technologies along the entire value chain of the agri-food sector, it is possible to identify different trends: Precision Farming, Animal Health, Vertical and Indoor Farming, Water and Crop Tech, Food Safety, Food Quality Management, Lifestyle healthy, 3D Printed Food, Connected Kitchen, Smart Packaging ecc.

At the same time, agri-food startups have recently become focal points of tech sector innovation and financing. In fact, has highlighted some scholars (Fairbairn et al., 2022), rapidly multiplying tech startups are promising to import the tech sector's trademark disruptive innovation into an industry often inefficient and unsustainable. In this scenario, startups played a significant role in promoting digital solutions in the agri-food sector. A 2019 study (Osservatorio Smart AgriFood, 2019) identified a sample of 500 startups that globally raised a total of \$2.9 billion in investments.

Parallel to what has happened in the industrial sector, the use of digital solutions, developed often by start-ups, within the agricultural sectors is driving this sector towards a new phase of development, referred to as 'Agriculture 4.0'. As noted by Klerx et al. (2019), the adoption of digital technologies within farms is the first piece of Agriculture 4.0, which is developed on the effects of digitalization on farmer skills, on the digitalization of agricultural knowledge, and so on the digitalizing agricultural production systems and finally the development of an Economics and management of digitalized agricultural production systems.

For several years in Italy too has been experiencing exponential growth in terms of the spread of high-tech solutions in the agri-food sector. Already in 2019, the value of Agriculture 4.0 had reached a total of around 400 million euros (equal to 18% of the European sector). Not even the Covid-19 crisis has reversed the positive trend, and the market has exploded, rising from 540 million euros in turnover in the first half of 2020 to 1.3 billion at the end of 2020, and to 1.6 billion in 2021 (Osservatorio Smart AgriFood, Marzo 2022).

The agri-food value chain is a complex system responsible for the flow of agri-food products from the production phase to the consumption phase. In the agri-food value chain the considerable number and heterogeneity of the stakeholders are involved from different sectors, such as farmers, distributors, retailers, consumers, etc., renders the agricultural supply chain management as one of the most complex and challenging fields of application of blockchain technology (Mirabelli and Solina, 2020).

Blockchain is a digital record-keeping system that removes the need for third-party intermediaries who traditionally facilitate a range of essential transactions (Crosby et al. 2016). This is possible thanks to a decentralization process of the management of those transactions, using cryptography to enable distributed verification of information and thus support secure and transparent peer-to-peer exchange (Swan 2015). In basic terms, a blockchain is composed of blocks that store data (currencies, software programs, contracts, etc.). These contain a unique identifying hash and a further hash that links to a previous block (hence, 'the chain'). The ledger of activity is shared publicly with everyone on the network, and when a new transaction is realized, all nodes on the network must validate its legitimacy before it is accepted on the blockchain (Pilkington 2016). These factors together make blockchain nearly immutable, leading some to suggest that blockchain represents a new paradigm. Some researchers have described blockchain as a foundational technology, the impact of which has been compared to that of the early World Wide Web (Iansiti and Lakhani, 2017). To date, the main applications of blockchain are in the financial context concerning cryptocurrencies and Bitcoin (Nakamoto, 2008), but the characteristics of blockchain have led to its application in numerous sectors, including manufacturing, energetic services, and insurance (Fernández-Caramé et al., 2018).

Blockchain technology is a solution for tracking agri-food products along the entire supply chain from 'farm to fork'. Through the traceability of agricultural products, it is possible to combat counterfeiting phenomena and therefore create value for local economies with an agricultural vocation, both from an economic and social point of view. The traceability of the agri-food chain is of particular importance, in an area like that of southern Italy, with an agricultural vocation.

In the last decades, managing traceability in food supply chains has gained increased societal and economic importance due to the impacts on a large scale, of disruptions in food safety on businesses and human health (Meuwissen et al., 2003; Ringsberg, 2014). Over time, there have been several attempts at traceability of the agri-food value chain, however as pointed out by some scholars (Zhao et al., 2019) these solutions are ever centralized, monopolistic, symmetrical, and sometimes opaque.

Traceability of the supply chain has the main objective of increasing the value generated by agricultural production. Through the traceability of the food supply chain, it is possible to distribute the value created, among all the actors involved along the supply chain, but even more so on the production territory and its community. In particular, our goal is to try to demonstrate how the adoption of this technology can contribute to the creation of value in the agricultural sector, and the distribution of value in the territory of reference, stimulating the birth of new businesses and the generation of economic and social impact, especially for rural areas (Burke, 2019).

The agricultural product quality policy is an integral part of the Common Agricultural Policy (CAP), as it is considered a strategy for maintaining and developing diversified agricultural activities in rural areas and strengthening the competitiveness of these territories.

Methodology. We chose to adopt a qualitative approach, based on the case study methodology (Yin, 2018). The paper describes an Italian case of a start-up operating in the sector, to analyze how the technology has been developed and implemented and the impact that the implementation of the project can generate for the local agricultural sector. The company has developed a traceability system aimed to "redesign the food supply chain bringing innovation to security and information management systems, ensuring that everyone involved in the value chain has the certainty of the product, starting from the origin e not from the document. This blockchain solution is able to overcome the problem of the low validity of digital twins (Botta et al., 2021; Henrichs et al., 2022). Digital twins (Stark et al., 2019) is considered the "Achilles' heel", of blockchain-based supply chains the use of blockchain technology to track goods is ineffective if there is not a strong correspondence between what is physically exchanged and the digital information that appears in blockchain transactions (Botta et al, 2021).

Results. The study has made it possible to identify that the impact of the application of blockchain technology, goes beyond technical aspects in terms of increase of transparency and efficiency of the supply chain, but it involves social aspects acting as an enabler of local development and contributing to give value to all actors involved in the process (Parente, 2020). In particular, results of our study highlight how the implementation of blockchain technology can radically change the agribusiness supply chain. Blockchain technology enables a new business model that innovates agri-food supply chains by supporting value creation for consumers and farmers located in rural areas. As a result, the value retained and reinvested in rural areas increases differently in a large percentage of the value created is retained by intermediation and distribution operators.

Research limitations. While we believe the present study is of great significance for having considered the impact of digital technologies on value creation and distribution process, we acknowledge that our research is not without limitations that open up new avenues for future research. First, we consider in our study a single case that limits the generalizability of our results. Second, we focus on a specific sector, that is agrifood sector, characterized for a very complex structure in terms of actors and subjects involved.

Managerial implications. The paper has both theoretical and practical implications. From a theoretical point of view, the paper contributes to digital entrepreneurship research showing how digital entrepreneurship, can support the development and distribution of value production. From a practical point of view, the paper provides evidence about the strategic role that the adoption and implementation of blockchain technology can play in the Agricultural supply chain (Burke, 2019), and in rural community development and resilience that can obtain benefits economic and organizational point of view through the implementation of a real blockchain-based platform.

Further, our study highlighting how the development of agricultural supply chain solutions, based on blockchain technologies, can guarantee greater traceability and transparency, suggest that the adoption of this technology could be a useful strategy that can lead to an increase in production and diffusion of value in a particular way to rural areas

Originality of the paper. Our paper provides useful evidences about the role of blockchain technology in agrifood sectors suggesting that its impact is not limited to technical aspects in terms of increase of transparency and efficiency of supply chain, but involves social aspects acting as enabler of local development and contributing to give value to all actors involved in the process.

Which are worthy? Achieving legitimation for innovative projects in the eyes of knowledgeable audiences[♦]

FRANCESCA CAPO^{*} LORENA MARIA D'AGOSTINO^{*} SALVATORE TORRISI[▲]

Abstract

Legitimacy is a key issue for startup projects, helping innovative ideas and potential ventures to achieve social and financial support from external stakeholders. When participating to competitive contests, startup projects need to achieve legitimacy and be considered appropriate entities by a jury of experts, who represent a knowledgeable and competent audience. In this study, we aim at investigating which elements characterizing startup projects are correlated with higher probability for the projects to be legitimated by knowledgeable audiences. We explore this issue by building on a dataset of 124 projects submitted to the BiUnicrowd contest (2018-2021) organized by the University of Milano-Bicocca. We discuss our results and suggest contributions to literature on category dynamics and entrepreneurship, also offering some insights in terms of implications for managers.

Framing of the research. *Innovative, early stage projects, often struggle to be considered legitimate (Aldrich and Fiol, 1994). Many projects, although incorporating novel ideas or solutions to social issues (De Silva et al., 2021) may not be perceived as appropriate in the eyes of stakeholder audiences, thus failing to achieve legitimacy (Suchman, 1995) and gather the financial and social support needed to develop and grow. This legitimacy may be particularly important in the case of innovative contests (Boudreau et al., 2011), during which participating projects need to persuade knowledgeable, expert audiences not only that their ideas are novel enough, but also that their goals and overall activities are appropriate, worthy to be transformed into new ventures. Indeed, in the case of contests, expert audiences evaluate various dimensions of projects, and thus for projects' proponents (e.g., potential entrepreneurs) it is important to understand which elements and signals they can leverage to persuade these audiences of their value and achieve legitimacy. Hence we ask: what are the elements that are correlated to startup projects gaining legitimacy in the eyes of knowledgeable audiences? In the following sections, we investigate this question by looking at BiUniCrowd, a contest for innovative projects created by the University of Milano-Bicocca.*

Purpose of the paper. *Legitimacy is defined as "a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions" (Suchman, 1995: 574) and represent a key factor for startup projects and potential ventures (Capo and Di Pietro, 2023; Fisher et al., 2016). Scholars have pointed out how nascent and young ventures may face a "liability of newness", showing - among other weaknesses - low levels of legitimacy (Singh et al., 1986), which may prevent them to attract the needed support (both in terms of financial resources and social capital) to survive and grow. New ventures striving to be noticed and recognized as a participant in a given market has to attract the attention of stakeholder audiences such as private investors, prestigious partners, intermediaries, and media (Petkova et al. 2013). Legitimacy also entails being evaluated on the basis of specific elements (Aldrich and Fiol, 1994; Suchman, 1995). Affiliation with high-status actors such as venture capital investors provide legitimacy as those actors are supposed to have the ability to assess the quality of a new venture. Participation in competitive contexts such as business plan competitions may also help startup projects gain legitimacy as "victories in contests legitimate organizations and validate their reputation because of the taken for granted axiom that winners are 'better' than losers" (Rao, 1994: 32). Indeed, by emerging as winners in contests, startup projects signal their future value to potential customers, partners, and investors and justify their existence as reliable entities in the entrepreneurial environment (Rao, 1994). However, to win competitive contests, startup projects need to persuade an expert audience (i.e., a designated jury) of their value and*

appropriateness, which will then provide validity clues to future stakeholders (Wang et al., 2016). Studies have argued that, when evaluating and providing legitimation to certain actors' categories, expert audiences employ specific mechanisms particularly in view of the knowledge and understanding they have of that category (Vergne and Wry, 2014). While the literature has posited that experts take into account several elements when undertaking decisions (Petkova et al., 2013; Eisenhardt, 1989), it has overlooked which are the elements they account as most important when evaluate candidates (i.e., deciding who is going to win a contest). In this sense, we build on crowdfunding and entrepreneurship literature (Belleflamme et al., 2014), and propose that two elements can play a key role in shaping expert audience's evaluations. First, studies focusing on crowdfunding campaigns have argued how team size can have a positive effect on their success (Oo et al., 2019), due to social network effects (Mollick, 2014) and human capital benefits that may accrue as the number of team members increases. This is because, on the one side, each individual can bring on her own connections and contacts (i.e., her own social network) as prospective investors and funders of the campaign; thus, as the team size grows, a campaign's chances to reach the target goal and be successful also increase. On the other side, scholars suggest that larger teams may also provide ventures with higher human capital (Ucbasaran et al., 2003), which in turn may allow a firm to leverage diverse competences, and skills as well as access to social and financial resources (Becker, 1975), resulting in increased likelihood of success when appealing to potential investors and backers. The potential to build on a wide social network and the diversity and richness of human capital incorporated may render a startup project viable and appropriate in the eyes of expert audiences. This suggests that team size may represent an element taken into account in legitimation processes by expert audiences. As such, we formulate the following hypothesis:

Hypothesis 1. *The number of members in a team is positively correlated with the probability of a startup project being considered legitimate by an expert audience.*

Second, entrepreneurial studies have focused on the importance of signals in persuading investors to finance a venture (Ahlers et al., 2015). Scholars agree that, among others, the level of education can work as an effective signal, portraying the venture's founders as competent and knowledgeable, and helping reduce the uncertainty investors may have regarding the entrepreneurial project feasibility (Hsu, 2007; Levie and Gimmon, 2008). Like investors, also expert audiences (such as members of a jury during a competitive contest) rely on signals to evaluate the worthiness and appropriability of a project. In this sense, conveying the image of competence by means of high levels of education possessed by the principal team member may increase project's chances to be considered legitimate in the eyes of an expert audience. Hence, we formulate the following hypothesis:

Hypothesis 2. *The education level of the principal team member is positively correlated with the probability of a startup project being considered legitimate by an expert audience.*

Methodology. *The dataset includes 124 projects submitted to the first four calls of BiUnicrowd (2018-2021), a contest based on a program of alternative finance organized by the University of Milano-Bicocca in collaboration with the Italian crowdfunding platform "Produzione dal basso". Students (both former and current) and employees (e.g., researchers, professors, administrative staff) of the university could submit their proposal to a jury of experts. The winners of the contest (i.e., the selected projects) received specific training from the university and from the crowdfunding platform experts, and later on, participated in a crowdfunding campaign. These campaigns were based on the "all-or-nothing" system, for which the collected funds are transferred to the project if the pre-set target is met. A peculiarity of BiUnicrowd is that the university or other associated partners (e.g. Fondazione Comunità Milano, Corepla, and Sorgenia) commit to co-finance the project if at least 50% of the target is met. Therefore, the benefits of participating in the BiUnicrowd program are related to access to funds, learning opportunities (e.g., in marketing and communication), visibility, and legitimacy. The first two calls of the contest received more projects (41 and 47, respectively), which may be related to the novelty of the program and then some proposals were outside the scope of the calls or of a too low quality; the third call received 24 projects, and the fourth 12. The number of winning projects that eventually did the campaign was 4 and 5 for each call. For each of the 124 projects, we have access to the biography of the proponents - i.e., the principal investigator (PI and - if any - of the other team members), and a description of the projects (including business plan and budget). From this information, we created a set of variables correlated to the probability of being selected by the commission of experts and eventually participating to the crowdfunding campaign. We estimate a probit model, where the dependent variable "winning" is equal to 1 if the project is selected by the experts, and 0 otherwise. All variables are listed in Table 1, with descriptions and some statistics. We clustered errors by each call.*

Tab. 1: Variables and description

Variable	Description	Mean	SD	Min	Max
Winning	Dummy (1/0): 1 if the project has been selected by the experts	0.15	0.35	0	1
Team size	Number of persons in the application	3.63	2.38	1	12
Team female shares	Share of females in the team	45.27	39.24	0	100
Team homophilia	Dummy (1/0): 1 if team members are either all females or all males	0.53	0.50	0	1
Team 50% females	Dummy (1/0): 1 if at least 50% of team members are females	0.49	0.50	0	1
Team n. females	Total number of females in the team	1.72	1.81	0	11
PI female	Dummy (1/0): 1 if PI is female	0.42	0.50	0	1
PI high school or bachelor	Dummy (1/0): 1 if the education level of the PI is high school or bachelor's degree	0.24	0.43	0	1
PI master	Dummy (1/0): 1 if the education level of the PI is a master's degree	0.48	0.50	0	1
PI PhD	Dummy (1/0): 1 if the education level of the PI is PhD	0.27	0.45	0	1
PI STEM edu	Dummy (1/0): 1 if the education level is in science, technology, engineering, or mathematics (STEM) fields	0.44	0.50	0	1
Mission digital & innovation	Dummy (1/0): 1 if the mission is related to digital and innovation	0.39	0.49	0	1
Mission environmental	Dummy (1/0): 1 if the mission is related to environmental issues	0.29	0.46	0	1
Mission social & health	Dummy (1/0): 1 if the mission is related to social and/or health issues	0.32	0.47	0	1

Results. *Our preliminary exploration of the factors related to the probability of being selected by an expert audience is mostly focused on the characteristics of the PI, and on the team members (if any). Table 2 shows the probit estimations of seven model specifications.*

Across models 1-7, the strongest and more consistent result is about the number of team members, which is positive and statistically significant in all models. Our hypothesis 1 is confirmed. This result is in line with the literature on crowdfunding success (e.g. D'Agostino et al., 2022), suggesting that larger teams are considered a good signal of the potential success of the campaign and subsequent development of the project. Larger teams embody a higher amount of human capital, can benefit from a greater division of labor and the presence of heterogeneous and complementary competencies, and access to a larger network that may support the campaign. In model 7, we also test the non-linearity of team size; we expect that too many members may be detrimental to success because of repetition and overlapping of competencies, but the squared term is not statistically significant probably because most teams in our sample have a limited number of participants.

In models 2-5, we investigate the composition of the team in terms of gender; this exploration is based on the observations that of the 18 projects selected, 11 (61%) are led by females, and these teams are more likely to have more women on board (i.e., 6 of these 11 project teams have at least $\frac{3}{4}$ of females). This overrepresentation of women in comparison to other contexts (e.g., Johnson et al. 2018) may be explained with two complementary motives. First, the University of Milano-Bicocca is more specialized in fields in which traditionally women are more represented (e.g., social sciences). Second, reward crowdfunding is usually linked to projects with strong social dimensions, and the calls of BiUnicrowd are oriented towards social or environmental issues, in which women tend to be more committed; for example, among the partners that have co-financed projects, there is Fondazione Comunità di Milano (which support projects with a social impact) and Corepla, a national consortium for plastic packaging recycling. However, none of the variables related to gender is statistically significant, not even PI being a female. The pairwise correlations between female PI and female composition of teams ("Team female share" and "Team 50% females") are above 0.8 and 0.7, respectively; however, the VIF does not raise concerns.

In general, none of the variables related to PI characteristics seem relevant, except marginally in models 3 and 7, where "PI PhD" is positively correlated to the probability of being selected for a campaign at a low level of significance ($p < 0.10$). The significance of "PI PhD" becomes stronger ($p < 0.05$) in model 6 after the exclusion of "PI STEM edu.", suggesting that having a PI with a PhD is a strong signal of quality, but part of this effect is mitigated when the PI has an education in STEM fields. We also tried the interactions between "PI PhD" and "PI STEM edu", and none of the three coefficients are statistically significant at the conventional levels (results not shown here). Therefore, we find support for hypothesis 2 on the importance of PhD for PI, although further investigation is required to check the robustness of this result.

Research limitations. *Our research is not without limitations. Firstly, BiUnicrowd is a very recent program, and this implies that the dataset suffers of different biases: few projects in total, large variance in the quality of projects for each call, and high variability across the calls because of different partners and experts involved. Secondly, we mainly codified information from CVs, whose format and quality of the information provided sometimes are inconsistent across calls (especially for team members), which further limit the information we can use across the calls. Finally, the generality of our results is limited by the peculiar context, which is the crowdfunding activity experienced by a specific public university.*

Managerial implications. *Our findings offer some implications for practice. First, it suggests how important is to know 'who you are talking to' (i.e., the audience you are targeting) and incorporate in a project or venture that will be evaluated by that target audience the elements that this latter will considered valuable and appropriate. As marketers do when segmenting their customer base and deciding which segment to target, startup projects or new ventures need to channel their initial resources, rather than towards persuading as much people as possible, towards convincing one specific audience. Such a strategy (i.e., target one audience and prepare for it) may enable new projects or ventures to employ limited amount of resources, only the amount needed to reach that target, and proceed incrementally in steps by allocating other resources towards the next target (and audience) that need to be persuaded to acquire support and legitimacy (which may be financial investors or backers in case of crowdfunding campaigns).*

Second, our findings highlight the importance of team size and level of education as dimensions that affect expert audiences, whose evaluation may eventually provide a strong legitimation signal to other less expert audiences such as financial contributors to a reward crowdfunding campaign. Project teams will probably benefit from a clear awareness of the importance of these factors. However, data limitations prevent a deeper understanding of team composition which we aim to investigate in our future research. Moreover, the analysis of projects selected into crowdfunding campaigns could help to understand to what extent expert evaluation predicts the actual success of a project during the crowdfunding campaign. Comparing the selection outcome with the performance of selected projects in the campaigns may provide useful information for the organization and assessment of the selection process.

Originality of the paper. *This working paper contributes to two streams of literature. The first one is related to category dynamics (David et al., 2023; Zuckerman, 1999) and particularly the issue of how actors can gain legitimacy when appealing to knowledgeable audiences. Indeed experts, in view of their competence and information about the entity they are evaluating, may take into account specific elements (Vergne and Wry, 2014) different from the factors that general audiences (such as crowdfunding investors, the public, or media) take into account when conferring (or not) the label of worthiness to an actor. The second stream of literature is related to entrepreneurial scouting, which has mainly investigated how venture capitalists select startups in which to invest and to a less extent has addressed the role of experts without financial interests in early-stage projects. The main contribution of our work to this latter literature is the specificity of the setting - a contest that allows a first-stage selection of projects that will participate in a crowdfunding campaign at a later stage. The presence of the University as a promoter of reward crowdfunding*

provides a rich pool of potential participants and projects. At the same time, the promotion and financial backing of a crowdfunding campaign by an academic institution probably play a legitimating role.

Keywords: legitimacy; entrepreneurship; competitive contests

Harvesting the future: the role of innovative companies in the agri-food sector

GIULIO FUSCO* GIUSEPPE CATALDI* ELISA TOMA* DOMENICO MORRONE**

Framing of the research. *Despite the importance of innovation in improving production processes and profitability, few studies have attempted to measure the level of innovation at the farm level. The purpose of this paper is to empirically test the effects produced by new investments on the efficiency of agricultural enterprises and to determine which factors characterize innovative companies in the Italian agricultural sector. Using a conditional Data Envelopment Analysis (DEA) approach this study analyses the data collected by the Farm Accountancy Data Network for the period 2011 - 2020. Findings show that in line with the literature, companies led by young entrepreneurs, which diversify production, and which adopt the new technology are the most innovative and most efficient.*

Purpose of the paper. *The main purpose of the agricultural sector is to guarantee a constant and quality production of food in order to satisfy the primary needs of the population, for this reason the agricultural sector has often found itself facing significant challenges related to the trade-off between productivity and the environment (Rosa-Schleich et al., 2019). Therefore, innovation represents one of the main drivers of productivity becomes a key factor in facilitating the development of the agri-food sector. This need has also been repeatedly emphasized by the European Union with the creation of the European Innovation Partnership for Agricultural Productivity and Sustainability (EIP-AGRI) whose purpose is to promote sustainable and innovative agriculture, oriented towards the creation and dissemination of innovation within the territory (Läpple et al., 2015). In addition, it is known that to ensure the increase of sustainability in the agricultural sector, the continuous innovation process through the adoption of new technologies and the making of new investments plays a key role (Armanda et al., 2019). In order to full fill these expectations, agricultural firms should be integrated into the innovation process with specific innovation policies for companies operating in this sector. However, it is believed that innovation in the agricultural sector depends on a series of factors other than the so-called "traditional", because most of the agricultural enterprises are small and sometimes located in desolate areas due to the characteristics of the business activity (Kantor and Whalley, 2019). For these reasons the innovation in agricultural is often studied from input side, it understood as the capacity to absorb new technologies, rarely from the output side that is the capacity to produce innovation. Hence, it is ignoring the capacity to an agricultural firm to the ability to invest in innovation with its own internal resources (Alarcón and Sánchez, 2016). To deepen this theme, this paper focuses on the role that innovation investments have on the performance and efficiency of Italian farms, our analysis will allow us to identify the strengths and weaknesses of the territory providing political decision makers to develop strategies able to mitigate weaknesses and consolidate strengths (Borghini et al., 2021). According to L'apple et al. (2016) we use the variable new investment as a proxy of level of innovation, and we go see how it impacts on the productivity and efficiency of firms, then we will focus on the analysis of the farmers characteristics such as gender, age, economic dimension (Fusco et al. 2022).*

Although the agricultural sector plays an essential role in ensuring food production, food production has a lower level of innovation than other sectors (Pardey et al., 2010). Showing how from the point of view of innovation the agricultural sector has ample room for improvement (Islam et al., 2013). The reasons for this gap can be linked to factors that characterize farms such as small size, low level of education, greater distance from knowledge poles, low level of investment (Bjerke and Johansson, 2022).

According to the internal innovation capacity Läpple et al., (2016) constructed an innovation index taking into account three different components the adoption of innovation (the use of an innovative technique), knowledge acquisition and continuous innovation, where continuous innovation means the farmer's ability to make new investments in order to maintain a high level of innovation.

