Dyadic Journeys: una prospettiva combinatoria sull'attivazione simultanea di consumatori e altri attori rilevanti nel processo d'acquisto

MARCO FRANCESCO MAZZÙ* MICHELE COSTABILE* AURORA PISANO[▲]

Inquadramento del lavoro. *Il concetto di customer decision journey ha assunto, nel corso del tempo, una sempre maggiore rilevanza teorica ed empirica. Si è, inoltre, progressivamente arricchito di importanti elementi concettuali rispetto ai primi rudimenti di definizione, che dai modelli classici sul processo d'acquisto (Kotler 1967, Howard and Sheth 1969) ha condotta a partire dagli anni 90 alla sua formalizzazione (Meyer e Schwager 2007) di maggiore risonanza manageriale (Court et al., 2009). L'evoluzione concettuale del modello, tuttavia, non si è di certo interrotta. La complessità dei cambiamenti nei processi decisionali di consumatori iper-connessi e immersi in contesti sociali sempre più articolati, si è a lungo focalizzata sul ruolo fondamentale attribuito agli attori che compongono il processo decisionale d'acquisto: il consumatore stesso, chi offre il prodotto/servizio e tutti coloro che, più o meno coinvolti nell'offerta del prodotto/servizio, il cliente incontra durante il proprio "viaggio" decisionale.*

Il presente lavoro introduce il concetto di dyadic journeys e contribuisce alla letteratura esistente investigando le implicazioni sul disegno e sulla gestione di decision journeys in mercati complessi, per natura dei beni scambiati, nei quali il comportamento del consumatore è fortemente influenzato dal ruolo di molteplici altri stakeholders. Sono mercati in cui lo scambio di valore avviene esclusivamente in presenza della piena attivazione di molteplici interazioni, e in particolare di alcune interazioni diadiche tra il cliente e l'agente esterno, erogatore di servizio e di raccomandazioni ad alto valore percepito. All'interno della diade, i due soggetti arrivano al momento decisionale provenienti da traiettorie spesso differenti, stimolate da azioni manageriali tra loro separate e spesso in capo a funzioni differenti, e si completa solo se entrambe le parti sono state opportunamente attivate nel momento del loro incontro. Tali relazioni, identificate all'interno di una rete o vissute come incontri indipendenti ed estemporanei, vengono approfondite prendendo l'esempio del settore farmaceutico e automotive. Viene quindi discussa la rilevanza manageriale che un'analisi di tutte le sfaccettature della dyadic journey può avere nel guidare il cliente verso l'obiettivo desiderato dell'azienda.

Inquadramento e Customer Journeys. *Negli ultimi decenni il concetto di consumer journey - o customer journey - è stato teoricamente ed empiricamente studiato e utilizzato in modo analitico e approfondito da ricercatori, accademici e practitioners (Tuenrat et al, 2021).*

I primi articoli accademici che nominano al loro interno termini quali customer journey (e i connessi touchpoints) risalgono agli anni 90 e la letteratura attuale ne conta più di 150 (Tuenrat et al, 2021). Nonostante, dunque, l'ontologia di questo costrutto sia relativamente recente, in realtà esso stesso si sta profondamente trasformando insieme ai cambiamenti che i consumatori apportano al proprio processo decisionale - consapevolmente o come una conseguenza delle mutazioni nell'ambiente che vivono.

La grande attenzione che il mondo scientifico e l'industria nel suo insieme ha riservato a tale tema è dovuta all'importanza che questo strumento ha dimostrato di avere nel dissezionare, amplificare e modellare l'esperienza del consumatore: poiché "ciò che le persone realmente desiderano non sono prodotti, ma esperienze soddisfacenti" (Abbot 1955, p.40), ciò risulta fondamentale per le aziende al fine di migliorare la customer experience e mantenere un importante vantaggio competitivo (Lemon e Verhoef, 2016).

Larga parte dei modelli empirici utilizzati si è per lungo tempo basata su approcci lineari, anche collegati alla scienza comportamentale, al modello AIDA (Attenzione-Interesse-Desiderio-Azione) (Vollrath e Villegas, 2021) e alla serie di passaggi sequenziali che i clienti compiono prima di arrivare alla decisione di acquisto (Perrey e Mazzù, 2011). I rapidi cambiamenti tecnologici e sociali e la proliferazione dei touchpoints hanno generato i presupposti per l'evoluzione dei tradizionali processi decisionali del consumatore (Giorgino e Mazzù, 2018). Nell'ultimo decennio, molti ricercatori hanno ampliato l'approccio tradizionale derivato dall'AIDA, verso modelli che enfatizzano l'importanza delle relazioni con i consumatori (McTigue, 2019). L'evoluzione deriva dall'osservazione che i consumatori non si limitano ad acquistare brand come transazioni isolate, ma li acquistano sulla base di una

percezione del valore formata dalla totalità delle proprie esperienze con il marchio (Edelman 2010). Questo aspetto, trascurato nei modelli derivati dall'AIDA, è incluso nel modello circolare del percorso decisionale del consumatore proposto Court et al. (2009). Nei nuovi Customer Decision Journeys (CDJ), il processo - dominato dalle interazioni digitali - implica la presenza di rilevanti fasi non lineari ed iterative, in cui i brand entrano ed escono dal decision-set (Court et al., 2009). Questo "processo decisionale e il modo in cui i consumatori ricercano, interagiscono, acquistano e interagiscono con prodotti e brand" (Court et al., 2009) evidenzia la sequenza che un cliente attraversa per accedere o utilizzare l'offerta di un'azienda, consente di analizzare il comportamento dei consumatori e di costruire prodotti ed esperienze differenziati in base alle esigenze e ai desideri del cliente. La nuova struttura del CDJ cambia profondamente la modalità con cui si forma il set competitivo nella mente dei consumatori, generando importanti conseguenze nell'utilizzo dei touch-points, nell'allocazione del budget e nella misurazione complessiva dell'efficacia delle azioni di marketing (Giorgino e Mazzù, 2018). Il ritorno economico, sociale e reputazionale ricercato dalle imprese nella loro interazione con i clienti, si collega quindi direttamente alla capacità di sviluppare e modellizzare Consumer Decision Journeys efficaci.

La rilevanza che questo tema ha assunto negli anni proviene anche dalla visione sempre più accettata e diffusa nell'accezione di marketing consumer-centric: si ritiene infatti che, il processo che porta il consumatore ad acquistare un prodotto o alla fruizione di un servizio si manifesti in un percorso complesso il quale, per poter essere compreso appieno e sfruttato efficacemente dalle aziende, deve vedere il consumatore al centro come attore protagonista di tale moto (Crosier e Handford, 2012). In questo contesto, un ruolo centrale è dato dalla comprensione della rilevanza e dell'influenza sviluppata dai vari stakeholders coinvolti nei journeys individuali del consumatore. L'intenso uso di dispositivi digitali permette infatti di aumentare considerevolmente la frequenza con cui i clienti sono esposti alle informazioni sulle diverse categorie ed in cui cercano o si confrontano con molteplici stakeholders. Questa continua interazione ed esposizione ai messaggi, ha un impatto fondamentale sulla durata, l'intensità e la sequenza delle fasi del processo decisionale del cliente e consente ai consumatori di modificare potenzialmente più volte opinioni e preferenze, fino all'ultimo momento prima dell'acquisto del prodotto.

Comprendere a fondo e mappare la customer journey è quindi un esercizio fondamentale per i marketers allo scopo di spostare la propria attenzione dall'offerta ai consumatori e di concentrare i propri sforzi su quei punti di contatto in cui massimizzare le proprie risorse per l'incontro con il cliente potenziale (Halvorsrud e Kvale, 2017). Il customer journey diventa il processo che intraprende il consumatore, dalla fase di preacquisto a quella di post acquisto (Rosenbaum et al, 2017), per accedere e fruire dell'offerta di un'azienda; descrive quindi tutti quei momenti in cui il consumatore e l'azienda stessa entrano in contatto (Fostald e Kvale, 2018). Il customer journey può essere quindi inteso come una "costellazione di touchpoints" (Halvorsrud e Kvale 2017, p.2), ovvero momenti o eventi in cui il consumatore e l'ente che offre il prodotto o il servizio entrano in comunicazione. Un touchpoint viene definito come tale se ad iniziare la comunicazione tra i due soggetti è il consumatore o l'azienda stessa, se l'incontro è circoscritto e delimitato nel tempo - anche se può essere asincrono - e se avviene tramite un canale scelto dal consumatore (Halvorsrud e Kvale 2017). Applicando il concetto di customer journey alla fornitura di servizi, emerge come il touchpoint non rappresenti esclusivamente l'incontro tra chi offre il servizio e chi ne fruisce, ma piuttosto che tale definizione si possa estendere anche all'evento di interazione e comunicazione tra il consumatore e qualunque altro attore che è rilevante all'offerta del servizio stesso (Zomerdijs and Voss, 2010). In particolare, l'avvento delle tecnologie ha profondamente cambiato il modo in cui i consumatori ricevono stimoli, prendono consapevolezza dei propri bisogni, reperiscono informazioni e quindi si imbarcano nel viaggio verso l'acquisto. Si sono moltiplicati i canali a disposizione e quindi anche le opportunità di incontro con gli attori fondamentali del processo (Flavian et al, 2019). Questi comportamenti causano la proliferazione di momenti in cui i consumatori "interagiscono con un marchio, prodotto o servizio, anche se da remoto, per formare o cambiare un'impressione su quel particolare marchio, prodotto o servizio, rispetto ai propri concorrenti" (c.d. moment of truth, Carlzon, 1987). L'ipotesi è che il successo di un prodotto/servizio riguardi la capacità di gestire le interazioni con i clienti del proprio brand nonché di generare un risultato positivo nelle interazioni più rilevanti, dove è necessario avere una performance superiore, per evitare che il consumatore possa prendere in considerazione prodotti/servizi alternativi. La presenza del digitale introduce cambiamenti rilevanti (es., gli Imagery moment of truth), dove la tecnologia permette di riprodurre nella mente del consumatore esperienze precedentemente basate su interazioni reali, con interazioni virtuali che danno forma a emozioni, esperienze e soddisfano bisogni che spesso si sovrappongono o si sostituiscono a quelli reali, con lo stesso livello di soddisfazione per i clienti finali (Giorgino e Mazzù, 2018).

Il nuovo customer journey ha quindi preso strutturalmente il posto del funnel tradizionale rendendo il processo molto più fluido, ma anche cronologicamente più diversificato (Grenwal e Roggeveen, 2020). In un sistema già di suo complesso, inclusivo di un grande numero di attori che entrano in contatto con mezzi diversi e in diversi luoghi e tempi, l'avvento delle tecnologie frammenta ancor di più la customer journey spargendo i vari touchpoints che la compongono tra i molti canali, le tante piattaforme e i differenti media disponibili (Varnali, 2019). I consumatori non seguono più una linearità nel processo decisionale ma piuttosto saltano da un incontro all'altro entrando e riuscendo dalla journey e creando delle scorciatoie al suo interno (Lemon e Verhoef, 2016). Questa maggior flessibilità complica inevitabilmente il processo di channel management delle aziende (van der Veen e van Ossensbruggen, 2015). In sintesi, il nuovo Customer Decision Journey tiene conto della complessità del nuovo contesto, fatto di un numero crescente di momenti della verità e di un proliferare di touchpoint e bisogni dei clienti, in cui i responsabili del marketing sono tenuti a migliorare le proprie competenze per padroneggiare il processo decisionale in una situazione iterativa, non lineare e ciclica.

Per questo motivo, la crescente complessità dei decision journeys, specialmente in alcuni settori, rende ad oggi difficile un'appropriata mappatura nel processo di acquisto che il consumatore intraprende per soddisfare i propri bisogni. Ciò avviene maggiormente in talune industrie in cui per quantitativo di attori coinvolti, di accessibilità al prodotto o servizio, di molteplici canali di informazioni, per la rilevanza della decisione presa, ma anche per la complessità dovuta all'attenzione delle istituzioni e della normativa, una customer journey più tradizionale diventa anacronistica. In particolare, in settori in cui la transazione di valore finale viene attivata esclusivamente in presenza di interazioni diadiche tra il consumatore ed un professionista esterno, erogatore di raccomandazioni che presentano un elevato impatto economico o emozionale sulla vita del consumatore. L'interazione diadica tra un fornitore di servizi e un cliente è un fattore determinante nella soddisfazione del cliente per il servizio (Solomon, 1985).

Sulla base della teoria dei ruoli e connesso alle componenti critiche dei service encounters, questo lavoro vuole quindi fornire una prima analisi introduttiva della modellizzazione e rilevanza dei dyadic journeys e delle conseguenti interazioni in ambiti ad elevata rilevanza personale della raccomandazione effettuata dall'erogatore del servizio, come ad esempio avviene nel settore farmaceutico e dell'automotive.

In questo contesto, tra i nodi propri della customer journey caratterizzati da maggior complessità, vi è il cosiddetto service encounter: abbracciandone una più ampia visione, si potrebbe definire come un incontro inserito all'interno di una serie di scambi ed interazioni in un periodo di tempo ampio che avvengono tra il consumatore e i diversi attori che contribuiscono all'esperienza stessa. Difatti, analizzare il solo incontro tra l'offerente del servizio e il consumatore finale rischia di non tenere in considerazione tutte quelle interazioni che inevitabilmente influiscono su questo scambio e sull'andamento della journey in senso più ampio. Osservando questi incontri dal punto di vista del consumatore, tutti gli attori che fanno parte della journey e che contribuiscono all'offerta del servizio sono in realtà collegati tra di loro anche se il consumatore finale ci interagisce in modo indipendente: nasce così il concetto di service delivery network (SDN), definito come "due o più organizzazioni che agli occhi del consumatore sono responsabili di provvedere ad un servizio interconnesso" (Tax et al. 2013, 455). La relazione tra i vari attori che fanno parte di questo network e l'interazione con il consumatore, comportano una vera e propria co-creazione di valore che vede il consumatore finale non più come recipiente e destinatario passivo del messaggio e dell'offerta del servizio, ma come personaggio attivo e propositivo nella creazione di valore per se stesso e per il network (Varnali, 2019). Quanto efficacemente il consumatore riuscirà a partecipare attivamente alla co-creazione collaborativa e inter-relazionale di valore all'interno del network dipenderà dalla sua percezione di familiarità e affidabilità del servizio (Tax et al., 2013).

La moltitudine di figure all'interno della journey del consumatore priva l'azienda di una porzione di controllo sul processo decisionale del potenziale cliente, ma non la deresponsabilizza: diventa infatti compito dell'azienda stessa fornire a tutti gli attori presenti nel SDN gli appropriati strumenti per accompagnare il consumatore nel suo viaggio all'acquisto (Barile et al., 2017). Poiché un SDN è come un sistema autopoietico, ossia un apparato dove ciò che accade in ciascun touchpoint contribuisce alla produzione di valore o alla trasformazione negli altri nodi focali della journey (Varnali, 2019), analizzare i dyadic journeys e inserire le più tradizionali relazioni diadiche tra consumatore e offerente all'interno del network, permette di avere una più ampia visione e più approfondita conoscenza di tutte le forze che effettivamente influenzano il consumatore durante il proprio journey. Tra le dimensioni che caratterizzano i service delivery networks, è presente il grado di libertà che il consumatore ha nella scelta dei providers, e la complessità dell'offerta del servizio (Tax et al., 2013).

Oltre ai diversi stakeholders che fanno parte del processo decisionale del consumatore, ci sono altre figure che possono condizionarlo anche non facendo parte del network di servizi: infatti, spesso le decisioni d'acquisto non avvengono in solitaria, ma piuttosto il consumatore si lascia influenzare da relazioni sociali ad oggi ancor più facilitate dalla tecnologia. Hamilton et al. (2020) definiscono questi ulteriori ed importanti attori "travel companions", ossia coloro che interagiscono con il consumatore durante una o più fasi della sua customer journey che ha quindi una natura estremamente interattiva. L'avvento dell'Internet of Things e dei social media accorcia le distanze e facilita l'influenza di quei compagni di viaggio che potrebbero sembrare più fisicamente distanti e quindi impossibilitati dall'esercitare potere sulla scelta del consumatore: in realtà la suggestione c'è ed è bidirezionale. Talvolta l'influenza è tale poiché la decisione d'acquisto riguarda direttamente anche il travel companion: in quel caso si tratta di una vera e propria joint journey, come tra due partner che devono acquistare un'automobile familiare o nel caso in cui uno dei due sia potenzialmente esposto ad un problema di salute.

È sempre bene ricordare, ancor di più nei casi di processi congiunti, ma in generale in tutti quei percorsi che prevedono l'interazione tra più attori, che questi ultimi possono tra loro riportare diversi livelli di esperienza, competenza, coinvolgimento, empatia e preferenza, creando asimmetrie nel processo decisionale (Burns e Granbois, 1977). Persino la percezione di influenza differisce tra gli attori: infatti, nei processi decisionali congiunti che prevedono un'interazione tra professionista e cliente, è il cliente a percepire di avere un maggior ascendente sulla scelta rispetto a quanto il professionista crede che il cliente stesso abbia (White e Johnson, 2001).

I nuovi processi decisionali, caratterizzati da forti interconnessioni - si parla in questi casi di concatenazione di diversi customer decision journey (Giorgino e Mazzù, 2018)-, ci porta a ipotizzare che in alcune categorie di prodotto, i decision journeys possano essere modellizzati in maniera appropriata solo a fronte della comprensione delle interazioni diadiche tra consumatore ed erogatore della raccomandazione nel momento della loro interazione.

Applicazioni empiriche e implicazioni manageriali. *La complessità e la moltitudine di attori coinvolti in determinati settori impedisce di costruire una customer journey lineare e più tradizionale, incoraggiando invece un percorso più articolato.*

Nel settore farmaceutico, in cui il prodotto deve essere prescritto da un professionista sanitario spesso non coinvolto nell'azienda che propone il farmaco o la cura, la relazione medico-paziente ricompre un grande ruolo nel processo decisionale. Questo comporta che le peculiarità dell'interazione tra i due, hanno un grande impatto sulla scelta finale e per tale motivo è necessario approfondirle. Infatti, è stato dimostrato come la fiducia nella relazione interpersonale tra medico/paziente può portare a significativi miglioramenti nella salute generale del paziente (Petrocchi et al., 2019). Tale fiducia non è scontata nella natura della relazione, ma piuttosto viene costruita nel rapporto e può essere agevolata grazie a una convergenza tra le percezioni che paziente e medico hanno della relazione stessa (Petrocchi et al., 2019). In questo caso le asimmetrie sono evidenti: i medici hanno una consapevolezza diversa di sé e delle proprie capacità comunicative rispetto alla percezione che ne hanno i clienti: si vedono come individui singoli e diversi gli uni dagli altri, credono di comportarsi in modo ragionevolmente simile da un paziente all'altro - mentre i pazienti hanno percezioni molto diverse tra di loro rispetto allo stesso medico e tendono a vederli più o meno similmente (Kenny et al., 2010). Ciononostante, nessuno delle due parti si concentra durante la propria capacità comunicativa durante l'incontro: il paziente cerca di dare voce alle proprie difficoltà, mentre il medico si concentra sulla diagnosi creando una divergenza tra i due (DePaulo et al., 1987).

Il medico, che fa parte di un service delivery network, viene inevitabilmente influenzato dal resto della rete - assicurazione sanitaria, case farmaceutiche, altri professionisti specialisti, medici di base ecc. (Tax et al., 2013): questi fattori, insieme a quelli menzionati prima, hanno un impatto sull'esperienza del consumatore e quindi a guidare la sua journey. Tali interazioni dovrebbero dunque essere esplorate per segmento alla luce delle aspettative e dell'angolo di riduzione del peso per differenti tipologie di prescrittori.

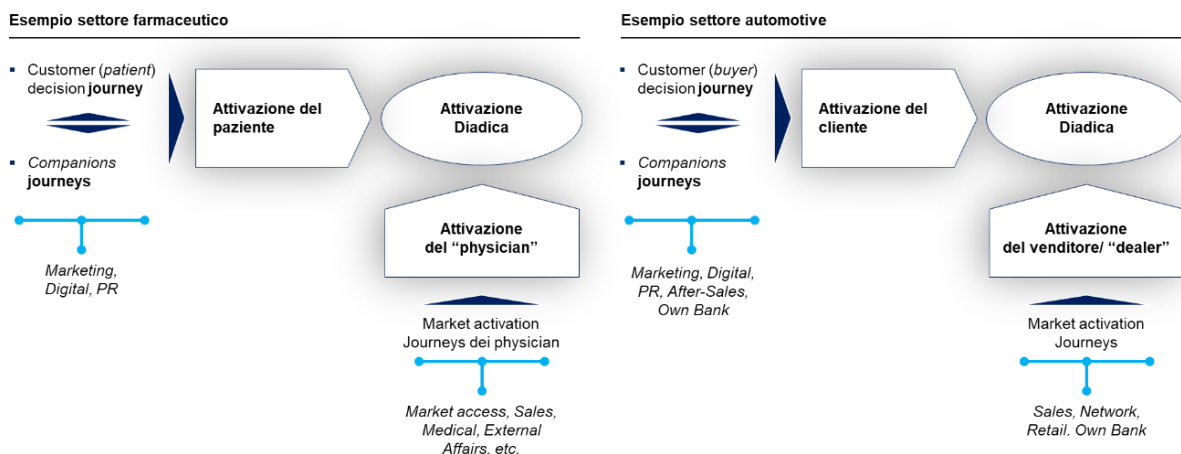

In particolare, un'attivazione diadica che risulti positiva nella generazione di valore per entrambe le parti, si deve concentrare sulla contemporaneità generata dalla doppia attivazione di due journeys differenti: da una parte il paziente e dall'altra il professionista. In questo contesto, nel caso i journeys del paziente e del medico non arrivino contemporaneamente all'attivazione nel momento del loro incontro, si generano limitazione all'attivazione diadica.

In un primo caso, possiamo osservare la casistica del paziente che si reca dal medico avendo già completato un processo di active evaluation delle alternative a disposizione, e con una propria chiara opinione su quale sia la cura migliore da seguire. In tal caso, il paziente si aspetta che il prescrittore fornisca la cura attesa; tale medico, nel momento dell'incontro/visita deve però aver già completato un processo che lo porta a considerare la raccomandazione implicitamente suggerita dal paziente, come valida alternativa perseguibile dal punto di vista professionale. In caso contrario, il medico fornirà una raccomandazione differente da quella attesa dal paziente (e dal suo network di companions), che potrebbe non essere seguita dal paziente, che andrà quindi in cerca di ulteriori raccomandazioni che possano confermare le aspettative proprie e del suo network di stakeholders. In questo caso, l'attivazione del paziente è stata completata da parte dell'azienda, tramite la corretta gestione dei touchpoint rilevanti nel customer journey, ma non è stata completata l'attivazione sul medico da parte dei journey collegati al modello di go-to-market dell'azienda stessa.

Un secondo caso, complementare, è rappresentato dal medico che è stato opportunamente stimolato dal sistema tradizionale di market activation in ambito farmaceutico, ed è quindi pronto a raccomandare una certa tipologia di cura a fronte di solide evidenze scientifiche, che incontra un paziente (ed indirettamente il suo network di companions) non attivato. In tale caso, la raccomandazione fornita da parte del prescriber potrebbe non essere pienamente seguita e accettata da parte del paziente, generando ad esempio dubbi e una minore aderenza alla terapia inferiore rispetto agli standard desiderati.

Nel caso in cui, nel momento dell'incontro, quindi, entrambe le parti che giungono all'incontro da journeys differenti, non siano pienamente attivate, non si completerà la transazione di valore: il prescrittore darà infatti una raccomandazione che potrebbe non essere seguita dal paziente o scoraggiata dal suo network di companions (Figura 1).

Fig. 1: Il modello di attivazione diadica - Esempi

In maniera simile, nel settore automotive, il journey di un consumatore passa prevalentemente tramite due canali: la distribuzione centrale che tramite le funzioni vendita, o decentrata che avviene tramite dealer autorizzati stadi (Diez 2012). La figura del dealer diventa dunque fondamentale all'interno del network di offerta dell'azienda, nelle fasi di configurazione, consultazione, test drive, negoziazione e conclusione del contratto (Bacher e Manowicz, 2020). In questo caso, l'attivazione diadica avviene gestendo opportunamente l'incontro tra due journeys: quello del cliente che arriva alla scelta e quello del venditore che deve essere pronto - e con gli strumenti opportuni - a guidare in maniera opportuna la chiusura della negoziazione. In questo settore, nonostante il processo si stia sempre più digitalizzando negli anni e i diversi touchpoint si spostano sempre più online, la relazione diadica tra consumatore e "agente" continua ad avere un'importanza rilevante per indagare il processo d'acquisto del settore. Ulteriori spunti suggeriscono come, grazie all'intelligenza artificiale, l'avvento di agenti virtuali nel settore possa modificare il panorama, ma non l'importanza di questa figura all'interno del processo decisionale del consumatore (Bleicher, 2022). La digitalizzazione ha però modificato il processo e il modo in cui i due attori principali si relazionano tra loro nelle diverse fasi: di fatto, le informazioni riguardo le automobili che suscitano l'interesse del consumatore, sono molto più facilmente e velocemente reperibili di prima e i consumatori stessi le utilizzano per portarsi avanti nel processo decisionale (MillwardBrown Digital 2013). Ciò diminuisce l'asimmetria di informazioni tra il consumatore e l'agente, ma al tempo stesso muta le aspettative della relazione tra i due (Bauer, 2018).

Diventa quindi fondamentale analizzare e comprendere l'effettiva journey del consumatore dall'insorgenza del bisogno alla fase di post-acquisto e fidelizzazione tenendo in considerazione la moltitudine di fattori che ne entrano in relazione e la influenza diventa fondamentale in settori di complessità intrinseca e crescente quali quelli analizzati. Poter cogliere questi articolati processi e saperli interpretare, può essere molto utile per utilizzarli a proprio vantaggio. Un'approfondita conoscenza della customer journey del consumatore, dei suoi companion, dei SDN e degli altri fattori che contribuiscono ad essa può infatti portare a evidenti miglioramenti nella gestione della qualità dei servizi e del fallimento dei servizi stessi, nella relazione con il cliente, nell'orientamento dell'offerta e nel design del processo (Tax et al., 2013). Più in generale, una customer journey in cui il consumatore viene messo al centro in ogni touchpoint e le relazioni che vive in questi punti d'incontro vengono ottimizzate per soddisfare i suoi bisogni, contribuiscono a una migliore esperienza e quindi a una maggiore soddisfazione del cliente (Lemon e Verhoef, 2016) nel caso in cui vengano rivisitate e pianificate in ottica diadica.

Originalità del paper, limitazioni e sviluppi futuri. Questa ricerca contribuisce alla letteratura esistente in due modi. In primo luogo, introduce in concetto di dyadic journey, fondamentale nello sviluppo teorico ed empirico in alcuni settori in cui i due soggetti centrali responsabili della transazione di valore consumatore-azienda arrivano nel momento decisionale provenienti da traiettorie differenti, stimolate da azioni manageriali separate, basate su journeys differenti e spesso in capo a funzioni differenti, e si completa solo se entrambe le parti sono state opportunamente attivate nel momento del loro incontro. In secondo luogo fornisce una prima base per collegare i concetti di decision journey con i service delivery networks, migliorando la comprensione degli elementi situazionali di non attivazione dei customers.

Opportunità per ricerche future potrebbero prevedere, oltre all'analisi delle customer journey in settori alternativi, la verifica empirica di come tali asimmetrie tra i due attori possano essere appianate e la divergenza di percezione diminuita fino a giungere a un cronologicamente contestuale consenso di intenti.

Art and Business for Social Innovation: the case of *Magnifico!*

DANIELA CAVALLO* ROSSELLA BARATTA• MARTINA CAVALLARIN^ ANTONIO CARUSO**

Framing of the research. *Given the urgency and relevance of the Sustainable Development Goals of Agenda 2030 (UN, 2015), contemporary society is witnessing the growing importance of associating traditional economic indicators with broader indicators that also take into account the environmental and social dimensions of value.*

In this regard, social innovation is a concept that has gained much prominence in recent years and has gained increasing attention from researchers and practitioners (Oeij et al., 2019). One of the most widely accepted definitions in the literature is one that describes it as “an innovative solution to a social problem that is more effective, efficient, sustainable or just than existing solutions and for which the value created is primarily for society as a whole rather than for individuals” (Phills et al., 2008, p. 36). Similarly, the Organization for Economic Cooperation and Development defines social innovation as “the design and implementation of new solutions involving conceptual, process, product or organizational change, with the ultimate goal of improving the well-being of individuals and communities” (OECD, 2022, p. 20). Social innovation, therefore, not only supports business innovation, but simultaneously creates well-being and enhances the quality of life of individuals, territories, and communities. Like traditional innovation, understood in the technological sense, social innovation also supports and fosters the competitiveness of firms, but it differs from it in that the innovation process is not only aimed at creating economic value, but also at creating new social structures and generating lasting change at the system level (Zahra et al., 2009; Phillips et al., 2017; Solis-Navarrete et al., 2021). The profit generated by social innovation is not an end in itself but becomes a means for the creation of social value (Zahra et al., 2009). In this sense, social innovation represents an immensely unexploited opportunity for businesses (Phillips et al., 2015).

The process leading to the generation of social change is similar to the traditional innovation process; thus, it starts with the recognition of an entrepreneurial opportunity, which is evaluated and subsequently implemented (Kickul and Lyon, 2020; Oeij et al., 2019) and yet ends with the diffusion of change at the system level (João-Roland and Granados, 2020). In addition, the potential of the entrepreneurial opportunity is understood and evaluated as both the potential for economic value generation and social value generation (Kickul and Lyon, 2020). Thus, the product of social innovation must necessarily address social problems and needs currently unmet by existing solutions and must also benefit traditionally excluded or marginalized groups (Gasparin et al., 2021). Finally, social innovation, at all stages of the process, cannot ignore the role of relationships and networks (Phillips et al., 2015; 2017; Mion et al., 2022). The network in which the social innovator is embedded provides a better understanding of currently unmet needs, ensures greater access to resources, and the subsequent transfer of these resources. Finally, the network allows for social change to be diffused and disseminated throughout the territory and community, and for the social value generated to benefit the many different stakeholders involved (Moore and Westley, 2011; Phillips et al., 2017). In this regard, the literature has also emphasized that diversity is a strength in social innovation, and that the network should certainly include other social innovators or social entrepreneurs, but it cannot disregard the involvement of other firms, professional figures, institutional actors, the community, and the territory where the innovation and social change take place (Phillips et al., 2015; Mion et al., 2022).

Despite being little explored, the relationship between social innovation and art can be profitable in involving businesses in the creation of social well-being. The mission of art operating in business is not only to create value for the enterprise, it is above all to create forms of interaction that have their central value in art-based interventions for the benefit of a social community that does not necessarily revolve around the enterprise itself.

Art in Business has multiple implications, or “roles”, from the economic one, played mainly in galleries and the art market, to the aesthetical, but also organizational, inspirational and innovative, social and ethical, experiential (Darsø,

2004; Knell, 2004; Hagtvædt and Patrick, 2008; Gilmore and Pine, 2009; Berthoin et al., 2015). When art enters the enterprise system according to the so-called aesthetic-inspired discourse (Berthoin et al., 2015), it approaches social innovation due to its nature to lead the enterprise beyond its branding and profit interests and its endemic openness to the social benefit of the enterprise's role.

Strategies to include Art in Business are characterized in increasingly stable and long-term art-based partnerships (McNicholas, 2004; Lewandowska, 2016). However, they still clash with a business model that tends to conceive art as an ancillary tool. Indeed, the relationship between Art and Business is characterized by the complex interrelation of creativity, innovation, authenticity, and values, which are often instrumental in achieving business objectives, from business performance to corporate image (Bourdieu and Haacke, 1995; McNicholas 2004; Pelzer, 2006; Hagtvædt and Patrick, 2008; Schiuma and Carlucci 2018). Therefore, apart from the wide variety of Art in Business engagement models, which can range from patronage, sponsorship, collaboration, CSR to Social Alliance, it is essential to focus on the approach adopted by the enterprise prior to the artistic collaboration, as it often simply adapts to the business model based on management needs, its performance metric, organizational culture and decision-making style (Cook and Weinstein, 2011). That which Lotte Darsø (2004) refers to as the "industrial paradigm", a condition whereby the business is not able to replace the command-and-control approach that defines the processes in the industrial economy of goods and services, even when its product is knowledge, service or experience. The intention is not to condemn a strategy that includes a competitive advantage for the enterprise, as the process always stems from the recognition of a business opportunity. Nevertheless, it is necessary for it to understand the importance of freedom of artistic expression to avoid artistic intervention being forcibly programmed on the basis of conventional business needs. The risk is that of fueling a one-sided view of the relationship between Art and Business, which in this case risks mystifying artistic content to a mere commercial operation (Bourdieu and Haacke, 1995; Pelzer, 2006). It is precisely social innovation that operates this shift. In fact, social innovation approach does not conform, but rather expands the business model. It aspires to effect a deeper change that does not derive from the business's nature, instead influencing its vision and mission for the real benefit of the context.

Therefore, it is crucial to distinguish between the business conception of creativity and the authentic artistic creation (Darsø, 2004). Affine with social innovation, the latter goes beyond the results expected by the enterprise and, to some extent, beyond its interests, as it derives from the intervention carried out by the artist on the basis of suggestions, inspiration, personal research and deepening of the project and context, to which the enterprise must allow itself to be led. Social innovation emphasizes the importance of Art and Business processes as the effective part in developing entrepreneurial interventions within the social context. Without such a strategic vision, the Art and Business project would not work. In fact, in the absence of social change processes, such as cross-sectoral involvement and dialogue, sharing of resources, exchange of expertise and skills etc., the artistic product would be "withered" too, showing only the commercial product of the enterprise - reverting to the business conception of creativity. In both cases, the benefits may be difficult to immediately translate into managerial terms, except at the level of justification of expenditures, which focuses on the profit between revenue and results. It is social innovation that strategizes this relationship, encouraging the involvement of the management organization in the operation to enrich the assessment of expected results with holistic factors that go beyond technical performance indicators, solving the dilemma that "not everything that can be counted counts, and not everything that counts can be counted" (Antal et al., 2015). This is essential to overcome the "industrial paradigm" and initiate a process of sense making, an alternative value system underpinning a new business culture (Qualizza et al., 2019).

Purpose of the paper. Considering previous literature, this research aims to explore the link between Art and Business for social innovation and shared value creation.

Italy is a country where art and artistic heritage certainly contribute to the generation of economic value, constituting more than 17 percent of the national GDP (Nomisma, 2021; Nethex, 2021). Art and Business strategy canalizes energies and skills in the territory through the transversal work of the artist and their ability to consider situations, urgencies and contingent needs, which find the epiphany in the artwork and can elevate collective sensitivity by generating a bridge of positive actions (Cavallarin, 2021). The core business of the wellbeing economy is precisely that of creating value and appropriate forms, and no one knows more about the processes for doing that than artists (Adler, 2006). Art raises questions without providing certain answers, but it always responds to certain needs, a basic prerogative of social innovation. As David Glassberg (2001) states "[a]rtists and writers have the power to make places for others, to transform otherwise ordinary environments into "storied" places".

Empowered by the support of the enterprise, art is able to "transform the ordinary" to the benefit of the enterprise itself, in accordance with multiple implications it has in business - economic, aesthetic, organizational, innovative, inspirational, ethical. It fosters creative innovation; it creates image return, brand reputation and value enhancement, producing new market value; it brings organizational well-being in terms of learning and performance; it conveys well-being deriving from the aesthetic and ethical implications of the artwork etc.

Moreover, set within the dynamics of social innovation strategy, art enables to combine these enterprise's perspectives of interest with the community's needs, fostering a transformative process in the context as well, through its action. This is because Art in Business works primarily as an experience-based process that involves and engages people, as it "tends to meet different needs that are subjective, idiosyncratic, context-specific and time-related" (Schiuma e Carlucci, 2015). Therefore, artistic interventions enable the site to be reinvented as "the town square for informed exchanged ideas" (Black and Farley, 2020). This concept, developed by Hilde Hein, concerns the relationship between

art and cultural heritage, yet it can be applied to the relationship between Art and Business as well, since it is focused on the process of engaging the social context prior to the tangible enhancement.

However, it is equally unclear how this value can be generated outside of the Cultural and Creative Industries (Tricarico et al., 2020). Moreover, it is unclear how this economic value can be considered as a means rather than an end for the creation of social value (Zahra et al., 2009) from which the territory and society can benefit. Ultimately, the role of art and culture as catalysts for territorial development remains little explored due to the complexity of measuring the outputs generated, while the definition of the intersection between art, culture, cultural heritage on the one hand and social innovation on the other hand remains open and uncertain (Tricarico et al., 2020).

Furthermore, the great variety of actions, models, and projects that can be adopted according to stakeholders, context, and characteristics of which the process of social innovation within the business project is precisely the common denominator should be clarified.

To fill this gap in literature and practice, the research aims to present a model of social innovation, defined as “the design and implementation of new solutions involving conceptual, process, product or organizational change, with the ultimate goal of improving the well-being of individuals and communities” (OECD, 2022, p. 20). The aim of the research is therefore to explore how the link between Art and Business generates social change and how it enables the co-creation of both economic value for enterprises and social value for the territory and the community. Precisely, the study aims to answer the Research Question:

RQ: How do Art and Business together create social innovation and shared value?

Methodology. To answer the research question and explore the ways in which Art and Business create social innovation and shared value, a qualitative approach was adopted. The qualitative approach is considered appropriate for exploratory research (Saunders et al., 2009), as it allows for in-depth exploration of a social phenomenon and the collection of data in their natural state, without manipulation or intervention during the process (Corbin and Strauss, 2015). Specifically, a multiple case study was adopted (Yin, 2003) and 43 Italian firms were selected as the unit of analysis. In selecting the firms, a purposive sampling approach (Patton, 2002) was adopted, which consists of selecting “information-rich” cases that best answer the research questions and present themselves as good examples of the phenomenon of interest. Firms then, varying in size, location, and industry, were selected for the initiatives and activities they had put in place aimed at enhancing the link between Art and Business. Each case was then documented in detail, and each initiative was subjected to a SWOT analysis. SWOT analysis is a strategic planning tool, which consists of systemizing the strengths, weaknesses, opportunities and threats of an enterprise or project. Also given its relative ease of use, SWOT is a frequently used planning tool in both scientific literature and management practice by enterprises (Helms and Nixon, 2010). Subsequently, the SWOT matrices of the different initiatives to enhance the Art and Business link were analyzed through a thematic content analysis (Miles et al., 2014), aimed at identifying the common traits among the different projects, mapping the different lines of intervention that constitute the process of social innovation based on the Art and Business link, and systematizing the areas where shared value, both economic and social, is created.

The data analysis thus made it possible to develop a best-practice model of social innovation, where the link between Art and Business enables the generation of social value addressing the needs not met by the existing system.

Results. Results enabled to answer the Research Question of the study and enabled the development of a best-practice model where Art and Business jointly bring economic and social value, namely the *Magnifico* project! Specifically, the results made it possible to:

- a) Identify 9 lines of intervention through which the social innovation process is developed;
- b) Identify 4 areas where shared value is co-created and generated.

There are 9 lines of intervention that enable the link between Art and Business to bring social innovation and shared value, as depicted in Figure 1.

1. Patronage

The enterprise offers its economic, financial or technical and fabril support to artistic, cultural or social interventions. Prerogative of such intervention, for the purpose of developing an adequate process, is the identification of the enterprise with the vision and values promoted by the initiative, to which are added the benefits in terms of advertisement and brand reputation.

2. Art in the factory

The enterprise provides space and/or technical knowledge. It can make a more or less direct contribution to the creation of the artwork - even depending on its core business - in which employees and collaborators can participate, and the results are exhibited to external visitors too. Moreover, the enterprise can place such works of art on its headquarters, which has a positive impact on human well-being and productivity. Finally, the enterprise can use art to create unique, handcrafted and customized products with greater added value and ethics than those offered by competitors.

3. Generation of value in the territory

The enterprise actively operates as a major player in its home territory by recognizing, preserving and enhancing its identity through projects that generate lasting benefits and create well-being in terms of community quality of life, following the Anglo-Saxon concept of give back.

4. Art awards

The company periodically presents an award to the artists who best interacted with and interpret its values, mission and vision.

5. Creation of new artworks (urban regeneration)

The enterprise takes part in initiatives to promote sustainable development and/or urban regeneration projects through the creation of art installations, the development of infrastructure or the redevelopment of specific areas through bottom-up public and participatory art projects.

6. Commissioning/Artistic Consultancy

The enterprise develops a partnership, sometimes exclusive, with the artist whose work it is commissioning. In other cases, it is the enterprise itself that offers art commissioning and consulting services, recognizing art as an important source of business.

7. Creation of shared art venues

The enterprise contributes to create spaces available to the community, in which art and culture prompt encounters, dialogue, and innovation. Such shared spaces can be restored urban areas, the corporate headquarters itself or that of a foundation that the enterprise decides to open.