Methodology. *In the first step, a quantitative analysis has been conducted, by applying a Data Envelopment Analysis on an unbalanced panel data composed by 33.607 observation for the period 2011 – 2020 in order to assess*

the relationship between farmers efficiency and innovation; in the second step with a correlation, we analyse the influence of characteristics farmers characteristics on innovation. The DEA methodology is a linear mathematical program that allows us to measure the relative efficiency of our decision-making units, traditionally called DMUs (Charnes et al., 1978), such as firms, provinces, regions, countries and other entities, which have no a specific functional expression. Proposed and developed by Farrell (1957) it allows us to evaluate the performance of each unit up to the achievement of the frontier, which once reached gives the possibility to use the efficient units as comparators or models (Hu, Wang, and Yeh 2006).

A peculiarity of the DEA methodology is to attribute a synthetic indicator to any phenomenon; from an empirical point of view the DEA allows us to identify the optimal frontier of the DMUs based on the inputs and outputs assigned to each one, given that all values can be a frontier point either above or below the productivity frontier.

The distance that separates each DMU from the border determines its level of efficiency, if the DMU is positioned on the frontier, therefore, it has a distance equal to 0, the DMU will be efficient, otherwise it will be inefficient.

An evolution of the traditional DEA is a DEA with conditional efficiency, given a certain level of technology we consider that the production activity is characterized by a series of inputs $X \in \mathbb{R}_+^p$ which are used to produce a series of outputs $Y \in \mathbb{R}_+^q$ and a generic vector of environmental variables $Z \in \mathbb{R}^d$.

As demonstrated by Cazals et al. (2002), Daraio and Simar (2005), the total unconditional output (the set of all possible and technically feasible combinations between (x, y)) is defined as follows:

$$\psi = \{(x, y) \in \mathbb{R}_+^{p+q} \mid x \text{ can produce } y\}$$

$$\text{Where } \Psi = \{(x, y) \mid H_{X,Y}(x, y) > 0\} \text{ and } H_{X,Y}(x, y) = \text{Prob}(X \leq x, Y \geq y).$$

$\overline{\Psi}$ is the support of the joint random variables (X, Y) . The Farrell-Debreu approach to estimate unconditional (marginal) efficiency with outputs and inputs (x, y) is defined as:

$$\lambda(x, y) = \sup\{\lambda \mid (x, \lambda y) \in \Psi\} = \sup\{\lambda \mid S_{Y|X}(\lambda y|x) > 0\} \quad (1)$$

Where $S_{Y|X}(y|x) = \text{Prob}(Y \geq y \mid X \leq x)$ represents the nonstandard conditional survival function of \overline{Y} with $\overline{X} \leq x$

This framework was extended by Mastromarco and Simar in (2015) and Toma (2020) including time dimensions, in line with their approach we considering a panel data composed by (x_i, y_i, z_i) with $i = 1 \dots n$, and $t = 1 \dots S$, in order to estimates the unconditional and conditional attainable sets. To include time in our analysis, the variable T time will be considered as a further conditioning variable, and for each year period \overline{t} (in this case each year), we will proceed to the definition of all attainable set $\psi_{\overline{t}}^z \subset \mathbb{R}_+^{p+q}$ as support for conditional probability:

$$H_{X,Y|Z}^t(x, y|z) = \text{Prob}(X \leq x, Y \geq y \mid Z = z, T = t)$$

According to Daraio and Simar (2005) the conditional output-oriented technical efficiency, with z conditions at time \overline{t} , is defined as follows:

$$\lambda_t(x, y|z) = \sup\{\lambda \mid (x, \lambda y) \in \psi_{\overline{t}}^z\} = \sup\{\lambda \mid S_{Y|X,Z}^t(\lambda y|x, z) > 0\} \quad (2)$$

Where $S_{Y|X,Z}^t(y|x, z) = \text{Prob}(Y \geq y, \mid X \leq x, Z = z, T = t)$.

Assuming the assumption of convexity and free disposability for the true attainable sets of inputs and outputs, including the z condition and il time \overline{t} . The formula of the DEA estimators according to Daraio and Simar (2007b) is:

$$\hat{\psi}_{\overline{t},DEA}^z = \{(x, y) \in \mathbb{R}_+^p \times \mathbb{R}_+^q \mid y \leq \sum_{j \in J(z,t)} \gamma_j y_j; x \geq \sum_{j \in J(z,t)} \gamma_j x_j; \gamma_j \geq 0 \text{ s.t. } \sum_{j \in J(z,t)} \gamma_j = 1\} \quad (3)$$

Where $J(z, t) = \{j = (i, v) \mid z - h_z < z_{i,v} < z + h_z; t - h_t < v < t + h_t\}$; $\overline{h_z}$ and $\overline{h_t}$ represent the bandwidths of suitable size choice by data-driven methods.

While $J(z, t)$ illustrate the procedure to localize and estimate the conditional DEA estimates and they define the points in a neighborhood of (z, t) , which will be using to compute the local DEA estimates. Following Bădin et al. (2010), Daraio and Simar (2005, 2007a) the choice of the appropriate bandwidths is determined by the value of conditional distributions $S_{Y|X,Z}^t(y|x, z)$, with $\overline{X} \leq x$, $\overline{T} = t$ and a particular value of $\overline{Z} = z$ using standard tools according to Hall et al., (2004).

Variables (t, z) need a smoothing and appropriate bandwidth for this reason we have:

$$\hat{S}_{Y|X,Z}^t(y|x, z) = \frac{\sum_{j=i,v} I(x_j \leq x; y_j \geq y) K_{h_z}(z_j - z) K_{h_t}(v - t)}{\sum_{j=i,v} I(x_j \leq x;) K_{h_z}(z_j - z) K_{h_t}(v - t)}$$

In this function we have include the kernels with compact support (for further and technical details see Bădin et al., 2010), in our studies we apply a quartic kernel.

$$\lambda_{\alpha}(x, y) = \sup\{\lambda|S_{Y|X}(\lambda y|x) > 1 - \alpha\}$$

$$\lambda_{t,\alpha}(x, y|z) = \sup\{\lambda|S_{Y|X,Z}^t(\lambda y|x, z) > 1 - \alpha\}$$

In the model we not considering the full support of Y under the conditioning, but with a value less extreme (with $\alpha \neq 1$). These partial estimates, including also possibly extreme values, providing similar information to the full frontier estimates. In order to select the reasonable value of α we following the approach adopted by Bădin et al. (2010), Daraio and Simar (2007a).

Results. According to the approach proposed by Bădin et al. (2012) we can identify the effects produced by conditioning variables on distribution of the inefficiencies and on the boundary.

The effects on the frontier can be assess using the ratio between conditional and unconditional efficiency measures, concerning to conditional and unconditional attainable sets on the full frontier.

$$R_o(x, y|z, t) = \frac{\lambda_t(x, y|z)}{\lambda(x, y)} \tag{4}$$

The focus of our paper is to assess the effect of T and Z on these ratios. When we apply the output oriented estimates, generally, the conditional efficient frontiers is below of the unconditional one, unless the ratio is equal to 1, this is possible when there is no shift due to variables condition T and Z .

From the analysis of boundaries differences between the possible attainable sets, we can assess if the our variables time T and Z influence the technology of production.

If the ratio tends to increase the product effect will be positive, alternatively as proposed by Bădin et al. (2012) we can consider the counterparts of α and use more central indicators such as the median to evaluate the effect of T and Z on the distribution of the inefficiency.

in this case the relationship is described as follows:

$$R_{o,\alpha}(x, y|z, t) = \frac{\lambda_{\alpha,t}(x, y|z)}{\lambda_{\alpha}(x, y)} \tag{5}$$

The shifting effect caused by our conditional variables already observed from the equation (4), they may be more evident (or less) in the ratio calculated from equation (5) using the ratios for the different levels of α .

In summary using non-parametric estimators for efficiency, we analyse how this value varies for the effects of our variables T and Z for the ratios described in equations (5) and (6).

The results show that, in line with the literature, companies led by young entrepreneurs, diversifying production and adopting new technologies, are the most innovative and most efficient.

Research limitations. The dataset used in the analysis include 12.601 observations distributed over 10 years (2011 - 2020), the data was extracted from FADN database. Our dataset includes all farmers who made investments in the reference year, for this reason our dataset is a unbalanced panel dataset. Some studies analyze the relationship between company size and innovation and underline how large companies have a greater propensity to innovate thanks to the availability of greater financial resources (Baumann, and Kritikos, 2016). In the primary sector this aspect has been evaluated by

Perales et al., (2020) where they find a positive impact between size and innovation, in their study using the number of employees as a proxy of the size of the enterprise. Another important driver in the innovation process is human capital, the ability to absorb and adopt knowledge in the process, the absorption capacity reflects the ability of the enterprise to increase its technologies and knowledge.

Although this variable is commonly used in the study of business innovation; in the agricultural sector there are only a few studies, due to the availability of data, which use human capital as an engine of innovation, in this sense Läßle et al., (2015) find a negative relationship between age and innovation, the explanation of these results is that older farmers respect compared to younger ones have a shorter time horizon ahead of them to enjoy the returns of investments in innovation and the fact that the Older farmers tend to have lower levels of education.

The ability to innovate often also depends on external as well as internal factors, often external factors such as networks and localization are necessary to integrate internal resources. One way to overcome the lack of time and resources (financial and human capital) and to draw on external sources, which can concern both relations with the territory and targeted national policies (Fitjar and Rodríguez-Pose, 2017). This perspective in the agricultural sector is not shared by all researchers, some pointing out that small farms tend to innovate by relying on their internal resources (Lindgaard Christensen et al., 2011).

Managerial implications. In this study in order to reduce the problem of the “curse dimensionality”, we considered an elementary production model with one output and only three inputs: value added as output and equity, machinery and labor as output. In addition, in order not to burden the model with conditional variables, we only use two variables: time and new investments.

All companies have a precise mission, and as the ultimate goal is the creation of profit and wealth for the property (Fridman, 1970). Innovative companies are strongly oriented towards dialogue with the external environment.

Sono destinatari di questo lavoro sia le Pubbliche Amministrazioni che le Aziende ed i giovani imprenditori. Tali soggetti sono in grado di cogliere l'opportunità di creare valore legato all'innovazione. For this reason, this study suggests that young people who try their hand at a business idea should be encouraged. The creation of new public incentives to facilitate the breeding of new young businesses and to encourage such enterprises to diversify their production. Diversification is in fact a process with medium-long times, to which is added the need for high investments. The organization must be ready and flexible to adapt to change, so as to develop new logics and procedures to make the most of the result of product diversification. Today's founders have a broader vision than that of the generations that preceded them. The territory of action of a young entrepreneur is much wider. Technological innovation for a young person is more accessible and easily usable.

A true culture of innovation is something profound that permeates the entire company vision. It allows us to listen to consumers, intercept technological and cultural changes and anticipate innovative solutions.

One of the elements that allows companies to have a greater chance of success is innovation. In close reciprocal relationship with developments in scientific research and knowledge and therefore with progress, it is a determining factor in the economic growth of a country.

Innovation therefore means adhering to circumstances, to changes in the environment, to scientific discoveries, it means not losing sight of the market, observing, and proposing concrete answers that are increasingly consistent with the needs of customers. A company with older management often has a very narrow view of innovation, identifying it exclusively as new product development and research and development.

On the other hand, a company with young management is easier to change one or more dimensions of its business system to reach high levels of performance

Every company, to be competitive, is called to deal day after day with the reality that surrounds it, above all it is called to look at the market. This means paying attention to the needs of its customers, to the answers that the market is offering them, to the possibilities still unexplored. Innovation also means taking risks and accepting the challenge of change.

The growing attention of consumers towards the quality of products, health aspects, the environment and the sustainability of production processes are today the main levers that push the innovation processes of agri-food companies.

Originality of the paper. In the analysis of innovation in the agricultural sector, different approaches have been used, including micro and temporal studies of innovation enablers that can be internal and external to enterprises (Klerkx et al., 2009).

With a macro approach Spielman and Birner and in their study, based on the national innovation system, identifying the main constraints related to the agricultural sector and proposing the construction of a series of indicators able to eliminate these constraints.

Researchers addressed the relationship between agriculture and innovation, which, although one of the drivers of the country's growth, has had few empirical studies also due to the difficulty of providing a single definition of innovation valid in all sectors (Gault 2018).

For the construction of these indicators, a theoretical framework is adopted that is based on the construction of indicators capable of measuring innovation efforts at national level (R&D expenditure, number of patents) and their impact on productivity and growth (Spielman and Birner, 2008).

From a micro-level approach there are a limited number of studies due to the difficulty of identification in the agricultural innovation process and the scarce availability of data (VanGalen and Pope, 2013).

The variety of results of previous studies requires more details on the relationship between innovation and growth in the Italian agricultural sector and what characteristics innovative farmers have.

Managing the digital healthcare services design: A preliminarily study on the role of human-like interaction, anthropomorphism and emotional receptivity on patients' intention to use medical intelligent agents

ANDREA SESTINO* ALFREDO D'ANGELO*

Framing of the research. *Today's technological advances are reshaping the world of digital-based healthcare services, by involving a radical process of digitalization. The broad scope of digital health includes categories such as mobile health (mHealth), health information technology (IT), wearable devices, telehealth and telemedicine, and personalized medicine representing new ecosystems able to empower health leaders to digitize point-of-care settings and propose advanced patient-centered care (Värri et al., 2020). Alongside teleconsulting platforms, existing digital business models propose automated services such as medical chatbots to interact with patients (Nadarzynski et al., 2019). Such chatbots consists in a computer program that simulates human conversation through voice commands or text chats or both: Technically, chatbots are built on the basis of Artificial Intelligence (AI) features that may be embedded and used through any major messaging application. Nevertheless, previous research stress their lack of human-like interactions. In this scenario, the advent of Metaverse may fill this gap by "catapulting" patients and doctors into a parallel virtual reality made up of avatars where interactions are as similar as possible to those in the real world. In the case of digital-based healthcare services through the Metaverse many promising opportunities emerge as face-to-face communication, affective communication, communicating with emotion and social interactions that are critical for doctors-patients' relationships may be expressed by the avatars (Córdova González, 2022). Indeed, the avatars technically consist of digital-based physical representations of people in the virtual world such as in the Metaverse: The avatars, may be realized by the using of specific software aimed to create a virtual version of the individuals who would enter the virtual world, finally appearing similar in the physical aspect, and usually looking exactly like as they do in real life, thus appearing as digital representations of ourselves (Sestino, Guido & Peluso, 2022).*

From a final users' perspective (i.e., the patients), the confluence of the aforementioned new technologies activating the Metaverse may enable healthcare specialists to deliver a suite of highly integrated, intentional, and individualized care, unfettered by the siloed nature of existing healthcare models in a "parallel" daily life environment (Sun et al., 2022). The Metaverse may foster rapidity of both doctor-patients and doctor-doctor communication enabling unprecedented levels of sophistication in prevention, diagnosis, and treatment, by conducting the doctor-patient experience to a futuristic level. To increase knowledge in this promising research field, we try to investigate what are the individual determinants of consumers' intention to use new digital-based healthcare services. We explore the role of three constructs - namely human-like interaction, perceived anthropomorphism, emotional receptivity, which might contribute to explaining consumers' intention to use such services.

Individuals' intention to use digital-based services delivered by human-like agents in the form of virtual agents (such as chatbots, fully automated and computer-driven) or intelligent agents (such as avatars, partially automated, and human-driven) in the digital environments has recently attracted scholars' attention. On the basis of the extant literature, the role of real individual similarity (or identification) to their avatar or to the online available human-like agents, (e.g., as in Yang et al., 2011; Keeling & McGoldrick, 2008; Kim & Kim, 2016; Jahn et al., 2021), along with the emotional components of digital interactions (e.g., as for empathy, social interaction, and so on; Aylett et al., 2005; Cordar et al., 2014; Jahn et al., 2021) with human-like intelligent agents such as the avatars seems to be important in influencing individuals' intention to use such healthcare digital service.

As for the human-like interactivity, while chatbots might be perceived as less human-like interactive due to their fully automated nature, avatars within the Metaverse might instead be perceived as more human-like interactive precisely because they represent the virtual translation of human individuals as for the doctors (Ciechanowski et al., 2017; Mystakidis, 2022; Mygland et al., 2021).

e-mail: alfredodangelo@unicatt.it

Similarly, in this domain, the role such intelligent agents' perceived anthropomorphism of has also captured the research attention as well: Indeed, the construct of anthropomorphism refers to the individuals' tendency to perceive inanimate objects as human-like entities (Guthrie, 1993), and consists in the inference process of attributing external characteristics, motivations, behaviors, and underlying states that are typical of humans to objects and non-human agents (Guido & Peluso 2014). By considering the digital environments, the virtual agents may be designed in an anthropomorphic way, which gives it characteristics that humanize it: For this type of agent, embodied, non-verbal ability (human gestures) and verbal abilities (voice and conversational skills) reflect ritual behavior (Koike & Loughnan, 2021). Individuals' perceived anthropomorphism may directly influence their intention to use a human-like intelligent agent, both depending on the agent type (e.g., robot gender, individual similarity) and on the type of service offered (Blut et al., 2021). This individuals' intention is mainly driven by the similarity they attribute to the digital tools, such as in the event of virtual agents e.g., chatbots (Sheehan et al., 2020), or avatars (Jahn et al., 2021). Accordingly, many studies demonstrated how the possibility of making intelligent virtual agents as anthropomorphic as possible may be one of the success factors in positively influencing the reactions of end-users (e.g., as in Moussawi et al., 2021; 2022)

By considering the healthcare sectors and current effort in proposing new digital-based environment for healthcare service delivery, despite the efforts of medical chatbots to reach increased level of anthropomorphism (Bulla et al., 2020), the avatars may be better welcomed by final users because perceived as more similar to the humans (e.g., doctors or clinicians) they represent in the virtual world. Indeed, as clarified above, since the avatars are not automated by computers but controlled by humans, they may embody all the positive sides, acting like humans, and not incurring in technological errors because driven by the humans behind them, by revealing higher level of human-like interactivity (Latoschik et al., 2017).

More importantly, in the healthcare sector, doctors' non-verbal communication during medical visits plays an important role in assessing patient compliance, satisfaction with care and monitoring health improvements (Goold & Lipkin, 1999; Ong et al., 1995). Indeed, doctors' medical profession requires they are both clinically competent and empathetic towards the patients (Kerasidou & Horn, 2016). Previous studies show that the doctors' non-verbal emotional communications may generate positive emotions and it may have positive effects of on patients' perception of the overall quality of the healthcare services (Ranjan et al., 2015). Patients are particular receptive these non-verbal approaches and are often looking for a "total guidance", both in professional and emotional terms. Accordingly, the literature demonstrates how socio-emotional interchange (e.g., approvals, laughter, legitimacy, empathy) largely influence how patients feel after the consultation (Pawlikowska et al., 2012). Indeed, such forms of non-verbal communication represents a fundamental factor of such socio-emotional exchange (Friedman, 1979; Roter, 2006). More prominently, this kind of communication is essential for patients' perceived quality of the healthcare service (Laine et al., 1996), and it is able to influence the overall perception of the delivered service.

Purpose of the paper. Based on above, in this study we hypothesized that the human-like interaction level (low vs high) may positively influence individuals' intentions to use through the effect of their perceived anthropomorphism. Moreover, by considering the peculiarities of the doctor-patient relationship resulting not only from professionalism, but also from emotionality, empathy, and non-verbal communication, we postulate that such an effect may be moderate by patients' emotional receptivity.

To test the hypothesis, an experimental design based on a two-cell experiment has been conducted by manipulating the level of human-like interactions in a digital-based healthcare service delivery. Building on previous literature explaining the different level of perceived human-like interaction levels, we manipulate human-like interaction level by exposing half sample to a scenario describing the use of chatbot for healthcare service delivery (low condition). The other half of the sample has been exposed to a scenario describing a Metaverse-based healthcare service delivery in where users are able to interact via their avatars (high condition).

Methodology. An experiment has been conducted among a sample of 312 randomly recruited participants, who have been invited to participate through the Mechanical Turk Platform by Amazon (Aguinis et al., 2020). Among the participants, half of them have been exposed to a scenario in which a target patient had the possibility of using a remote teleconsultation in an online environment through the use of a chatbot able to interact with the patient asking him/her about their symptoms, allergies, and so on in a private chat (human-like interaction; low condition). The other half of participants has been exposed to a scenario where a patient had the opportunity to enter the Metaverse and interact with his/her GP for the desired teleconsultation (human-like interaction; high condition). To confer more consistency in our stimuli, before conducting the main study a pre-test was performed among a sample of 40 participants, who rated the perceived level of human-like interaction about the chatbot vs the avatar in the Metaverse (1 = "Totally non-human-like interactive", 7 = "Totally human-like interactive").

As for the main study, we administered questionnaire built through the Qualtrics platform (Weber, 2021). The questionnaire has been organized in four sections. Firstly, we welcomed participants and we asked them to report their emotional receptivity based on Lee and Lim (2010) (i.e., "The use of hands and other body movements is very helpful in facilitating communication", "It is necessary to show too much facial expressions", "People should show a lot of facial expressions when talking", "I pay close attention to people's gestures when talking to them", "When communicating, a person should use a lot of variation in his/her voice tone, pitch, and loudness"). In the second section, on the basis of our two-cell experiment, participants have been randomly assigned to two different scenarios/settings in where we manipulated the level human-like interaction in the online digital-base healthcare service delivery (low level, by using chatbot vs high level, by using Metaverse-avatars). Then, in the third section, we asked for participants' intention to use

digital-based healthcare service by using a two-items scale drawn by Fishbein and Ajzen, (1975) (i.e., "I intend to use such digital-based healthcare service in the future", "Probably, I will use such digital-based healthcare service in the future" there and perceived anthropomorphism consisting of a four-items scale drawn by McLean et al. (2019) (i.e., "When I communicate with the digital doctor, it feels like someone is near me", "The interaction experience with the digital doctor is close to that with a human being", "During interactions the with the digital doctor, I feel like I am communicating with a human", "I interact with the with the digital doctor in a way similar to how I interact with people"). Both individuals' intention to use, and perceived anthropomorphism, together with their reported emotional receptivity were assessed on a 7-point Likert-scale.

Results. Confirming our hypothesis, results show that high level human-like interactions (low; chatbot vs high; avatars) positively influences individuals' intention to use such digital-based healthcare services, through the effect of their perceived anthropomorphism. Furthermore, such effect is significant only among individuals with a higher level of emotional receptivity, by confirming the relevance of having to maintain a certain degree of emotionality even in totally digital-based environments.

Research limitations. In this study, we focused on the technicalities of some intelligent agents used for digital-healthcare service purposes, specifically by alternatively using medical chatbots and medical avatars which served to manipulate the human-like interaction level of such proposed intelligent medical agents. By considering we would investigate consumers' reactions to such intelligent agents' characteristics in terms of human-like interactivity, and anthropomorphism, together by considering individuals' emotional receptivity (which underlies the doctor-patient relationship), some "product"-related variables have not been considered. Future studies may leverage seminal suggested variables (e.g., as for perceived usefulness, ease of use, and so on) to enrich our proposed conceptual framework, or may consider further patients'-related individual differences (e.g., as for their openness to experience, innovativeness, need for security) together with some sociodemographic variables in this domain (e.g., as for the role of age).

Managerial implications. This study attempts to provide a response to the plea by Dwivedi et al. (2022) for research examining how the Metaverse may contribute to telemedicine and other healthcare activities. The study presents theoretical and managerial implications. Findings our paper may be useful to advance current understanding of individuals' intention to use digitalized healthcare services, and it sheds light on the drivers that may influence the use of the Metaverse technologies in healthcare. The current study also extends research related to both anthropomorphisms, and the role of emotional receptivity literature. Managerially, this research suggests healthcare managers how to deal with newer digital tools such as avatars. From a service-design perspective, we propose some insights on how to design acceptable and usable digital-based healthcare services by suggesting managers which aspects they should emphasize in designing such avatars, e.g., guaranteeing certain levels of human-like interaction and anthropomorphism. These latter make the user experience of digital-based healthcare services in the virtual world closer to the real one, and above all, without sacrificing the role of emotionality in the doctor-patient relationship. Furthermore, our work can provide useful ideas for the design and planning of digital platforms for the provision of digital-based health services by observing careful co-planning with the end users, capable of favoring a deeper digital transition in this industry as well. Summarizing, our results may suggest marketers and managers how to design effective digital-based healthcare platform (e.g., as for teleconsulting purpose) by accessing the Metaverse. In this sense, Metaverse applications in healthcare may significantly improve patient outcomes by opening up completely new channels for delivering cost-effective treatments. Moreover, such new kind of digital-based healthcare service, may represent a prodigious tool for healthcare professionals, allowing remote monitoring and telemedicine for geographically limited or social limited patients.