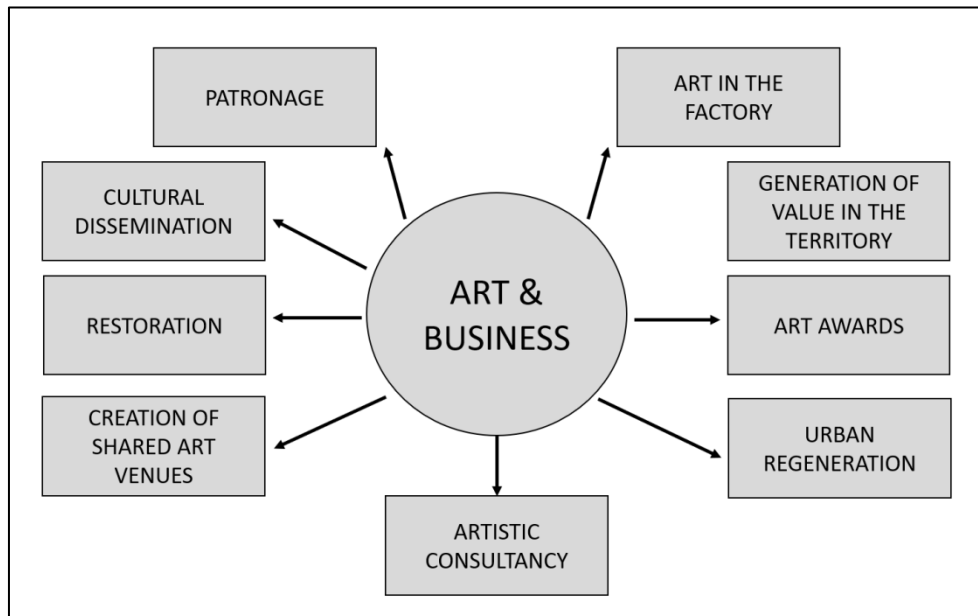

8. Restoration

The company financially and/or technically supports the restoration of monuments of great historical, artistic, architectural and/or cultural value for its home territory or nationwide. The choice regarding the monument to be restored can be made internally within the company or as a result of user consultation on dedicated platforms.

9. Cultural dissemination

The enterprise undertakes initiatives or actively supports some cultural dissemination projects. The spaces used for this type of activity are often the company's own headquarters or a foundation opened by the company.

Fig. 1: Lines of intervention

Source: authors' adaptation on *Magnifico! All the Good of Italy* by PG&W, Daniela Cavallo and Jacopo Ghidini for Fondazione Accademia Carrara.

The output of the social innovation process triggered by the link between Art and Business is the co-creation of value in the following 4 areas (reported in Figure 2): Business; Workplace; Territory; Society.

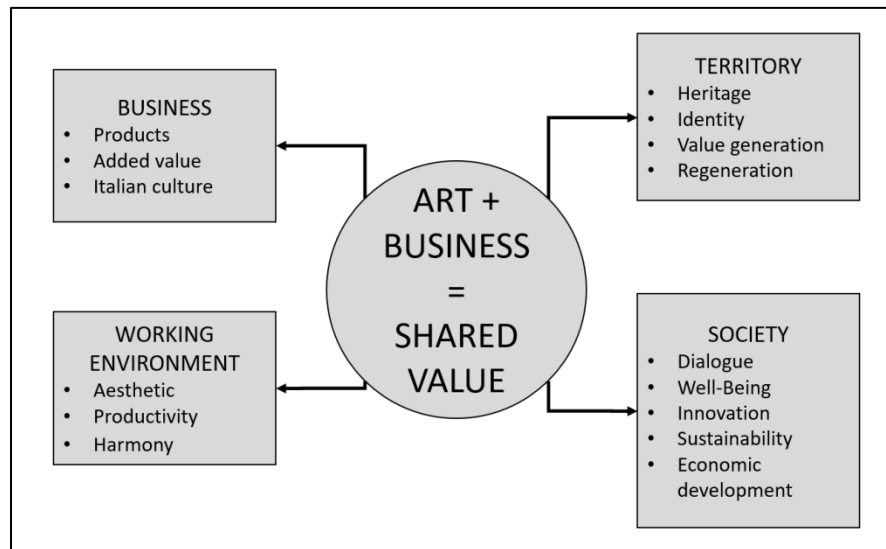

Business: Art and Business link primarily generates economic value for the enterprise itself, enhancing its brand identity, its connection with the territory, and its local roots, allowing the valorization of the made-in-Italy also on an international competitive context. Social innovation thus supports the competitiveness of innovative enterprises.

Workplace: Art and Business link improves the quality of the working environment, including but not exclusively from an aesthetic perspective, and thus increases organizational well-being, as well as the productivity of employees and collaborators. Social innovation thus fosters change in an ethical and human sense, improving the work environment, and in an indirect way it promotes enterprise competitiveness.

Territory: Art and Business link expresses in non-market strategies and policies too, and thus in the concrete enhancement of the territory, identity, and local roots, thanks to public and participatory art projects, cultural regeneration, and through the recovery of the territory's cultural heritage. Social innovation involves the local and territorial productive fabric, fostering inclusivity and strengthening local identity values, generating change in relations between different stakeholders in the territory.

Society: Art and Business link expresses in non-market strategies and policies, thus overcoming the traditional limits of measuring wealth through new indicators of well-being. In this regard, social innovation fosters the implementation of ethical and sustainable actions that improve sustainability, quality of life and the Well-Being of the local community.

Fig. 2: Shared value co-creation

Source: authors' adaptation on *Magnifico! All the Good of Italy* by PG&W, Daniela Cavallo and Jacopo Ghidini for Fondazione Accademia Carrara.

Given the lines of intervention and the areas of value generation, it is possible to elaborate a social innovation model based on the link between Art and Business, namely the *Magnifico!* project.

Magnifico! is a project inspired by the figure of “Lorenzo the Magnificent” and was created at the behest of the Fondazione Accademia Carrara, the foundation responsible for managing the artistic and cultural heritage of the homonymous art gallery in the city of Bergamo (Northern Italy). *Magnifico!* aims to create a new paradigm in the relationship between Art and Business, with tangible and measurable benefits for both. *Magnifico!* systematizes the network of relationships, skills, knowledge, and good practices implemented by innovative enterprises, with the ultimate goal of disseminating them on a national scale (João-Roland and Granados, 2020).

In this sense, *Magnifico!* is framed as a model of social innovation based on the link between Art and Business since it transcends the traditional concept of beauty, promotes Well-Being, leads to real change in the social and relational structures of the system (Phillips et al., 2017), and responds to currently unmet social needs (Phillips et al., 2008).

Magnifico! is the entity that monitors, protects, and promotes the best practices of the social innovation process and makes it possible that the value co-created by the Art and Business link is not only economic value but also social value (Zahra et al., 2009).

In addition, *Magnifico!* makes it possible for the creation of social and shared value to be participatory and accessible to even the most marginal stakeholders (Gasparin et al., 2021), such as small businesses, micro-enterprises, and artisans. In line with the social innovation process, it is the entire relational network of the territorial system that leads to the co-creation of value (Phillips et al., 2015).

Research limitations. The research has some limitations. In particular, the composition of the “pilot” sample has some limitations both in terms of numerosity and representativeness of the population. As the present research is still a work in progress, future steps will need to expand the unit of analysis and involve more examples where the link between Art and Business leads to the generation of social innovation and shared value. The research will also need to broaden the sample to encourage comparison and involvement of enterprises and deepen the knowledge of needs currently unmet by the existing system, so as to guide future developments of the *Magnifico!* project based on perceived problems and opportunities. Moreover, given the important role of the relational network in fostering social innovation in all its stages, from the recognition of the opportunity to the diffusion of the Innovation, the *Magnifico!* project will certainly need to extend the involvement to not only corporate but also institutional stakeholders, also with the aim of enhancing diversity.

Managerial implications. The research has important practical implications for enterprises and entrepreneurs. Given that the link between Art and Business generates value first and foremost from an economic standpoint, it is crucial for enterprises to invest in Art and Business. Second, the Art and Business link also supports business competitiveness indirectly by improving the organizational environment and thus increasing employee productivity. Similarly, Art enables businesses to expand their relational capital (Phillips et al., 2015; 2017), increasing their trust and reputation.

Art can and must be considered for all intents and purposes as a resource to be leveraged (leverage), such as through supporting the creation of artworks, organizing events, collaborations, or consultancies.

*On a management development strategy basis, the Art and Business project works on several levels. The project itself generates change by fostering new insights, recover and re-elaborate the contents present in the territory, adopting a transformative approach. If the project is reiterated, it can regenerate the context, changing its prerogatives, fostering widespread creativity to the point of creating new activities and business opportunities. Additionally, it prevents the so-called “intervention fatigue”, when communities get tired of outsiders coming in for short-term projects and then leaving (Breen 2020). Finally, it does not merely “artificate” the business product, instead it initiates a process centered on the existing activity while connected to a more progressive and relational *modus operandi*, contributing to the creation of new spirit of place (Markevičienė, 2012).*

On the long term, the project fosters a true system change, which is always to be understood as a process and not a result nor a phase. Such change involves the social fabric because art creates unconventional, permanent and long-lasting solutions that involve all sectors and processes of public and private life (Cavallarin, 2021). However, it primarily involves the business because “when knowledge and competencies become the main asset, the real value of organizations is no longer material products, controlled by the business, but knowledge in people’s heads and bodies” (Darsø, 2004).

However, proper resource management necessarily involves the possession of appropriate skills, which consist of the ability to organize and combine resources. There are two implications coming from the two spheres that constitute the Art and Business project: the role of the curator and the role of the manager.

The artist’s vision skills are the first pillar on which the Art and Business project is built. It is up to the curator, the professional between the organization and the artist, to work out which artist is most suitable for the project and to enter into a dialogue with the enterprise, and it is up to the curator to design a program consistent with the aims of the business and community oriented at the same time, leading the ethical action of the enterprise for the benefits of the community (Shaw et al., 2020).

The enterprise’s ability to pay attention is the basis on which the relationship between Art and Business operates. A key implication for fostering a system change is to integrate more holistic aspects of management to business education, which promote core values such as shared perspectives, passion, morale, imagination, flexibility, and creativity as new drivers of strategic organizational value (Adler, 2006; Melé and Sanchez-Runde, 2011; Maleško and Tjurđju, 2016).

*A further practical implication concerns the possibility of replication of the project also by small businesses, and artisans. A peculiar characteristic of social innovation is precisely that it addresses categories traditionally “excluded” from innovation processes (Gasparin et al., 2021), and *Magnifico!* on the contrary promotes the accessibility of art and the value it generates. Moreover, for the very purpose of the long-term durability of the Art and Business strategy, it is equally important to start small with respect to projects that can be developed along the way (Darsø, 2004).*

*Finally, the research offers important social implications. As *Magnifico!* is a best-practice model of social innovation, the economic value generated by the link between Art and Business is not an end but a means (Zahra et al., 2009) for the broader generation of social value for the local area, through the enhancement of local roots, identity values, and through the interaction and involvement of the local community. The link between Art and Business also generates important spillovers for society, fostering inclusiveness, improved quality of life and Well-Being also in line with the achievement of the Sustainable Development Goals.*

Originality of the paper. *The research contributes to the literature by responding to the need identified by previous literature (Tricarico et al., 2020) to explore the link between Art and Business by presenting a model, *Magnifico!*, that systematizes the process by which Art and Business lead to social innovation and shared value generation. In fact, the research emphasizes that Art can and should be considered in all respects as a key resource, on which it is possible not only to base competitive advantage, but which leads to the generation of additional benefits, co-created and shared also with the territory and society at large.*

*The originality of the research lies in the contamination between different disciplines, with a view to crossing over and enhancing diversity, which is at the heart of social innovation. In fact, research is only possible through the joint use of different and complementary theoretical frameworks. On the one hand, the research adds to the literature on social innovation by presenting a model that also includes art as a source of social innovation, while on the other hand it exposes a system of innovation, *Magnifico!*, oriented toward the Well-Being of society as a key to development on which to orient the Art and Business project field on a national scale. The creation of a model based on the sharing of best practices and the gradual development of guidelines delineated among context, stakeholders, nature of the business and goals is meant to foster the creation of a broad spectrum of theoretical reference points capable of covering an equally broad range of case studies, bringing order to a literature that is extensive but lacking in shared parameters.*

Keywords: *Art and Business; Social Innovation; Shared value; Well-Being; Society; Territorial development.*

Focusing Exaptation Processes by Microfoundational Lens: a Historical Analysis

TINDARA ABBATE* ANNA PAOLA CODINI* ANTONIO MESSENI PETRUZZELLI[♣]

Abstract

Despite the increasing contributions in exaptation, no studies hitherto focused their attention on what might support the various steps of exaptation process leading to radical innovations. Thus, adopting a microfoundational approach we expect to shed new light on how latent functionalities and/or unused resources might emerge, triggering exaptation, as a source of innovation. Basing on the historical analysis of five cases of radical exaptation (as the Gutenberg press, the Triode, the Jukebox, the Microwave oven, and the Glass fiber), our research aims to build a model depicting what routines and capabilities come to light in each one of the exaptation sub-processes - i.e. “functionality emergence”, “deliberate selection”, and “adaptation” and how they act in the defined sub-processes. As this extended abstract represents a preliminary draft of our research, in this extended abstract we will focus our attention on the microlevel origins of routines and capabilities - i.e. individuals, processes, and structure - that played a key role in the three sub-processes of exaptation. The preliminary results of our historical analysis will be reported. A narrative description of how the radical exaptations we analyzed were developed will show the role that individuals, processes, and structures levels of microfoundations played in the three main processes of “functionality emergence”, “deliberate selection”, and “adaptation”.

Framing of the research. Sources of new functions and corresponding artifacts mainly lie in i) the discovery of a new phenomenon in the science and technology fields, thus resulting in the design and development of new artifacts and processes, and ii) the expression of a need driving the formulation of functions, then translated into new artifacts (Arthur, 2009). A third source of novelty generation is represented by exaptation defined as an evolutionary process “by which features acquire functions for which they were not originally adapted or selected” (Andriani et al., 2017, p. 320). Deriving from biology, exaptation has led to the recognition that any object —whether it be an asset, technology or resource -has indefinite uses and “latent functionality” (Dew et al., 2004; Cattani, 2005; Cattani, 2006; Andriani et al., 2017), involving internal and external search processes or arising from individuals’ serendipitous discoveries, rather than from deliberate strategies (Garud et al., 2018). Exaptation can determine the interaction between an artifact and a context, which may bring alternative new uses/functionalities and unexpected results linked to the discovery of new uses for existing resources (Beltagui et al., 2020). However, given the manifold possible uses for any resource, there is no way to fully account for all the market opportunities related to exapted products or processes (Andriani and Cattani 2016; Felin et al., 2016) as well as many uses cannot meaningfully be anticipated and delineated (Felin et al., 2021). In order to make exaptation more concrete, thus increasing the opportunities to identify new uses for existing resources, the literature on exaptation tried to observe this as a discontinuous evolutionary process (Andriani and Cattani, 2016, p. 116) articulating it in distinct sub-processes: i) the emergence or association of a new function with an existing artifact, process, and ecosystem, ii) the deliberate selection of a new functionality as the basis for an innovative product, and iii) the adaptation as a process in which innovative products are transformed because of user selection (Andriani and Carignani, 2014, p. 169). Despite the increasing contributions in the field of exaptation, no studies hitherto concentrated the attention on what might support each step of exaptation process leading to radical innovations. Thus, focusing on the microfoundational approach (Felin et al., 2012) we expect that this approach may shed new light on how latent functionalities and/or unused resources might emerge, triggering exaptation, as a source of innovation. In management studies, microfoundations are almost defined as to the micro-level phenomena or mechanisms, such as individuals, processes, and structures, and/or their interactions, that can be considered the causes of the emergence, function, and dynamics of routines and capabilities (Feldman and Pentland, 2003; Salvato, 2003; Hoopes and Madsen, 2008; Miller et al., 2012). The adoption of microfoundations approach for investigating exaptation processes is grounded on the idea that routines and capabilities emerged from microlevels of individuals,

processes, and structures drive differences in the competitive behaviour and performance of firms (Coff, 1997, 1999; Johnson and Hoopes, 2003), and represent key constructs in a number of management fields, notably in technology strategy and management (Felin et al., 2012; Palmiè et al., 2022). A set of microfoundations may thus serve as causal explanations for the origin of a routine or capability, or, alternatively, it might affect the development, operation, maintenance, and/or change of a routine or capability without necessarily contributing to its creation (Garud et al., 2010; Vergne and Durand, 2010). As a result, some microfoundations may be temporally prior to others, and their analysis require the consideration of both initial conditions and evolutionary processes (Felin et al., 2012). In light of these peculiarities of microfoundations, we might expect that a microfoundational approach could provide inspiring insights in studying exaptation processes, and that this kind research could greatly benefit from the adoption of a historical method. Combining microfoundations' and exaptation's literature, we thus developed a frame for data collection and preliminary data analysis. The frame was a table (Tab. 1), where columns were the three sub-processes of exaptation, and the rows were microlevels of routines and capabilities articulated in sub-sections (individuals, social processes, and structures).

Tab. 1: The theoretical frame

Microlevels origins of routine and capabilities / Exaptation sub-processes	Functionality emergence	Deliberate selection of the new functionality	Adaptation
Individual level elements - Motivation and attributes - Choice - Human Capital (skills, knowledge, experience, cognitive capacities) - Big Five Personality characteristics - Abilities (relational or integrational) - Mobility			
Process level elements - Rigidity of process - Flexibility or adaptation - Trial and error learning - Ad hoc problem solving Methods of coordination (formal and informal) and integration (cooperation and coordination; technology and ecology)			
Structure level elements - Design of decision-making activities (heuristic or rules) - Organizational structure form - Resource and organizational conditions			

Source: Authors' elaboration

Purpose of the paper. *Basing on the historical analysis of five cases of radical exaptation (as the Gutenberg press, the Triode, the Jukebox, the Microwave oven, and the Glass fiber), our research aims to build a model depicting what routines and capabilities come to light in each one of the exaptation sub-processes - i.e. "functionality emergence", "deliberate selection", and "adaptation" and how they act in the defined sub-processes. As this extended abstract represents a preliminary draft of the study, here we will focus our attention on the microlevel origins of routines and capabilities - i.e. individuals, processes, and structure - that played a key role in the three sub-processes of exaptation.*

Methodology. *With the aim to discover the existence of general patterns that interrelate microfoundations and exaptation process, we decided to adopt a historical method, as considered suitable to this aim (Gottschalk, 1951). Historical methods, indeed, seems to enrich qualitative case studies of innovation for two main reasons. Firstly, because they enable to follow the temporal order of roles played by the different agents (inventors, users, technologies, needs, etc.) involved in the innovation process, providing a longitudinal perspective on how these roles evolve over time (Page and Schirr, 2008; Rosenzweig et al., 2015). Secondly, because in historical methods collecting data from various independent sources is needed, in order to detail the sequence of events close to the time they occurred, to provide the necessary detail and, at the same, to guarantee a distance for capturing how innovation emerged from its technological, social, and institutional context (Hargadon and Douglas, 2001).*

Differently from random sampling in theory testing studies, sampling in historical approach requires selecting cases according to their likely contribution to existing theory about the investigated phenomenon. As a result, the focus can be on one or a small number of cases (Eisenhardt and Graebner, 2007), i.e., organizations, projects or processes developed across multiple temporal phases. Basing on these considerations, in our study we focused on five cases of historical radical exaptations picked from the literature (Andriani and Carignani, 2014). The five cases are the following: i) the Gutenberg press, the rotative type press exapted from the rotative press for winemaking (Johnson, 2010); ii) the Triode (De Forrest Audion), the amplification function exapted from the detection of radio signal (Nebeker, 2009); iii) the Jukebox, the coin-operated music-box exapted from the phonograph (Dew et al., 2004); iv) the Microwave oven, the cooking function exapted from the magnetron in radar system (Osepchuk, 1984); v) the Glass fiber, the Fiber optics exapted from the specialty glass (Cattani, 2005; 2006). These cases were selected because

considered explanatory cases of exaptation since they are classified in the literature as “radical” (Andriani and Carignani, 2014). According to Andriani and Carignani (2014) definition these represent “completely new system, built around the exapted module, that results in the emergence of a novel artifact with a new function and ultimately the creation of a new market” (p. 1612). Within the cluster of historical cases of radical exaptations, the five cases (in a list of seven) were selected as mostly fitting the criteria of a multiple historical case study analysis where highly diverse innovations allow the researchers to discover general patterns overcoming the risk of anecdotal selection bias.

Regarding data collection, historical research involves “collecting, verifying, interpreting and presenting evidence from the past” (Golder, 2000, p. 157). To overcome issues relative to the nature of historical data (e.g., incomplete, temporally remote records, created in specific historical contexts by various authors for reasons other than the researcher’s aim to answer a specific research question), in analyzing these documents we stuck to the tripartite approach articulated by Kipping et al. (2014). First, we performed a discriminating analysis of texts, in order to establish the validity and credibility of any historical document. We also considered the audience for the documents we analyzed, and we carefully identified the Author of the text, as well as its purpose and its institutional setting. We thus selected the sources that might contribute to our specific aim - as to say, identifying the patterns that interrelate microfoundations and exaptation process. Second, we triangulated our historical sources, basing on multiple sources. Triangulation furthermore was helpful to avoid ‘misuse’ of historical interpretations that lack criticality or empirical credibility (Perchard et al., 2017). Third, we followed the hermeneutic circle (Kipping et al., 2014), an iterative process of situating the texts within their historical context. It is important to note that the above processes were not necessarily performed in a linear manner, rather, they often co-occurred. As a consequence of this process, each source has been read by two researchers a minimum of three times, concretely forcing them to apply triangulation and follow the hermeneutic circle, as an iterative process of reading, coding, recoding, and rereading texts while considering all the microlevels origins of routines and capabilities supporting each exaptation sub-process.

Because of the fragmentary nature of the historical documents that represented the basis of our data collection, we felt the need of structuring our analysis to ensure rigorous application of source criticism, triangulation, and the hermeneutic circle (Corbett et al., 2007). So, we created a frame (Tab. 1) for guiding data collection. After completing this preliminary step, the contents of the table were analyzed to evidence patterns relating microfoundations and exaptations sub-processes in the five cases, using a narrative interpretation of our historical analyses (Thornton and Ocasio, 2008).

Results. In this section, we will report the preliminary results of our historical analysis. Since data collection is not completed yet, we would like to precise that these results are a draft of the main findings and consequent discussion that will be completed as soon as data collection and analysis will be integrated. A narrative description of how the radical exaptations we analyzed were developed will show the role that individuals, processes, and structures levels of microfoundations played in the three main processes of “functionality emergence”, “deliberate selection”, and “adaptation”. Thus, our results’ section will be articulated following the three exaptation sub-processes.

During functionality emergence, a new function of an existing artifact emerges and, thus, creates exaptation. This process is usually preliminary to the deliberate selection, since it represents the “technological pre-adaptation as the part of the firm’s technological knowledge base that is accumulated without anticipation (foresight) of its subsequent uses, though might later on prove valuable for alternative, yet unknown applications” (Cattani, 2006, p. 289). Analyzing the evolution of selected radical exaptations, individuals and processes levels of microfoundations seemed to play a crucial role in this step.

Functionality emergence for Gutenberg press was radically endorsed by motivations and human capital of its “inventor” Johannes Gutenberg, who, just back from a disastrous business venture manufacturing small mirrors with supposedly magical healing powers, immersed in the technology of Rhineland vintners (Johnson, 2010).

“Johannes Gutenberg was not interested in wine, he was interested in words, and his genius laid in borrowing a mature technology from an entirely different field, and putting it to work to solve an unrelated problem. We don’t know exactly what chain of events led Gutenberg to make that associative link (...). But it is clear that Gutenberg had no formal experience pressing grapes. His radical breakthrough relied, instead, on the ubiquity of the screw press in Rhineland winemaking culture, and on his ability to reach out beyond his specific field of expertise and concoct new uses for an older technology. He took a machine designed to get people drunk and turned it into an engine for mass communication” (Johnson, 2010, p. 153).

Similarly, in the case of Glass Fiber, the theoretical possibility of using light for communications purposes had been envisioned by two researchers, Charles K. Kao and George Hockham, from the Standard Telecommunications Laboratories (STL). The inventors didn’t act as the sole storage point of knowledge, but played a key role in facilitating the diffusion and recombination of skills and knowledge accumulated in otherwise distinct technological domains (Cattani, 2006), maybe as a sign of integrational ability.

Moreover, in the development of Glass Fiber, several firms had prior experience in glass manufacturing as a clear vantage point for producing optical glass fibers. However, even firms from the same origin industries exhibit a differential ability to take advantage of their prior experience across different domains, as a consequence of different purposive behavior.

“Firms, indeed, can differ not only with respect to their ability to leverage preexisting skills and knowledge, but also with respect to when and/or how quickly they decide to do so” (Cattani, 2006).

This was probably the sign that, despite motivation, ad hoc problem solving played a key role in functionality emergence.

In the case of Glass Fiber, also structure, in the form of organizational framework, contributed to functionality emergence, since Corning - the company considered responsible for inventing and developing the fiber optics technology - formed a research team to study the properties of optical waveguides to satisfy the needs of the British Post Office, which at the time operated the British telephone network and was trying to improve the national telecommunications infrastructure (Cattani, 2006).

In deliberate selection, after a new function of an existing artifact emerged, the existing artifact is converted into an innovative commercial offering. This requires the construction of a dedicated architecture around an exapted module (Andriani and Carignani, 2014). While in functionality emergence the process is almost serendipitous, in deliberate selection higher level of foresight starts guiding the efforts (Cattani, 2006). As in making functionality emerge, motivations, human capital and abilities at individual level were crucial also in transforming the existing artifact in innovative products.

In the Gutenberg press development, thanks to his training as a goldsmith, Gutenberg made some brilliant modifications to the metallurgy behind the movable type system, but without the press itself, his meticulous lead fonts would have been useless for creating mass-produced Bibles. Gutenberg was trained as a metallurgist, and had weak ties to the vintners' business, but, surprisingly, without that link, he would have merely a pioneering typesetter. It was by not restricting himself exclusively to the island of metallurgy, that he became a printer (Johnson, 2010). This revealed how skills and knowledge assumed a strategic role.

Similarly, in Triode development, in deliberate selection stage, various individuals with heterogeneous backgrounds other than the “inventor” De Forest gave their crucial contribution.

“[In Triode technology development] most important was the move from the “soft” tube, containing gas at low pressure, to the “hard” tube, with the enclosed space at high vacuum. De Forest had believed the gas necessary for the tube’s operation. He and others were misled by the fact that when used strictly as a detector of radio waves, the “soft” tube was indeed more sensitive than the “hard” tube. For the tube to function effectively as an amplifier or oscillator, however, a high vacuum was necessary. This was recognized in about 1912 by several engineers working independently: Harold Arnold at AT&T’s manufacturing subsidiary, Western Electric; Irving Langmuir at General Electric; and Alexander Meissner at Telefunken” (Nebeker, 2009).

For what concerns the process microfoundations level, Glass Fiber was illustrative of how they contributed to deliberate selection. Specifically, formal and informal methods of cooperation and integration were crucial in deliberate selection of this exapted technology.

“To test the properties of the new fibers his team was trying to develop, Maurer established a working relationship with Stewart Miller who at the time was the coordinator of research on optical communications at AT&T Bell Laboratories. Thanks to this collaboration, Maurer and his research group had the chance to promptly embrace the latest advances in light emission and detection. This corporate belief in supporting innovation contributed to creating an environment where new ideas and initiatives were consistently generated and errors/mistakes seen as valuable learning opportunities” (Cattani, 2006).

Furthermore:

“A well-established practice at Corning was to send out senior researchers to visit research laboratories and existing or potential customers, attend conferences, etc. When William Armistead was head of corporate R&D, two to three senior researchers who were well known in the scientific community and with a wide knowledge of Corning’s technical skills were asked to act as Corning’s R&D ambassadors. The main objective of having “technology scouts,” was to spur innovation by facilitating the acquisition and diffusion of knowledge, both technical and at the market level” (Cattani, 2006).

Regarding the structures, more than one radical exaptation benefitted from the creation of ad hoc organization structure forms along deliberate selection. It was the case of Microwave oven with the creation of the International Microwave Power Institute, and in the case of Glass Fiber with the development of a dedicated research team.

In adaptation of the exapted technology the new product based on an emergent functionality, gets transformed on the basis of users’ selection, and where users’ selection turns the functionality embedded in the new product/service into a market-driven function (Andriani and Carignani, 2014). The contribution of individuals’ human capital (skills, knowledge experience) was critical also in this stage.

In Triode development much of the advance that favored adaptation came from increased understanding of how the tube functioned.

“Walter Schottky of Siemens & Halske, G. Stead at the Cavendish Laboratory of the University of Cambridge, Henry J. Round of the British Marconi Company, and Harold D. Brown of Western Electric were leading contributors, but perhaps most influential was Irving Langmuir of General Electric. A Columbia University graduate who obtained a Ph.D. under H.W. Nernst at Göttingen, Langmuir began publication of his studies of vacuum tubes in 1913” (Nebeker, 2009).

Triode technology adaptation was then illustrative of how also process level of microfoundations -in the form of ad hoc problem solving as well as informal methods of cooperation -contributed as crucial.

“Though invented in 1906, the triode was little developed before 1912 (...). But in 1912 there began a remarkable development of the technical potentials of the device. Before the end of the Great War, it had found numerous applications and was being mass produced in huge quantities. This technical development and the proliferation of applications continued at a rapid pace in the decades after the war, to the degree that the world that emerged after the next Great War was, as a result of electronics, strikingly different in many respects from the world of 1914. Technology transfer was facilitated by collaboration by different companies on government orders and by sharing of techniques between allies” (Nebeken, 2009).

Regarding processes level sustaining adaptation, also Glass Fiber technology deserves attention, specifically by means of formal methods of integration.

“In 1977, Corning integrated vertically to cable production by creating Siecor, a joint venture with Siemens, which continues to be its manufacturing arm for optical cables. Searching for new markets, Corning formed several partnerships in the early 1970s with cable-makers such as Siemens in Germany, Pirelli in Italy, BICC in UK, public laboratories in France and Furukawa in Japan. In general, each partner was expected to develop waveguide components and cables. In return, Corning agreed to license its patents and know-how to make waveguides in the partner’s country” (Cattani, 2006).

Last, at structures level, organizational structure form revealed to be strategic in adaptation too. Specifically, in Glass Fiber development, as part of a strategy of continuously improving existing processes and new product development, Corning decided to establish a business unit devoted solely to the production of optical fibers (Cattani, 2006).

Managerial implications. *Following Andriani et al. (2017), this study highlights that exaptation can be concretely considered as a third way of novelty generation, by permitting to discover, explore, experiment and develop distant valuable business opportunities related to the emergence of latent functionalities from existing technologies. Specifically, the findings here presented underline clearly how exaptation can be a useful source of radical innovative solutions, by constituting a mechanism through which unexpected solutions “push” (Andriani et al., 2017, p. 1) the emergence of novel problems. Therefore, the potential discontinuity an exaptive products/services can generate in the technological and marketing process has an impact both on the macro and microenvironments (at industry level and firm level). In this perspective, at firm level, organizations may proceed to define and implement an exaptation strategy that concretely stimulate the exploration of internal and external products and technologies with the aim to discover and experiment new and unexpected field of application and, consequently, to consider new opportunities in term of activities and markets. Therefore, organization may consider that “exaptation effectively ‘enables’ a jump into distant and active areas of the space” (Andriani et al., 2017, p. 11).*

Additionally, the findings show how this interesting mechanism of innovation, thanks to the microfoundations, can be effectively triggered, specifying what and how individual, processes and structure components, including their complex interactions and relationships, may contribute to the emergence of exaptation with a radical nature. Indeed, once completed the historical analysis of the cases that we selected we should be able to underline how routines and capabilities develop in each one of the exaptation sub-processes (i.e., functionality emergence”, “deliberate selection”, and “adaptation”), by showing how various levels of microfoundations interact continuously to foster and improve those sub-processes. In this respect, our study will shed new light on how organizations may develop and reproduce those routines and capabilities that can conduct to the generation of novelty by enabling evolutionary technological processes. By observing the dynamics of intense interactions among the individual, process and structure components, organizations may proceed to the activation of learning processes because learning achieved in solving specific problems can become available for new fields of applications.

Research limitations. *The limitation of this study may open the door to future lines of research. Firstly, there are evident limitations related to the generalisability of the results derived by the exploratory multiple case studies. Accordingly, the results of the present analysis can be utilized to the further development of theoretical ideas regarding the novelty generation, particularly radical innovation, through exaptation processes, by assuming the theoretical perspective of microfoundations, but not to generalize about populations of firms or markets. This implies that there is a need for more systematic analysis of the microfoundations of routines and capabilities (individual, processes, and structure components) that characterize the complex sub-processes of exaptation, observed as important contributor to technological change and the exploitation of new market opportunities. Specifically, the analysis of the sub-processes in terms of routines and capabilities may shed new light on the evolutionary determinants of innovation dynamics. Another*

interesting area of future research may be studying complementarities between the different combinations of routines and capabilities for each sub-process of exaptation by providing new insights for the emergence of novelty.

Originality of the paper. This study has important implications in terms of theoretical framework and methodological approach. From a theoretical perspective, it is aligned with the existing scientific literature by emphasizing and substantially confirming exaptation as a potential way of innovation, capable to create entirely new markets, industries and phenomena. But the originality of this contribution resides in the first attempt of empowering the connection between exaptation and microfoundation of routine and capabilities, which has not been explored in the literature on technology and innovation management despite the well-investigated impact that microfoundations have on firm innovation performance (Felin et al., 2012). By considering the relevant potential of the microfoundations paradigm to advance the understanding of important phenomena (Palmiè et al., 2023), this study investigates exaptation sub-processes by identifying and exploring routines and capabilities developed within these specific processes, including their complex dynamics.

From a methodological point of view, the originality of this study resides in bringing together history and social theory (see Kipping and Üsdiken, 2014), by performing an in-depth historical analysis of the complex specificities and dynamics of the evolutionary processes of exaptation. In particular, the use of an historical approach is seemed particularly suited to investigate several examples of radical innovation through exaptation processes because this approach enriches and transforms our understanding about organizational phenomena, by overcoming trends of some theory to downplay the “exceptional value of the long-time span” (Braudel, 1980, p. 27).

Keywords: exaptation; microfoundations; individuals; processes, structures; historical approach

The successful factors for SEZs' implementation: a systematic literature review

NICOLA FACCILONGO* MELANIA RIEFOLO* RAFFAELE SILVESTRI[▲] ANNUNZIATA TARULLI**

Framing of the research. *In the scope of the industrial policy, SEZ concept no longer sounds so recent, considering its first implementation happened in the thirties in America and was widespread in 1978 during Deng Xiao Ping's Chinese government. The idea behind SEZ was the liberalization of Chinese trade, tax, and other policies nationwide, aiming to attract external investors (Wang, 2013). After the American and Chinese experiences, SEZs have been applied worldwide differently, revealing themselves as a proficient and boosting tool for local development, reaching the number of 5,4000 countries (UNCTAD,2019) with different forms aiming to suit local exigencies. Behind the SEZs' concept, there is the conception that they can pave the way for the country's economic growth, the attraction of foreign direct investments, the construction of production capacity, the diversification of the economy, the improvement of the competitiveness of local industry, the development of international trade, the limited-scale experimentation of specific industrial policies (Akinci and Crittle, 2008; Wang, 2013; Zeng, 2015). However, the literature contributions until now have been focused more on the final effects of SEZs, such as the growth of GDP, foreign investments, and the rise of demand for workers, without understanding the successful backing factors for these policies can be. Considering the SEZs' literature heritage, this paper aims to go over the academic contributions of the last twenty years and systematize them with a systematic literature review (SLR), which is still in progress.*

Purpose of the paper. *The paper's main objective will be to understand what is meant for SEZs' efficiency and what are likely the critical endogenous and exogenous factors of success for SEZs. Considering these results, the research aims to end with the determination of steering guidelines for a proficuous implementation of special economic zones by public institutions and guaranteeing their survival too.*

Methodology. *Although the interest in SEZs' application among researchers is rising, a systematic approach that synthesizes the drivers of success for special economic zones has yet to be put forward. Based on this gap, this research has been set out through the application of a systematic literature review (SLR).*

SLR suits the purpose of this study as it allows to review of the findings of both internal and external success factors for SEZ implementation, supported by the extant literature. In addition, it is the starting point for new research areas and domains as well as trends and implications for both theory and practice, thus shaping a rigorous future agenda and tracking the way forward for SEZ' adoption and its efficiency. The reliability and validity of SLR depend greatly on one or more significant novel research questions remaining unanswered in current scholarly research. Well-defined and articulated research questions permit researchers to design an effective research protocol aiming at identifying relevant academic articles and subsequently determining the study sample (De Menezes and Kelliher, 2011; Leonidou et al., 2020; Massaro et al., 2016; Nguyen et al., 2018; Petticrew and Roberts, 2008; Talon-Ballesteros et al., 2018; Xiao and Nicholson, 2013). The review acknowledges that some areas of major understanding can be identified in the debate on SEZ application in international industrial policy concerning (1) the concept of SEZ efficiency, (2) successful internal factors, and (3) successful external factors for the application. Considering the research gaps identified earlier, three research questions have been defined as follows:

- *RQ1. How is the literature on SEZ developing in its efficiency evaluation?*
- *RQ2. What are the internal success factors enabling SEZs' implementation?*
- *RQ3. What are the external success factors enabling SEZs' implementation?*

In details, the first research question aims to describe the state of the art in the current literature regarding this topic. The second research question has the goal to identify the focus of the existing literature on the relationship between internal factors and success of SEZ. The third question aims to detect the relationship the external factor and the success of SEZ. In this, the research will develop helpful insights that politics can take into consideration for developing successful economic policies.

▲ Professor of *Business Innovation* - University of Foggia
e-mail: raffaele.silvestri@unifg.it

** Research Fellow of *Business Innovation* - University G. Degennaro LUM
e-mail: tarulli@lum.it

In the first step, the research time frame has been considered without any kind of restrictions to the attempt to gather all studies regardless of the SEZs publication, as Hsieh, Lee, and Tseng 2021 suggested. Thus, the first research results span from 1982 with the work of Fitting G. (1982) to 2023 with four papers of Chaisse (2023), Michael (2022), Dubinina (2022), and Chernyakevich (2022). Furthermore, all multiple disciplines such as business, marketing, management, political economy, psychology, and geography have been considered as multiple sources can derive more comprehensive interpretations in general (Baek et al., 2018). After that, inclusion and exclusion criteria for the study sample were detected to address what the study aims and questions effectively. The inclusion criteria were established based on the search string and search boundaries (Dada, 2018; Wang and Chugh, 2014).

After the application of the, the final sample to be analysed comprises 80 studies.

Descriptive Analyses Results. The preliminary results of the activity research are related to the performed descriptive analyses which will be described in detail below.

Geographical analysis of authorship data. This analysis aims to understand the geographical area of authorship by considering the distribution of the number of articles published in the countries examined. Looking at the Table 1, the United States has the highest amounts of publications, with 15, followed by the Russian Federation at the second position with 11 publications and China with 9. The two last places are occupied by the United Kingdom and India, respectively, with 9 and 5 publications. Surprisingly, as showed by Figure 1, any Southern European contribution has been detected by the analysis. Given these data, it is possible to understand that eastern countries have been more engaged in this topic, except the United States. This result is probably related to the historical pathway of this industrial policy that started with the American government in the thirteens, which has been the pioneer of this political innovation and drawing into it the other countries, as shown by the American highest score citation

Fig. 1: Geographical analysis of authorship data

Tab. 1: N. Documents and citations of each country

Country	N.Documents	Citations
United States	15	184
China	9	63
India	5	82
Russian Federation	11	59
United Kingdom	8	128

Number of Publications. The starting point of SEZs’ publications was the beginning of the twenty-first century, with a markedly spread in the Asian continent. Until 2010, different publications set up the basis for future contributions, detecting both external and internal factors for SEZs’ implementations; the former refers to the relevance played by the external linkages (Namkoong, 2003; Ye, 2009) of the country adopting the SEZs, as well as their geographical position close to industrial poles (Lim, 2010) the latter, instead, deals with the positive effect guaranteed by a high level of industrialization of the areas in the cross-hairs of SEZs (Lim, 2010; Seshadri and Storr, 2010). After 2010, the analysis of success factors was carried out again by Zeng (2012), who detected different factors enabling the development of SEZs’ zones, such as: a strong commitment to reform and the pragmatism from top leadership; the preferential policies and institutional autonomy; the strong support and proactive participation of governments; the land reforms; the foreign direct investment (FDI) and the Chinese diaspora; the presence of technology learning, innovation, upgrading, and strong links with the domestic economy: the innovative cultures; clear objectives, benchmarks, and intense competition; location advantages. To this list can be added the innovation and technology rates of the country as a determinant for the success of SEZs because of its attractive force to foreign investment (Dziura, 2013; Maslikhina, 2015). A more detailed look at Figure 2 reveals that after 2015, the number of publications has considerably risen, growing to 47 per cent until the beginning of the twenties and reaching their highest peak after 2020. This time trend demonstrates that SEZs are currently under the spotlight of researchers, who are trying to detect the harvested results

of this industrial policy and the factors enabling their overwhelming success. In these ten years, there are main trumping arguments detected by literature to set up an efficient and successful SEZ. First, many authors pointed out the necessity of stable governance and the definition of a specific SEZ framework, which can easily bridge and coordinate the private and public sectors (Hidayat and Negara 2020; Zaitseva et al., 2017; Doroz'yn'ski et al., 2021; Mukoreraet al., 2021). Other authors summarized this concept in; building a "one-window" (Bogoviz et al., 2016; Naeem et al., 2020), which consists of a space where investors can approach and be guided, and to take care of their exigences. Although, this implementation could be suitable with a special arrangement between provincial and federal governments, and all other departments involved. Apart from political concerns, several contributors revealed the importance of the economic sectors involved in the SEZ regulation, hinting at developing them in industrial production centres and innovation-hub (Zeng, 2016; Kuznetsov a and Kuznetsova, 2019). This last concept was demonstrated by several Russian contributions, which stress the gap between the different SEZs, focusing on the necessity of tourism SEZs to catch up to the others (Maslikhina 2016; Rostom 2019; Bagiryan et al., 2018; Kirillov et al., 2020). The most recent contributions have revealed the common conception that Chinese SEZs have been deemed the most successful examples of this industrial policy worldwide. That is why many countries have shaped their SEZs model taking into account the Chinese heritage, and in some cases, fallen into a das reception, as shown by Indian contributions (Alkon 2018; Jacopin, 2021; Agarwal, 2021; Goodburn and Knoerich, 2022). The growing interest in SEZs reveals that many fields must still be discovered and better analysed, stressing the need to uncover and synthesize the relevant literature using a systematic approach.