Originality of the paper. This paper is the first to investigate individuals' reactions to intelligent agents able to confer certain level of human-like interactions: To the best of Authors' knowledge, no studies investigated patients' reactions to chatbot (characterized by low level of human-like interaction) vs. Metaverse-based avatar (characterized by high level of human-like interaction), and specifically on their intention to use. More importantly, we alternatively consider individuals' perceived anthropomorphism of such intelligent agents, and decisively their emotional receptivity tendency.

Keywords: metaverse; chatbot; digital healthcare; healthcare; human-like interaction; anthropomorphism; emotional receptivity; intention to use

Managing communication and business strategies for a better society: The issue of obesity prevention and digital therapeutics. Findings from a preliminary literature review

ALESSANDRO GIANNATTASIO * ANDREA SESTINO[•]
CESARE AMATULLI[▲] ALESSANDRO M. PELUSO^{**}

Framing of the research. *Current technological advances have radically reshaped society (Younes and Al-Zoubi, 2015). By considering the healthcare sector, the digital progress has a great potentiality as it could overcome current barriers to healthy behavior changes by providing behavioral interventions that enable the management and treatment of chronic diseases such as obesity (Allen et al., 2013). In this domain, Healthcare 4.0 refers to the efforts directed at providing healthcare services designed to improve individuals' health and well-being management through the use of advanced technologies, such as IoT sensors and devices, smartphones, electronic health records (EHR). Such technologies could also facilitate the collection of personal and behavioral data that might be leveraged to influence patients' behavior and personalize their therapies (Jayaraman et al., 2020), thus transforming the traditional relationship between doctor and patient into in an equal and collaborative partnership. This empowerment process places the patient at the center of the healthcare system (Meskó et al., 2017). The aforementioned digital features may make digital medicine more effective than in the past in treating and preventing chronic disease (Von Huben et al., 2021) in that their execution mode allows greater accessibility to cognitive-behavioral interventions (CBT) (Kambeitz-Illankovic, 2022) and thus the development of self-regulation practices (Bryant, 2021). Indeed, chronic disease management often occurs not only by treating the clinical disorder but also by correcting daily life habits (Arlinghaus and Johnston, 2019). However, it has been shown that the effectiveness of digital healthcare may be different by considering both the condition and severity of the disease. Indeed, previous literature demonstrated that the application of digital interventions for the prevention of depression in patients with back pain had halved the risk of the onset of depressive disorder (Sander et al., 2020), while the same intervention implemented for the treatment of depression for the same type of people did not bring benefits (Baumeister et al., 2021). In this domain, the digital medicine may play an important role in the development of a new approach to the prevention and treatment of another urgent disease such as obesity (Hinchliffe et al., 2022), by both facilitating weight loss in overweight and obese individuals and educating and encouraging them to engage in healthier lifestyles (Lang and Froelicher, 2006). The Obesity Medicine Association (OMA) has defined obesity as "a chronic, progressive, relapsing, and treatable multi-factorial, neurobehavioral disease, where in an increase in body fat promotes adipose tissue dysfunction and abnormal fat mass physical forces, resulting in adverse metabolic, biomechanical, and psychosocial health consequences" (<https://obesitymedicine.org/what-is-obesity/>, 2022). Medical literature (Al-Kandari, 2006; Poirier, 2007; Kanthe et al., 2012) has defined three grades of obesity: Grade 1 (BMI ranging from 30 to 34.9 kg/m²), Grade 2 (BMI ranging from 35.0 to 39.9 kg/m²), and Grade 3 (BMI ≥ 40 kg/m²). Nowadays, obesity is now considered the largest non-infectious epidemic of the third millennium and has been recognized as a major public health problem as it represents an important risk factor for major chronic diseases such as Type-2 diabetes, cancer, or cardiovascular diseases (Ali et al., 2022). To date, the WHO European Regional Obesity Report 2022 Health Organization (WHO) found that 59% of European adults and almost 1/3 child (29% of males and 27% of females) is overweight or is suffering from obesity, which is responsible for about 13% of total European deaths (<https://www.who.int/europe/news/item/03-05-2022-new-who-report--europe-can-reverse-its-obesity--epidemic>, 2022). A study by the McKinsey Global Institute (MGI) specifies that the obesity epidemic produces about 5% of worldwide mortality and points out that the costs of the disease not only expressed in terms of health but also in economic terms: the total economic impact of obesity is about 2 trillion dollars per year or 2.8% of world GDP (<https://www.mckinsey.com/mgi/overview/in-the-news/the-global-obesity-threat>, 2022).*

Therefore, through a holistic approach that allows the collaboration of medical professionals, politicians and consumer behavior scientists (Roberto et al., 2014), a major public health effort is urgently needed to tackle the current of obesity challenge at a global level (Nestle and Jacobson, 2000). Obesity is recognizable as a lifestyle illness (Egger and Dixon, 2014). Therefore, a multidimensional therapeutic method based not only on prescription drugs but especially on cognitive-behavioral interventions is important for an effective treatment of the disease (Alimoradi et al., 2016).

By deeply analyzing this domain, the digital therapeutics (hereafter, DTx) may become central to preventing obesity. DTx have been defined by the Digital Therapeutics Alliance as software systems that, once installed on smartphones, tablets, or wearable devices, provide a therapeutic service, in stand-alone mode or plug-in with other therapies or medicines, with the aim of preventing and treating clinical diseases (<https://dtxalliance.org/understanding-dtx/what-is-a-dtx/>, 2022). On the basis of its technicalities, DTx may represent an effective and important opportunity in designing new digital healthcare service delivery processes (Sverdlov et al., 2018), and may contribute to treating patients' dysfunctional behaviors by improving adherence and management of diseases such as obesity. To clarify, DTx uses digital tools like mobile devices, apps, sensors, virtual reality, the Internet of Things, and other tools to spur behavioral changes in patients (https://www.pharmastar.it/binary_files/instantbook/PDF_Digital_Therapeutics__finale_29462.pdf, 2022). The DTx development may thus have a positive impact on providing customized health services as their design is tailored to fit patient's needs (Dang et al., 2020). Two practical examples of digital therapeutics currently available in the market are reSET-O and Sleepio, which are mobile applications that provide cognitive behavioral therapies (as a form of psychological treatment that has been demonstrated to be effective in contributing to heal), and lead patients with narcotics use disorders to track their substance use, cravings, and triggers (<https://peartherapeutics.com/products/reset-reset-o/>, 2022). The strength of DTx is the ability to customize treatments according to the therapeutic needs of the patient (Hong, 2021) and according to the important US market research company, Allied Market Research, the DTx market will grow up to \$13,8 billion by 2027 compared to \$2.88 billion in 2019 (<https://www.alliedmarketresearch.com/digital-therapeutics-market>, 2022).

Purpose of the paper. This paper systematizes the body of knowledge related the issue of DTx for the treatment and prevention of obesity through a systematic review of the literature. Our goal is twofold: a) to identify the most promising discussion topics to date, and b) to prepare a research agenda for the future, which identifies the useful questions to be investigated for the construction of services based on DTx and the communicative inputs that optimize cognitive-behavioral therapies by making the visual interface of multi-channel digital platforms (e.g., web, mobile, notification app mobile) more effective in actively involving the patients, eventually guiding them towards virtuous and behaviors for the obesity prevention and treatment.

Methodology. A systematic review of the marketing and consumer behavior literature regarding the obesity issue has been conducted. We have analyzed how marketing efforts and appropriate communication strategies may improve eating behaviors and prevent obesity. In so doing, we have shed light on issues that are worthy of further study by scientific research in the future. To provide a critical review of academic studies, we examined scholarly articles published in international peer-reviewed journals over the last twenty-two years (2000-2022).

Our process started by defining a list of 12 keywords that could be used to extract the most appropriated scientific contributions, published in the most relevant management journals. We then searched the three main business databases (Business Source Premiere and EconLit, hosted by EBSCO; and ABI/INFORM Complete from ProQuest, Scopus) for articles published in the appropriate journals that contained the words "marketing", "consumer", or "advertising" in their title. To strengthen our research, we also considered other relevant journals that cover research areas related to healthcare marketing and obesity/overeating.

A sample list of selected keywords referred, for example, to "obesity", "digital therapeutics", "communication", "health marketing", "behavioral experiment", and "overeating", combined with keywords related to consumer behavior such as "healthcare consumer behavior", "decisional process", "self-monitoring", "food styles", "communication stimuli", "nudging". After selecting the final set of keywords, we launched a series of queries combining the selected keywords, according to database-mining criteria, for the purpose of extracting the best articles useful for the complete description of the state-of-the-art that contain words, such as "business", "management", "marketing", "consumer" or "advertising" and the abstract (Tranfield et al., 2003).

A query was for example: "Title-Abs (("obesity" and "consumers") and ("marketing" or "advertising" or «communication»)) and pubyear > "2000" and < "2022" and (limit-to (doctype, "ar") or limit-to (doctype, "cp")) and (limit-to (language, "English"))).

Results. The document analysis resulted in three most prominent topics namely 1) Products' label for obesity prevention; 2) Technology-aided prevention; 3) Marketing and communication strategies.

For each prominent topic, four sub-topics have been identified. Specifically, for the products' label for obesity prevention, we identified labelling, packing features, definition of food and variety of assortment. The results showed how nutritional labeling induces consumers to make food choices that reduce fat intake during each meal (Wansink and Chandon, 2006). Moreover, providing calorie counts on restaurants' menus has a very strong visual impact that affects the decision-making process by reducing calorie intake by 24.4% (Dallas et al., 2019). The characteristics of the packaging and the variety of the assortment also influence eating style as the palatability of the food is conditioned by the size of the packaging (Chandon, 2013; Koo and Suk, 2016; Wansink and Kim, 2005). Furthermore, the presence of more options available increases the amount of consumption (Kahn and Wansink, 2004; Raynor et al., 2006).

Consumers perception of the food quality has a strong impact the name given to the product: Indeed, empirical evidence suggests that, for the same amount of fat, sugar, and carbohydrates, a food product with an unhealthy name is perceived as more caloric than the same food with a healthy name (Cardello et al., 2012; Irmak et al., 2011; Oakes, 2005).

Regarding technology-aided prevention, we associated four sub-topics namely mobile and web apps, electronic food self-regulation, text messages, DTx. Technological progress is an important ally for the prevention of obesity, it promotes behavioral interventions of food self-regulation (Berry et al., 2021; Patel et al., 2021). The development of mobile apps and websites may improve self-monitoring of lifestyle, calorie intake, and physical activity (Butryn et al., 2020; Patel et al., 2018). However, most available apps lack a solid scientific foundation and input from healthcare professionals (Stevens et al., 2014). Furthermore, studies have shown how sending daily text messages (SMS) remind a user to engage in healthier behaviors promoting a decrease in BMI for obese and overweight people (Burke et al., 2011; Faghanipour et al., 2013; Shaw and Bosworth, 2012; Silina et al., 2017). Finally, DTx are comparable to traditional therapeutic treatments; therefore, prior to their commercialization for the purpose of measuring their safety profile and clinical efficacy, they must be approved and certified by regulatory authorities (Hong, 2021). Specifically, DTx in the United States are regulated by the Food and Drug Administration (FDA) (Patel and Butte, 2020) and in Europe by Medical Devices Regulation (EU) n. 2017/745 of the European Parliament and Council (Lang, 2017). It is quite acknowledged therefore that DTx offer new treatment opportunities as they ensure to biopsychosocial approach including medical treatment and lifestyle changes (Kim and Choi 2021).

Regarding marketing and communication strategy, our review highlighted four subtopics: Communication in advertising, nudging, focus on the consumer healthcare behavior, obesity in the new generations. Existing empirical evidence suggests that the application of communication and marketing strategies have a strong impact on the promotion of healthy lifestyles (Worsley et al., 2014; Smeesters et al., 2010). However, it is through the integration of regulatory interventions - e.g., appropriate nutrition labeling of foods (Wansink and Chandon, 2006), banning junk food from schools (Dority et al., 2010) - that there is a maximization of the positive results through the creation of nudging health (Roberto et al., 2014).

In conclusion, the current state-of-the art show how appropriate marketing and communication strategies can guide consumers' healthy behavior and how technology, ensuring self-monitoring of lifestyles, is a valuable tool for combating and preventing obesity.

Research limitations. *Despite the promising insights related to the emerging topics and the future avenue for research, our contribution has some limitations. For instance, we only considered English articles and thus, other relevant contributions might have been neglected. Moreover, almost all the experiments of the quantitative papers were conducted with Western consumers. It would be interesting to know if the same experiments with Eastern consumers, endowed with clear cultural differences, might lead to different results.*

Managerial implications. *This research suggests to marketers, physicians, practitioners, nutritionists, politicians, and managers of the health sector how to organize health care for paths of care and prevention. Leveraging advanced analytical algorithms and combining diverse healthcare data, we suggest industry leaders design a healthcare service that harnesses the potential of technological progress not only for the development of new digital therapeutics but also for the collection of health data. DTx extend the care capacity of doctors and enable home care that provides the added benefit of privacy by lowering the stigma associated with the administration of some therapies. We recommend a political effort because, from a legislative and regulatory perspective, there is still no centralized European approval process. The global digital therapy scenario moves at different paces as individual nations, with extremely diverse healthcare systems, draw up processes, requirements and regulatory standards generating strong entry barriers for DTx. Also in Italy, especially following the Covid-19 emergency, interest in the adoption of new digital therapeutics has grown. However, this momentum is dampened by the lack of a legislative framework that regulates clinical validation. We propose the establishment of a fast-track regulatory path that sets out clear rules for the conduct of clinical trials, greater certainty on the timing of approval, medical prescription, and reimbursement.*

Originality of the paper. *The paper provides new insights into the greater potential of technological progress in the healthcare sector. It is the first paper that presents a range of the most effective digital tools for the fight and prevention of obesity such as mobile apps, websites, text messages with particular attention to the development of digital therapeutics. DTx and communication strategies are presented in a healthcare marketing perspective with the aim of an assisted prevention focused on the cognitive behavioral element of therapy that leads to the development of effective health nudging.*

Ecosystem Emergence when Supply, Demand, and Incentives are scarce: The Case of the Clinical Trials Ecosystem for Rare Diseases

ALESSIO COZZOLINO* LUCA PISTILLI* SUSI GEIGER[▲]

Framing of the research.

“Do you know how many children die every year from choking on french fries? Many more than from Adrenoleukodystrophy. You see, ours is what is known as an orphan disease, too small to be noticed, too small to be funded, especially with the iron hand of Reaganomics”.
(Prof. Nikolais’s quote from the movie Lorenzo's Oil)

In recent years there has been a growing and consistent interest in business ecosystems to study their emergence (e.g., Hannah and Eisenhardt, 2018), management (e.g., Adner and Kapoor, 2010), and disruption (e.g., Ozalp, Cennamo, and Gawer, 2018). Scholars have also examined when ecosystems are better than markets (Jacobides, Cennamo, and Gawer, 2018). While markets are characterized primarily by transactions, ecosystems are characterized by complementarities of value creation and interdependences, and by specific dynamics between ecosystem actors (e.g., Cozzolino, Corbo, and Aversa, 2018; Jacobides et al., 2018). When supply and demand are scarce and incentives are limited, markets are less likely to emerge (e.g., Autio and Thomas, 2014; Murthy and Madhok, 2021; Navis and Glynn, 2010). Similar conditions of small/scattered demand, supply bottlenecks, and limited incentives are largely overlooked by scholars, but we submit that ecosystems can still emerge. Contexts characterized by such conditions can be important, as is the case of “rare diseases” where both patients and clinical trial participants are few in number and often difficult to identify. Therefore, the investigation of ecosystem emergence as a solution to non-market emergence is both theoretically relevant and practically valuable, especially for those cases where the ecosystem in question produces goods or services that have important societal implications. To help fill this theoretical and practical lacuna, we investigate the following research question: What are the processual mechanisms enabling ecosystem emergence in conditions when a market would not emerge, such as when supply, demand, and incentives are scarce?

The phenomenon guiding our investigation is the emergence and evolution of the clinical trials ecosystem around rare diseases, a revelatory case (Yin, 1994) for our research questions, as shown below. The clinical trial focus was chosen because this is the most important and expensive phase in drug development. Over the past two decades, pharmaceutical firms have outsourced most of their clinical trials to so-called clinical research organizations (CROs), which conduct clinical trials on patients on behalf of pharmaceutical companies. Clinical trials are a critical component of the pharmaceutical value chain, not only from a regulatory perspective but also because they allow for building direct relationships with patients - a factor that is particularly vital when it comes to rare diseases. This interdependence is key for our research: we believe that it is important to study the interdependent relationships between CRO, pharmaceutical companies, and patients / patient organizations, extending prior studies focused only on pharmaceutical companies and biotech startups (e.g., Arora and Gambardella, 1990; Rothaermel, 2001) and contributing to the broader perspective of ecosystem research (Hannah and Eisenhardt, 2018; Jacobides et al., 2018).

Purpose of the paper. *Our purpose is to examine an important phenomenon - rare diseases and related clinical trials - to advance ecosystem emergence literature. The phenomenon presents new challenges that have not been examined by prior literature. Based on data from the European Union DG Health and Food Safety:*

Any disease affecting fewer than 5 people in 10,000 in the EU is considered rare. Although this might appear small, it translates into approximately 246,000 people. Most patients suffer from even rarer diseases affecting 1 person in 100,000 or more. Approximately 5,000-8,000 distinct rare diseases affect 6-8% of the EU population i.e., between 27 and 36 million people.

As it can be understood, there are challenges that prevent the market of clinical trials for rare diseases to emerge in the first instance. If the demand from patients is rare and scattered, pharmaceutical companies do not have an economic incentive at spending money and time on similar cases. Scientists do not have an intrinsic motivation type of incentive because they would rather be willing that their name is associated with the solution to cancer and other big problems. Therefore, supply is also scarce because producers lack sufficient incentives due to the limited and scattered demand (from final patients).

Early on in our study, we found that a solution to this problem has been offered by patient associations and the families of people with rare diseases. They represent a sort of social movement phenomenon (e.g., Pacheco, York, Hargrave, 2014) or in general actors facing a problem and having a huge motivation to solve the problem by themselves. Therefore, in our research, we investigate how similar actors have worked together with other important actors for the emergence of the ecosystem for clinical trials around rare diseases. Media and regulators are important actors on which patient associations put pressure. At the same time, the CROs are the other critical actors as they need to attract enough participants to successfully execute clinical trials related to drugs for treating rare diseases. The challenge in attracting similar patients is that they are scarce in numbers and often dispersed worldwide. Specifically, with respect to that last feature, CROs have evolved their structure adopting a platform-based approach (HBS Digital Initiative, 2018)¹. Following this platform perspective and with respect to the CROs, patients (as clinical trial participants) are seen as input (i.e., part of the supply equation) rather than part of the demand side (though admittedly they are both at the same time), and so the access to this rare input strengthens the platform firm. Hence, in our context, CROs can be considered as platform firms, with clinical trial participants as critical input and pharma firms as buyers. This has important scale implications: the more numerous and more diverse a patient pool a CRO has at its disposal, the more valuable that pool becomes for pharma. This, of course, heightens the importance of the CRO's relationship with patient associations, who act as important gatekeepers in this ecosystem.

As it can be seen from above, the purpose of our research is twofold: 1) to explain a societally important phenomenon from which many actors including managers and policy makers can learn; and 2) to contribute to the theoretical literature on ecosystem emergence and platforms, market failure, and related studies on non-market actors.

Methodology. Since we know relatively little about how ecosystems with small and scattered demand or supply can emerge and be managed, we conducted a historical and longitudinal study (see Ansari, Garud, and Kumaraswamy (2016) for a similar approach in an ecosystem study). We are collecting a mix of archival material (secondary data) and face-to-face interviews (primary data) - some of which have already been conducted. Secondary data include industry reports published by leading consulting companies, specialized magazines and blogs, newspapers, press releases, pre-recorded media interviews, annual reports, and strategic plans related to pharmaceutical and biotech firms, CROs, patient agents, regulators, and other ecosystem actors. Primary data consist of some integrative face-to-face interviews to be conducted with managers working for two leading multinational pharmaceutical firms which recently increased their focus on rare diseases, with CROs, patient organizations, and other key actors. Sample key actors in the ecosystem are Pharm-Olam and Ergomed (for the CROs), Eurordis and NORD (for the patient associations), Roche and Amgen (for the pharmaceutical companies), and FDA and EMA (for the regulators). Our sampling strategy of two pairs of firms per ecosystem actors is a re-elaboration of Eisenhardt's cross-case study method (Eisenhardt, 1989; see also Yin, 2009). We have started analyzing our data using Gioia's method (Gioia et al., 2013) of first-order and second-order coding and progressive theoretical abstraction with the scope to understand the mechanisms between emerging constructs and develop a process model of ecosystem emergence under challenging conditions. Table 1 presents a summary of the couples of the key ecosystem actors sampled for the study.

Tab. 1: Sample Key Actors in the Focal Ecosystem.

Ecosystem Actor Type	Sample Actors	Description	Est.
CRO	Pharm-Olam	Specialized in life-threatening therapeutic areas such as oncology, hematology, infectious disease, rare disease, allergy, and autoimmune	1994
	Ergomed	Focused on rare diseases, provides a full range of clinical research services across all stages and types of clinical trials.	1997
	Eurordis	EURORDIS is a non-governmental patient-driven alliance of patient organisations representing 1000 rare disease patient organisations in 74 countries.	1997
Patients Association	NORD	It is the voice of 30 million people affected by rare diseases throughout Europe. Patient advocacy organization dedicated to individuals with rare diseases and the organizations that serve them. NORD, along with its more than 300 patient organization members, is committed to the identification, treatment, and cure of rare disorders through programs of education, advocacy, research, and patient services.	1983
	Roche	Swiss multinational healthcare company that operates worldwide under two divisions: Pharmaceuticals and Diagnostics	1896
Pharma	Amgen	American multinational biopharmaceutical company headquartered in Thousand Oaks, California. One of the world's largest independent biotechnology companies,	1980
	FDA	Federal agency of the Department of Health and Human Services. The FDA is responsible for protecting and promoting public health through the control and supervision of food safety, tobacco products, dietary supplements, prescription and over-the-counter pharmaceutical drugs (medications), vaccines, biopharmaceuticals, blood transfusions, medical devices, electromagnetic radiation emitting devices, cosmetics, animal foods & feed and veterinary products.	1906
Regulator	EMA	Agency of the European Union (EU) in charge of the evaluation and supervision of medicinal products. Prior to 2004, it was known as the European Agency for the Evaluation of Medicinal Products or European Medicines Evaluation Agency (EMA)	1995

Results. *Preliminary empirical results show that the rare disease and clinical trial ecosystems present interesting characteristics that inform our theoretical understanding of ecosystem emergence. First, we found that ecosystems around rare disease solutions for patients successfully emerged, thus avoiding a “blocking from the start” effect (e.g., Ozcan and Santos, 2015), despite the rarity conditions regarding demand, supply, and incentives. The small number of affected patients and the paucity of treatments for diseases induce an additional lack of funding opportunities² which represents a tangible issue (Hartman et al, 2020). From a purely economic point of view, serving geographically disperse and “rare” patients may be unprofitable. However, the obstacles represented by difficulties in gathering the required financial resources from a few customers are partly neutralized through beneficial regulatory measures for developing and marketing pharmaceuticals for rare diseases such as the European orphan drug designation regulation³, highlighting the societal and ethical importance of this ecosystem: developing or not developing drugs for rare diseases can make the difference between living or dying.*

Pharmaceutical firms found it advantageous to outsource rare disease clinical trials for two key reasons. First, the heterogeneity and multitude of rare diseases require distinct specific skills and capabilities in running clinical trials with these cohorts, which are costly to develop and maintain. Consequently, pharmaceutical firms do not find it opportune to heavily invest in developing those capabilities for small numbers. Hence, the aggregation of the clinical trial phase to third parties (i.e., the CROs) allows for a more efficient allocation of resources. Second, and relatedly, clinical trials are the costliest part of medical R&D (Wouters, McKee, and Luyten 2020). Economies of scale through specialization are particularly important in this phase and can be obtained through developing dedicated physical infrastructures for trial recruitment and execution, and through fulfilling the stringent quality controls required by medical regulators such as the FDA or EMA. Those two key caveats, taken altogether, led to a progressively increasing propensity of pharmaceutical firms in externalizing the clinical trial stage to CROs.

However, even CROs would struggle to reach satisfactory profitability conditions in rare diseases without support from three different actors. Our initial finding is that patient associations play a primary role in the new ecosystem emergence by promoting an active search and aggregation process of the few and scattered affected patients, who ultimately constitute an essential input for clinical trials. Without patient associations’ support, for CROs it would be very difficult and resource-consuming to find enough candidates for clinical trials. These associations manage, in many cases, to help recruit participants to the clinical studies, permitting, in turn, to fulfill the regulatory requirements in terms of sample size. In addition, we observed that many rare disease patients (or patients’ associations) are even more knowledgeable than medical professionals themselves, which has some implications for trial designs, reporting, and the power structures of the ecosystem, as the firms that are ‘closer’ to the patients (the CRO, in many cases) may have an upper hand. The director of a pharmaceutical company in our sample told us:

We understood that when rare diseases are taken into consideration, the patient almost knows more than the doctor. This has radical implications for our business model [...] (Business Unit Director, Leading Pharmaceutical Firm)

A second but equally important role, based on our initial findings, is played by regulators, i.e., the interventions of policy-makers aimed at ensuring the proper functioning of the ecosystem, with the ultimate goal of promoting the well-being of rare disease patients. Hence, a beneficial mix of crowdfunding activities and governmental/supranational organizations’ incentives can allow an ecosystem with rare demand and supply to successfully emerge. Specifically, local governments and supranational organizations (such as the EU or the UN) are systematically supporting in different ways clinical trials for rare disease drugs, including direct financial support, grants, market exclusivities, and tax exemptions. In this way, regulators play the role of enablers in the new ecosystem’s emergence. A third important role is played by investors, including commercial banks, venture capitalists, and business angels, who have shown an increasing propensity in investing in the development of rare disease medications, which are now known in the industry as ‘niche blockbusters’. These three “supporting ecosystem actors”, which are mutually interdependent and reinforcing their effectiveness and commitment to the new ecosystem, allowed CROs to gradually acquire more power. This was reflected in CROs’ unique relational capital with patients’ association and a deep level of specialization, not only from an intangible (capabilities) point of view but also in the tangible infrastructure continuously developed and improved to better accomplish clinical trials for rare diseases. Such a specialization and growing expertise in their core activities made CROs even more appealing for pharmaceutical firms for an externalization standpoint, but also more powerful compared to them.

In sum, we found that starting from an initial period when pharmaceutical companies were conducting their clinical trial for rare diseases in-house and a pure market solution was not feasible, a new ecosystem has emerged thanks to a variety of actors complementing each other. In particular, patient associations have played a crucial role of non-market actors, regulators have enabled the ecosystem emergence, and the CRO organizations have become platform firms matching scarce demand with scarce supply, at the potential long-term disadvantage of the former ecosystem hub - the pharmaceutical firm. In our more extended version of our initial research, we also derived a preliminary process model summarizing the findings exposed above.

² In this case, patients’ associations contributed to address the challenge. For example, we mention the important phenomenon of crowdfunding initiatives undertaken by patients’ associations and families (Young and Scheinberg, 2017).

Research limitations. *At the current stage of this research, we have started to combine archival material and semi-structured interviews in the setting of clinical trials for rare diseases, but we have yet to complete the full study. However, our preliminary findings were already interesting and novel, and we expect that additional interviews and data analysis will corroborate and extend our results. A second limitation, intrinsic to qualitative studies, is the lack of large sample evidence of our results. We necessarily needed to sample select two cases for each ecosystem actor (two pharmaceutical companies, two regulators, two patient associations, two CROs) to enable us to do a cross-case comparison and to learn from differences and similarities among cases (Eisenhardt, 1989; Yin, 1994). A research opportunity for other scholars is to corroborate and extend our findings using quantitative methods.*

Managerial implications. *This paper allows managers to understand how ecosystems can emerge to solve specific problems when challenging conditions exist such as rare/scarce demand and supply and missing incentives, a phenomenon overlooked by the existing literature. Similar conditions are so challenging that markets do not offer a solution. However, we show that ecosystems offer a solution to the market failure problem due to specific actors and interdependence relationships.*

Based on our findings, we suggest to managers that non-market ecosystem actors (such as people suffering from rare diseases, patient associations, and regulators) play a critical role in activating a process of emergence of a new ecosystem. Managers and decision-makers shall learn how non-market actors can work in synergies - as our study shows - to solve problems for which market actors would miss sufficient incentives. A second major takeaway for managers relates to the role of intermediaries (complementors) and their possible transformation into a platform to manage an ecosystem. In particular, we showed that when demand and incentives are scarce, core suppliers (e.g., pharmaceutical companies) find it increasingly convenient to externalize some operations to complementors (e.g., Clinical Trial Organizations - CROs). Moreover, similar complementors are likely to offer a solution to the scarcity of demand and incentive problems if they organize themselves as platform organizations. For instance, CROs were found to connect patients, patient associations, regulators, and pharmaceutical companies. Managers shall also be aware that externalizing to complementors playing the role of platforms in the new ecosystem can create the conditions to be disrupted. The externalization to CROs triggered a progressive power flow from suppliers to complementors, which constantly become more powerful till covering the role of competitors. In this way, a value chain can be partially disrupted, with the support of a mix of prior complementors and non-market actors. A final managerial implication can be about how to use social movements to mobilize change. The CRO organizations used the patient associations (e.g., a social movement actor) to enable an ecosystem emergence that otherwise would not have occurred.

The sustainability advantage of state-owned firms from emerging markets

FEDERICA NIERI* ALVARO CUERVO-CAZURRA* ELISA GIULIANI* ANDREA VEZZULLI**

Framing of the research. *State ownership is commonly seen as being detrimental to the success of firms. There is a long tradition in economics and management studies of arguing that state-owned companies tend to be less profitable than private firms, reflecting an overall competitive disadvantage. A common reason is that state-owned companies suffer from a multi-level agency problem in which politicians interfere with normal business decisions and impose political objectives that undermine the achievement of business goals and profitability desired by citizens (Cuervo-Cazurra and Li, 2021). Another common explanation is that state-owned companies are created to address market imperfections and provide public goods that are socially desirable but unprofitable, leading to the emergence of a liability of stateness (Musacchio and Lazzarini, 2018). However, some scholars argue that state-owned companies benefit from their privileged access to the government, for example, helping them in their international expansion (Duanmu, 2014). Thus, we have empirical and theoretical tensions about whether state ownership is good or bad for companies.*

Therefore, in this paper, we provide another solution to the debate by building on agency theory (Jensen and Meckling, 1976) to propose that state-owned firms have a sustainability advantage over private firms because of their mandates to address market imperfections and build public goods. Specifically, we propose that state-owned firms are faster in adopting sustainability codes than private firms because their principals' goals are aligned with sustainability. We add depth to this idea by arguing that the relationship is accelerated by external principals' expectations at home and abroad. In particular, we argue that the speed in adopting sustainability codes is accelerated for state-owned firms in democratic home markets and for state-owned firms operating in multiple host markets because of the wider diversity of external stakeholder expectations for state-owned companies to focus on sustainability.

Purpose of the paper. *State-owned firms are created to provide public goods and solve market imperfections, placing them in a pole position towards implementing sustainability. A common explanation for the government to create state-owned companies is that there is a need for addressing market imperfections that cannot otherwise be solved through regulation, i.e., mandates or constraints, or incentives, i.e., subsidies or taxes, i.e., to private firms. This is commonly the case of public goods with important externalities in which the government wants to reduce the negative externalities (e.g., pollution) or promote the positive externalities (e.g., health) and feels compelled to create a firm that addresses this because the private sector lacks the incentives or ability to do so.*

State-owned companies tend to be associated with low profitability because they are expected to achieve a wide diversity of social goals by citizens and politicians. This is especially the case in emerging markets in which the government suffers from imperfections in their ability to monitor misbehavior and thus results in companies that are used by politicians to achieve political goals. However, this focus on addressing market imperfections and providing public goods positions state-owned companies in emerging markets in a leading position to address sustainability issues. State-owned companies have already in their mission solving externalities and supporting social causes. Thus, when new sustainability requirements emerge, they can quickly adapt to those, given that it is part of their corporate culture and managerial attitudes toward solving social needs. They can clarify their focus on sustainability through the adoption of sustainability standards that make explicit what companies have been doing in the past. This requires companies to evaluate activities and assess how they are in compliance with a particular set of criteria created by the standard-setting entity. State-owned companies can easily evaluate their current activities in response to the new sustainability standard, helping them adopt it quickly. Additionally, state-owned companies have the incentive to clarify how they are contributing to society's development in a more explicit way by adopting sustainability standards quicker. It can enable managers, as well as the politicians influencing them, to justify that even if the state-owned companies are not very effective or efficient in their use of resources and thus run large losses, they are nevertheless contributing to

sustainability as they are able to be among the first to adopt the sustainability standards. We summarize these ideas in the following hypothesis:

Hypothesis 1. State ownership is positively related to the speed of adoption of sustainability standards by emerging markets firms.

We add depth to this idea by analyzing how this relationship is strengthened for firms that face a diversity of external principals in the home and host markets.

The ability of external principals to put sustainability pressure on companies depends on whether the market is a democratic one. In a democracy, individuals feel free to seek their interests and align with others in the pursuit of these, knowing that they have rights to free speech and assembly that enable them to organize and ensure that companies are matching expectations for corporate social responsibility. Additionally, the free press helps identify companies that misbehave and thus creates a check on misbehavior and additional pressure on all types of companies to embrace sustainability. We summarize these arguments in the following baseline hypothesis:

Hypothesis 2a. Home market democracy is positively related to the speed of adoption of sustainability standards by emerging markets firms.

Additionally, in a democracy, civil society and interest groups can express their preferences for sustainability and social development and thus push state-owned companies towards adopting sustainability codes faster as part of their social mandates. In a democracy, the perception that state-owned companies are created for the benefit of society enables interest groups to pressure the government to redirect the state-owned firms towards sustainability and thus accelerate the adoption of sustainability standards. In a democracy, politicians depend on the periodical expression of support of citizens through votes to continue in power, making them more responsive to a variety of interests and interest groups in their requests for actions by state-owned firms. Additionally, in democracies, the existence of a free press also keeps a check on state-owned companies and further increases the pressures on these firms towards sustainability, accelerating the adoption of sustainability standards by state-owned firms. These ideas support this hypothesis:

Hypothesis 2b. Home market democracy strengthens the positive relationship between state ownership and the speed of adopting sustainability standards by emerging markets firms

The diversity of markets in which the firm has operations can induce it to engage in sustainability and accelerate its adoption of sustainability standards. Investing in a few host markets can induce the company to rethink its sustainability attitudes but not enough to try to change its sustainability as this will create complexity and additional costs for the firm. However, as the number of markets in which a company's operations increases, they encounter a wider diversity of expectations regarding their behavior, which create additional incentives for the company to rethink how it approaches its sustainability as there are increasing numbers and variation in the expectations of the external principals. Additionally, with operations in multiple markets, the firm might learn of new expectations and superior practices in terms of sustainability that it can incorporate into its operations, facilitating its ability to adopt new sustainability standards faster. The ideas support the following baseline hypothesis:

Hypothesis 3a. The diversity of host markets with foreign direct investments is positively related to the speed of adoption of sustainability standards by emerging markets firms.

The host markets' diversity of external principals will also induce state-owned companies to accelerate the adoption of sustainability standards to match the additional expectations. As the diversity of principals increases with the higher number of markets in which the state-owned company has operations, it is faced with new expectations regarding its ability to serve local communities. State-owned companies tend to be viewed with suspicion in host markets by both the government and in some cases individuals because of their association with the foreign government, especially when this foreign government is perceived to be unfriendly. State-owned companies in the host market might be perceived as not just companies providing products and services or employment and investment to the local communities, but also as instruments of the foreign governments to exercise undue influence in the host market. In fact, many governments establish additional constraints on investment by foreign state-owned companies. As a result, state-owned companies that face a large variety of external principals in host markets might use the adoption of sustainability standards as a way to signal that they are superior in their focus on solving societal needs and thus compensate for the negative perception that they have across host markets. These ideas lend support to the following hypothesis:

Hypothesis 3b. The diversity of host markets with foreign direct investments strengthens the positive relationship between state ownership and the speed of adoption of sustainability standards by emerging markets firms.

Methodology. We investigated the research question in the context of a sample of 245 firms selected from Fortune Global 2000 list that comprises 245 companies headquartered in eight emerging markets (i.e., 29 from Brazil, 74 from China, 51 from India, 18 from Malaysia, 15 from Mexico, 25 from Russia, 19 from South Africa, and 14 from Thailand). After merging the data, our sample contained an unbalanced panel dataset of 3,356 firm-year observations for 245 firms, observed between 2000 and 2018.

To measure companies' speed of adoption of the UNGC principles at a given time t , the variable $UNGC$ takes the value 0 during the years before the firm's adherence to the UNGC, and 1 at the time t when the firm becomes a UNGC member.

We measured whether the firm is state-owned or not with a dummy variable (SOE) which takes the value 1 if the government is the largest stakeholder, the value 0 otherwise. $HomeDemocracy$, is a dummy variable that takes the value 1 if the Polity IV Project Institutionalized Democracy Score of the home market is higher than 6, 0 if the score is lower than 6 in a given year. We measured $HostMarketsDiversity$ as the number of markets where the firm has made

capital investments up to year t , either by setting up new affiliates (i.e., greenfield and brownfield investments) or by way of cross-border merger and acquisitions.

We controlled for the logarithm of the amount of GDP per capita ($HomeGDPpc$) as well as for whether in the home market a UNGC Local Network has been set with a dummy variable ($HomeUNGNetwork$). We also controlled for the number of human rights treaties ratified by each home market in each year ($HomeHRtreaties$), which proxies the extent to which each home market cares about human rights. We included Performance measured as Return on Assets, SlackResources measured as the ratio of equity to debt, and Leverage measured as the ratio of debt to sales since prior research shows that firms' financial characteristics are related to the adoption of CSR initiatives. We included the size of the firm ($Size$), proxied by the log of total sales at time t , since larger companies tend to face greater public scrutiny and external pressures which may affect the adherence to UNGC. We also accounted for whether firms are part of a BusinessGroup with a dummy variable, which takes the value 1 for firms being part of a group, and the value 0 for independent companies since these firms may have specific governance structure which may affect their CSR practices. We further controlled for firm age (Age) measured as log of the number of years since the company foundation. Finally, to control for industry effects we used dummy variables, using the Standard Industrial Classification.

As for the estimation procedure, the adherence to the UNGC decision in general is not a frequent event at the firm level. In our sample indeed only the 34% of the firms adhered to the initiative in the 2000-2018 period. In order to take into account these issues, the most appropriate estimation approach to relate the speed of adherence to the UNGC to firm and home market characteristics is a survival model, which aims to estimate, for each time period t , the hazard of a firm to participate in the UNGC, conditional on the fact that this event hasn't occurred up to year $t-1$. Duration models have the advantage that they allow for "right censoring" of the data: - firms may experience the event after the end of the period of observation. Since the event of interest can be observed only in discrete time intervals (i.e., in years) we adopt a complementary loglog duration model with firm's specific random effects that account for the correlation structure among the multiple firm-level observations in our longitudinal dataset.

Results. Table 1 shows the estimation results. In Model 1, the coefficient of SOE in this model is positive and significant ($b = 0.936, p < 0.05$), indicating that state-owned firms adopt UNGC earlier than non-state-owned firms. The estimated hazard ratio is about $\exp(b) = 2.550$, which means that, on average, state-owned firms have a hazard to adopt UNGC that is more than twice higher than the one of non-state-owned firms. Hypothesis 1 is therefore supported. The coefficient of HomeDemocracy in this model is positive and significant ($b = 2.099, p < 0.01$), which means that firms based in a democratic market adopt UNGC earlier than those based in a non-democratic market. Hypothesis 2a is therefore supported. The coefficient of HostMarketsDiversity in this model is positive and significant ($b = 0.063, p < 0.1$), indicating that the higher the number of markets where firms have FDI the higher the speed of UNGC adoption. Hypothesis 3a is therefore supported. Model 2 presents the results for Hypothesis 2b. We found that the coefficient of HomeDemocracy is positive but not significant ($b = 1.127, p > 0.10$), which means being based in a democratic or non-democratic market does not affect the speed of UNGC adoption. The coefficient of SOE is not significant ($b = -0.299, p > 0.1$). However, the interaction term between SOE and HomeDemocracy positively affect UNGC participation ($b = 2.084, p < 0.05$), which means that the hypothesis is supported. This result indeed confirms that state-owned firms based in democratic markets adopt UNGC quicker than non-state-owned firms based in the same markets. Model 3 contains the result for the main test of Hypothesis 3b, which predicted that the level of diversity of host markets where firms have FDI positively moderates the (positive) relationship between state-ownership and the adoption of sustainability standard. The coefficient of SOE is positive and significant ($b = 1.594; p < 0.01$) which means that for non-internationalized firms, state-ownership increases the hazard of UNGC adoption. The coefficient of HostMarketsDiversity is positive and significant ($b = 0.139, p < 0.01$) which suggests that for non-SOEs, the higher the number of international markets where they have FDI operations the more they speed up the UNGC adoption, with $\exp(b)-1 = 0.149$, which means that the hazard of UNGC adoption increases on average by 14.9% every time a non-SOE internationalizes in one additional market. The coefficient of the interaction term between SOE and HostMarketsDiversity is negative and significant ($b = -0.175, p < 0.01$), meaning the hypothesis is not supported. We ran several robustness checks on our key variables measuring the diversity of home and host markets stakeholder demands. In all cases, results are consistent with the main analysis.

Research limitations. *The limitations of our work provide opportunities for further research. First, our empirical analysis is based on a limited sample of large public companies in eight developing countries, and it is necessary to interpret our results in the context of this boundary condition. Second, state-ownership as measured in this paper provides little information on the magnitude and quality of state investment and the corporate strategies behind such an ownership structure. Unfortunately, data on the percentages the state owns and how they changed in the cohort we analyzed, is not available for all the companies in our sample. We would therefore recommend that future research use more refined measures of what constitutes an SOE. Third, our measure of internationalization breadth relies only on foreign direct investment deals, and counts the number of different countries into which the firm has expanded up to a given year. Further research might explore different dimensions of internationalization strategies which could affect firms' adoption of sustainability strategies.*

Managerial implications. *The paper has important implications for managers. Managers of state-owned companies are commonly criticized as not being successful overseers of the firms because their companies tend to have lower profitability. The arguments presented here provide a counterargument by explaining how they can indeed be good overseers of the firms as they direct them towards the goals of the broader society and the achievement of sustainability that benefit not just the owners but a broad set of stakeholders.*

Originality of the paper. *These ideas contribute to two streams of research: agency theory in its study of state-owned firms, and sustainability strategy in its study of sustainability codes. First, in terms of theory, we question the universality of the traditional view of state-owned companies as suffering from multi-level agency problems that create additional conflicts and objectives (Cuervo-Cazurra et al., 2014) and create a disadvantage in comparison to private firms. We introduce the notion of aligning social objectives with sustainability goals providing an advantage for state-owned companies over private firms in emerging economies. Thus, future studies need to avoid assuming that state-owned companies will always suffer from serious agency problems that undermine their competitiveness and advantages. Instead, they need to analyze how their objectives might undermine particular outcomes, like profitability,*

while they may facilitate their achievement of other outcomes, such as sustainability. In other words, state-owned companies may not always suffer from a disadvantage of stateness; in some cases, they may enjoy an advantage as stateness (Cuervo-Cazurra and Li, 2021). This highlights the importance of challenging theoretical assumptions and, in the case of agency theory, moving it away from the widely-held assumption that owners are interested in just profit maximization and incorporate a wider variety of objectives for shareholders, such as sustainability in the case of state-owned firms.

The arguments also contribute to a better understanding of sustainability strategy by bringing the importance of owners' objectives in sustainability decisions. Much of the literature on sustainability has focused on the drivers of sustainability or how sustainability contributes to financial performance (Matten and Moon, 2008). The comparison between private and state-owned companies helps better understand the importance of ownership in sustainability strategy and how the alignment of objectives in state-owned firms results in a sustainability advantage. Future studies can extend this idea to analyze how some companies may be more inclined toward sustainability by external pressures from stakeholders and the internal preferences of their owners. Owners' predisposition toward sustainability results in firms being better prepared and ready to engage in sustainability when the opportunity to certify the sustainability credentials of the company appears.

Keywords: sustainability; state ownership; standards; democracy; host market diversity; emerging markets.

Relationship between CSR and FDI: a systematic review

ANDREA FRANZONI* CHIARA LEGGERINI* MARIASOLE BANNÒ[▲]

Framing of the research. *‘Corporate Social Responsibility (CSR) is the voluntary integration by companies of social and environmental concerns into their relevant operations’ (EU Green Paper, 2001). Increased global competitiveness has pushed companies to improve resource management, particularly those that generate competitive advantage, such as Corporate Social Responsibility (Sánchez Torné et al., 2020). On the other hand, Foreign Direct Investment (FDI) are investments that reflect the objective of obtaining a lasting interest by an investor in one economy in another economy’ (OECD, 2021). The lasting interest implies that a long term relationship exists between the investor and the firm, and that the investor has a significant influence on the way the firm is managed CSR and foreign direct investment are two topics that have a strong relationship with each other. In particular, the social value of sustainable investment is becoming more and more relevant; in fact, investors are increasingly inclined to invest in companies that promote corporate responsibility and more generally are sensitive toward environmental issues (Chipalkatti et al., 2021). For this reason, by improving environmental, social and governance (ESG) performance, the company can retain and approach an increasing number of consumers and investors, creating a gain in the medium to long period (Hwang et al., 2022; Misiuda & Lachmann, 2022). In this sense, empirical evidence shows how ESG performance positively influences foreign investment inflows; more specifically, how corporate governance related ratings are more impactful than social and environmental ratings (Alregab, 2022). Moreover, FDI data provide a good measurement of most of the real economic activities of the company (Wacker, 2016). As a result, readers have also become more intrigued by the topic of sustainability. The growing awareness of the strategic importance of sustainability and CSR for companies has played a significant role in this trend (Cooney et al., 2022; Teerikangas et al., 2021). Companies recognize the long-term benefits of integrating sustainability and CSR into their operations and strategies, such as improved reputation, increased stakeholder engagement, and better risk management (Chollet & Sandwidi, 2018; Hwang et al., 2022; Khuong et al., 2021; Louche et al., 2010). Additionally, consumers are becoming more conscious of the sustainability commitments of individual companies and are increasingly making purchasing decisions based on these commitments. CSR can be an important aspect of FDI, as it can help companies to mitigate the negative impacts of their operations and enhance their reputation with stakeholders (Aguilera-Caracuel et al., 2017; Choukroune & Donde, 2022; Nyeadi et al., 2021; Sheng et al., 2022). Thus, understanding the relationship between CSR and FDI is crucial for firms, governments, and researchers.*

Purpose of the paper. *In recent years there has been a considerable increase in the adoption of corporate policies aimed at improving all aspects in the field of sustainability (i.e., all corporate social responsibility policies). The objective of this paper is to investigate through a literature review the relationship between corporate social responsibility and foreign direct investment, using FDI as an indicator of the degree of internationalization achieved by the company. This review analysis will be carried out taking into consideration only the studies conducted at the company level. After conducting preliminary analyses we will proceed to the reading of the abstracts to select the research topic and to determine the focus or perspective to be taken in the study. This step is crucial as it allows to refine the research question and to define the specific aims and objectives of the study. The review will focus on analyzing the main studies that have been conducted on this topic. It will analyze the methodology approach used in these studies, such as whether they are qualitative or quantitative, and also we will examine the data structure, such as whether cross-sectional or panel data was used. Additionally, we will study sample characteristics, such as sample size, firm characteristics, year of study, and the country of study. These details can provide insight into the generalizability and relevance of the findings. Furthermore, we would like to identify the main themes addressed by the studies and study their temporal evolution. This will enable us to understand the changes and trends in the research on this topic over time and identify any shifts in focus or priorities.*

Methodology. *The state of the art analysis was conducted following Callahan (2014) and Moher et al. (2009). First, keywords were sought that would capture articles useful for research, and these were found through analysis of articles that previously addressed the topics under consideration (Ibeh et al., 2012; Rondi et al., 2022). Next, the*

following search key was used among title, keywords, and abstract, with the goal of collecting the literature regarding CSR and FDI, and the industry field, we selected a set of keywords for each topic. To find the articles that simultaneously discuss these three aspects, the topics are linked by an AND-type relationship: CSR AND FDI AND Firm. A set of keywords were selected for each topic, which as shown in Table 1 are linked by OR-type relationships.

Tab. 1: Selected keywords

Topic	Keywords
CSR	(sustainab* OR (corporate AND social AND responsibility) OR csr)
FDI	(merge* OR brownfield OR greenfield OR acquisition* OR (joint AND venture) OR FDI OR (foreign AND direct AND investment))
Firm	(firm* OR compan* OR enterprise*)

After obtaining the results from Scopus and Web of Science (respectively 2.769 and 1.948 publications), we applied inclusion criteria to narrow down the field to the macroareas of Business, Economics, Management and Business Finance, resulting in 1.232 papers on Scopus and 988 on Web of Science. We further refined our selection by considering only papers published in English language and focusing on finished publications in the categories of Articles and Review Articles. This resulted in 861 papers on Scopus and 806 on Web of Science. To ensure a recent perspective, we limited our search to publications from the last 10 years, i.e., from 2013 to 2022, which resulted in 532 papers on Scopus and 634 on Web of Science. Finally, we removed duplicates by merging the results from Scopus and Web of Science, resulting in a final sample of 764 publications. The Graph 1 summarizes the results of this selection.