Fig. 2: Number of publications in years

Number of citations. Figure 3 compares the number of citations received over the years by the articles included in the sample and the number of publications published during the same period. The first significant year of citations was 2015, followed by the period between 2018 and 2019. Table 2 refers to the most cited articles until now and confirms that the most influential articles right now have been Lenner K. and Turner L., who focused on refugees SEZs (Lenner and Turner 2019). Considering previous research, the study has the necessity for more influential articles using a citation per year index (CPY) (Massaro, Dumay, and Guthrie 2016) as well as sufficient time for the recently published articles to "garner citations" (Dumay and Cai 2014). The analysis was also performed using CPY (i.e., a parameter obtained from the result of the number of citations divided by the time elapsed between the publication date and the end of the analysis period) is the article by Lenner and Turner 2019 with 60 citations. This work analysed the Jordan Compact policy instrument, which focused on the renewal of SEZs' framework. In reality, the conclusion of this work could be more promising since they pointed out the difficulty of refugee integration in SEZs' Syrian territories, especially for ethical issues and the hard work conditions newcomers have to accept. The article ranks first in terms of citation (60) and also its CPY was the highest (15). These metrics study the articles' impact over time, allowing researchers to understand the actual literature development observed in the field (Massaro, Dumay, and Guthrie 2016). The second and third places are occupied by the articles of Crane et al. (2018) and Alkon (2018), both published in 2018. However, Crane et al., 2018's work has been more influential, with a CPY difference of 1.8. Interestingly, in the last place, there is the Zeng (2012)'s works with a CPY of 2,1. This analysis has shown that more recent productions have been more influential than the older ones, especially those written between 2018 and 2019.

Common keywords. Table 3 shows the common keywords authors used to classify their articles and underlines the most critical areas in this domain. Following previous SLRs (Massaro, Dumay, and Guthrie, 2016, Armstrong, McCulloh, and Johnson, 2013; Ribièrè and Walter, 2013, keywords were extracted from the articles included in the study sample and then listed in a dictionary of terms. Similar keywords were aggregated in four clusters. The aggregation was done using the VosViewer software, creating a map based on the Scopus database, using occurrences that indicate the total number of times the keywords occur in all documents. The analysis showed us that the most frequent keywords were "Special economic zone" (with 50 occurrences) and "Special economic zone" (with 24 occurrences). The keyword Special Economic Zone(s) is redundant since it appears in three clusters with the "development" word twice. That is why SEZs are commonly conceived as an economic policy to boost the territorial development of disadvantaged territories.

Tab. 3: Common keywords

Cluster	Items	Keywords	Occurrence
Cluster 1	9	Competitiveness	3
		Economic policy	7
		Export	3
		Innovation	4

Cluster 4	2	economic development	5
		employment	3

Distribution of papers in journals. The distribution analysis of papers published in the journals included in the study sample demonstrates a high level of heterogeneity and interdisciplinarity. As a matter of fact, Academic journals of various fields have published few papers relevant to the topic under study, with a scale between 1 and 5. So far, the three top-ranked outlets in which the most significant numbers of papers were published are Transnational Corporation (with five publications); World Development with one publication as well as European Journal of development research with one publication. These articles have focused on the successful aspects of SEZs application, detecting the enabling factors and the favoring conditions. Against the tide, however, other contributions clearly emphasized the SEZ application's weaknesses and negative influence, showing the other side of the coin.

Analysis of the most influential authors. Figure 4 relates to the most influential authors on SEZ topic, and was performed with VosViewer, narrowing the analysis field down by filtering the ones who have published at least two documents. The results of the procedure reveal that Alkon M. has been the most influential right now, with his work on the spillover effect of SEZ application. In the second and third places are the Russian author Kuznetsov A. and Kuznetsov O., dealing with the Russian SEZ implementation.

Fig. 4: Most influential authors

Authors	Title	Year	Cited by	Source	Country
Lenner K., Turner L.	Making Refugees Work? The Politics of Integrating Syrian Refugees into the Labor Market in Jordan	2019	60	Middle East Critique	Syria
Crane B., Albrecht C., Duffin K.M., Albrecht C.	China's special economic zones: An analysis of policy to reduce regional disparities	2018	43	Regional Studies, Regional Science	China
Sampat P.	The 'Goan Impasse': land rights and resistance to SEZs in Goa, India	2015	40	Journal of Peasant Studies	India

Analysis of adopted methodology. The study findings also identified the research methodology scholars applied to investigate SEZs' adoption in different countries. Figure 5 reports research methodologies used for each year of publication. The qualitative methodology was primarily applied in these studies to identify the successful framework for

SEZs' adoption. Also, quantitative methodologies have been developed, especially in recent years when data are finally available for models.

Fig. 5: Analysis of adopted methodology.

Bibliographic Coupling. A cluster analysis using bibliographic coupling was then conducted based on the interaction of the references included in each study paper. This is done to evaluate the bibliographic link, which is a link between two articles citing the same documents; only articles presenting the same references in their reference list were selected (Boyack and Klavans 2010). Using VOSviewer, the unit analysis included only papers having two references in common at the minimum. The analysis results consisted of 7 clusters with 36 papers, which are presented in Table 4.

Figure 6 shows the clusters arising from the bibliographic coupling analysis after running 10 interactions, showing the strength of the closeness according to the number of references in each paper, including in the reference list. The software cluster technique works after running 10 interactions.

Based on these linkages, a content analysis will be performed aimed at detecting the principles research areas of SEZs.

Fig. 6: Cluster of intersected literature

Managerial implications. The basic idea is to develop a model which can easily fit in the territory of the countries which would implement SEZs for boosting their inner economy. The attempt is to figure out a model that can tailor itself to the contextual conditions that can affect the proper implementation of the SEZ. It is a fact that many countries have tried to adopt SEZs to seam the social divergences and disparities (Crane et al.,2018), considering the positive Chinese experiences. However, several authors have detected that starting directly from the Chinese SEZ model can fail because of a lack of preliminary understanding of the territorial conditions, lagging the expected positive effects and, in the worst cases, making the initial situation worse. Contributions regarding Indian experiences have dismally described these experiences, as witnessed by the works of Alkon (2018), Tantri (2012), who detected a negative spillover effect of this policy, and the falling back of the results comparing to the political expectations.

Future research steps. The research is still in progress, and it will continue with going deeply through the cluster analysis of the sample to systematize the main research areas developed so far. Alongside this method, content analysis will be performed too to detect future indications for scholars and practitioners regarding SEZs' implementation.

Originality of the paper. The paper provides a comprehensive SLR of the articles dealing with success factors and the efficiency of Special Economic Zones. Despite these issues' relevance and the increasing literature focused on them, research in this area is still fragmented and underexplored, requiring more systematic and holistic studies.

Keywords: special economic zones; SEZ; efficiency; success factors; innovation; business model.

Renewable Energy Communities in Africa: evidence from a systematic literature review

FABIO IANNONE* ELEONORA ANNUNZIATA* FRANCESCO RIZZI[^] MARCO FREY**

Framing of the research. Africa is vastly gifted with energy resources, especially renewable ones, but it performs really bad in terms of supplying of energy, leaving more than 660 millions of people without access (IEA, 2022b). Considering the demographic projections on the growth of the population, the rising energy demand in Africa represents one of the most significant challenges to sustainable economic growth (Adenle, 2020). An improvement in access to energy, especially in Sub-Saharan Africa (SSA), can lead to the enhancement in healthcare, life expectancy, recreation, education, and economic opportunities (Opuku et al., 2021). The main reasons for not accessing to energy, in Africa, are lack of infrastructure and poverty (IEA, 2022c). Moreover, the lack of energy is a form, outcome, and cause of poverty (Action, 2010). According to the International Energy Agency-IEA, the percentage of people without access, in Africa, increased in 2021 after declining for 6 years, due to the Covid19 shock (IEA, 2022c).

The IEA, in the Net Zero Emissions by 2050 scenario (NZE), illustrates a trajectory to achieve full access to electricity by 2030: more than half of the people gaining access by 2030 is doing this through decentralized solutions, including mini-grid and stand-alone systems, which are 90% based on renewable solutions (IEA, 2022a). Mini-grid solutions are emerging as a third alternative to rural electrification, coming between the option of large-scale grid extension and pico-scale stand-alone solutions (Pedersen, 2016). Especially in rural areas, where over 80% of the electricity-deprived live, mini-grids and stand-alone systems, mostly solar based, are the most viable solutions. (IEA, 2022d). In addition, micro-grids are considered a cost-effective and reliable energy option (Pedersen, 2016). Finally, in the last decade, the technological cost to supply rural communities through local renewable energy sources has dramatically dropped (Irena, 2018; Moretti et al., 2019). Therefore, decentralized renewable energies (mini-grid, micro-grid, stand alone, etc) represent an attractive alternative to grid extension (Mandelli et al., 2016).

There are several ways of managing decentralized renewable energy systems. One of these is when the local communities own, manage, operate, and maintain the plant (Peter et al., 2019). In the research conducted by Katre and Tozzi (2019), community-led model in developing community-based projects on decentralized renewable energies can be a factor of success. At the same time, Peter et al. (2019), in their work, identified some challenges related to community management of mini-grids, like initial investment, skills and financial and technical sustainability. On the other side, some scholars argue that the nascent energy systems in SSA offer an opportunity to collaboratively design energy communities and address energy access challenges present in many SSA countries (Ambole et al., 2021). In particular, the involvement of communities and local ownership can be a driver to create value and solve problems, such the economical and skills' ones (Ahlborg & Sjöstedt, 2015). Moreover, energy communities could also represent a response to barriers to the electrification of rural areas, such as the little interest from private sector (Ahlborg & Hammar, 2014).

Looking to the local communities' role in managing RE plant, the European Commission has recently presented the revised Renewable Energy Directive (2018/2001/EU) which is dedicated to renewable energies-RE and a light is turned on the role of citizen (Lowitzsch et. al, 2019). European Union, through the directive, gave a definition of Renewable Energy Communities (RECs) as a legal entity: (a) based on open and voluntary participation, autonomous, and effectively controlled by shareholders or members that are located in the proximity of the renewable energy projects that are owned and developed by that legal entity; (b) the shareholders or members of which are natural persons, SMEs or local authorities, including municipalities; (c) the primary purpose of which is to provide environmental, economic or social community benefits for its shareholders or members or for the local areas where it operates, rather than financial profits. Energy communities and consumer (co-)ownership in RE are essential cornerstones to the overall success of the energy transition (Lowitzsch et. al, 2019). RECs can foster the ecological transition (Dóci et al., 2015) and in Europe this seems to be one of the most recurrent motivations (Soeiro & Dias, 2020) to participate.

Renewable Energy Communities, therefore, may represent, if applied and properly shaped taking into consideration the features of a different context such the African one, an epochal turning point in order to bring energy to those who are disconnected from the grid and ensure sustainability of the three pillars. RECs can help in achieving a just and fair low carbon transition, in line with the UN2030 Agenda on the SDGs, especially n.7 “Ensure access to affordable, reliable, sustainable and modern energy for all”.

Purpose of the paper. *Considering their possible role in enhancing energy access and pursuing environmental and social benefits, RECs can represent an innovative business model for electrification in Africa, able to “actively create and drive sustainable economic development in underserved areas” (Trotter & Brophy, 2022). Nonetheless, the majority of the studies have been conducted in the Global North and the RECs’ concept, as intended in Europe, may not work in Africa (Ambole et al., 2021). Therefore, this research aims at identifying the status of the art and the challenges for the development of RECs in Africa, especially concerning the management related issues. The study makes an important contribution to the management sector through a systematic literature review on the existing literature between 1985-2022. In doing this, the study relies on the theoretical framework developed by Bauwens et al. (2022), identifying the different dimensions of RECs, such meaning, energy activities and objectives. In particular, the objectives pursued by the RECs can be iconic of the possible impacts in terms of elements of sustainability of the business model. Regarding to the latter, we added to our analysis a dedicated part on the factors that affect the implementation of REC, such as managerial and financial issues, failure factors, and on the features of the eventual business models which have been adopted, when present.*

Methodology. *We carried out a systematic literature review according to Xiao and Watson (2017)’s methodological approach. We used Web of Science (Wos) and Scopus that are the two most used scholarly databases and cover most of the scientific contributions related to the field of investigation. Considering our aim, we were willing to include all the studies which provide insights on energy communities in Africa. We immediately realized that few studies covered the topic, therefore we had to use a set of words that goes a little beyond the strict “Renewable Energy Communities” expression. First, the literature search used the following keywords: “renewable energy communities”, “renewable energy”, “bottom-up initiatives”, “micro-grid”, “stand-alone”, “standalone”, “rural energy communities”, “energy poverty”, “Africa”, “developing countries”. Then, we realize, with an iterative process, that that set of keywords was too wide, bringing us to generic and broad results. Therefore, we decided to exclude “renewable energy”, “energy poverty”, and “developing countries”. At the same time, we needed to narrow the field to management studies or studies related to the management field, to limit the results in numbers, still high. In doing this, we used the options available in the two databases, selecting a specific topic/field of study, through a research area (WoS) or a sub-area (Scopus). We therefore decided to restrict our search to Business Economics, Development Studies, Government Law, Public Administration, Urban Studies, Energy Fuels, Science Technology, Environmental Sciences Ecology research areas (WoS), and sub-areas of business, social, economics, energy and engineering (Scopus). Lastly, we decided to only include studies written in English.*

We limited the publication date to 1985 and 2022, considering 1985 the possibility given by one of the two databases and aligning to that. With the final algorithm based on the keywords selected and the inclusion criteria, we found n. 194 on Scopus and n. 111 studies on Web of Science. The following step was a duplication check for avoiding overlapping between the two databases, which brought us to a first-step final selection n. 238 studies. After this step, we went through a selection of the articles, based on the title and abstract analysis. In case there was not unanimity among the team (two researchers were working in parallel), discrepancies within the team were discussed and resolved, also going through a full text read of the paper. Finally, a total of n. 33 studies were deemed relevant. Then, we obtained the full-text article for eligibility assessment. In addition, through backward and forward search, and recurring to most cited articles, we identified other additional articles (n.13). A total of n.46 articles was analyzed.

As anticipated, we used an electronic sheet to extract the data and to response to the purpose of our paper. Therefore, first we systematized the manuscripts considering the pertinence to some general information, as year of publication, journal, type of article, etc. Then, we extracted the information related to the dimensions and sub-dimensions proposed by Bauwens et al. (2022). Bauwens et al. (2022) identified various sub-dimensions related to the meaning of community: outcome, process, identity, actor, network, place, scale, technology. Then, the second category divides the energy-related community activities in three groups: supply-side activities, such as energy generation and distribution; to demand-side activities, including energy use, energy efficiency measures, and information and dissemination; integrated activities, when the two different sides are combined. Finally, the last category of observation are the objectives pursued by the communities. These could be various, such as economic, environmental, social, political, and infrastructural, or energy autonomy. In the second step of our content analysis, we add extraction dimensions, such as managerial and financial issues, failure and barriers, and other factors, essential to the purpose of our research.

Through the full-text analysis for the extraction of the data, we identified articles that were not fitting our purpose and we deleted them. The final number of articles used for the Systematic Literature Review was n. 39.

Results. *The analysis of selected paper is still ongoing. Therefore, we present some preliminary results.*

Most of the articles were published in the last decade with an increase in the last years, especially 2022. Both data indicates that the field of study has raised an increasing interest of scholars. At the same time, the concept of RECs has been developed and adopted in Europe but is not present in papers investigating experiences of energy communities (also non-renewable: i.e., with diesel power plant) or the involvement of local communities in the implementation of energy stand-alone installations in African countries. Finally, regarding the type of renewable energies (REs) studied,

the analysed papers mainly focus on solar and partially on hydro and hybrid powerplants (with diesel generator or biomass). Other REs are really rare, such as wind. Geothermal energy is absent.

Regarding the framework adopted from Bauwens et al. (2022), the dimension “meaning of communities” is generally not deepened in literature. This can be related to the type of articles (most of them are techno-economic studies). Considering the sub-dimensions “actor” and “network”, studies analyze mostly rural communities of villages, where the prevalent activities are related to agriculture and fishing. Regarding the scale observed, it includes micro-grid, off-grid, mini-grid, with plants that are small-scaled. Regarding “energy-related community activities”, they indicate a prevalence in use in comparison with production. Most frequent use purposes are domestic, agriculture, cooking purpose, but also water pumping, and some little business activities.

The dimension “objectives pursued by the communities” is giving interesting results. Environmental objectives are not the prevalent ones: REs are used because of their availability, not for sustainability reasons, even if some effects are of course beneficial for the local communities (i.e. clean cooking technologies). Economic objectives are pursued through REs, especially related to the possibility of enhancing the wealth of local communities, allowing commercial activities and businesses. Social objectives, directly pursued or indirectly resulting, are wide. Among the others, gender inequalities are reduced; education for children is more accessible; safety during dark hours is improved. Finally, political objectives are pursued, through the participatory approach described in a few articles. Other effects experienced by the local communities were enhancing people’s sense of well-being, through the possibility of communication and entertainment.

Regarding managerial and financial issues, what emerges is that there is not a unique or prevalent management model adopted represented in literature, while rather a variety of tentative solutions are proposed. Some scholars (Ambole et al. 2021) argued that “the sophisticated business models used by energy communities in the Global North (peer-to-peer, prosumer-to-grid, and organised prosumer group models) are not - yet - replicable in SSA” because of a lack of regulatory framework allowing to govern such complexity. In relation to the regulatory and policy aspects and business models, it has been observed that off-grid sector development plans in SSA have opened up the market for business and created opportunities for companies to innovate (Trotter, & Brophy, 2022).

Experiences of the involvement - with a real responsibility - of local communities in the management of the plant are present, such as, i.e., the creation of a village energy team, properly established and trained (Ahlborg, 2018). Local communities were also involved in the initial investment for the plant, even if not covering the total amount. Butu et al. (2021) promotes Community Based Organisations - groups of individuals with a common goal, are mainly formed to help otherwise poor individuals aggregate capital for varying purposes - with an active role in managing and financing the plant, also in contrast to banks that often charge farmers relatively high maintenance fees, even on their savings account.

Ensuring financial sustainability of the project is still a challenge, especially for the high investment cost of some components of installations, such as, i.e., batteries (Barelli et al., 2019; Camblong et al 2009; Gammon, & Sallah, 2021), or lack of funding - considering the diffused poverty of the rural context. Nevertheless, the willingness has been observed to be high in some rural villages (van Gevelt, 2016) and this can be an enhancing factor for their development.

Finally, other soft barriers are present, such as lack of skills to ensure the managing of the project at the end of the donor’s supervision, impeding the long-term perspective. In most of these projects, local communities are inadequately resourced to institute and manage their own projects (Ambole et al. 2021). In addition, regulatory barriers such as lack of a legal, regulatory and institutional framework promoting renewable energy communities hamper the implementation of projects.

Research limitations. The paper is affected by some limitations. First, the concept of RECs is not still directly addressed in scientific papers investigating initiatives for the development of renewable energies in rural and remote African context. Therefore, this literature review might overlook existing cases of RECs in African countries and already reported in grey literature. Second, our sample focused only on English scientific articles and published in journals as listed in Scopus and Web of Science.