Graph 1: Publication selection process

After extracting the abstracts, an initial exploratory analysis was performed, we studied the trend of total publications and by type, broken down by articles and reviews, we identified the author most active on the topic, we identified the journals in which it is published most and we studied the co-occurrence of keywords using VOSviewer.

Next, we began to analyze the abstracts of the articles to make a selection based on the topics covered by the articles. We implemented a “traffic light” system in which discarded papers were classified as red, uncertain papers as yellow, and papers approved for study as green. The yellow ones will be reanalyzed at a later stage to understand whether to exclude them or keep them in the study.

In order to achieve the most accurate analysis possible and to minimize errors, all abstracts were personally analyzed by two of the authors. This made it possible to compare any discrepancies and obtain more accurate results.

Results. The data depicted in Graph 2 demonstrates a consistent upward trend in the number of publications pertaining to the concepts of CSR and FDI over the past 10 years. This increase in publications reflects the growing interest among researchers in studying the relationship between these two topics. The number of publications grew from 37 in 2013 to 135 in 2022.

Graph 2: Trend of publications

The analysis of the journals in which the majority of articles on CSR and FDI are published, as presented in Table 2, reveals that they primarily originate from the fields of industry, environment, and business. This indicates that the articles being analyzed will likely center around the relationship between CSR and internationalization, and how CSR can affect a company’s internal performance. From Table 2 we can see that 54 publications were made in the “Journal of cleaner production” and they account for about 7.06% of the papers, followed by “Business strategy and the environment” with 17 publications, the other 18 journals vary from 13 to 6 articles each. The other papers are distributed over a total of 432 journals and have at least 6 publications.

Tab. 2: Reference journals

Source title	Numbers
Journal of cleaner production	54
Business strategy and the environment	17
Journal of world business	13
Journal of international business studies	12
Journal of business ethics	11
Technological forecasting and social change	11
International business review	10
Strategic management journal	10
Journal of business research	10
Corporate social responsibility and environmental management	9
Management decision	9
International journal of production research	7
Journal of knowledge management	7
Journal of corporate finance	7
Journal of management studies	7
Resources policy	7
International journal of emerging markets	7
Resources, conservation and recycling	6
Emerald emerging markets case studies	6
Entrepreneurship and sustainability issues	5

The analysis of the type of documents reveal that they are divided into two categories, Article and Review. Specifically, there are 730 articles and 34 reviews. This classification can provide insight into the nature of the research being conducted and the level of knowledge on the topic. In this case, the majority of the documents being analyzed (730 out of 764) are articles, which suggests that there is a significant amount of new research being conducted on the topics of CSR and FDI. The presence of 34 reviews among the analyzed documents suggests that there is a growing interest in reviewing and synthesizing the existing knowledge on the topics of CSR and FDI. As illustrated by Graph 3, the trend in the number of articles and reviews on the topic of CSR and FDI has been increasing for articles and constant for reviews over the years under consideration.

Graph 3: Number of publications over the years

This classification of documents highlights that the research on CSR and FDI is active and dynamic, with a mix of new findings and synthesized knowledge. This is important to consider when interpreting the analysis results, as it can provide a more comprehensive understanding of the topic.

Tab. 3: Authors in multiple publications

Author	Documents
Zhang Y.	6
Shams S.	5
Liu X.	4
Li Y.	4
Chen L.	3
Khan Z.	3
Krishnamurti C.	3
Lee S. - H.	3
Liu M.	3
Ridzuan A. R.	3
Wang X.	3
Wu J.	3
Yang Z.	3

From the Table 3 above it can be seen which are the main authors of the articles identified through the search key used. It can be appreciated how multiple authors considered have published several articles on the topic. This assumes a high degree of specialization and makes the reading and classification of the results obtained even more interesting. Only 13 authors present more than 3 publications on the topic and only one Zhang Y. has 6 publications followed by Shams S. with 5 publications.

We decided to analyze the occurrences of the keywords selected by the authors of the articles (Figure 1). To make this graph we set the minimum number of occurrences as 4 which allowed us to display 115 out of 2506 keywords used by authors. This is useful for a visual and equally effective representation of the relationships between the keywords selected by the various authors. As expected, terms such as “corporate social responsibility,” “FDI,” and related synonyms are among the most used keywords. Within the image we can also identify which are the main topics under study, respectively:

- keywords related to foreign direct investment and internationalization issues;
- keywords related to environmental aspects;
- keywords related to innovation in the green field;
- keywords related to investment and supply chain.

potential benefits of these levers to gain competitive advantage. With a deeper understanding of the interplay between CSR and internationalization, managers can make informed decisions that can positively impact their organizations in the long run.

Originality of the paper. Given the large number of articles produced on the topic of CSR and FDI, it is essential to periodically conduct systematic reviews to identify the key findings, gaps in the literature, and potential areas for future research. This can help researchers to identify areas where more research is needed and to focus their efforts on the most critical issues related to CSR and FDI. Additionally, it can also help practitioners, policymakers and other stakeholders to understand the current state of knowledge on a topic and to make informed decisions. To the best of our knowledge, our study is the only one that addresses this particular relationship between CSR and FDI limited to the last 10 years, and we believe it can fill a gap in the literature by providing insights for future research on the topic.

Exploring Countries' Cargo Commercial Power

FRANCESCO SMALDONE* GIADA MAINOLFI*

Framing of the research. *Firms worldwide are facing times of uncertainty due to current issues emerging in the 5.0 era. In the last decade, the business society had assisted to the rapid development of technological tools, the high degree of digitalization, and diffuse globalization together with pandemics, wars, and recessions that have spread worldwide, generating monetary shocks, and influencing the exchange rate (Koray and McMillin, 1999). Examples can be found in the wine sector (Carrasco et al., 2023), energy (Chen et al., 2023; Cheng et al., 2023; Fartash and Ghorbani, 2023), aerospace (Caliari et al., 2023), baby foods (Mota-Castillo et al., 2023), trade (Panta et al., 2023), aquaculture (Jaikumar et al., 2023), and agricultural commodities (Cheng et al., 2023). In this rugged storyline, the international trade has globally suffered, finding new threads and opportunities bringing to a redefinition of commercial standards and spending basket compositions, to establish a competitive advantage (Porter, 1980). Considering national accounts, the trade balance is one of the most significant (Panati and Golinelli, 1991). Its value corresponds to the difference between the value of exports and that of imports. Thus, the balance makes it possible to analyze the ability of a country to be able to trade in a global context (Alexander, 1952; Greenwood, 1984; Haynes and Stone, 1982; Ju et al., 2010). Elucidating, the trade balance represents the degree of attractiveness of its goods towards foreign countries (Baharumshah, 2001; Shirvani, and Wilbratte, 1997). Finding a trade surplus is not always mirroring a proper and sustainable business activity (Davis and Weinstein, 2002; Rose, 1990). In fact, a too positive balance could be signal of the country's inability to import or to express an adequate domestic demand (Bahmani-Oskooee, 1992). Consequently, national firms should differently evaluate their cargo commercial power in response to a commercial redefinition, i.e., liberalization or devaluation, of the compositions of shopping baskets, in terms of quantity, quality, origin, and extent of commercial traffic (Himarios, 1985; Lane and Milesi-Ferretti, 2002; Parikh and Stirbu, 2004; Upadhyaya and Dhakal, 1997). Thus, a need to identify an indicator to in-depth clarify the evaluation international trade for global firms emerges in the current scenario, not limited to a transactional evaluation (Moral and Ghoshan, 1996; Narayan, 2006). To better evaluate the trade balance, exploring measures such as quantity and weight of the shipment is crucial to assess a country's cargo commercial power, especially in the e-commerce and e-trade era (Liu et al., 2019). In the sea cargo sector, and so in airplane shipping, traders evaluate the capacity of the ship first and foremost assessing the volume employing standard units: twenty-foot equivalent (teu), representing the container, or forty-foot equivalent (feu), twice the container (theloadstar.com). Considering that vessels and planes convey a limitation on the amount of weight that can be carried, indicators such as teu and crafts, to express the max out charge of the load is, generally, measured in volume, and not in weight (Florido-Benítez, 2023; Skrucany et al., 2020). This can generate a bias in evaluating a country's cargo commercial power, together with a little consideration of the ratio within overall shipments.*

Purpose of the paper. *The purpose of the paper is exploring countries' cargo commercial power through a pilot study on the import supply chain of a US company, to explore the commercial traffic related to the main suppliers of beverage sector. In particular, the aim is exploring the commercial traffic considering shipments, weight, and teu to determine the possibility of building an indicator to assess a country's cargo commercial power. The study takes into consideration the different measurement units to conduct a specific analysis of exporting countries, and to evaluate the particularities of import and export after the Covid-19 pandemic. Thus, this research aims to examine what are the main metrics for evaluating the commercial strength in terms of cargo of a country.*

Methodology. *To explore the commercial traffic in the beverage sector, data on cargo's trades were derived from importyeti.com, an open-source platform with several data on the cargo supply chain of various companies worldwide. Data concerning the import of the selected company from 01-01-2021 to 31-12-2022 were scraped, recording 1,926 shipments, with a weight of 189,822,578 tons in 15,012 containers (expressed in teu). Data were thus organized in pivot tables and sorted to derive a local sum of firms belonging to a specific country. Descriptive statistics were derived, together with correlations, ratios, and other measures to assess the significance of the analyses. Computing those analytics, it was possible to establish a first step to profile countries' cargo commercial power, to further derive standard measures to build an indicator. Data have been finally plotted through several visualization methods showing the commercial traffic.*

Results. Results showed interesting insights concerning suppliers in the beverage sector. In particular, ten countries resulted as suppliers for the selected firm, respectively: Belgium, France, Germany, Greece, Ireland, Italy, Panama, Portugal, Spain, Sri Lanka. After frequency, weight, and volume measures, the relative number of companies exporting in the country's market can represent a good indicator of both the attractiveness of a market for the parent company, and the suppliers' portfolio, encompassing subsidiaries and other suppliers. The average shipments were 96.7, with a standard error of 39.2, showing that the mean was strongly affected by extreme values, where the mode was equal to 1 and the standard deviation equal to 309. The average weight of the shipments was 9,491,128.9 with a standard error of 679,795.365, no mode and a standard deviation of 536,384. The average teu were 750.6 with a standard error of 53, a mode of 4 and a standard deviation of 2,398.79 showing a great variability in the distribution. Moving deeper, Belgium presented most of the firms with 7 companies exporting in the US beverage market (35%). In France there are 3 exporting firms (35), followed by Italy and Spain with 2 exporting firms (10%). Other countries have only one exporting firm, holding 5% of the cargo traffic each. Analyzing the shipments in detail, it is possible to find France as the country exporting the most in terms of count and weight (153286095 tons), shipping 80.7% goods in 12,087 containers. Belgium follows France in the list, shipping 20159421 tons of goods in 1585 teu (10.62%) and Panama is the third country in this chart with 14,334,301 tons of good shipped to the US market in 1,156 teu (7.55%). The top port where the goods were shipped from were Anvers with 4,227 shipments, Fos-sur-Mer with 3,828 shipments, Algeciras with 783 shipments, Balboa with 333 shipments, and Valencia with 284 shipments. According to these data, France is dominating the import scenario regarding beverage, and water, for one of the most consistent firms in the US market, and one of the first benefit corporations in the sector, while Belgium is the country with the most active port as an origin for imported goods in the American beverage market. This is for sure due to the large number of companies involved in the business in France, producing and exporting beverages overseas. Results from the correlation analysis showed a negative correlation between the number of firms actively exporting in the country of origin and teu ($\rho = -0.39$), the shipments ($\rho = -0.31$), and the weight of the shipments ($\rho = -0.32$). A positive correlation as found between the shipments and the weight of the shipments ($\rho = 0.98$), and no correlations were found between teu and shipments ($\rho = 0.02$), and through teu and the weight of the shipments ($\rho = 0.04$). Results show that, in this specific case, having a large number of firms exporting overseas negatively influence the number of teu and the shipments, together with the number of teu exported. Contrarily, containers seem to be independent from the weight of the shipments, and the number of shipments.

Research limitations. The limits of this research are to be found in the extremely limited sample and limited to a single company within the American market, even if this represents one of the few benefit corporations in the sector and therefore the study takes on an even more specific connotation. Another limitation is that of geographical sampling, which only took into consideration the American market without considering other markets for a comparison and to verify which countries were most active in exports, also considering the possibility of finding exporting countries with a differentiated composition of shipments. Over and above that, data relate to a period in which the import/export system was affected by the Covid-19 pandemic, and companies were in the first stage of recovery, talking in commercial terms. In the future, the research will consider more countries involved in the data extraction process, to further test the possibility of constructing an indicator through new metrics based on specific cargo composition parameters. Another limitation of the research lies in the composition of the sample, which sees only three dominant countries in terms of exporting companies, a gap that can be filled by widening the range of sectors and companies to be analyzed in the various countries. Considering that this is a pilot study, the results can be considered valid even considering the tests of significance and can be enriched by subsequent comprehensive studies in terms of geography and sectoral composition. Another limitation of this research is having a data structure suitable for a big data approach ($v > n$) but not having a sufficient volume to allow the effective application of artificial intelligence and machine learning methodologies. In the future, massive data collection will be carried out to apply predictive algorithms, useful for prospective and prescriptive analytics regarding international import/export.

Managerial implications. The managerial implications of this work embrace various points of view and applications of this analysis with respect to the international import/export dynamics of today. In particular, the substantial change that has affected the international export and import sectors in recent years, mainly caused by the Covid-19 pandemic and the wars that have emerged globally, is addressed in this research in terms of volumes of shipments from various perspectives, analyzing the correlations between the various units of measurement and which countries contribute more to exports to the United States of America than to the beverage sector. In fact, this study aims to be a trailblazer for a future deep and comprehensive exploration of imports and exports with respect to various sectors and various countries under study. In particular, the analysis of the countries conducted through the use of various units of measurement can be a first step for the subsequent construction of a commercial indicator that represents the commercial strength of the countries in terms of import/export cargo. The analysis of the exporting countries will therefore be considered with respect to the crossing of the units of measurement, which in fact represent a very sensitive indicator when it comes to shipments, and which does not always see a possible standardization of the metrics. To boot, this research takes into consideration the commercial traffic in terms of shipments, weight, and container (teu), thus highlighting the main characteristics of exports by country, and taking into account the degree of geography. In fact, the results of this study and of this approach could be useful for managers in evaluating the commercial strength of the various countries and therefore adopting appropriate outsourcing and internationalization strategies also based on the strength of an exporting country. Notwithstanding, it will be possible to evaluate incoming and outgoing logistics with respect to various parameters taken into consideration. Together with this, the assessment

of the current commercial traffic in the beverage sector sheds light on how international markets have redefined themselves or not, and which can subsequently be compared with data derived from historical series to better understand the evolution of the sectors. In particular, this study shows how few countries have sufficient commercial strength to hold a substantial share of the market, and how among these one dominates the world scene, namely France, with a strong market share (80.7%), although this country is neither the one with the largest number of exporting companies, nor the one from which, at a logistical level, the largest quantity of shipments departs, possessing the second port in terms of exports. In fact, it is Belgium that excels in terms of main port of derivation and exporting companies. This evidence highlights a new useful aspect for both researchers and practitioners, namely that of having to consider various factors when evaluating the commercial strength of a country, which cannot be limited to volumetric factors. Specifically, it seems obvious that the commercial strength of a country in terms of cargo exports must take into consideration in a different way the quantitative aspects of the goods shipped, and the logistical ones such as for example the main export centers and the number of exporting companies present on the territory. In a future construction of a commercial indicator, this could constitute an important aspect of differentiation, to separate the commercial force between the in-house one, and therefore territorial and linked to the points of origin of the export, and the effective one which can be calculated on the goods imported from a specific sector of a specific country. This research could be useful in determining which countries are the hub of commercial traffic with respect to a specific sector of an importing country, and the analyzed results could be treated in the future with artificial intelligence and machine learning models that will lead to an optimization in logistics and evaluation terms of international import/export. To date, the pilot study has shown how with respect to international commercial traffic, some companies in the beverage sector are influenced by logics of oligopoly with respect to the countries from which to import raw materials and goods necessary for in-house industrial production.

Originality of the paper. The originality of this research can be found in the approach, which employs a digital data collection, from platforms which, compared to modern analytics, give the possibility of obtaining data in open-source form, which can be analyzed to obtain useful insights into the commercial traffic of a given country. The approach takes into consideration different units of measurement such as the number of shipments, volume, and containers (teu), to determine the commercial strength of a country's cargo exports. In particular, the approach is original because it represents a schematic profiling of countries, which is not limited only to descriptive analyses, but also considers the correlations between the units of measurement to evaluate how best to interpret the results of commercial traffic. A peculiarity of the analysis is to work on a big data type distribution, which uses data with greater variability than the number, and which allows you to start laying the foundations for a future analysis of machine learning and artificial intelligence, which can be considered a big data analysis once the right numbers are obtained to test a different methodology. Into the bargain, the study analyzes in an original way the determinants of commercial cargo traffic to be able to construct an indicator with the units of measurement taken into consideration. In fact, the study mainly served to understand how variables such as shipments, weight, and TEUs are distributed across countries, and by analyzing these specifically, it will be possible to evaluate a new standard indicator that expresses the commercial strength of countries in terms of cargo. Nevertheless, the research is one of the first to evaluate the commercial traffic of the food and beverage sector in the American market after the Covid-19 pandemic and can be replicated in various sectors and countries for the purpose of profiling import and export after a global recession. Another peculiarity of this study is the joint approach which evaluates not only the units such as weight, volume, and number of shipments, but also the logistical aspect of the territory and the effective evaluation of the metrics in relation to each single village. This has made it possible to evaluate the strength of the countries not only in descriptive terms, but also in cognitive terms, to derive summary indicators in the future useful for assessing the commercial strength of a specific country, and which takes into consideration both the incoming than outgoing cargo traffic.

Corporate heritage marketing: a bibliometric-based literature analysis

GIUSY MIGNONE*

Framing of the research. *In recent years, scholars have devoted increasing attention to the topic of corporate heritage marketing. Originally the term heritage was associated with the cultural dimension of society; in other words, it was used to indicate the set of tangible and intangible works, expression of a community's identity which had to be preserved over the time. Only in the last decades the term heritage has entered the management literature (Napolitano and Marino, 2016). At first, it was introduced in studies on corporate longevity, where heritage is viewed as a potential source of competitive advantage for firms relying on a long and glorious past (Riviezzo et al., 2015). Then, it extended its reach, and it was also used to identify a new way of communicating the uniqueness of the company and its products to clients (Napolitano et al., 2018). Thus, corporate heritage has become the core of a specific marketing literature stream.*

Burghausen and Balmer (2014b, p. 394) defined corporate heritage as the set of “all the traits and aspects of an organization that link its past, present, and future in a meaningful and relevant way”. For example, the figure of the founder or entrepreneurial family, the value system, the people who have made a product a brand name over time, the processing techniques, the traditions, etc., are all these elements that represent the heritage of an organization (Riviezzo et al. 2021; Mosca, 2012). It follows that heritage has, above all, a social meaning and expresses an organization’s identity (Burghausen and Balmer, 2014a).

According to scholars in this research field (Montemaggi, Severino 2007; Martino 2013; Burghausen, Balmer 2014; Napolitano et al., 2018; Garofano et al., 2020; Riviezzo et al. 2021), the ability to strategically interpret the legacy acquired from the past is recognized as a potential source of competitive advantage. In fact, corporate heritage is considered an important asset, useful for implementing successful differentiation strategies and building long-lasting bonds with all the organization's stakeholders. In this perspective, “heritage marketing is seen as an elective choice of companies aiming to enhance their history and shared values, for purposes of generating a sense of belonging in the consumer and creating a lasting emotional bond, for strengthening ties with external stakeholders and building feelings of solidarity with internal stakeholders, and for motivating employees to spread the organizational culture and substantiate the company's identity” (Riviezzo et al. 2021, p.11).

Research on corporate heritage focused on the study of different aspects: corporate brand identity and its dimensions (Urde et al., 2007), management, activities and tools (Burghausen and Balmer, 2014a; Napolitano et al., 2018; Riviezzo et al. 2021), corporate memory (Burghausen and Balmer, 2014), corporate heritage identity stewardship (Burghausen and Balmer, 2015), and also on conceptualization and evaluation of brand heritage (Urde et al., 2007; Hakala et al., 2011; Pecot et al., 2019). Existing literature appears fragmented (Sacco and Conz, 2023) and systematization is highly required.

Purpose of the paper. *This article analyzes the state of the art of research on corporate heritage marketing. The main aim of this study is: (1) to get a comprehensive overview of the research topic, mapping the different fields of study; (2) to uncover emerging trends in articles and journal performance; (3) to explore the intellectual, conceptual and social structure of the specific domain. To reach these objectives, we conducted a bibliometric analysis to identify authors, research institutes and journals contributing to a large volume of publications to identify patterns of collaboration and components of research.*

Methodology. *The main aim of this study is to analyze the state of the art of research on corporate heritage marketing through a bibliometric analysis. Analyzing the bibliometric structure of a specific body of literature has gained immense popularity across disciplines (Aria and Cuccurullo, 2017) because it allows the researcher to sift through large amounts of data (Wallin, 2012) and make an objective contribution compared to other types of reviews (Snyder, 2019). Indeed, while systematic literature reviews might be flawed by scholarly interpretation biases (MacCoun, 1998), as they rely on qualitative techniques, the bibliometric approach can avoid or mitigate such biases (Donthu et al., 2021). Moreover, it is a suitable method for science mapping at a time when scholars are feeding voluminous and fragmented streams of research (Aria and Cuccurullo, 2017). The results that can be obtained from the bibliometric analysis are manifold. According to Donthu et al. (2021), bibliometric studies can help advance a field in new and meaningful ways, as it allows scholars to: gain a comprehensive overview, identify gaps in knowledge, derive new ideas for inquiry, and position their intended contributions to the field.*

e-mail: giusy.mignone@unicampania.it

To our knowledge, the literature on heritage marketing has not yet been reviewed, and neither it has been analyzed with a bibliometric approach.

For this study, we adopted a rigorous, transparent, and reproducible protocol of the research, typically used for systematic literature reviews (Tranfield et al., 2003; Postael et al., 2020), and we followed the guidelines of bibliometric analysis (Donthu et al., 2021; Oliveira et al., 2019; Aria and Cuccurullo, 2017; Merigó and Yang, 2017). The research was carried out in February 2023.

In order to detect the most appropriate keywords for our research, we started by reading the first seminal articles in the domain of heritage marketing. This process allowed us to identify the most commonly used keywords within these studies. Thus, we collected bibliographic data from the Scopus database repository using the following boolean search: "corporate heritage" OR "brand heritage" OR "heritage brand*" OR "use of the past" OR "use of the history" OR "organizational memory" OR "corporate heritage marketing" OR "heritage marketing" OR "heritage marketing management" OR "corporate heritage identity" OR "organizational heritage identity". These words are consistent with the definition of corporate heritage marketing.

First, we searched for these words in the title, abstract and keywords. The analysis resulted in 2,108 documents. Then, we introduced some filters. Due to variability in the peer-review process, conference papers, book reviews, and notes were not considered in this review. We limited our analysis to articles, books, and book chapters written in English. Lastly, we did not restrict our search to any specific subject area or time.

The final query was as follows: TITLE-ABS-KEY ("corporate heritage" OR "brand* heritage" OR "heritage brand*" OR "use of the past" OR "use of the history" OR "organizational memory" OR "corporate heritage marketing" OR "heritage marketing" OR "heritage marketing management" OR "corporate heritage identity" OR "organizational heritage identity") AND (LIMIT-TO (DOCTYPE , "ar") OR LIMIT-TO (DOCTYPE , "ch") OR LIMIT-TO (DOCTYPE , "re") OR LIMIT-TO (DOCTYPE , "bk")) AND (LIMIT-TO (LANGUAGE , "English")).

Overall, this protocol of research yielded 1,134 documents. The research process continued. In order to select relevant documents, we analyzed all the abstracts of our dataset; in some cases, it was also necessary to deepen the full text. Only papers that explore the value of heritage (brand and corporate heritage) and the use of the past and heritage as strategic asset have been selected. This screening allowed us to choose a final sample of 131 documents.

Results. The first result of this study is the dataset extracted from the Scopus database, with the inclusion criteria described above. The sample is composed of 131 documents, in particular: 107 articles, 22 book chapters, and two books.

The growing interest in research on heritage marketing began to develop over the last decades, with particular progress evident after 2014.