Managerial implications. The paper provides a framework for implementing a management model to be replicated in rural and remote areas in African countries. Moreover, this study highlights the needs in terms of knowledge, financial resources, and technologies for developing effective renewable energy stand-alone initiatives in African countries.

Originality of the paper. The study contributes to the management field addressing both the new concept of RECs and a new field of research related to managerial aspects associated with the effective implementation of RECs in rural and remote areas. Moreover, to the best of our knowledge, there are not systematic literature reviews on this field.

Innovative nutraceutical products on the market: an acceptability evaluation of recently developed functional foods^{*}

GRAZIANO ABRATE^{*} ELIANA BAICI[•] CLEMENTINA BRUNO[▲]
GILDA LUTRI^{**} CINZIA MAININI^{••}

Framing of the research. Nowadays, consumers show a higher level of awareness, with respect to the past, in making their purchasing choices in the food market. In particular, consumers increasingly look for food products able to accomplish not only their basic functions related to nutrition (primary function) and sensorial satisfaction (secondary function), but also a tertiary function related to physical and mental wellness preservation and diseases prevention.

In this context, the market for functional foods is growing and developing. The functional food concepts emerged in the Eighties, in Japanese studies, but the precise meaning of the term is still ambiguous and not linked to a unique definition, also in relation to the dynamicity of the market and the continuous development of new products. A useful framework, in this sense, comes from Diplock et al. (1999): a food is “functional” if, for its nature or as a consequence of a particular process, shows a composition that is judged as beneficial for health. The definitions apply both in positive sense (in terms of presence of particular nutrients) or in negative sense (free from or with reduced content of elements potentially harmful for health). Functional foods represent a subset of nutraceutical products, a category that includes also food supplements. The difference between the latter and the former relies on the fact that supplements are additional elements for nutrition, rather than being foods themselves. Moreover, they also appear as different from functional foods since they are distributed in pre-measured forms.

The market for functional foods has experienced a noticeable expansion starting from the first decade of the XXI century. Following a literature review of the year 2014 (Özen et al., 2014), in Europe the distribution of functional food consumption was quite heterogeneous: in Countries such as Finland, Poland, Sweden, Cyprus and Spain these products were commonly consumed. In Italy, Belgium and Denmark they were not. Indeed, notwithstanding the awareness about the links between health and nutrition, for the Italian market, however, in that period the knowledge of nutraceutical products was limited, but with consumers showing a positive attitude towards the new product (Annunziata et al., 2009; Annunziata and Vecchio, 2011). Later studies, for Italy, demonstrate that not all the nutraceutical characteristics are equally important in driving consumer choices; moreover, more educated consumers tend to show higher attention towards the intrinsic products characteristics and to be more loyal to the brand. An issue, however, is represented by the negative role of price in driving consumers’ choices (Boccia and Punzo, 2019).

In parallel, issues related to the environmental sustainability of current approaches to food production have been widely debated in the recent years (Reisch et al., 2013), and Italian consumers show a certain sensitivity to this issue: for instance, Annunziata et al. (2019) find that households more used to the Mediterranean diet are more likely also to buy organic and local foods. Environmental attitude sometimes involves preferences related to other (non-nutritional) characteristics, such as packaging (Vergura et al., 2020).

In this context, the project XXX, funded by XXX, aims at applying, within an integrated platform, bioeconomy concepts to the production of functional foods and nutraceuticals, in a circular economy framework. The project, that involves academics belonging to different University and Departments, as well as several firms active in the food supply

^{*} This work was funded by Regione Piemonte and European Regional Development Funds within the Bioeconomy Platform "NUTRAcore" 333-128 (POR-FESR 2014-2020).

chain at local level, with different food specialization, adopts an interdisciplinary approach and aims at developing new nutraceutical ingredients to be included in innovative food products. At the time of writing, the project is in its ending phase, and the market evaluation of some representative products is ongoing and almost reaching the end of the data collection process. Therefore, this short paper describes a work-in-progress research. Most of the contents of this paper is included, or will be included, in the project deliverables (reports).

Purpose of the paper. This paper aims at presenting the result of the eighth work package (still work-in-progress) of project XXX, focused on the evaluation of the acceptability, by the market, of some innovative food products chosen among the output of the project, i.e. some final products incorporating the nutraceutical ingredients developed within the integrated bioeconomy platform that represents the object of the itself.

With the acceptability evaluation we aim at assessing which features are potentially relevant for consumers and, among these, we will focus on the role played both by the intrinsic characteristics of the products, especially in relation to their health purposes, and by the price.

Three types of questionnaires have been developed and distributed to different targets: potential consumers who have not tasted the products, consumers involved in direct trials under medical supervision, pharmacies.

The primary source of information is represented by questionnaires to potential consumers who have not tasted the products. This questionnaire mainly relies on closed-ended questions and choice scenarios, providing a detailed textual description of the innovative products characteristics. The questionnaire has been distributed online.

This information is complemented by a questionnaire (based mainly on closed-ended questions) distributed to a sample of responded directly involved in the medical trials of few of the final products, i.e. the use of some of the products for nutrition under medical supervision. In this case the questionnaire requires an evaluation after tasting the products.

Finally, another online questionnaire has been distributed to the pharmacies in the area of reference. The questionnaire is theoretical (products are presented by a verbal description only), organized with closed-ended and open-ended questions (the latter aimed at collecting, for instance, professional opinions on the products) and aims at assessing how the operators of one of the potential distribution channels evaluate the market perspectives of the products.

Among the products developed within the project, a set of product has been selected for testing; the selection criteria are related to the following points:

- Although the product is innovative, it has to be realistically described (together with its characteristics) to potential consumers who have neither seen nor tasted it yet;
- For consumers' evaluation, the product must have a "standard" (non-functional) alternative in the market to be compared with.

As mentioned, the variable to be tested mainly refer to the products characteristics and price, the latter also intended as consumers' willingness to pay for the products itself.

The products for which we will provide an empirical evaluation are:

- Different kinds of biscuits, whose receipts include different nutraceutical elements;
- An ice cream with probiotics;
- Legume pasta, with high concentration of proteins;
- Tomato mousse, with balanced omega 6 / omega 3 ratio, designed for people with eating problems.

Notice that, due to the particular products characteristics or to their development phase, not all the products have been tested in all the three questionnaires.

Methodology. In acceptability study, it is common to rely on questionnaire for consumers, where the respondent are asked to express their opinion or their appreciation in different way. It is common to ask to express the appreciation towards (or the importance of) certain characteristics assigning a score on a scale. Descriptive statistical analysis or statistical tests can subsequently be run on such data. For a similar approach, see for instance Bouasla et al. (2016), for pre-cooked gluten free pasta with legume flour; Hooper et al. (2019) for gluten-free fresh pasta with dry bean flour; Jayasena and Nasar-Abbas (2011) for pasta with lupin flour; Mridula et al. (2011) and Ramírez-Jiménez et al. (2017) for snack bars. We rely on this approach for the questionnaires addressed to the pharmacies and for respondents who tasted the products under medical supervision.

As to the questionnaire to potential consumers, we will rely on a consolidated methodology able to provide reliable evaluation of consumers' preferences, as well as (as long as a monetary characteristic is included in the analysis) the willingness to pay (WTP) for a product with specific features. The approach rely on choice experiments, where respondent are asked to choose what they would prefer among different scenarios defined on the basis of product characteristics (attributes), potentially presented with different levels. Since the data are collected by asking consumers how they would behave in certain situations, and not by directly observing their behavior on the market, choice experiments are often classified within stated preference methods. This approach is common for the evaluation of non-market goods (Louvière, in Bennet and Blamey, 2001), but can be employed with effectiveness also for other goods, including foods with particular characteristics (see Van Loo et al., 2011, for an application to organic chicken breast) and functional foods (Moro et al., 2015, evaluating an enriched yogurt; Boccia and Punzo, 2019, evaluating mini-drinks).

For the econometric analysis of choice experiments data, a widely used model is represented by the conditional logit model (McFadden, 1973; for the model definition we refer to Franses and Paap, 2001, whose notation is maintained).

The conditional logit model is suitable for modelling respondent discrete choice with more than two options (i.e. the situation in which the respondent has to define one preference among more than two alternatives), if some of the explanatory variables take values that differ across the options themselves (In our case, respondents are asked to compare each functional product with a “standard” (i.e. non-functional) comparable alternative. In addition an opt-out alternative is provided, allowing respondent of not preferring none of the product). Individual specific variables can also be included.

In simple case of a single regressor, the model expresses the probability that respondent i choses the option j , given the value assumed by a certain explanatory variable $w_{i,j}$ (and the element related to the intercept) as

$$Pr [Y_i = j | W_i] = [exp (\beta_{0,j} + \gamma_1 w_{i,j})] / [\sum_{l=1}^J exp (\beta_{0,l} + \gamma_1 w_{i,l})] \quad (1)$$

The model can be generalized in order to include several explanatory variables. When one of the variable captures a monetary attribute, such as price, the related coefficient can be employed for assessing the willingness to pay for a product with certain characteristics and, possibly, WTP can be correlated also with respondents characteristics.

In addition to the choice experiments sections, the questionnaire for consumers includes a wide section devoted to evaluate the general respondents' opinions and attitudes with respect to the relationship between nutrition and health, nutraceutical products and functional food, as well as environmental issues related to food consumption.

Results. At the time of writing, the data collection process is still not completely concluded and data analysis represents the next step.

With respect to the questionnaire to potential consumers, preliminary findings show a high variability of choices in the experiment, but with a certain level of acceptance of the scenarios proposing the functional food option.

As to the questionnaire based on products trials and from the questionnaire for pharmacies, the number of observations available from will not be sufficient for multivariate statistical analysis or for testing. The results, however, will provide descriptive insights useful for achieving a deeper understanding about the market potential of the products. For instance, with respect to the questionnaire for consumers tasting the products under medical supervision, preliminary results show a certain appreciation towards the products (in general, respondents like or do not dislike what they have tasted), but a limited propensity to buy the product if it was available on the market. In this sense, the price level represents an issue, although some respondents definitely states that the product do not correspond to what the usually prefer for consumption.

With respect to pharmacies, preliminary results suggest that most of the proposed products are actually perceived as new, with limited competitors on the market. The findings about the importance of the product characteristics are mixed, but sensorial attributes and price seem to play a relevant role.

Research limitations. A limitation of this research will be probably represented by the low response rate to the online questionnaires, that probably would prevent the possibility of applying inferential statistic analysis to the sample of pharmacies. With respect to the questionnaire to potential consumers, instead, the number of responses seems sufficient for econometric analysis, although the representativeness of the sample is not granted at the moment of writing.

Managerial implications. Notwithstanding the issue related to the samples dimension, we believe that our analysis will satisfy its primary purpose of giving insights on the expected behavior of consumers and distributors (pharmacies) if (or when) the considered products would be launched on the market, supporting the producer choice related to pricing and target market segment.

With the awareness of the limited generalizability of our results, our findings could represent a contribution to the empirical evidence on the attitude of Italian consumers with respect to nutraceuticals and functional foods, that could represent a support for other producer or marketers.

Originality of the paper. Our work will provide an updated contribution to the relatively scarce empirical evidence related to the attitude of Italian consumers towards functional foods and their willingness to pay. A strength of our contribution relates to the fact that we assess a plurality of new (and innovative) products from multiple perspectives (consumers tested through the online questionnaire, describing products they have not tasted; consumers who have tasted some products under medical supervision and therefore know that they are good for health; pharmacies used to dealing with consumers looking for the best, and often the cheapest, products to improve their health). This multiplicity of information sources will allow us to get a more complete evaluation of the market potential and of the target segment for the (possible) commercialization of the considered products

Keywords: functional foods, consumer preferences, acceptability.

Nutrition, Marketing and Consumer Behaviour: a systematic bibliometric analysis

CHIARA BACCHILEGA* SILVIA BELLINI* DAVIDE PELLEGRINI* SIMONE AIOLFI**

Framing of the research. *Individuals that do not meet the recommended standard of fruits and vegetables (F&V) intake are at a higher risk of mortality (Gustafson et al., 2019; Glabska et al., 2020), obesity (Moran et al., 2019; Gustafson et al., 2019; Sutton et al., 2019; Charlebois et al., 2023), diabetes (Moran et al., 2019; Charlebois et al., 2023), heart diseases (Moran et al., 2019; Gustafson et al., 2019; Glabska et al., 2020) and some type of cancer (Moran et al., 2019; Gustafson et al., 2019; Charlebois et al., 2023). Furthermore, the absence of F&V in a diet contributes to a worsening of mental and social health (Charlebois et al., 2023; Glabska et al., 2020), thence F&V's important role in the treatment of mental illnesses (Glabska et al., 2020).*

Researches show that the consequences of a low intake of F&V do not only fall on the person but also on the healthcare costs of a country (Charlesbois et al., 2023; Ekwaru et al., 2017). For example, UK and Australia estimated the economic burden of a diet poor in F&V of, respectively, \$AU 269M in 2008 and £4.9M in 2006 (Ekwaru et al., 2017): considering that in most countries the optimal consumption of F&V still has not been reached (Yi et al., 2022; Polksky & Garriguet, 2020; Lin & Morrison, 2016), it is possible to assume that the burden is as substantial for most countries.

Numerous F&V have been considered as 'superfood', term used to identify foods with major health advantages, and their benefits come from the presence of vitamins, phytochemicals (Arumugam, 2021) fiber and complex carbohydrates (Glabska et al., 2020). Since the rise of healthcare expenses, governments have acknowledged the importance of a diet rich in F&V (Charlebois et al., 2023), but behaviors are difficult to change, especially if considered that differences among high-income and low-income population exist: the low-income bracket usually has a restricted budget and the most affordable choices in a grocery store are typically unhealthy options (Engel & Ruder, 2020; Sutton et al., 2019). The disparity between low-income and high-income individuals has been tried to be mitigated with the introduction of programs such as the American Supplemental Nutrition Assistant Program (SNAP), introduced in 1939, that give access to healthy food to the low bracket, using subsidies (Engel & Ruder, 2020). Taking into example the United States, even though SNAP is the costliest American program, serving more than 40 million individuals (Wilde, 2013), Americans still do not meet the recommended intake of fruits and vegetables (Kalmpourtzidou, 2020).

A change in the quality of diet at a young age is able to determine a reduced risk of diseases in the future, so, another factor to consider is the importance of F&V consumption in children and teenagers, also considering that children, teenagers, and students reportedly do not consume the recommended portions of F&V (Yi et al., 2022). Determinants of the underconsumption could be unavailability of F&V at home and scarce parental intakes (Moran et al., 2019). Despite most people make food purchases' decisions in supermarkets (Payne et al., 2014), this context is not ideal for F&V because of their perishability, time needed to cook the food, and minor promotions in comparison to branded products (Yi et al., 2022). In addition, COVID-19 played a drastic role in shaping consumers' shopping expenditures: purchases were not only influenced by personal choices and habits but also by social distance requirements. Thus, the sensorial experience started to be lacking, with a spill-over effect on the F&V department, which is, by nature, particularly sensitive to physical touch (Otterbring, 2022). However, Aksoy et al. (2021) affirm that the pandemic also had a positive unintended consequence, that is a growing interest in a healthier nutrition, related to the ingredients of foods and in order to have a strong immune system.

Besides the proven effectiveness of money incentives, as 2-for-1 (Moran et al., 2019), discounts (Moran et al., 2019; Sutton et al., 2019; Olstad et al., 2017; Waterlander et al., 2013) and coupons (Moran et al., 2019; Sutton et al., 2019), Shopper Marketing is another way to increase F&V purchases (Sutton et al., 2019). Shopper Marketing is defined by Shankar (2011) as the "planning and execution of all marketing activities that influence a shopper along, and beyond, the entire path to-purchase, from the point at which the motivation to shop first emerges through to purchase,

consumption, repurchase, and recommendation". Regarding Shopper Marketing, there are different types of interventions that are often effective in promoting both purchasing and consumption of F&V, such as POP materials (Gustafson, 2019; Sutton et al., 2019; Fergus et al., 2021), grocery cart interventions (Payne et al., 2014; Payne et al., 2015, Wansink et al., 2017), taste tests or cooking demonstrations (Fergus et al., 2021; Sutton et al., 2019), and store layout (Shankar et al., 2011, Cardinali, 2009). Recently, researchers have also become more interested in the topic of nudging (Yi et al., 2022; Vecchio & Cavallo, 2019; Gonçalves et al., 2021; Broers et al., 2017), defined by Thaler and Sunstein (2009) as "any aspect of the choice architecture that alters people's behavior in a predictable way without forbidding any options or significantly changing their economic incentives" or more simply 'gentle pushes'. Nudges are important because intentions do not always turn into behaviors (Aiolfi et al., 2023) and they are able to modify the choice environment, with the goal of orienting individuals' behaviors, without imparting an order (Broers et al., 2017) or forbidding options (Yi et al., 2022). The effectiveness of nudges on F&V was verified in a meta-analysis proposed by Broers et al. (2017), that affirms that, among the different nudges available, to alter placement and to use combined nudges are the most effective ones for F&V. Furthermore, Gonçalves et al. (2021) study shows that nudges applied to F&V affect in a positive way the individuals considered as less healthy, whilst individuals considered healthy were negatively affected. Vecchio and Cavallo (2019) put in doubt the long-term effectiveness of nudges, but also keeping in mind that studies usually only evaluate short-terms results.

Purpose of the paper. Shopper Marketing, Nudging and Money Incentives are ways to increase purchases of fruits and vegetables in grocery stores. The purpose of this short paper is to frame the state of art on health problems and of in-store interventions aimed at enhancing healthy food choices providing a map of Keyword Co-occurrence, in order to confirm or deny the recent interest in new ways to increase fruits and vegetables purchase and consumption. The paper also aims at providing useful direction for future research in the field. The study proposes the following research questions:

RQ1: What is the evolution of the literature on Nutrition, Marketing and Consumer Behavior?

RQ2. Which are the most influential areas, countries and sources that have published documents on the research topic?

RQ3. What are the new trends on the topic?

Methodology. Although our work should be considered a preliminary effort to a deeper analysis, a systematic literature review approach was considered the most appropriate approach to analyze past research, in a way that is easily replicable. The topic of F&V has been studied from a social, economic and healthy perspective.

To better investigate the topic, we conducted a systematic bibliometric analysis, that uses statistical techniques to assess qualitative and qualitative shifts in a particular scientific field (De Bakker et al., 2005). Data mining was carried out on Web of Science (WoS) in February 2023, while the Data Analysis was conducted on VOSviewer version 1.6.19, defining the theme of health and food, via the following research query:

TITLE-ABS-KEY

Nutrition OR Health* OR Chronic Disease*

PUBLICATION YEARS

2015-2023

The results of the Data Mining were analyzed in terms of title and abstract to discard ambiguous or irrelevant results. In conclusion, from 756 contributions only 368 documents were used as the final dataset. A summary of the skimming process is presented in Figure 1. Based on these articles a preliminary analysis of their main characteristics has been carried out, by examining the Research Areas, the main Countries of Publication and the most Relevant Sources. Research Areas have been identified on WoS in the "Web of Science Category" section, while the main countries of publication and the most relevant sources have been identified on VOS Viewer.

An activity of data cleaning of the keywords identified by VOS Viewer was carried out on Excel to aggregate singular and plural versions of the same words and to aggregate acronyms and respective meanings.

Fig. 1: Data Mining Process

Source: Own elaboration

Results. The first set of findings are related to the analysis of the main characteristics of the articles selected for the VOSViewer Keywords Co-occurrence Analysis. The characteristics explored are Research Area, Country of Publication and Most Relevant Sources. The second set of findings is an analysis of the Keyword Co-occurrence Analysis followed by a definition and explanation of the clusters identified.

Research Area

To comprehend better who is interested in the topic analysed, Table 1 reports the articles published based on the research area. Nutrition & Dietetics is the most interested knowledge field, with 315 articles published, probably because the topic has a strong relevance with Food and with Obesity prevention and cure. Joining Nutrition & Dietetics in the theme of health there are the following research areas: Diabetes, Social Psychology, and Healthcare Policy. A cluster of areas could be found combining Smell & Taste Science, Neuroscanning, and Neuroscience: for example, in the Smell & Taste Science most articles dealt with labelling and shelf positioning, these kinds of articles give useful insights to understand whether different packaging or shelf allocation are valid methods to help consumers make reasoned choices. A smaller but still relevant group of knowledge fields is represented by: Management, Economic Theory and Economics. Lastly, a research area that might stand alone is Agricultural Policy that mainly deals with sustainability.

Tab. 1: Research Area

Research Area	Articles
Nutrition & Dietetics	315
Smell & Taste Science	12
Agricultural Policy	8
Social Psychology	7
Neuroscanning	6
Management	6
Diabetes	5
Healthcare Policy	4
Economic Theory	3
Neuroscience	1
Economics	1

Source: Own elaboration on Web of Science results.