Fig. 1: Annual Scientific Production

Source: Author elaboration

As shown in figure 1, scientific production started in 2006, with the publishing of the first two articles and a book. The graph shows that the research topic has been around for 17 years and has developed with an annual growth rate of 1.71%. 58% of all articles on this topic were published in the last five years, and a large part was published last year. 2022 is the year that recorded the highest number of productions, equivalent to 21 documents. This result allows us to demonstrate an ever-growing interest towards the topic.

An initial analysis of the data shows a considerable number of authors involved, exactly 222: the single-authored documents are 23, while the average number of authors per document is 2.05. There is a relatively significant international co-authorship rate, 32.06%.

As for the authors, Table 1 shows that the most prolific in terms of publications are Balmer JMT (17 articles), Pecot F. (13) and Merchant A. (10), followed by Burghausen M. and De Barnier V. (both with 8 papers). Regarding the authors' production over time, Balmer JMT has been confirmed as the most prolific author: his publications cover a period that goes from 2009 to 2023. 2015 is the year in which he published more articles, exactly 4.

Tab. 1: Most relevant authors

Source: Author elaboration

Overall, the total number of citations is 3.246, while the average number of citations for each document is 24.78. If we explore the most cited papers on a global level¹, the articles with the highest number of citations were by Leigh TW, Peters C. and Shelton, 2006 (355 citations); Schultz M. and Hernes T., 2013 (277 citations); Spiggle S., Nguyen HT., and Caravella M., 2012 (185 citations); Micelotta E.R. and Raynard M., 2011 (151 citations); and Balmer JMT., 2011 (115 citations). If we consider only local cited documents², the most cited papers are: Balmer JMT, 2011 (49 citations); Hudson BT, 2011 (44 citations); Burghausen M. and Balmer JMT, 2014a (37 citations), Hakala U., Lätti S., and Birgitta Sandberg, 2011 (37 citations); and Hudson U. and Balmer JMT 2011 (30 citations).

It is worth highlighting the most cited references: the most cited article is “Corporate Brands With A Heritage” (36 citations), published by Urde, M., Greyser, S.A., and Balmer, J.M.T., on the *Journal of Brand Management* in 2007. This paper is not part of our sample (because not present in the Scopus database), even if it is considered one of the first seminal works on this topic. The other most cited articles are: Hudson B.T., 2011 (31 citations); Balmer JMT., 2011 (28 citations); Blombäck A. and Brunninge O., 2009 (21 citations); Balmer JMT, Greyser S.A. and Urde M., 2006 (19 citations).

The reference scientific journals of the analyzed literature are: “*Journal of Brand Management*” with 13 papers, followed by “*Journal of Business Research*” (11), “*Developments in Marketing Science: Proceedings of the Academy of Marketing Science*” (11), “*Corporate Communications*” (6), and “*European Journal of Marketing*” (5). These five journals also represent the so-called “nucleus”. Using Bradford's Law, the bibliometrics software allows to highlight the scientific journals that have devoted the most attention to the topic. The function divides all citations of a topic equally into three zones. The core zone (zone 1) gathers the highest number of citations with the smallest number of journals, while the second zone requires more journals to obtain the same number of citations and so forth (Locatelli et al., 2021); therefore, the third zone will have the bulk of journals. The core zone (or nucleus) comprises five scientific journals, while zone 2 and zone 3 comprise 26 and 43 journals, respectively.

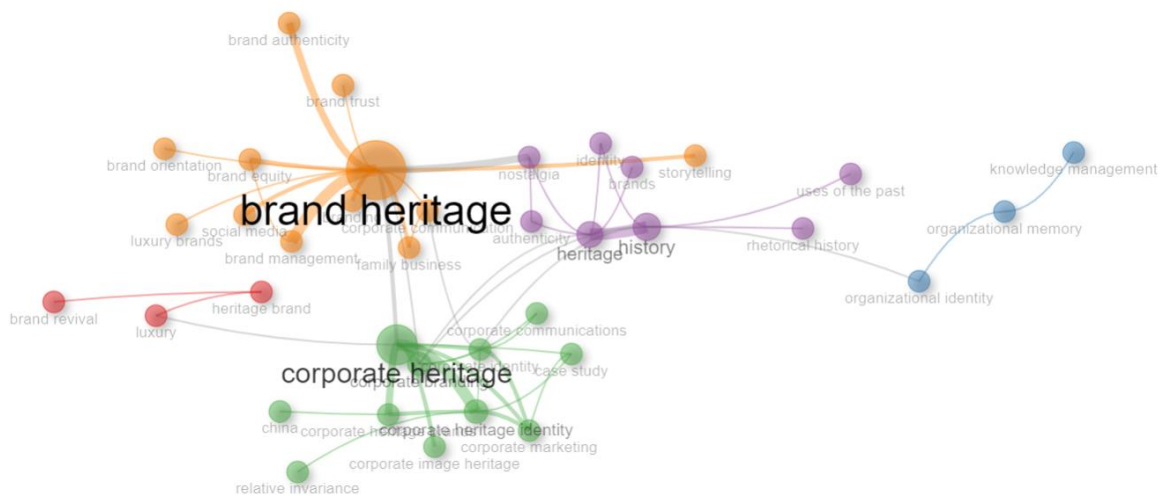

Concerning the country's scientific production, the analysis allowed us to identify countries where the most knowledge is concentrated: the UK came first with 60 works, followed by the USA (39), France (32), Italy (18), and China (14).

The analysis continues with the deepening of knowledge structure precisely, we analyzed the conceptual, intellectual, and social structure of the sample selected. First, we analyzed the co-occurrence network based on the author's keywords to understand the conceptual structure of our sample. This structure is examined to identify the topics covered by a research field and helps to understand the most important issues.

¹ The “most global cited documents” function measures the number of citations a document has received from documents contained in the entire database.

² The “most global local documents” function measures the number of citations a document has received from documents contained in the analyzed collection.

Fig. 2: Conceptual structure: co-occurrence network graph

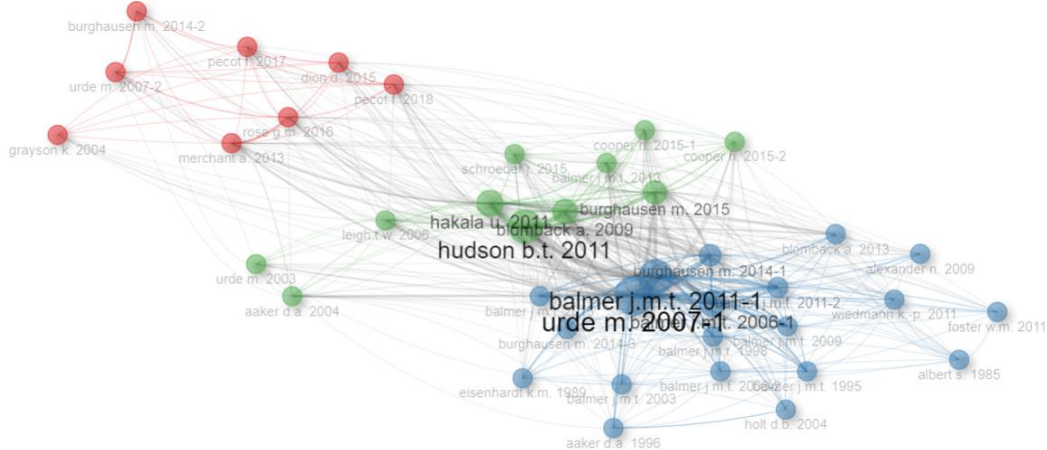

Source: Author elaboration

As shown in Figure 2, the analysis led to the identification of five different clusters. In this type of graphic, the nodes (or vertices) represent the keywords, and the lines (also called edges or links) represent the relations among keywords nodes (Locatelli et al., 2021). The size of each node is related to the number of documents containing that specific keyword, while the thickness of the lines is determined by the magnitude of the correlation between the two nodes. The most influential clusters are two: the orange cluster represents the heritage brand-related field, and the green cluster, slightly smaller than the first, represents the corporate heritage-related field. The purple cluster is close to the heritage brand topic and seems strongly linked to it through the nostalgia node. This cluster also highlights the strongly linked both history and heritage, so the purple cluster can be traced back to using of the past/history in the strategic key. The two little clusters are more or less of the same size and can be traced back to the "organizational memory" and "brand revival" research streams.

Second, we deepened the main intellectual structure of the research topic. Also, in this case, the intellectual structure was represented by graphics through nodes and lines, where each circle represents a document and the lines on which articles have been cited together in the same paper. As a result, the diameter of these circles is proportional to the number of citations, and the documents with similar co-citation profiles tend to be in close proximity (van Eck and Waltman, 2010). When two articles are cited in the same paper, that means they are closely related because they belong to the same topic area or because their topic areas are connected.

Fig. 3: Intellectual structure: co-occurrence network graph

Source: Author elaboration

Figure 3 shows the area of the most cited documents. These focus mostly on heritage as a part of corporate brand identity (Urde et al, 2007; Balmer J.M.T., 2011; Burghausen and Balmer, 2014a), on brand heritage framework (Hakala et al., 2011; Hudson B.T., 2011), and on the use of heritage or corporate history in the communication

activities (Blombäck A., 2009). The thickness of the lines demonstrates the close correlation between these subject areas.

Finally, the analysis of a social structure made it possible to identify the network of collaborations between countries. As highlighted previously, the countries where knowledge is most concentrated are UK, USA, and France. These three countries hold meaningful collaborations with each other. USA scholars collaborated most frequently with scholars from Spain, Germany, and Korea, while UK scholars collaborated with scholars from Canada, Italy, India, and Denmark.

Research limitations. This study is not without limitations. In particular, the conventional limits due to the research method are highlighted. First of all, in order to be able to carry out a bibliometric analysis with the Bibliometrics software, only one database was considered (SCOPUS of Elsevier database); therefore, it is necessary to take into account the possible incomplete search of the works present in the literature (Visser et al., 2021). Second, we limited our analysis to documents written in the English language. In this case, the possible incomplete search of the published works on the topic under investigation must be considered; the contributions written in other languages may have been underestimated. Third, bibliometrics analysis is a method that allows a summary of a large quantity of bibliometric data to present the state of the intellectual structure of a research topic or field (Donthu et al., 2021), and it does so by using a quantitative approach. It is a purely quantitative analysis that does not allow deep investigations of the contents, but its application is limited to performance analysis and clustering (Mukherjee et al., 2022). This is an inherent limitation of bibliometric reviews, which tend to focus more on citations, authors, and affiliations and less on theories and structures (Paul and Criado, 2020).

This paper represents the first step of a wider research project. Starting from these results, we will proceed to a qualitative analysis of the documents included in the final sample to systematize the existing literature on corporate heritage marketing and to identify any gaps that could be addressed by future research.

Managerial implications. In recent years, heritage marketing has gained interest within the research community, but at the same time among practitioners and managers.

From a theoretical point of view, the paper offers an overview of the existing literature on corporate heritage marketing. It provides preliminary insights that may support further studies in this field; therefore, it promotes the advancement of knowledge. As stated before, heritage is a potential source of competitive advantage for firms. Further research in the field of heritage marketing could support entrepreneurs and managers in defining appropriate heritage marketing strategies.

Originality of the paper. To the best of our knowledge, this is the first study to analyze literature on corporate heritage marketing. As a result, this is also the first study that investigates the bibliometric structure of this specific topic.

The bibliometric analysis presents areas within which scholars study the “corporate heritage”, the trend in the number of publications from year to year, the countries where the knowledge is concentrated, the most relevant journals for literature review, the most cited and prolific authors, etc. As a result, this paper is useful to researchers in the field. This analysis offers a helpful guide to upcoming scholars, providing information on which journals to consult and which authors are most relevant.

Keywords: heritage marketing; corporate heritage marketing; use of the past; bibliometrics analysis

The localization of corporate museums in the cities: Some hints from a qualitative analysis

DIEGO MATRICANO*

Framing of the research. *Over the last years, corporate museums have attracted a noticeable interest among marketing scholars (Danilov, 1992; Nissley and Casey, 2002; Piatkowska, 2014; Carù et al., 2017; Wu, 2017; Iglesias et al., 2020) who have explored several research paths ranging from the relationship between companies and corporate museums (Gilodi, 2002) to the setting up of corporate museums (Montemaggi and Severino, 2007), from the social experiences (Rihova et al., 2015) to the relevant, novel, surprising, informative and engaging interactions (Poulsson and Kale, 2004) that corporate museums can offer to customers/visitors.*

The most important aspect, on which marketing scholars seem to agree, is the strong relationship occurring between companies and their corporate museums. According to Bonti (2014), this strong relationship reveals itself also in reference to practical choices, such as the fact that corporate museums are located next to the company's headquarters or factories and are run by the company itself. With due exceptions, very often localization of corporate museums is close to the company's headquarters or factories.

The above-mentioned due exceptions catalyze attention since they lead to question a largely shared assumption. From an extended literature review, in fact, it comes out that localization of corporate museums in cities is an underestimated topic of research. Only few scholars have already tried to investigate the choice about the localization of corporate museums in the cities (Lepawsky, 2008; Capriotti, 2010). Most of them briefly cite where corporate museums are located.

Purpose of the paper. *The choice to focus attention on the localization of corporate museums in the cities is due to the fact that they are effective marketing tools (Danilov, 1992; Amari, 1997; Griffiths, 1999; Gilodi, 2002; Nissley and Casey, 2002; Montemaggi and Severino, 2007; Stigliani and Ravasi, 2007; Montella, 2010, 2014; Bonti, 2014; Piatkowska, 2014) and if the settlement of corporate museums is not properly evaluated, then it might conflict with the image, the message, and the intrinsic values that customers recognize to brands. Corporate museums, in fact, exist only in reference to the company (Gilodi, 2002). They are implemented in order to celebrate the successes achieved by the company in the past and, at the same time, to differentiate the company from competitors in the present and in the future (Gilodi, 2002; Pulh et al., 2019). As such, they are "exclusive" and "selective" marketing tools (Gilodi, 2002, pg. 17).*

According to the above premises, the main aim of this research is to investigate the nexus "corporate museum-city" - i.e. the relationship between corporate museums and the cities or, in other words, the choices about the localization of corporate museums in the cities - and to offer two research propositions that need to be properly discussed by other marketing scholars in order to proceed with further empirical investigations.

Methodology. *In order to offer two research propositions related to the nexus "corporate museum-city", the case-study methodology is adopted. This methodology was proposed at the end of 1980s when Eisenhardt (1989) proposed to build theories from case studies. In the following years, several scholars used this methodology (Dyer and Wilkins, 1991; Yin, 1994; Flyvbjerg, 2006; Eisenhardt and Graebner, 2007; Lee et al., 2007; Baxter and Jack, 2008) thus affirming its relevance in management studies. Of course, caution is always required when selecting the cases to investigate, reporting the results and offering research propositions (Baxter and Jack, 2008).*

For a start, attention is focused on the criteria of selection of cases to analyze. Two different corporate museums have been selected. The criteria at the basis of this choice are:

- *They both refer to the fashion industry (Steele, 2008; Jung and Yim, 2018);*
- *Their brands are well known all around the world (Iannone and Izzo, 2017; Jin and Cedrola, 2017).*
- *They represent the so-called "made in Italy" (Bertoli and Resciniti, 2013; Aiello et al., 2015);*
- *They have put into practice two different choices about localization of their corporate museums.*

The selected corporate museums that are going to be analyzed are: Armani/Silos and Gucci Museum or Gucci Garden.

Results. *The present extended abstract aims to propose two research propositions about the nexus "corporate museum-city". For this reason, two selected cases of corporate museums located in urban areas are presented in the following lines and the research propositions (the findings of this research) are expressed soon afterwards. For each of*

* Associate professor of *Startup and Innovation* – Università degli Studi della Campania "L. Vanvitelli"
e-mail: diego.matricano@unicampania.it

selected cases, a short review of the origins of the company is presented (particular attention is paid on the stories of founders that create the strong or weak relationship with the city). This review is necessary to figure out the possible reasons of the localization of corporate museums.

The first case selected for the present research is Armani/Silos.

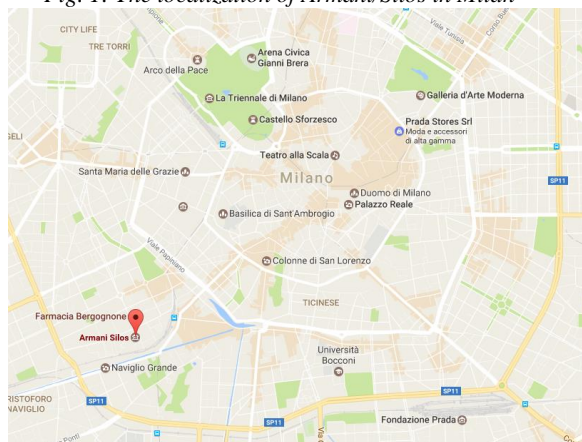

Giorgio Armani was born in Piacenza, Italy, in 1934. He became interested in fashion in 1957, when he left the school of medicine at the University of Piacenza to become a buyer for the La Rinascente chain in Milan. In 1964 Armani met Nino Cerruti, owner of Hitman, the Italian men's clothing producer. After a brief period to see how Armani worked with materials, Cerruti asked him to restructure completely the company's approach to clothing. Armani worked with Cerruti for six years, developing a simplified form of menswear that could be reproduced in series. In 1973 his friend Sergio Galeotti persuaded him to open a design office in Milan, at 37 corso Venezia. This led to a period of extensive collaboration, during which Armani worked as a freelance designer for a number of fashion houses, including Allegri, Bagutta, Hilton, Sicons, Gibò, Montedoro, and Tendresse. The international press was quick to acknowledge Armani's importance following the runway shows at the Sala Bianca in the Pitti Palace in Florence. The experience provided Armani with an opportunity to develop his own style in new ways. He was now ready to devote his energy to his own label, and in 1975 he founded Giorgio Armani Spa in Milan with Sergio Galeotti. In October of that same year he presented his first collection of men's ready-to-wear for spring and summer 1976 under his own name. He also produced a women's line for the same season. In 1978 Giorgio Armani dressed Diane Keaton on the night of the Oscars and two years later Richard Gere for his role in the film *American Gigolò*: thanks to this, he became the most recognizable world symbol of Milanese fashion. After that, everyone knows the story of Giorgio Armani and his maison (Sollazzo, 1999; Celant and Koda, 2000; White, 2000).

In this vein, it is very interesting to analyze the relationship with the city of Milan. The historical location of the company is in via Borgonuovo 21 where, up to 2002, fashion shows took place. In 1996, two new locations are open - in Via Borgonuovo 11 and 18 - where the main offices took place. In 2001 headquarters are moved from via Borgonuovo 21 to via Bergognone 59. The new headquarters, located in the Nestlé disused factory comprehends also the Armani/Teatro, designed by the world famous Japanese architect Tadao Andō.

In that area, in 2015, in order to celebrate the 40 years of his career, Giorgio Armani decided to open the museum "Armani/Silos" about history of his collections. In the occasion of the opening, Giorgio Armani explained the name of the building: "I have chosen the name silos because there the people stored grain, things for living. And so is the food, even the clothes need for living" (<https://www.armanisilos.com/>). The Japanese architect Tadao Andō projected also this building, just like the other ones in via Bergognone. The selection of clothes tells the story and the aesthetics of Giorgio Armani and it is divided into themes: at the ground floor there is the section of Stars and the section dedicated at Daywear. At the first floor there is the section of Esotismi. At the second floor there is the section Cromatismi and at the third (and last) floor there is the section Luce.

Armani/Silos is a marketing tool, of course, but it is an instrument useful to celebrate the brand. The marketing tools chosen by the company never celebrate the city of Milan. The connection between the company and the city is relevant in reference to the basket team (Armani Milano) and to the hotel managed by the company (Armani Hotel Milano). According to the above, the relationship between the company and the city does not seem to close. In this vein, it is important to remind that Giorgio Armani, together with several very important fashion designers - such as Gianni Versace, Krizia, Paola Fendi, Valentino Garavani, Gianfranco Ferré, Mila Shon, Ottavio Missoni, Franco Moschino and Luciano Soprani - made Italian fashion industry and the city of Milan well known in the world (Bucci, 2002). They all were part of a cultural movement that took place in Milan. Accord to the above, the location of Armani/Silos enhances more the history of the company and less that of the city (see Figure 1).

Fig. 1: The localization of Armani/Silos in Milan

Source: google maps.

From the case of Armani/Silos it is possible to derive the following research proposition:

PI: If brand history is not strictly linked to a city, then location of corporate museum is driven by brand and it is expected to be close to brand headquarters.

The above research proposition is perfectly in line with the idea that corporate museums are located next to the company's headquarters or factories (Bonti, 2014; Matricano, 2017). This choice strengthens the image, the message, and the intrinsic values that customers recognize to brands (Gilodi, 2002).

The second case selected for the present research is Gucci Museum or Gucci Garden.

While working as a porter at the Savoy Hotel in London, Guccio Gucci was really impressed by the luxurious luggage of international guests at the hotel and so he decided to create his first collection of leather luggage. After coming back to Florence (his city), and together with three of his sons, they started their own leather workshop in Via della Vigna (in the centre area of Florence) in 1921. The business idea was "to underline the pinnacle of Italian craftsmanship and the unsurpassed interest in quality and attention to detail" (<https://www.florenceinferno.com/the-gucci-museum/>). That was the origin of the Gucci brand.

For many years, Guccio Gucci has been working in his leather shop in Florence in order to increase popularity of Gucci brand. Over time, the number of products offered to customer has been growing (in particular suitcases and travel bags) and more and more customers were asking for Gucci products. Only in 1938 Gucci expanded his business to Rome and in 1951 in Milan. In 1953 the company grew overseas with the opening of the Manhattan store.

Despite the international growth, the brand has always been linked to Florence. When, in 1955, the logotype of the brand was modified there was a clear reference to the Florentine Middle Ages and to Renaissance time. Undoubtedly, this choice has contributed to make the brand a distinctive expression of "made in Italy". It was only in 1960 that Aldo Gucci (one of the three sons of Guccio) designed the symbol with the two crossed "G", a clear reference to the initials of the founder. The logotype still continued to celebrate the city of Florence.

Nowadays, the story of Gucci brand is well known all around the world and - in particular - is celebrated in Gucci Garden. Gucci Garden, in fact, was opened in 2011 (it was called Gucci Museum) to celebrate its 90th anniversary of the brand. The museum is in the heart of Florence's Piazza della Signoria and it includes a permanent exhibition dedicated to the theme of Travel. The first floor is dedicated to the representation of some themes and icons. The second floor is focused on the evolution of the double G monogram (this exhibition is called Logomania). The last floor is dedicated to the Bamboo handbags, an iconic Gucci product. Since 2018 the museum has been turned in an exhibition celebrating the brand and hosted in the Gucci Garden (<https://www.gucci.com/it/it/store/gucci-garden>). The location - in Piazza della Signoria - is still the same.

Beyond the exhibitions in the museum/garden, what is relevant is the choice about location. In reference to this, Jessica Dysart (<https://www.theflorentine.net/2011/10/27/gucci-museum-a-review/>) argues: "The location of the Gucci Museum makes sense for another reason: Guccio Gucci, who founded the company in 1921, was a native Florentine. The first Gucci store opened its doors in Florence, selling classic leather luggage pieces inspired by the rich, elegant patrons of the Savoy Hotel in London". In this vein, Suzy Menkes, a reporter of New York Times interested in fashion industry titles her article "Gucci Feeds Its Florentine Roots" (<https://www.nytimes.com/2011/09/28/fashion/gucci-opens-a-brand-museum-in-florence.html>). As noticeable, the choice about location of museum is not of secondary importance according to some experts in the field. A very important aspect that is worth pointing out in reference to this is that the headquarters of Kering Group, a world leader group in apparel and accessories that owns a portfolio of powerful luxury and sport and lifestyle brands - including Gucci - are not in the same area. According to this, the choice about location of Gucci museum in Piazza della Signoria needs to be properly evaluated. The celebration of Florence, of Florentine Middle Ages and of Renaissance time in the first logotypes of Gucci brand (up to 1960s) and the choice about location of Gucci Museum in the hearth of Florence are a clear example of an unbalanced nexus "corporate museums - cities" where city seems to prevail over brand. The relevance of the city - celebrated by the brand - positively affects the brand itself by reverse. Tourists interested in visiting Galleria degli Uffizi, Basilica di San Lorenzo, Basilica di Santa Maria Novella and Ponte Vecchio can find Gucci museum close by (see Figure 3).

Fig. 3: The localization of Gucci Museum in Florence

Source: google maps.

From Gucci case study it is possible to derive the following research proposition:

P2: If brand history is strictly linked to a city, then location of corporate museum is driven by the city and it is expected to be in the city centre.

The above research proposition differs from the assumption that corporate museums are located next to the company's headquarters or factories (Bonti, 2014). In the above case, in fact, the relationship between company and city does not seem to favor the company in comparison to the city. It is clear that the city prevails over the company. It seems that the city can be the driver able to convey tourists towards corporate museums and this makes them unintended visitors of the exhibition (Trueman et al., 2004; Kavaratzis, 2009; Carù et al., 2017). In this case, the city itself is a brand that can attract and convey tourists towards different destinations (such as corporate museums).

The proposition about Gucci Garden - even if in contrast with the general assumption about localization of corporate museum close to the company's headquarters or factories (Bonti, 2014) - is in line with a new trend of research that aims to disclose and understand territorial identity (Capello, 2019). More and more often, in fact, cities are going to be considered as drivers of inclusive growth (Trullén and Galletto, 2018). They can create valuable synergy in communication and tourism development (Patsiou, 2019) and promote their image all over the world - historic cities are advantaged in this sense (Shirvani Dastgerdi and De Luca, 2019). Of course, this new role of cities - as centre of a valuable ecosystem - is particularly relevant in reference to fashion companies (Bellini and Pasquinelli, 2016) that can exploit the country of origin effect by underlying the "made in" production (Bertoli and Resciniti, 2013; Aiello et al., 2015; Iannone and Izzo, 2017; Jin and Cedrola, 2017). A very interesting topic that scholars are investigating just deals with city of Florence as it can be read in a recent article authored by Lazzeretti and Oliva (2018) and titled "Rethinking city transformation: Florence from art city to creative fashion city".

Research limitations. The present extended abstract discloses some limitations that need to be properly analyzed. The first and main one deals with used methodology and expected outputs. As already said, noticeable caution is required when selecting the cases to investigate, reporting the results and offering research propositions (Baxter and Jack, 2008).

The second limitation deals with selection of cases. Armani/Silos and Gucci Garden are two cases that refer to one industry (i.e. fashion industry) and to one country (Italy). Corporate museums launched by companies operative in other industries (linked to physical resources localized in a specific place) and in other countries (aiming to celebrate a city and thus opening corporate museums with a touristic aim) might undergo different dynamics and this might prevent generalization of results.

The third limitation deals with the passage from a theoretical analysis to an empirical research. Several obstacles might arise and they could prevent from developing a set of independent/dependent variables useful for the research aim pursued.

Managerial implications. Theoretical propositions about the nexus "corporate museum-city" (and probable empirical investigations that can derive from them) can have relevant implications in reference to marketing and urban development arenas. By investigating "who affects whom", in fact, it is possible to derive some intriguing insights (Grodach, 2008; Vivant, 2011).

If the cities affect the localization of corporate museums, then marketing managers can leverage local tourism to increase brand awareness (Trullén and Galletto, 2018; Capello, 2019; Shirvani Dastgerdi and De Luca, 2019). It seems rational to hypothesize that tourists can become unintentional visitors of corporate museums because of easiness in finding the corporate museum (Patsiou, 2019). In this case, marketing managers should think of intriguing exhibitions able to attract tourists and make them prefer the exhibition rather than other sites of interest (Bellini and Pasquinelli, 2016).

On the contrary, if the brands affect the localization of corporate museums, then tourists/visitors intentionally move in the city to find the corporate museum. In this case, awareness of brands - disclosed through corporate museums - can be a driver for urban development. The case of Armani/Silos, situated in via Bergognone, in the Southern part of Milan, is a clear example. Visitors interested in the museum go there intentionally just to see the exhibition since few other sites of interest are localized there.

Implications of this preliminary study, then, are relevant both for marketing managers and representative of urban institutions. Despite priority of relevance, what matters is that corporate museums and cities can nurture their awareness reciprocally. Corporate museums are catalysts of visitors while city centers are catalysts of tourists. If reputation of brand prevails, then new areas of cities could be developed. If reputation of city prevails, then corporate museums might get advantages in terms of image and reputation.

Originality of the paper. The present extended abstract is original for three main reasons. Respectively they are: the launch of the nexus "corporate museum-city", the relevance of empirical evidences, and the mix of different fields

First, the nexus "corporate museum-city" can open up new paths of research that - from the marketing perspective - should focus on the localization of corporate museums and investigate their effectiveness since they are new marketing tools that companies are exploiting more and more (Piatkowska, 2014; Carù et al., 2017; Wu, 2017; Iglesias et al., 2020).

Second, this extended abstract derives from practical evidence rather than from theory. Practical choices made by companies (such as Armani and Gucci) are at the basis of this research. This gives value to the research since it aims to catch an empirical phenomenon and to formalize it (Eisenhardt, 1989; Flyvbjerg, 2006; Eisenhardt and Graebner, 2007; Lee et al., 2007; Baxter and Jack, 2008).

The third and last aspect of originality consists in the fact that this study perfectly fits with a new trend of research that investigates territorial identity (Capello, 2019) and underlines the role of the cities (Trullén and Galletto, 2018) - in particular historic cities (Shirvani Dastgerdi and De Luca, 2019) - since they can support the development of several companies and, in particular, of fashion companies (Bellini and Pasquinelli, 2016).

The influence of parental Dietary Behaviors, food literacy and chronotype on Children's eating habits and psychometric factors

IRENE RACCA* ORNELLA BONAFEDE* ANDREA BAZZANI* GIUSEPPE TURCHETTI**
LEOPOLDO TRIESTE**

Abstract

The study aims to investigate the relationship between various psychometric characteristics, such as eating habits, food literacy, chronotype, chrono nutrition, and anthropometric variables, such as age, Body mass index (the range to value the normal or overweight or obesity status) and education, within family units consisting of parents and children. The goal is to analyse the drivers of children's BMI and eating habits, by investigating the interdependence between their dietary patterns and their families' environment. Total of 190 parents complete an online survey comprising validated questionnaires and anthropometric data concerning themselves and their children. The results show that the higher the food literacy was in parents the healthier was eating habit of children, although the better eating habits do not necessarily correspond to a lower child BMI. The chronotype of parents also influenced the children's chronotype, and parents with a morning chronotype reflect positive eating behaviours in their children. Results confirm the growing part of the literature focusing on the role of chrono nutrition and chronotype in weight-related issues. As obesity is a complex disease, these new prospective emphasise the role of psychometric variable to impact daily eating habits. We provide new cues to extend the current literature on social campaigns - which split children and adults - by suggesting the relevance to integrate the communication strategy to families as a target unit. In conclusion, the study sheds light on the complex relationship between psychometric characteristics, anthropometric variables, and familial environment in determining children's eating habits and BMI.

Framing of the research. *The World Health Organization has declared that in European countries childhood obesity is about to become a public health problem (World Health Organization. Regional Office for Europe n.d.). After Covid-19 the trend is getting higher (Pietrobelli et al. 2020) and the institutions need to face this trend mainly for two reasons, on one hand the presence of obesity in childhood represent an important risk to maintain obesity in adulthood and on the other hand obesity represent, in general, an important risk factor for several disorders (Simmonds et al. 2016). The overweight and obesity are complex diseases where internal and external variable matches (Jebeile et al. 2022). The internal variables are expressed by non-modifiable characteristics as sex, age, and genetic predispositions. The external ones refer to environment for example the eating habits, the society, the children care and school (Jebeile et al. 2022). These external ones represent the main working area of health social campaign, that focuses to improve and to change the obesogenic environment to reduce and counterbalance the impact of internal risk factors. For example, in Australia a social campaign targeted on children was conducted at school to prevent childhood obesity using an informative campaign providing concept in a caching way (Colin Bell et al. 2013). In Italy the ViviSmart campaign, a social marketing-oriented campaign was conducted to improve nutritional skill of child through interactive lessons and ludic activity involving school and parents obtaining benefits for their eating lifestyle (Nosi et al. 2021).*

In the last decades, a little part of literature is providing interesting results on the relationship between BMI or metabolic risk and some psychometric variable, that are manifestation of internal characteristics; however, the interesting peculiarity is that we can partially modify them changing habits and even if they can impact on external environment, social campaigns have never used these variable to impact habit's change. Psychometric variables refer to chrononutrition and chronotype; the first one, the chrononutrition, refers to the relationship between three element that are the circadian rhythm of the biological function of the body, the meals timing and the nutrients consumption

(Johnston 2014; Oike, Oishi, and Kobori 2014). The chronotype is the attitude of a person to be more active during the day and emerging evidence suggest a relationship between chrononutrition and chronotype. (Almoosawi et al. 2019)

The review of Mazri and colleague assumes that adults more active during the evening (evening-chronotype) tend to have bad eating habits associated to obesity, contributing to obstacle the achievement of a healthy lifestyle (Mazri et al. 2020). Felső and colleague asses that a lack of sleep and a change in the circadian rhythm affect food metabolism functions, predisposing individuals to develop obesity and metabolic disorders (Felső R 2017). Consuming the meal at inappropriate times of day leads to an alteration of biological processes such as insulin secretion, lipid metabolism and blood pressure (Katsi et al. 2022). The chrononutrition appears relevant and really interconnected with lifestyle and dietary pattern. For instance, the evening chronotypes performed worse than intermediate and morning chronotypes in the food literacy score (Trieste et al. 2021) and this accentuates the need to better understand the relationship between these parameters considering a broader view. Regarding children, the morning chronotype predominates in childhood, shifting towards eveningness around puberty ((Jankowski 2015). Childhood and adolescence represent a vulnerable period and if they are not well directed, they risk establishing inadequate dietary patterns. The psychometric aspects are poorly taken in consideration even if they could impact on eating habits. They can represent a new prospective to ameliorate dietary pattern also in the social campaign along with other variables.

Purpose of the paper. The aim of this paper is to investigate if and how the lifestyle of parents can impact their children's habits. Specifically, we are interested in comparing the daily mealtimes (chrono nutrition), the attitude to be more active in a certain part of the day (chronotype), the food knowledge (food literacy) and the anthropometric variables (age, sex, education) of the parents with the same variables of their children. These insights could provide relevant knowledge for developing effective social marketing strategy capable of improving positive behavioural changes.

Given these premises the research hypotheses are:

H1. The food literacy is associated to a specific psychometric or anthropometric determinant such as BMI and chronotype in adults.

H2. Different chronotype in child can reflect differences between the child's anthropometric and eating habits.

H3. The parent's chronotype influence the child's chronotype and his eating habits.

Methodology

Participants

We enrolled a total of 190 parents in our study. To be eligible for inclusion, parents had to have child between 2 and 13 years old. They were recruited through school groups, sports associations, or social networks and we reached out respectively 179 (94,2) mothers and 11 (5.8) fathers. To collect data, we sked them to complete the questionnaire gathering information referred to themselves and to their child. We send them a link to fill the online questionnaire structured in Italian. The data collection lasted one month from 30/04/2021 to 25/05/2021. Participants live in Italy and most of them (89.5%) in Piemonte. Parents given the informed consent to participate.

Survey

Data were collected with an online survey and it lasts 20 minutes. Survey has validated questionnaires and anthropometric aspects concerning children's and parent's characteristics.

The validated questionnaire adopted for parents were:

- the chronotype, that asses in which time of day the subject is most active with the Italian version of the reduced morning-evening questionnaire (rMEQ)(Natale et al. 2006);
- the chrononutrition that study the rhythm of the eating behaviour (Veronda et al. 2020)
- the Self Perceived Food Literacy (SPFL) to investigate 8 domains on food habits and food purchases (Poelman et al. 2018)

The validated questionnaire adopted for children were:

- Childrens Chronotype Questionnaire (CCTQ) Werner & C.
- The eating habits, using ten questions about the frequency consumption of several food, where each question could be rated 0 or 1, and the final score was the media of answers. The closer the score was to one the higher was the eating habits.

The anthropometric data collected were level of education, residence and BMI (weight/ height²) considering different scoring for paediatric (Harrington et al. 2013) and for adult group (Ministero della salute Italiana 2021)

Results. The sample of parents was characterized by a median age of 39,5 years and the majority of subjects were Italian (96.9%). Other participants came from Albania, Romania, Switzerland, France and Spain. Concerning the Italian participants, 149 were born in the north Italy (Piemonte, Lombardy, Liguria and Emilia-Romagna), 18 subjects were born in centre Italy and 17 in south. However, of all those participants the 89.5% lives in north-Italy. Slightly more than half of parents declared to have a university degree (52%), the 4.7% and 42.9% have a middle school licence and high school diploma respectively. Only one individual stated to possess a primary school licence. Of these subjects, 33%, 62 participants, had attended courses providing information on nutrition. We included these question in the survey to assess if participant had received any nutrition education because previous conducted study found that subjects with specific nutrition education reported higher levels of nutrition literacy, regardless of gender (Trieste et al. 2021). Furthermore 169 subjects (89%) stated to be employed, only 2.1% were unemployed, one individual retired and 8.4%, declared to be housewives. Then, we calculated parents' BMI based on weight and height. Results show that most of participant are within the range of normal weight, 5 subject are in the underweight category (BMI < 18.5). 52

subjects (27%) are considered overweight, 11 subject are withing first degree obesity ($30 < BMI < 40$) and 4 are within second degree obesity ($BMI > 40$). BMI was calculated also for children but in a different way from adult. We have considered the BMI distribution according to the corresponding percentile of growing. 7.4% of child were overweight and 13.7% had obesity.

The level of food literacy was investigated for parents, and the scoring system range from zero to one, where zero represents the lowest value of food literacy and one the highest. The results, shown in Figure 1, depict a clear prevalence of parents with medium to high level of food literacy.

Fig. 1 Food Literacy Score

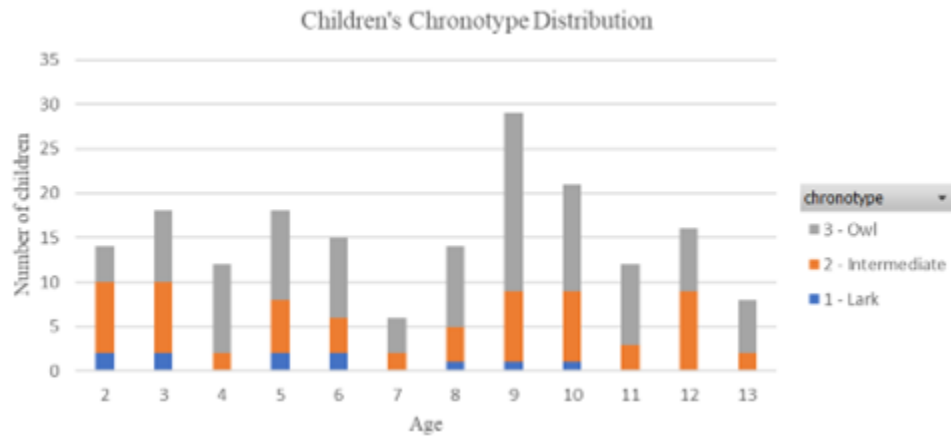

The chronotype of the adult sample is composed of 8 evening type, 69 morning type and 111 intermediates. Figure 2 summarised the results where the evening chronotype are indicated as “owls” and the morning type as “larks”. The distributions don't reflect the general population distribution, usually characterized by 70% intermediate, 15% morning type and 15% evening type (Bazzani et al. 2022).

Fig. 2 Parent's chronotype

The chronotype distribution changes among children with a prevalence towards a serotonin chronotype, shown in Figure 3. Only 12 children have a morning chronotype and they are between 2 and 6 years old, accordingly with literature studies. The average age of the owls is about 8.5 years, while the larks are on average about 6 years old. Usually, in the first few years of life (0-5 years) the morning type predominant, whereas towards the age of 8 years old there increase the percentage of intermediates and evening type (Almoosawi et al. 2019).

Fig. 3 Children's chronotype

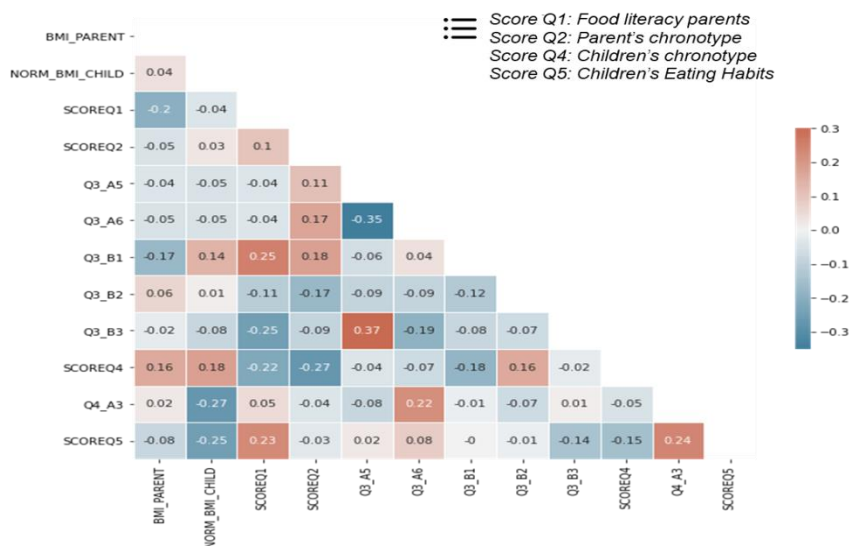

Moving toward children's eating habits (Figure 4), in our sample the majority of children have good eating habits. The scoring assume value from zero to one where lower score indicated poorer eating habits, and higher score closer to one indicate healthier eating habits.

Fig. 4 Score of children's eating habits,

We analysed the data from questionnaire using a statistical software (R program). We carried out linear regressions to highlight possible relations between variables studied. The first step was to perform a correlation analysis between scores to study the existing relationships for psychometric and anthropometric characteristics of participants as shown in Figure 5. The analysis was conducted using Pearson's correlation method (value between +1 and -1, where +1 corresponds to perfect positive linear correlation, 0 corresponds to no linear correlation and -1 corresponds to perfect negative linear correlation). We fixed p-value score $\leq 0,05$, and homoscedasticity values > 0.5 to analyse variables.

Fig 5. Pearson correlation coefficient

The results show that the food literacy can predict the BMI value of parents assessing the first hypothesis. Food literacy and BMI are significantly related in an indirect way, when food literacy grows the BMI decrease (p -value < 0.047 , homoscedasticity > 0.54). Figure 6 also shows some outliers in the linear relationship regression, and they correspond to subjects with BMI > 30 . We decided to re-analyse data excluding the outliers and we obtain better results as shown in Figure 7. Obesity is a complex disease where internal and external factors play together, excluding these subjects we have the possibility to study the role of food literacy in the contents of normal weight. Food literacy is a powerful variable that can help the maintenance of weight. When obesity is present, the food knowledge does not be longer sufficient to determinate behavioural chance. Doesn't emerged other psychometric or anthropometric relationship with food literacy.

Fig. 6: Relationship food literacy and BMI parents

Fig.7 Q-Q Plot – Residue distribution eliminating BMI>30.

We can affirm that eating habits can influence BMI and chronotype's children. As the parent's case, the children's eating habits are statistically related to BMI in an indirect way (p -value < 0.009 , homoscedasticity > 0.513 , normal distribution of residues > 0.702). Also, chronotype is related to eating habits (p -value 0.02 , homoscedasticity > 0.72 , normal distribution of residues > 0.62).

A strong relationship emerged between parent's food literacy and children's eating habits confirming the third hypothesis (p -value < 0.001 , homoscedasticity > 0.44 , normal distribution of residues > 0.73) (Fig. 8)

Fig. 8: Relationship parent's food literacy and children's eating habits.

For the children's and parent's groups resulted a significant relationship (p -value < 0.0002 , homoscedasticity > 0.72 , normality of residue > 0.81) (fig. 9). We tested the relationship also for BMI but it doesn't emerge values statistically significant.

Fig. 9: Relationship parent's chronotype and children's chronotype

Research limitations. There are limitations to consider when interpreting the results of the study. The first one is the reduced sample size that reduce the generalizability of our finding to the Italian population. Additionally, we have to consider that the group is not really heterogeneous as the subject involved were recruited from common places for example the neighbouring residence, the same sport club or children's school. Again, these could imply that the taken sample does not reflect the diversity of the Italian population. Furthermore, we asked parents to answer questions on behalf of their children, which may have introduced the social desirability bias and it has an impact on the truthfulness of the answers. In that case the main risk is that the subject answers base on his own perception and memory. Although our study presents limitations, this research is fundamental in establishing a starting point for future research. In the future we plan to expand the sample and to make it more heterogeneous. Furthermore, we would like to investigate the psychometric variable adopting more accurate tools, for example to apply neuroscience technique as actigraphy to monitor sleep quality and to use food diary to collect eating habits. These instruments were not used for this study because this was an exploratory pilot study.

Managerial implications. Considering obesity one of the most impactful causes of a lot of disease as cardiovascular, cancerogenic, respiratory issues both for adulthood and childhood (Kumar and Kelly 2017; Pi-Sunyer 2002), the main goal of institution is to reinforce primary and secondary prevention approach. Most of the social campaign work on the environmental characteristics to induce a positive behavioural change. For example, one of the most used appoache is to increase the awareness and the knowledge of healthy lifestyle; these campaigns appear to be useful and consistent, however our results suggest an integrative prospective. Results also consider the relevance of the psychometric variable as the chronotype and chrono nutrition highlighting their impact on the daily lifestyle, even if they are variable related to internal characteristics. Using that variable to create a targeted communication to adult and children could be useful to impact on dietary change. We believe that our work would have an important contribution for social campaign programmes in establishing a more personalised communication towards their target group. Furthermore, we strongly believe the familiar content should be consider as a new target unit. It's important

emphasise the parental role and improving the familiar environment to impact indirectly also the dietary. Change the familiar environment first, makes the best condition for apply the knowledge of good eating habits.

Originality of the paper. Considering the literature, we chose to focus on determinants that influence dietary habits directly and indirectly within the family unit (parent/child). Few studies focus on the influences of the parent on the child and, there are no research studies that analyse dietary habits in a family unit by also taking the chronotype into account. Our novelty lies in having studied the impact of psychometric variables (chronotype and chrononutrition) in the family unit with the aim of being able to use these results in the future to better understand how to set up the communication of a behavioural change in eating habits campaign. Therefore, to the best of our knowledge no prior study correlated, anthropometric psychometric variable for example, the parent's food literacy with the child's chronotype or BMI. In improving diet quality and health of future generations, we suggest studying family's eating habits and to define areas of intervention. The way parents behave influences, even unintentionally, the upbringing and behaviour of children, creating a pattern of habits that they are likely to carry into the future. Therefore, society should contemplate this aspect considering also the parent's involvement in social campaign to encourage them to adopt virtuous behaviour to set up best conditions to behavioural change in their children.

Keywords: Parents, children, dietary behaviours, food literacy, chrono nutrition, psychometric profiling, nutrition education

Virtual reality engagement ed esperienza di marca nel metaverso

MARIA VERNUCCIO* SARA BOCCALINI* MICHELA PATRIZI* ALBERTO PASTORE**

Inquadramento della ricerca. Il metaverso è un ambiente virtuale tridimensionale, interattivo, persistente e interconnesso, in cui gli utenti possono vivere esperienze sociali, politiche, economiche e culturali (Park e Kim, 2022). Si configura, quindi, alla stregua di una realtà alternativa, che consente agli utenti di vivere anche esperienze virtuali di marca (Lee e Cho 2022), sulla base delle cosiddette tecnologie immersive, quali l'Augmented Reality, la Mixed Reality e la Virtual Reality (Ko, 2017). Quest'ultima può giocare un ruolo preminente nell'esperienza dell'utente mediata da tecnologia (Han et al., 2022), grazie alla sua capacità di creare un ambiente virtuale totalizzante e ricco di stimoli sensoriali attraverso i quali è, ad esempio, possibile rafforzare la brand image (De Gauquier et al., 2019).

Considerando il metaverso basato sulla Virtual Reality (VR), è stato messo in luce come questo ambiente innovativo e coinvolgente rappresenti un'interessante opportunità in ottica di marketing esperienziale (Pengnate et al., 2020), favorendo un significativo impatto sul consumatore in tutte le fasi del customer journey (Yoo et al., 2023), nonché, più nello specifico, un'opportunità di branding (Vernuccio et al., 2023).

Lo sviluppo di una piattaforma in VR da parte di Meta, proprietaria delle reti sociali più utilizzate dai brand e dai consumatori (come Facebook e Instagram), insieme all'aumento delle vendite dei visori del 241,6%, registrato durante il primo semestre del 2022 rispetto allo stesso periodo del 2021 (Shirer et al., 2022), enfatizza ulteriormente il potenziale ruolo della VR nell'innovazione della brand experience (Han et al., 2022). Ciononostante, la letteratura accademica sull'esperienza di marca nel metaverso VR-based è ancora nelle sue fasi iniziali, avendo finora delineato un quadro conoscitivo piuttosto parziale e prevalentemente teorico. Alcuni Autori affermano che il metaverso, essendo un ambiente altamente immersivo, poli-sensoriale, interattivo e personalizzabile, possa offrire un'esperienza di maggiore valore (Dwivedi et al., 2022; Spajić et al., 2022). Altri studi propongono una visione più focalizzata, concentrandosi sulla progettazione di una specifica piattaforma di metaverso, in grado di stimolare determinate risposte del consumatore durante la shopping experience (Shen et al., 2021), limitatamente ad esempio alla purchase intention (es. Patil et al., 2022) o alla customer satisfaction (Hwang e Lee, 2022).