Country of Publication

Figure 2 illustrates a representation of the number of articles produced in different countries. As seen in the figure the country that produces most articles is the United States (228), followed by England (50), Australia (40) and Canada (35). The United States also is the country that collaborated with most of the other countries represented. A strong connection is present between Canada, Australia and New Zealand and the Netherlands.

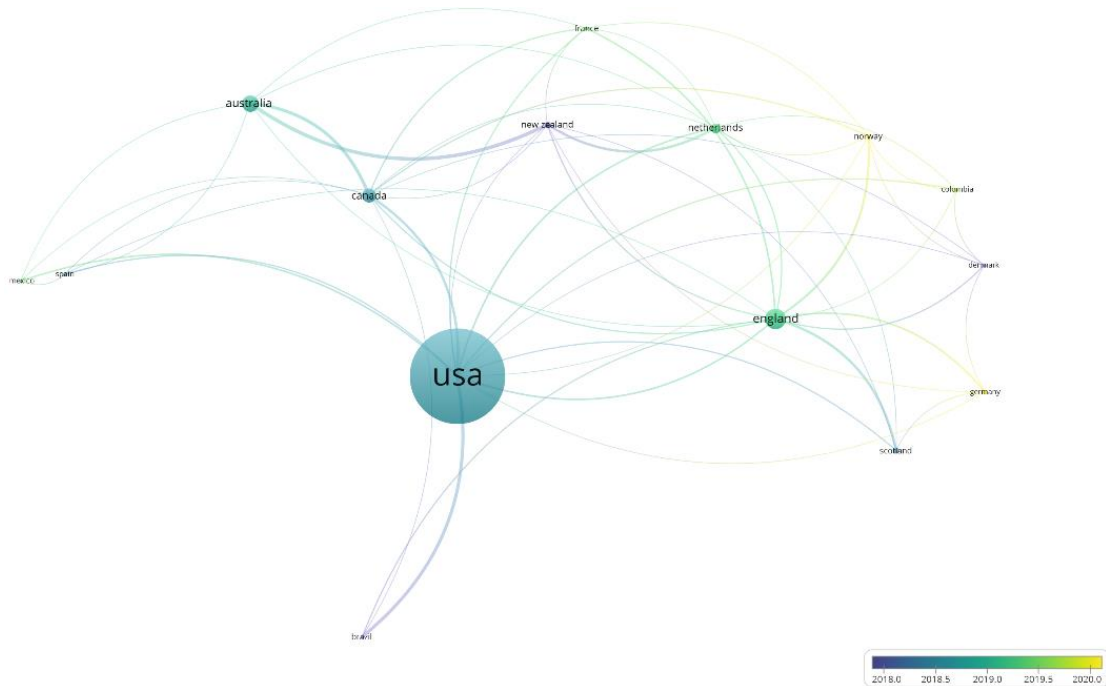

On the other hand, the Fig. 3 represents a graph of the countries that produced documents but based on the time when they were published. Based on the selected period of time, New Zealand and Denmark are the two countries that started to publish, while Norway, Germany and Colombia are the last countries that joined the conversation, and this might justify their small number of documents produced.

Most Relevant Sources

Table 2 shows the most cited journals based on the most relevant sources. If we look at the number of documents produced the top three sources are: *Public Health Nutrition* (47), *International Journal of Environmental Research and Public Health* (47) and *Nutrients* (30). However, it is notable that if we look at the citations per source, the rank is considerably different and the top three are *Public Health Nutrition* (1090), *International Journal of Behavioral Nutrition and Physical Activity* (607) and *Bmc Public Health* (458). All the sources are primarily focused on Health; some also have a component of Behavioral Nutrition.

Tab. 2: Most Relevant Sources

Source	Documents	Citations

Keywords

Only 36 keywords met the threshold (with a minimum number of occurrences of 14 for a keyword). The keywords and their occurrences are presented in Table 3. The top 3 keywords are those who appeared the most and can be considered the focus of interest of the literature and they are Obesity (166), Fruits and Vegetables (103) and Intervention (90).

Tab. 3: Keyword Co-occurrence Analysis

Keyword	Occurrences	Total Link Strength
Obesity	166	542
Fruits and Vegetables	103	411
Intervention	90	282
Food Environment	82	301

Clustering

VOS Viewer identified four clusters that are summarized in Table 4. 7

Tab. 4: Clusters and Items

Cluster	Name	Color	N° of Items	Keywords
1	In-store Intervention	Red	16	Behavior, Choice, Consumers, Disease, Financial Incentives, Food Choice, Food Environment, Food Purchases, Grocery Store, Intervention, Nudging, Perception, Price, Public Health, Socioeconomic Status, Supermarket
2	Vulnerable Groups	Green	12	Accessibility, Communities, Corner Store Intervention, Disparities, Environment, Food Store, Fruits and Vegetables, Healthy Food, Low-Income, Neighborhood, SNAP, Vegetable Consumption
3	Nutrition	Blue	7	Association, Children, Diet Quality, Health, Obesity, Store, Weight
4	Food Desert	Yellow	1	Food Desert

Source: Own elaboration on VOS Viewer

The first cluster is named “In-store Intervention”, it is the biggest cluster and it includes a vastity of keywords that can be connected to the step to develop an in-store intervention: from the analysis of the context (Public Health, Disease, Food Environment, Socioeconomic status, Behavior) and of the placement (Grocery Store, Supermarket) to the different available levers (Financial Incentives, Choice, Food Choice, Price, Perception). One particular keyword that emerged is Nudging, its appearance, even if small, confirms the emergence of this technique in relation to the theme of Health and Nutrition.

The second cluster is called “Vulnerable Groups” and it includes 12 items. The articles in this cluster deal with the disparities that exist, in terms of income, as the literature suggested different levels of income lead to diverse healthy food intakes. The most relevant keyword in this cluster is fruits and vegetables, sustained also by the presence of SNAP, that is the Supplemental Nutrition Assistance Program funded in the 1930s in the United States to give low-income individuals access to a better diet via subsidies to buy healthy food, such as fruits and vegetables.

The third cluster includes the most occurrent keyword, that is Obesity, it is composed by 7 items and mainly deals with health and nutrition matter. An important keyword of this cluster is Children, in fact many articles are focused on child obesity prevention and cure.

The last cluster is abnormal due to its composition. There is only one keyword: Food Desert. Food deserts are particular areas that do not have access to healthy and/or affordable food, they exist in socio-economically disadvantaged regions (Beaulac et al., 2009), however this item might stand alone since their existence and their meaningful influence on health and nutrition is debated (Zhen, 2021).

The results of the analysis suggest that marketing-related interventions, such as financial incentives, shopper marketing activities like corner store intervention, and the most recent nudging are relevant tools to increase the consumption of healthy food, such as F&V. Still, there are many obstacles that might prevent the effectiveness of those strategies: disparities in the population, socioeconomic status, food deserts, food environment, prices are just a few of the barriers to a decent quality diet.

Research limitations. This study is not without limitations. First, it represents a preliminary study of a larger research project. Second, we focused on findings based on keywords and we did not provide an exhaustive analysis of all the articles. Also, given the great extent of existent documents we also had to consider mainly articles and we selected a restricted time frame. Lastly, in order to provide a greater validity of the results, an empirical analysis would be needed.

Managerial implications. Although the managerial implications are based on partial results, we expect development of future research in the topic. In details, the present analysis on the research areas and the main sources demonstrates how the theme has been primarily observed in a medical optic. This paper confirms the existing gap of the topic in the marketing area: since the existence of the problems defined in the framing of the research and the scarce results obtained with traditional promotion that did not lead to an increase in consumption of healthier food, it is evident the necessity of exploring the potential of new techniques, such as Shopper Marketing and Nudging. In fact, the results suggested the emergence of new trends that companies should consider to be able to influence consumers towards the transition to a better quality of life. The theme of obesity, and chronic diseases in general, is relevant, and it does not only have a downfall on the individual, but it is a problem that concerns the entire society. Supermarkets under this point of view have an important strategic role that they must not take lightly, in fact most food choices are taken inside grocery stores. This is why, given its characteristics and relevance, the department of F&V should be considered more.

Lastly, governments and policy makers should put more effort in helping the vulnerable groups with more subsidies and incentives, because the existent social and economic disparities do not allow the same access to healthy food to all individuals.

Originality of the paper. *The literature on the theme of Nutrition, Health and relative Marketing Intervention is vast. However, to the extent of our knowledge, ours is the first attempt at trying to define the state of art of the chosen intersection of topics through the use of the VOS Viewer Software. The originality of the paper must be found in the selected method of analysis, also considering that, until now, the topic has been mainly studied under a medical perspective, while we have opted for a multi-disciplinary approach. To stimulate correct consumer behaviors, in fact, it is necessary to consider the knowledge coming from marketing and behavioral economics, in our case namely related to shopper marketing and nudging.*

Digitalizzazione del settore healthcare e soluzioni di intelligenza artificiale. Un'analisi esplorativa

FRANCESCO SCHIAVONE* DANIELE LEONE* ANNA BASTONE* FEDERICA ZEULI**

Inquadramento della ricerca. L'emergenza sanitaria causata dalla pandemia di COVID-19 ha posto le basi per una radicale trasformazione del panorama sanitario. Lo shock di questa crisi ha sottolineato il ruolo fondamentale della digitalizzazione dell'assistenza sanitaria e dello sviluppo dell'e-health. L'intero ecosistema, infatti, deve essere in grado di adottare innovazioni per gestire la vasta gamma di dati disponibili, da cui estrarre le informazioni critiche per supportare un processo decisionale intelligente anche per le soluzioni di marketing (Zainuddin et al., 2013; Annanpera et al., 2015; Kraus et al., 2021; Iyanna et al., 2022). Ciò ha portato ad un ampliamento dei campi di applicazione delle soluzioni basate sull'intelligenza artificiale (IA) (Leone et al., 2022; Cannavale et al., 2022). L'IA è "l'intelligenza delle macchine, in contrapposizione all'intelligenza degli esseri umani o di altre specie viventi" (Weng et al., 2001; Meskò et al., 2018; Musacchio et al., 2020). L'intelligenza artificiale può anche essere definita come lo studio degli "agenti intelligenti", ovvero qualsiasi agente o dispositivo in grado di percepire e comprendere ciò che lo circonda e di conseguenza intraprendere azioni appropriate per massimizzare le possibilità di raggiungere i propri obiettivi (Wooldridge and Jennings, 1995; Wang, 2019; Dyer-Witheyford, 2019).

La digitalizzazione in sanità introduce vantaggi significativi nelle relazioni medico-paziente e nel coordinamento tra i vari attori coinvolti nell'ecosistema sanitario (Panch et al., 2018; Payne et al., 2018; Leone et al., 2021; Schiavone et al. 2022). L'indagine MIT-BCG del 2017 sui report IA riporta che il servizio clienti/pazienti è la seconda area funzionale più coinvolta. Queste tendenze sottolineano l'urgente necessità per i manager di applicare modelli nuovi e su misura per la progettazione di soluzioni di intelligenza artificiale che migliorino i servizi, le esperienze, i viaggi e i punti di contatto dei clienti/pazienti nel loro viaggio di cure, il cosiddetto "patient journey" (Robbins et al., 2013; Håkansson Eklund et al., 2019).

Un primo punto critico per lo sviluppo di tali modelli è realizzare, dal punto di vista manageriale, quale sia la tecnologia IA più utile per la progettazione e la gestione della patient experience e del journey. Come riportato in precedenza, l'IA è un dominio molto ampio, un termine generico sotto il quale sono compresi diversi rami tecnologici, soluzioni e servizi (Agrawal et al., 2019; Copeland, 2020). In effetti, i rami dell'intelligenza artificiale si riferiscono all'apprendimento automatico (ovvero apprendimento profondo, supervisionato, non supervisionato), apprendimento di processi naturali (ovvero estrazione di contenuti, classificazione, traduzione automatica, risposta a domande, generazione di testo), sistemi esperti, visione (ovvero riconoscimento di immagini, riconoscimento automatico visione), discorso (ovvero discorso a testo, testo a discorso), pianificazione e robotica (Simon, 2019; Siala and Wang, 2022). Tuttavia, le tassonomie tecniche non forniscono informazioni utili e dirette ai professionisti del marketing su ciò che queste tecnologie possono fare per i clienti. Una nuova tipologia di IA, recentemente apparsa nella letteratura sulla ricerca sui servizi, risolve questo problema. Questa categorizzazione delinea quattro tipi di IA (Huang and Rust, 2018). La più semplice è l'"intelligenza meccanica", adatta alla routine e comune. Il secondo livello si riferisce all'intelligenza e si chiama "intelligenza analitica", attraverso la quale i computer elaborano le informazioni per risolvere problemi e imparare da esse. Il terzo tipo di AI è l'"intelligenza intuitiva": in questo caso, le macchine possono pensare in modo creativo e fornire nuove soluzioni ai problemi. L'ultima e più sofisticata forma di intelligenza artificiale è l'"intelligenza empatica" mediante la quale le macchine apprendono e adattano il loro comportamento e la loro decisione in base all'esperienza. I quattro tipi di intelligenza artificiale possono migliorare notevolmente le funzioni e i meccanismi di funzionamento di qualsiasi punto di contatto tra l'organizzazione e i suoi clienti/pazienti.

Un'altra variabile critica da considerare per progettare servizi di IA efficaci sono i dati (disponibili per l'azienda o acquistabili dai fornitori) che la tecnologia deve elaborare per creare e offrire esperienze soddisfacenti ai clienti/pazienti in termini di co-creazione di valore (Vargo et al., 2008; Marcos-Cuevas et al. 2016; Mele et al., 2018).

* Ordinario di *Economia e Gestione delle Imprese* - Università degli Studi di Napoli Parthenope.

** Dottoranda di *Imprenditorialità e Innovazione* - Università degli Studi di Napoli Parthenope.
e-mail: federica.zeuli001@studenti.uniparthenope.it

Il valore dei dati per la gestione della patient experience è ben noto. Ovviamente, i dati sono cruciali anche per qualsiasi servizio di intelligenza artificiale i cui dati sono il suo principale “input”. In generale, ricercatori e professionisti delle scienze sociali, come il marketing, possono prendere in considerazione più livelli di analisi e fonti di dati per sviluppare teorie o informare i processi decisionali, ossia: 1) dati a livello micro, che riguardano gli individui; 2) dati di livello meso, che si riferiscono a comunità, organizzazioni e categorie sociali (ad esempio, i sessi); 3) dati di macrolivello, che riguardano la società e il contesto istituzionale. L'attuale ascesa del paradigma digitale dei big data mostra che in diversi settori non solo le fonti di dati a livello micro (ad esempio, i clienti) ma anche a livello meso e macro sono molto importanti per la progettazione di servizi basati sull'intelligenza artificiale (Musacchio et al., 2020; Haefner et al., 2021).

Obiettivo del paper. Questo studio mira a proporre un quadro concettuale sui principali driver che hanno contribuito alla trasformazione digitale del settore healthcare, infatti, la domanda di ricerca è: “In che modo l'IA contribuisce al miglioramento del patient journey nel settore healthcare? Per raggiungere questo obiettivo, abbiamo seguito diversi passaggi. Il settore healthcare è stato raramente indagato dal punto di vista del miglioramento del patient journey grazie all'utilizzo di nuove tecnologie come l'IA.

Innanzitutto, abbiamo eseguito una review della letteratura sull'intelligenza artificiale e le sue diverse tipologie; successivamente, abbiamo sviluppato speculazioni teoriche (King e Walsh, 1993) incentrate sul ruolo dell'IA nel settore healthcare. L'analisi ha permesso di aggiungere una panoramica della produzione letteraria e del conseguente mutamento temporale che caratterizza questo argomento. Introducendo la letteratura sull'innovation management, è essenziale sottolineare il cambiamento sistematico e fondamentale nel modo in cui le imprese intraprendono attività innovative di organizzazioni coinvolte in settori di servizi. L'approccio esplorativo attraverso casi studio ha permesso di identificare alcuni filoni di ricerca (es. miglioramento nella customer/patient relationship management) che aiutano a chiarire le direzioni dello studio di settore. L'obiettivo è sviluppare un conceptual framework per indagare il ruolo dell'intelligenza artificiale come strumento a supporto delle relazioni sopra menzionate nel settore healthcare ormai digitalizzato.

Metodologia. Per affrontare la domanda di ricerca, il nostro studio utilizza un approccio qualitativo attraverso l'analisi di casi di studio (Yin, 2017). Questo approccio metodologico è fondamentale quando l'ambito della domanda di ricerca è “come” e quando l'indagine riguarda eventi contemporanei. Eisenhardt (1989, p. 534) ha attestato che gli approcci esplorativi sono adatti quando la ricerca “si concentra sulla comprensione delle dinamiche presenti all'interno dei singoli contesti”.

Abbiamo realizzato una selezione orientata all'informazione di tre casi estremi con lo scopo di indagare le migliori pratiche che adottano regolarmente le diverse tipologie di IA, concentrandosi in particolare sul settore healthcare.

I costrutti implementati in questo documento per analizzare come le soluzioni di IA supportano il miglioramento di servizi in ambito healthcare sono: (1) la complessità del settore esplorato in termini di collaborazioni e relazioni tra i diversi attori coinvolti (ad esempio policy makers, decision makers, pazienti, aziende sanitarie e farmaceutiche) e (2) le diverse iniziative di IA dei diversi attori coinvolti.

Le molteplici fonti di prova sono state triangolate per migliorare il valore e la solidità dei costrutti, infatti, abbiamo esplorato (Yin, 2017): 1) dichiarazioni dei manager 2) osservazioni dirette e artefatti fisici 3) documentazione online e documenti d'archivio ufficiali. La sezione dei risultati fornisce dettagli approfonditi.

In particolare, attraverso le dichiarazioni dei manager, abbiamo analizzato le modalità di utilizzo dell'IA per capire se questa tecnologia potesse migliorare il patient journey nel settore healthcare.

Attraverso osservazioni dirette, abbiamo analizzato le attività dei manager e altri attori coinvolti nelle soluzioni di IA durante le diverse fasi del patient journey. Infine, per rafforzare la nostra indagine, artefatti fisici (ad es. medical devices di IA) e altra documentazione online (ad es. stampa specializzata) hanno contribuito ad arricchire la raccolta di dati e la comprensione dei benefici e dei rischi promossi da questa tecnologia nel contesto healthcare digitalizzato.

Di seguito le informazioni principali sui casi selezionati:

- “Alira Health” (<https://alirahealth.com/>) è una società di servizi globale che fornisce un set completo di dati incentrati sul paziente e servizi tecnologici (es. soluzioni basate sull'intelligenza artificiale) per accelerare l'innovazione nel settore sanitario. L'azienda riunisce esperti negli Stati Uniti, nell'UE e in altri mercati con una profonda conoscenza delle caratteristiche locali del settore in termini di costruzione e sviluppo del mercato sanitario globale. Una divisione di Alira Health Ventures è impegnata in investimenti in nuovi prodotti e società nel mercato focale.
- Fondata nel 2015, “Pieces Technologies” (<https://piecestech.com/>) è un'azienda statunitense di tecnologia dell'informazione sanitaria e sociale, con sede a Dallas, che sviluppa software per l'analisi e la gestione dei dati dei pazienti in tempo reale. Pieces Technologies ha sviluppato due principali soluzioni basate sull'intelligenza artificiale. Innanzitutto, Pieces DS aiuta gli ospedali e i sistemi sanitari con l'uso dell'archiviazione dei dati nel cloud. L'obiettivo di questa soluzione basata sull'intelligenza artificiale è duplice, ovvero identificare un problema di salute in modo più rapido ed efficiente, oltre a fornire cure immediate al fine di massimizzare la co-creazione di valore tra fornitori e clienti. La seconda soluzione basata sull'intelligenza artificiale è Pieces IRISTM, un sistema di archiviazione dati che consente ai pazienti di essere assistiti fuori dall'ospedale. Questa tecnologia mette in collegamento le strutture sanitarie e i servizi territoriali, offrendo un programma di supporto oltre che di assistenza sociale nei casi in cui la malattia possa colpire la sfera emotiva. Pieces IRISTM supporta il paziente nello svolgimento delle cure post ospedaliere, migliorando le abitudini di vita per evitare di incorrere in ulteriori problemi di salute.

- “Aiforia” (<https://www.aiforia.com/>) fornisce a patologi e scienziati nei laboratori preclinici e clinici un potente software di intelligenza artificiale di deep learning per tradurre le immagini in scoperte, decisioni e diagnosi. I prodotti e servizi Aiforia basati su cloud mirano a incrementare l'efficienza e la precisione dell'analisi delle immagini mediche oltre le capacità attuali, in una varietà di campi, dall'oncologia alle neuroscienze e altro ancora.