Osservando, invece, la più ampia letteratura sulla VR, si può riscontrare come siano state analizzate diffusamente le risposte sia non comportamenti che comportamentali dei consumatori legate all'esperienza virtuale di marca. In particolare, tra le risposte percettive più rilevanti che sono state indagate richiamiamo: la vividness (Kim e Ko, 2019); l'interactivity (Mütterlein, 2018); la mental imagery (Cowan et al., 2021); la telepresence (Breneman et al., 2022) o presence; il flow (Kim e Ko, 2019; Cowan et al., 2021). A queste variabili, si affianca lo studio, ancora ad uno stadio iniziale, di un'altra risposta del consumatore, ossia il VR engagement (es. Pengnate et al., 2020), da intendersi come un costruito multi-dimensionale specifico del contesto mediale VR-based, che può manifestarsi quando l'utente interagisce direttamente con i contenuti di un ambiente virtuale (medium), vivendo un'esperienza di attivazione psicologica verso lo stesso (Papagiannidis et al., 2013), orientata al raggiungimento di uno o più obiettivi personali (Calder et al., 2016). Nell'ultimo decennio, la letteratura di marketing ha posto l'accento sulle diverse dimensioni dell'engagement, in primis le dimensioni cognitive, emotiva e comportamentale (Hollebeek et al., 2011). Facendo riferimento specifico ai contesti medialti VR-based, la concettualizzazione proposta dal contributo teorico di Hollebeek et al. (2020) consente di declinare la multidimensionalità dell'engagement verso il contesto mediale VR-based (VR engagement) su quattro fondamentali versanti: 1) cognitive VR engagement, che si estrinseca nel livello di elaborazione mentale attivata dalle interazioni in VR; 2) emotional VR engagement, legato al livello di 'affettività' brand-related che si sviluppa grazie alle interazioni in VR; 3) behavioral VR engagement, consistente nel livello di energia, impegno e tempo che viene raggiunto nelle interazioni in VR; 4) social VR engagement, sintetizzabile come l'investimento sociale dedicato alle interazioni in VR.

Tra gli studi empirici di marketing che ad oggi hanno approfondito l'engagement verso la VR, solo Violante et al. (2019) hanno tenuto in considerazione la sua multidimensionalità, proponendo delle linee guida per il design di un ambiente immersivo (un supermarket in VR) in grado di esercitare, grazie alle sue caratteristiche tecnologiche, un

elevato impatto sul consumer engagement espresso nelle dimensioni cognitiva, emotiva e comportamentale. Altri studi di marketing hanno proposto, invece, una prospettiva parziale sul VR engagement, interpretandolo principalmente nella sua dimensione cognitiva (Papagiannidis et al., 2013; Pengnate et al., 2020).

Alla considerazione circa la scarsità di studi empirici sul VR engagement soprattutto in ottica multidimensionale, si aggiunge l'evidenza di un ulteriore gap conoscitivo: questo concetto non è stato mai studiato nell'ambito dell'esperienza di marca nel contesto mediale del metaverso VR-based. Di conseguenza, la prima domanda di ricerca del presente lavoro è la seguente:

RQ1: Quali dimensioni del VR engagement possono essere sviluppate attraverso un'esperienza di marca vissuta nel metaverso?

Il VR engagement, oltre a potersi configurare come un costrutto multidimensionale "context specific", potrebbe avere una relazione con diversi outcome di marca, quali ad esempio la brand trust e la brand loyalty, in analogia con quanto emerso sinora dagli studi condotti in altri contesti esperienziali di marketing (es., Leckie et al., 2016; Samarah et al., 2022). Sebbene un tema emergente negli studi sulla VR experience riguardi le conseguenze di branding (es., De Gauquier et al., 2019; Cowan et al., 2021), con riferimento al VR engagement nel metaverso, l'unico studio ad oggi rinvenuto sul potenziale legame tra il VR engagement e gli outcome di marca, è il contributo teorico di Hollebeek et al. (2020). Secondo il framework proposto dagli Autori, il VR engagement multidimensionale sviluppato durante l'esperienza di "virtual customer journey", influenzerebbe in modo diversificato a seconda della dimensione interessata, le diverse componenti della "brand relationship quality" nella fase successiva all'esperienza.

Alla luce di queste considerazioni riguardo al potenziale ruolo del VR engagement nello sviluppo di outcome di branding legati all'esperienza di marca nel metaverso, formuliamo la seguente domanda di ricerca:

RQ2: Quali risultati di branding sono connessi al VR engagement multidimensionale nell'ambito di un'esperienza di marca nel metaverso?

Metodologia. Al fine di rispondere alle domande di ricerca, si è fatto ricorso a un approccio metodologico qualitativo esplorativo, con interviste in profondità. Sono stati coinvolti utenti aventi esperienza pregressa con le tecnologie immersive di VR e appartenenti alla Generazione Z (età compresa tra i 18 e i 27 anni) (Francis e Hoefel, 2018), essendo il segmento che ha mostrato tassi di adozione delle tecnologie di VR superiori rispetto alle generazioni più adulte (Jayaraman, 2022). Inizialmente, gli intervistati sono stati selezionati applicando la "key informant technique", e, successivamente, la "snowball sampling strategy", raggiungendo la saturazione teorica del dato (Glaser e Strauss, 2017) mediante 14 interviste. Il set d'indagine finale è equamente diviso tra uomini e donne, mentre risulta eterogeneo riguardo alla professione (es., studente, UX designer, impiegata in agenzia di comunicazione, insegnante).

La brand experience posta alla base dell'indagine è quella proposta da Nike Jordan (brand che si rivolge principalmente ai target generazionali più giovani), con l'ambiente di marca "Jumpman Zone", fruibile nel metaverso VR di Fortnite. Accessibile dal 2021, "Jumpman Zone" consente agli utenti di collezionare diversi accessori ("skin") del brand Nike Jordan con cui personalizzare il proprio avatar. A tal fine, l'utente deve completare molteplici sfide legate allo sport del basket, afferenti a quattro diversi portali di difficoltà crescente. Tutti gli intervistati hanno vissuto per la prima volta l'esperienza di Nike Jordan durante lo svolgimento dell'intervista, utilizzando un proprio visore di VR (Sony PlayStation VR2 o Oculus Quest 2) connesso alla console Play Station 5 oppure al PC. L'esperienza vissuta attraverso il visore ha consentito agli intervistati di avere una visualizzazione in modalità "schermo" e di giocare con il proprio avatar, senza avere, tuttavia, una prospettiva in "prima persona".

Con lo scopo di raccogliere risposte spontanee, è stata redatta una traccia d'intervista semi-strutturata composta da domande ad ampio respiro, volte a rilevare, in primo luogo, l'expertise e la conoscenza pregressa del brand Nike Jordan. Dopodiché, gli intervistati hanno indossato il visore per vivere la brand experience selezionata. Specificatamente, è stato chiesto agli utenti di completare il primo dei quattro portali presenti nell'esperienza, che, a sua volta, ha richiesto il completamento di quattro livelli di gioco.

Accedendo all'esperienza, gli utenti si sono trovati in una prima area caratterizzata dalla presenza di oggetti 3D attinenti sia allo sport del basket sia alla marca, come il brand logo riprodotto sul pavimento. In questa area, gli intervistati hanno visualizzato i quattro portali. L'accesso al primo di questi ha condotto l'intervistato in una stanza contenente un'installazione di scatole sovrapposte fino al soffitto e quattro porte, relative a ciascun livello di gioco. In ogni livello, gli intervistati hanno effettuato tiri al canestro dentro un grande campo da basket. Il superamento dei quattro livelli ha concluso l'esperienza interattiva in VR. In seguito, sono state formulate nuove domande finalizzate a rilevare le diverse dimensioni del VR engagement vissute durante l'esperienza di marca, così come le risposte degli utenti verso il brand Nike Jordan.

Tutte le interviste, della durata media di 50 minuti sono state condotte mediante sistemi di videoconferenza nel mese di dicembre 2022. L'analisi del corpus ottenuto tramite la trascrizione di ciascuna intervista è stata eseguita applicando la thematic content analysis (King e Horrocks, 2010). Nello specifico, seguendo il percorso logico di progressiva astrazione, sono stati individuati, anzitutto, i "descriptive codes", ovvero i temi più puntuali, proseguendo con gli "interpretive themes" e gli "overarching themes". Il processo di codifica è stato svolto separatamente da due membri del team di ricerca e in seguito confrontato. Inoltre, per garantire un livello accettabile di affidabilità, i risultati sono stati confermati da due esperti codificatori indipendenti, rivelando un "agreement ratio" soddisfacente (89%).

Risultati. L'analisi tematica del contenuto ha consentito di individuare alcuni temi chiave (overarching themes e interpretive themes) che, da una parte, qualificano le dimensioni del VR engagement attuabili attraverso un'esperienza di marca nel metaverso (RQ1), e, dall'altra parte, definiscono i risultati di branding raggiungibili in associazione con

le diverse dimensioni del VR engagement, vissute effettivamente durante la stessa esperienza (RQ2). In particolare, con riguardo alle dimensioni del VR engagement, sono state astratte le tre dimensioni più analizzate in letteratura, ossia: cognitiva, emotiva e comportamentale. Per quanto concerne i risultati di branding connessi al coinvolgimento sotto i diversi profili, sono stati elicitati i seguenti temi: brand recall, brand familiarity, brand attitude, brand trust e brand self-connection.

Inoltre, attraverso il processo di astrazione induttivo sopra descritto, sono emerse due ulteriori tematiche, la brand attitude (BA), ex-ante ossia pre-esperienza, e la percezione di immersione maturata nel contesto virtuale grazie all'esperienza di Nike Jordan (VR brand-related immersion). Queste variabili percettive del consumatore si sono rivelate dei fattori individuali in grado di condizionare in modo combinato tanto le dimensioni del VR engagement espresse dagli intervistati, quanto i connessi risultati di marca. Infatti, il grado di apprezzamento generale verso il brand (Nike Jordan), manifestato dai rispondenti prima di vivere l'esperienza virtuale di marca, ha mostrato avere effetti diversi a seconda della valenza (atteggiamento verso la marca positivo vs. negativo) e dell'intensità (atteggiamento verso la marca forte vs. debole). Al contempo, lo stato psicologico di immersione sperimentato dall'utente all'interno dell'ambiente di marca in VR, legato al senso di completo assorbimento cognitivo nelle attività svolte, alla concentrazione mentale in queste ("absorption") e alla facilità nel compierle ("fluency") (Mütterlein, 2018), si è palesato come un fattore condizionante il VR engagement e i risultati di marca, a seconda del livello di intensità (percezione di immersione elevata vs. bassa).

Analizzando qualitativamente la ricorrenza combinata dei temi sopra richiamati, è stato possibile delineare un framework integrato che rappresenta sei diversi vissuti esperienziali degli intervistati (Figura 1), caratterizzati da mix di differenti dimensioni di VR engagement attivate e diversi risultati di marca (risposte percettive brand-related espresse dagli intervistati), nel quadro delle condizioni di brand attitude ex-ante (positiva vs. negativa, forte vs. debole) e percezione di immersione nella VR brand-related (forte vs. debole). Di seguito, proponiamo una breve descrizione dei vissuti esperienziali di marca nel metaverso emersi dall'analisi.

Fig. 1: VR engagement multidimensionale e risultati di branding nel metaverso

Brand attitude ex-ante - Valenza	Positiva	VR engagement parziale: Cognitivo & Emotivo / Emotivo & Comportamentale Risultati di marca: ↑ Brand familiarity ↑ BRQ (Trust)	Full VR engagement: Cognitivo, Emotivo e comportamentale Risultati di marca: ↑ Brand attitude ↑ BRQ (Trust, Self connection)	Forte	Percezione di immersione
	Negativa	VR engagement comportamentale Risultati di marca: ↑ Brand recall	VR engagement parziale: Cognitivo e comportamentale Risultati di marca: ↑ Brand attitude	Debole	
		VR engagement comportamentale Risultati di marca assenti	VR engagement assente Risultati di marca assenti		
		Debole	Forte		
Brand attitude ex-ante - Intensità					

1. I rispondenti che hanno mostrato un'attitudine ex-ante verso il brand positiva e forte, insieme ad un'elevata percezione di immersione nell'esperienza di marca virtuale, hanno vissuto un pieno VR engagement, con l'attivazione di tutte le tre dimensioni: cognitiva, manifestando interesse e attenzione verso l'ambiente in VR e le connesse attività di marca; emotiva, principalmente attraverso il divertimento, le emozioni di gioia, sorpresa e un'ispirazione di tipo edonistico; comportamentale in termini di intenso impegno nelle azioni del gioco virtuale di Nike Jordan. Circa i connessi risultati di marca, l'esperienza di VR engagement con l'ambiente di Nike Jordan è stata associata ad un ulteriore rafforzamento della BA dei rispondenti totalmente coinvolti, insieme a un miglioramento della brand relationship quality (BRQ), in particolare con riguardo alla brand trust, ossia la convinzione che il brand abbia qualità specifiche che lo rendono affidabile (Delgado-Ballester e Luis Munuera-Alemán, 2005), e alla self-connection, ossia la misura in cui il consumatore si riconosce nel brand e si sente in connessione con esso (Smit et al., 2007).

2. Una seconda fattispecie esperienziale riguarda i rispondenti caratterizzati da attitudine pre-esperienza verso il brand positiva, ma intensità debole, e con una percezione di immersione elevata. Questo gruppo di rispondenti ha sviluppato il VR engagement parzialmente, sperimentando solo due dimensioni di coinvolgimento in modo combinato: cognitiva ed emotiva oppure emotiva e comportamentale. In termini di risultati di marca, i rispondenti hanno verbalizzato un potenziamento della brand familiarity, la conoscenza della marca che riflette le esperienze dirette e

indirette del rispondente con la stessa, attraverso le associazioni che avvengono nella sua memoria (Campbell e Keller, 2003), nonché un rafforzamento della BRQ, ma limitatamente alla brand trust.

3. In terzo luogo, dall'analisi del contenuto è emerso come anche i rispondenti con attitudine precedente verso il brand positiva e forte, ma con una bassa percezione di immersione durante l'esperienza abbiano vissuto un VR engagement parziale, stavolta sia cognitivo, in termini di maggiore interesse, sia comportamentale, in termini di maggiore impegno nelle azioni previste dall'esperienza virtuale di marca. La BA verso Nike Jordan è stata ulteriormente rafforzata, mentre non è stato evidenziato un miglioramento della BRQ.

4. Il quarto vissuto esperienziale riguarda i rispondenti che hanno manifestato un'attitudine pre-esperienza verso il brand positiva, ma con bassa intensità, insieme a una bassa percezione di immersione. In questo caso, il VR engagement è stato circoscritto unicamente alla dimensione comportamentale, espressa tramite un maggiore impegno nell'azione durante la fruizione dell'esperienza. Non vi è stato un rafforzamento della brand familiarity, come nel "vissuto 2.", caratterizzato anch'esso da una BA debole, ma solo un consolidamento del brand recall, ovvero la capacità del consumatore di ricordare la marca in una determinata situazione (Prashar et al., 2012).

5. Nel quinto vissuto, l'attitudine precedente verso il brand è negativa, ma in modo piuttosto debole (si tratta quasi di indifferenza), e le percezioni di immersione sono deboli. Anche in questo caso, come per il "vissuto 4.", gli intervistati hanno provato un VR engagement solo comportamentale, in completa assenza di risultati di marca.

6. Infine, è emersa una sesta e ultima area che riguarda i rispondenti con un'attitudine fortemente negativa verso il brand prima dell'esperienza, nonché una percezione assai debole di immersione. In tal caso, possiamo evidenziare come non sia stato vissuto alcun tipo di engagement verso il contesto virtuale di marca e non vi siano state implicazioni in termini di risultati di marca.

Alla luce dei risultati, viene ad evidenza come la brand attitude e la percezione di immersione siano determinanti nel condizionare l'ampiezza del VR engagement e le connesse implicazioni di branding. Infatti, nel primo vissuto (Figura 1), caratterizzato da brand attitude positiva e forte ed elevata immersione, ricorrono tutte le condizioni per sperimentare il livello più completo di engagement e raggiungere dei risultati di marca particolarmente significativi (ulteriore rafforzamento della BA e miglioramento della BRQ). Nel caso del secondo vissuto, invece, nonostante vi sia una BA positiva e un'elevata immersione percepita, la debolezza della BA di partenza sembra incidere riducendo l'ampiezza del VR engagement (dove la costante è la dimensione emozionale) e determinando un effetto di branding più in termini di maggiore familiarità (conoscenza) e di maggiore fiducia, senza un rafforzamento della BA.

Nel terzo vissuto, la debole percezione di immersione sembra condizionare il VR engagement, che è solo cognitivo e comportamentale e mai emotivo. Inoltre, viene rafforzata solo la BA (già forte), mentre non vi sono conseguenze sulla qualità relazionale tra utente e marca. Nel quarto caso, la duplice condizione di debolezza dell'immersione e della BA (comunque positiva) sembra incidere sulla riduzione del VR engagement alla sola sfera comportamentale e sui risultati di marca, ridotti al solo miglioramento del ricordo di marca. Nel quinto vissuto, la debolezza e la negatività della BA, insieme alla scarsa percezione di immersione hanno reso questa esperienza non solo estremamente limitata sul versante del coinvolgimento (comportamentale), che sembra relegato all'impegno nella meccanica del gioco virtuale, ma anche priva di qualsiasi implicazione di branding.

L'immersione sembra quindi influenzare l'ampiezza del VR engagement e la qualità relazionale, in condizioni favorevoli di BA. La brand attitude sembra incidere: 1) con la sua positività o negatività sulla presenza/assenza di risultati di marca; 2) con la sua forza o debolezza sul tipo di risultato di marca. Entrambi i fattori incidono sul manifestarsi delle dimensioni specifiche del VR engagement.

Limiti della ricerca. I limiti del presente lavoro suggeriscono fruttuose linee di ricerca future.

In primo luogo, i dati sono stati raccolti concentrando l'attenzione sull'esperienza di marca "Jumpman Zone" di Nike Jordan, che presenta come principali limitazioni l'assenza di una dimensione sociale e una visione non completamente immersiva. Pertanto, future linee di ricerca potrebbero approfondire le risposte del consumatore con riferimento a differenti esperienze di marca nel metaverso VR-based, caratterizzate da una totale immersione (visualizzazione a 360°, prospettiva "in prima persona") e da dinamiche di interazione many-to-many tra gli utenti, in modo da poter osservare lo sviluppo anche della dimensione del VR engagement di tipo sociale, ritenuta imprescindibile in ambienti di metaverso (Yoo et al., 2023).

Inoltre, in questo studio, si è concentrata l'attenzione su utenti appartenenti alla Gen-Z con esperienze pregresse di utilizzo delle tecnologie di VR. Di conseguenza, futuri lavori empirici potrebbero analizzare l'esperienza di utenti con livelli inferiori di expertise appartenenti ad altre classi generazionali (es., Millennials, Gen-X).

Infine, la natura esplorativa del presente lavoro, basato su tecniche di analisi qualitativa del contenuto, non consente di ipotizzare e verificare relazioni di causa-effetto tra le variabili indagate, né di generalizzare i risultati ottenuti. Quindi, invitiamo i ricercatori accademici ad adottare disegni quantitativi causali per identificare e testare le relazioni che sussistono tra i concetti emersi.

Implicazioni manageriali. Il framework concettuale proposto rappresenta uno valido strumento conoscitivo, utile per i manager coinvolti in attività di progettazione di brand experience nel metaverso VR-based, poiché delinea le diverse risposte cognitive, emozionali e comportamentali dei consumatori in questo specifico contesto esperienziale. In particolare, si evidenziano i ruoli dell'immersione percepita e della brand attitude ex-ante, che possono favorire o vincolare, fino ad ostacolare, il raggiungimento del VR engagement multidimensionale e degli obiettivi di branding. Nello specifico, poiché la percezione di immersione sembra esercitare un'influenza significativa sulla piena manifestazione del VR engagement multidimensionale e sulla qualità relazionale, emerge l'esigenza per il management

di creare un'esperienza virtuale di marca di qualità, capace di favorire la percezione di immersione basando, ad esempio, il disegno della stessa su fattori tecnici riconducibili alla User Experience Design (“grafica 3D”, “suono spazializzato”, “usabilità”, “physical comfort”) (Vernuccio et al., 2023). Inoltre, poiché la BA ex-ante sembra incidere particolarmente sia sulla percezione di specifiche dimensioni del VR engagement sia sul raggiungimento di peculiari risultati di marca, si consiglia ai marketing manager di rivolgere l'esperienza principalmente a target di utenti caratterizzati da un atteggiamento positivo e forte verso la marca. Inoltre, a monte, suggeriamo di creare campagne di comunicazione volte a migliorare e rafforzare la BA.

Originalità del paper. Il nostro studio esplorativo si colloca nell'alveo della letteratura di marketing, all'intersezione del filone di studi sul media engagement con quello sull'esperienza di marca nel metaverso VR-based, contribuendo ad avviare un'analisi sia sulle specifiche dimensioni del VR engagement in questo innovativo contesto sia sui principali risultati di branding connessi al VR engagement. Nello specifico, la ricerca analizza empiricamente tre dimensioni del VR engagement, cognitiva, emotiva e comportamentale, percepite durante la brand experience nel metaverso VR-based. Inoltre, si individuano una varietà di risultati di branding, quali brand recall, brand familiarity, brand attitude, brand trust e brand self-connection, connessi alle dimensioni del VR engagement emerse durante l'esperienza.

In termini di contributo accademico, questo studio indaga per primo il VR engagement multidimensionale a livello empirico nell'ambito di un'esperienza di marca che esula da finalità di acquisto, contribuendo a colmare il primo gap individuato nella letteratura accademica di marketing che, ad oggi, ha indagato il VR engagement esclusivamente in prospettiva o parziale (Papagiannidis et al., 2013; Pengnate et al., 2020) o concettuale (Hollebeek et al., 2020), oltreché in ambiente di shopping con finalità commerciali dirette (Violante et al., 2019). Peraltro, il presente lavoro è il primo che indaga le variabili individuali in grado di condizionare gli esiti della brand experience all'interno dell'ambiente innovativo del metaverso VR-based.

Il secondo elemento di originalità risiede nell'aver avviato l'analisi della connessione tra il VR engagement e il raggiungimento di una varietà di risultati di marca, contribuendo ad arricchire la letteratura accademica che, attualmente, non ha studiato empiricamente questa associazione. In particolare, sono state rilevate combinazioni diverse di dimensioni di VR engagement, nonché risultati di branding peculiari associati alle differenti dimensioni del VR engagement, a seconda sia della valenza e dell'intensità della BA ex-ante sia dell'intensità dell'immersione percepita. Con riferimento alla BA, i nostri risultati sono indirettamente supportati da precedenti studi empirici condotti nei contesti dell'advertising (es., Lee, 2010) e dei social media (es., Jahng e Hong, 2017), che hanno messo in evidenza il ruolo della BA ex-ante quale variabile in grado di alterare le risposte dei consumatori ad uno specifico stimolo di marketing. Ad esempio, lo studio sperimentale di Lee (2010) mostra come un messaggio pubblicitario con intento persuasivo riesca ad indurre risposte cognitive (es., “perceived ad persuasiveness”) e attitudinali (es., “ad attitude”) nei soli utenti con BA ex-ante positiva (vs. utenti con BA ex-ante negativa). In modo simile, Jahng e Hong (2017) dimostrano come in situazioni di crisis communication, un tweet di scuse da parte del brand possa migliorare la corporate reputation e la purchase intention quando gli utenti hanno una BA ex-ante di intensità elevata, mentre l'effetto è significativamente inferiore se i consumatori mostrano bassi livelli di atteggiamento preesistente verso la marca.

Riguardo all'immersione percepita, il presente studio mette in evidenza per primo il ruolo di questa variabile nel condizionare la percezione del VR engagement multidimensionale e la varietà di risultati di branding ad esso connessi, contribuendo ad arricchire la letteratura accademica di marketing che, al meglio della conoscenza acquisita, ha individuato solo la “satisfaction with the VR experience” (Mütterlein et al., 2018), il “recall of information” (Shen et al., 2021) e la “continuance to usage VR devices” (Dehghani et al., 2022) quali conseguenti dell'immersione percepita in ambienti di marca basati su VR.

Parole chiave: metaverso; VR engagement; brand experience; brand results; brand attitude; immersion