Risultati. I casi analizzati hanno permesso di riassumere i risultati del presente studio in tre direzioni: 1) presenza di approcci “patient-centric”, 2) diagnostica di precisione e intelligent visualization, 3) modelli decisionali predittivi e di co-creazione di valore.

Dunque, i risultati dimostrano che le soluzioni AI sono progettate per consentire informazioni in tempo reale, consentendo ai professionisti di concentrarsi su un pool di pazienti molto più piccolo e ottenere un set di dati chiaro e completo. Inoltre, la raccolta e l'analisi dei dati mostrano che un'immagine più chiara delle informazioni sui pazienti consente una maggiore attenzione all'assistenza personalizzata e alle reali esigenze degli individui. Pertanto, grazie alla diagnostica di precisione e all'intelligent visualization aumenta il coinvolgimento dei pazienti ed evidenzia la necessità per gli ecosistemi sanitari di effettuare un radicale cambio di paradigma adottando un approccio basato sui pazienti e sui loro bisogni e adattando i loro modelli di business ai cambiamenti digitali. Le soluzioni IA non possono essere implementate indipendentemente dalle caratteristiche del contesto organizzativo e dalla gamma di esperienze vissute dall'organizzazione. Per ogni percorso del cliente, la propria gamma di soluzioni AI. Ispirandosi a Pieces Technologies, l'IA si è dimostrata difficile in termini di adozione clinica; quindi, quando si valutano le soluzioni di intelligenza artificiale, è fondamentale garantire livelli molto elevati di valori predittivi positivi e sensibilità a seconda del caso d'uso. Se i medici non si fidano dei risultati dell'IA o se il sistema è troppo sensibile e “eccessivo di allerta”, la soluzione non verrà adottata, soprattutto dai medici. Inoltre, i risultati dimostrano che i sistemi sanitari e le organizzazioni che forniscono i servizi ai consumatori/pazienti si trovano ad affrontare enormi sfide per quanto riguarda la vasta gamma di dati disponibili e la capacità di estrarre le informazioni più importanti che realmente informeranno il processo decisionale intelligente. Data l'enorme quantità di informazioni presentate ai team sanitari, il tempo per prevedere, identificare, attivare e monitorare gli esiti diventa sempre più difficile da gestire durante l'incontro di un paziente senza un sistema intelligente in grado di far emergere approfondimenti pertinenti e attuabili presso il punto di cura.

Limiti della ricerca. L'utilizzo della metodologia del caso di studio potrebbe non consentire la generalizzazione dei risultati ottenuti e può rendere lo studio sensibile al contesto. La ricerca futura potrebbe concentrarsi sull'analisi di casi in diverse località geografiche o implementare una tecnica quantitativa che consenta l'analisi di un campione rappresentativo dell'intera popolazione. Inoltre, la ricerca futura può essere sviluppata considerando la prospettiva di attori normativi di grande reputazione come agenzie governative, società scientifiche e altri decisori per comprendere l'idea istituzionale dell'ecosistema sanitario digitalizzato.

Implicazioni manageriali. Lo studio ha diverse implicazioni manageriali che possono essere preziose per i professionisti del settore per capire come organizzare i loro servizi di assistenza sanitaria in maniera digitalizzata. Ad esempio, gli ospedali potrebbero aumentare la credibilità e la rilevanza delle loro attività condivise sui vantaggi economici ed esperienziali dei loro servizi digitali proposti da un mediatore centrale della piattaforma digitale in grado di creare e fornire valore ai diversi stakeholder coinvolti nell'ecosistema. Inoltre, l'implementazione della sola tecnologia raramente crea risultati migliori e sostenibili a supporto di un ritorno sull'investimento (ROI).

Originalità del paper. Quello che si può apprendere dall'indagine esplorativa del settore healthcare è che le soluzioni IA oggi in ambito clinico richiedono supporto clinico e analitico da parte del fornitore di soluzioni IA per personalizzare, supportare e analizzare ulteriormente i dati oltre le informazioni in tempo reale fornite al team di assistenza. Inoltre, la capacità di iterare e implementare rapidamente nuovi algoritmi per il sistema sanitario dovrebbe essere richiesta anche a qualsiasi fornitore di soluzioni di intelligenza artificiale. Pensare all'IA come a un insieme di tecnologie da scegliere solo in base alle loro prestazioni significa non preoccuparsi dei clienti né tenere conto della natura mutevole delle loro esigenze. Un approccio corretto dovrebbe prevedere una scelta saggia bilanciando il lato performante della soluzione AI e il loro impatto sui clienti, spostandosi sempre più verso soluzioni AI intuitive ed empatiche. Nuove opportunità hanno modellato il mercato delle sperimentazioni digitali sui farmaci, monitorando lo stato dei partecipanti alla sperimentazione, la loro maggiore integrazione nel processo e così via. La scelta dei candidati più adatti ai test, così come il loro maggiore coinvolgimento in ottica di co-creazione di valore, aumenta la possibilità di ottenere risultati più corretti, richiesti dagli stakeholder del settore. A sua volta, la gestione dei dati è un collegamento chiave in un nuovo tipo di generazione di valore, nonché nella fornitura di valore per le parti interessate del settore.

Parole chiave: intelligenza artificiale; digitalizzazione; healthcare; approccio patient-centric.

La comunicazione strategica della sostenibilità come elemento di differenziazione delle imprese e delle destinazioni turistiche¹

ROBERTA MINAZZI* ALESSANDRO PANNO*

Inquadramento della ricerca

Sostenibilità e turismo

Gli studi relativi alla sostenibilità nel settore turistico si sono sviluppati notevolmente negli ultimi decenni sia in ambito manageriale sia nella comunità accademica. In particolare, il tema risulta rilevante sia per le singole imprese del settore turistico che decidono di investire in pratiche orientate alla sostenibilità, anche con l'obiettivo di differenziarsi dai competitor e aumentare il proprio successo di medio lungo termine, sia per le destinazioni turistiche nel loro complesso che risentono, a livello di sistema di offerta turistica, delle azioni dei singoli operatori (Buhalis e Main, 1998; Kozak e Rimmington, 1998; Bohdanowicz, 2005). Alcuni studi infatti identificano l'investimento in pratiche sostenibili per le imprese (EMPs - Environmental Management Practices) una azione che influisce positivamente sia sull'azienda e sia sulla destinazione turistica nel suo complesso (Bagur-Femenias et al. 2015; Buffa et al., 2018). Questo anche in considerazione di una clientela sempre più sensibile al tema della sostenibilità (McClay, 2021), disposta anche a pagare un "premium price" per acquistare servizi ecologici o "green" (Rodriguez-Anton et al., 2012; Chang et al., 2015; Alonso-Almeida, 2018; Buffa et al. 2018). La sostenibilità rappresenta quindi per le imprese e per i territori una importante leva competitività e di differenziazione (Bohdanowicz, 2005; Vadakkepatt et al., 2021). Tuttavia, nonostante il moltiplicarsi degli studi sulla sostenibilità, la letteratura si concentra prevalentemente sugli aspetti più legati alla dimensione ambientale rispetto all'adozione di un approccio multidimensionale che consideri anche le sue altre dimensioni: sociale ed economica (Tölkes C., 2018, Franco et. al., 2021). Inoltre, una maggioranza degli studi si focalizza più sulle pratiche dei singoli operatori del turismo con particolare riferimento al prodotto (Tölkes C., 2018). Meno diffusi gli studi che considerano il tema della sostenibilità anche in considerazione degli effetti delle pratiche delle imprese sull'immagine della destinazione turistica nel suo complesso.

Un'impresa può essere considerata sostenibile se è in grado di sviluppare un vantaggio competitivo durevole, con un ritorno stabile nel tempo, e che garantisce un flusso di valore continuo agli apportatori di capitale e agli altri stakeholders; nel moderno sistema economico, questo vantaggio competitivo è sempre più ricercato nell'utilizzo di risorse immateriali, rinvenibili nei concetti di capitale strutturale e relazionale, quali conoscenze, competenze specifiche, abilità esclusive e sistemi di relazione interna ed esterna, che permettono all'azienda di instaurare relazioni di valore con gli stakeholder primari. In pratica, una strategia sostenibile finalizzata alla resilienza del business, mira a creare valore economico per i propri shareholders, e al contempo a contribuire alla creazione di una società veramente sostenibile in quanto incontra le esigenze delle attuali generazioni, senza sacrificare i bisogni e le opportunità di benessere delle future generazioni. In questi termini, una strategia veramente sostenibile è quella che integra la sostenibilità materiale, in senso multidimensionale, con l'abilità del business-model aziendale di garantire un impatto netto positivo sui valori economici, le risorse ambientali e i valori sociali.

Un'impresa resiliente è quindi in grado di creare valore per gli stakeholder nel tempo, ed è chiamata a monitorare i risultati (in termini di output e di outcome) e gli effetti delle decisioni strategiche intraprese sui processi e sulle risorse chiave che utilizza mediante indicatori di performance (finanziari e non finanziari); comunicare in modo strutturato ed efficace queste attività, e in particolare l'orientamento alla sostenibilità, l'impegno del management e i risultati ottenuti nel gestire i cosiddetti sustainability risk (Environmental, Social and Governance - ESG risk), può divenire uno strumento di differenziazione in chiave di comunicazione strategica. Questi tre criteri ESG danno la misura di quanto un'azienda sia sostenibile e responsabile con riferimento alle tematiche di impatto ambientale, di responsabilità sociale e di adeguati assetti di governance, e sono sempre più spesso anche considerati per valutare la solidità complessiva dell'impresa (Aksoy et al., 2019). Sono esempi di fattori ambientali l'investimento in riduzione delle emissioni inquinanti, l'uso di energia sostenibile, la tutela della biodiversità, ecc. Rientrano nella dimensione sociale la

costruzione di un ambiente interno di lavoro di qualità, l'investimento sulla parità di genere, l'attenzione alla diversità e all'inclusione nella gestione delle risorse umane ma anche il rapporto con i partner dell'impresa e con la comunità nel suo complesso. Infine, il fattore "governance" si riferisce al comportamento etico e trasparente dell'azienda, all'adozione di adeguati e coerenti assetti di governo, in tema anche di concorrenza leale, delle policy adottate e delle procedure di controllo e di misurazione delle performance implementate in azienda.

La trasparenza e l'accountability sulle tematiche ESG è oggi una tendenza sempre più richiesta dai consumatori e dagli stakeholder di riferimento degli operatori di una determinata destinazione turistica, attuali e potenziali; sempre più spesso infatti, nelle loro scelte di consumo, anche i turisti valutano i rischi e la performance ESG degli operatori di una destinazione quando pianificano un viaggio, e pertanto, molte società della filiera di settore stanno allocando quantità crescenti di capitale e risorse per affrontare gli aspetti ESG e aumentare l'attrattiva della propria offerta. Anche gli investitori sono sempre più inclini a valutare la performance ESG di un operatore o l'orientamento alla sostenibilità di una determinata destinazione turistica quando conducono le proprie attività di due diligence finalizzate a valutare l'attrattività complessiva del finanziamento di progetti nel settore turistico.

Nel settore turistico le prestazioni ambientali misurano il modo in cui l'attività aziendale contribuisce al cambiamento climatico, all'inquinamento, alla biodiversità e all'esaurimento delle risorse naturali del mondo. In tutti i settori del turismo, le aziende affrontano altresì una crescente pressione per adottare pratiche socialmente più sostenibili; l'insicurezza e l'instabilità del lavoro nel settore dei viaggi e del turismo è un problema importante. Gli operatori del settore sono sempre più monitorati dagli stakeholder critici interessati ad apprezzare se e come stiano mettendo in pratica ciò che predicano in termini di promozione di condizioni di lavoro eque e corrette, della diversità, dell'inclusività e delle pari opportunità.

La sempre maggiore attenzione a questi aspetti immateriali che definiscono l'esperienza complessiva di un viaggio e caratterizzano, differenziandola, una destinazione turistica da un'altra, è anche riscontrabile dall'affermarsi della tendenza turistica emergente del "viaggio lento", sintomo ed evidenza della ricerca dei viaggiatori di esperienze sempre più significative e autentiche. Il viaggio lento, oltre all'evidente richiamo alla velocità del viaggio e ai tempi di permanenza presso una destinazione, evoca un significato più profondo, più ampio, in quanto il turista che soggiorna nelle destinazioni più a lungo, da conto della sua volontà/esigenza di stabilire una maggiore e più profonda connessione con la popolazione locale, la cultura, il cibo e la musica; ciò significa che viaggiare lentamente è anche più sostenibile per le comunità locali e l'ambiente (Kim et al., 2020). Questo è un ulteriore elemento che la comunicazione strategica della performance sui temi ESG di una destinazione può utilizzare in chiave di differenziazione. Recenti studi evidenziano come i turisti sono sensibili alle tematiche ambientali e sociali, quali la sicurezza, la tranquillità, il tasso di criminalità e violenza, l'integrità del territorio, la stabilità politica o regolamentare, e tendono quindi ad evitare destinazioni con bassi profili di tali fattori (Ballia et al, 2018; Demir and Gozor, 2018; Yap e Saha, 2013).

I viaggiatori di oggi hanno una notevole quantità di informazioni a disposizione per pianificare le proprie scelte di viaggio e di consumo, e sono anche consapevoli dei potenziali tentativi di greenwashing degli operatori di una determinata destinazione turistica; una non corretta, fuorviante o ingannevole disclosure della performance ESG potrebbe creare danni o effetti indesiderati all'immagine dell'azienda o dell'intera località/destinazione. Le imprese turistiche possono quindi pensare di adottare investimenti e attività ESG in chiave funzionale ad affrontare strategicamente e con pro-attività i fattori macroeconomici emergenti, o mega-trends, con l'intento di sviluppare leve di differenziazione rispetto ai competitors; la performance, per quanto riguarda gli aspetti ESG di un'impresa turistica, ha effetti sull'intera destinazione turistica e l'efficace strategia di comunicazione di questa performance può decretare la crescita e il successo della singola impresa ma anche della destinazione stessa.

Da un punto di vista teorico, la performance ESG degli operatori di una destinazione misura quanto tale località ha individuato e presidia i rischi correlati all'impatto ambientale, sociale e di governance degli operatori economici e degli stakeholder di riferimento (Crifo et al, 2017, Berritella et al, 2006, Hamilton et al, 2005); vista la natura iper competitiva del mercato turistico, piccole differenze nelle misure degli indicatori ESG e dei rischi correlati possono generare impatti significativi nelle scelte di consumo dei viaggiatori, e decretare così la preferenza e quindi il successo, di una destinazione rispetto ad una concorrente, caratterizzata da indicatori ESG peggiori o da una peggiore strategia comunicativa di tali performance.

Dall'analisi della letteratura sul tema emerge una prevalenza di studi volti a comprendere come i comportamenti dei turisti/consumatori siano prevalentemente influenzati da fattori di natura economica, quali i prezzi, il reddito, i tassi di cambio, i costi commerciali e di viaggio (Abedtalas e Topras, 2015; De Vita, 2014; Martins et al., 2017; Shafiullah et al, 2018); un minor numero di contributi si sono invece focalizzati sul ruolo degli elementi immateriali, non strettamente economici e correlati agli aspetti ambientali, sociali e di governance, che invece sembrano influenzare notevolmente le decisioni di consumo dei viaggiatori (Aksoy et al. 2022, Kim et Al, 2020). Recenti contributi hanno altresì evidenziato come la pandemia abbia agito da catalizzatore per una maggiore sensibilità alle tematiche legate alla sostenibilità ambientale, sociale e di governance delle aziende e del generale sistema di offerta turistica (Hassan, Meyer, 2022).

La comunicazione strategica della sostenibilità

L'immagine della destinazione, e come questa rappresenti un elemento di differenziazione, risulta un tema di particolare interesse soprattutto per l'influenza che questa può avere sulle scelte dei consumatori (Baloglu e McCleary, 1999; Buhalis, 2000; Beerli e Martin, 2004; Chen e Tsai, 2007, Kapferer, 2012). Come abbiamo precedentemente

argomentato, l'investimento in sostenibilità attuato da una destinazione turistica e dagli operatori di un territorio può contribuire alla differenziazione della propria immagine rispetto ai territori concorrenti (Ekinci, 2003). Questo però viene percepito dalla clientela, e considerato nelle decisioni di acquisto dei clienti, nel momento in cui la destinazione riesce a sviluppare una appropriata comunicazione della propria immagine. Molte imprese del turismo e territori adottano una strategia di comunicazione con un approccio più operativo, ossia utilizzano una serie di strumenti di comunicazione volti alla mera produzione e distribuzione del servizio. Più raro lo sviluppo di una comunicazione integrata e strategica. La comunicazione strategica è considerata un asset fondamentale per le organizzazioni moderne, specialmente quelle di grandi dimensioni. Tale approccio mette in relazione comunicazione, management e attività dell'organizzazione in chiave strategica superando i consueti confini esistenti tra le varie funzioni dell'impresa (Falkheimer et al. 2017). Il focus non è il prodotto in sé ma il brand dell'organizzazione inteso in senso olistico e le relazioni che esso genera con gli stakeholders e la comunità locale. Falkheimer et al. (2017) identifica quattro aspetti che giustificano l'importanza della comunicazione strategica nelle organizzazioni: sviluppare l'efficacia e la fiducia; consolidare, rafforzare oppure modificare l'immagine di marca presso i vari stakeholder; rafforzare e valorizzare l'identità e la cultura aziendale presso i dipendenti; favorire l'apertura e la trasparenza nei confronti delle altre organizzazioni, degli stakeholder e del pubblico in generale.

La letteratura sui temi della comunicazione e relazioni pubbliche sottolinea l'importanza della corporate communication nel processo di creazione del valore dell'impresa (Hallahan et al. 2007; Moss and Warnaby, 2010, Grunig and Grunig, 2011). Invernizzi e Romenti (2015) partendo dalla *Entrepreneurial Organization Theory (EOT)* (Alvarez e Barney, 2004) identificano un unico framework concettuale per integrare le dimensioni chiave della comunicazione strategica. In particolare, secondo gli autori, alle quattro dimensioni del modello EOT (Gatekeeping e networking; Orientamento all'innovazione, Leadership trasformativa; Enactment) corrispondono quattro dimensioni della comunicazione strategica: *Aligning, Energising, Visioning e Constituting*. Le attività di *Aligning* riguardano la comunicazione volta ad allineare le strategie dell'organizzazione con il suo ambiente mediante attività di analisi dell'ambiente e collegamento con gli stakeholder di riferimento. Tale approccio risulta maggiormente sostenibile non solo sul fronte interno ma in relazione alle aspettative degli stakeholder e dei pubblici esterni di riferimento (Lurati e Eppler 2006) perché crea un ponte (bridging) tra l'impresa e i suoi stakeholder (Van den Bosch e Von Riel, 1998). Nella pratica questo si trasforma in coprogettazione di attività e condivisione di strategie. Le attività di *Energising*, riguardano la comunicazione rivolta verso gli stakeholder interni dell'organizzazione. La condivisione degli obiettivi, delle strategie aziendali, soprattutto se è in atto un processo di innovazione, genera maggiore consapevolezza, coinvolgimento e responsabilizzazione del personale nel processo che si traduce nel miglioramento del clima interno e nella collaborazione nel raggiungimento degli obiettivi (Welch e Jackson, 2007). L'attività di *Visioning* riguarda l'azione di comunicazione agli stakeholder di riferimento interni ed esterni dei contenuti della strategia e delle più importanti decisioni aziendali e la comunicazione a supporto del business aziendale. Infine, l'attività di *Constituting*, secondo cui la comunicazione rappresenta un processo costitutivo dell'organizzazione (sense making) che influenza i processi cognitivi di interpretazione dell'organizzazione.

Nell'ambito della comunicazione strategica, la misurazione risulta una parte integrante del processo (Romenti, 2014 e 2016). In particolare, non si tratta della misurazione dei risultati delle singole campagne ma del valore complessivo generato dalla comunicazione a livello funzionale, organizzativo e sociale. Esistono vari tipi di misure della comunicazione. Le misure formative legate ai risultati di efficienza che misurano la capacità di raggiungere gli obiettivi (es. rapporto attività/output). Particolare rilevanza ricoprono le misure legate al capitale intangibile della comunicazione che presenta sei dimensioni: umana (competenze e skills delle risorse interne); relazionale (rete di relazioni interne ed esterne); organizzativa (stile di comunicazione e management interno che facilitano la comunicazione); narrativa (le conversazioni e le storie collettive relative all'impresa); reputazionale e di immagine (branding).

Vari studi hanno dimostrato che gli standard ESG prevedono una comunicazione generalmente diretta agli stakeholder (investitori e policy makers) più che alla clientela (Fernandez-Feijoo et al., 2014; Ioannou and Serafeim, 2017) mediante strumenti quali il Bilancio di Sostenibilità e l'Integrated Reporting. La comunicazione non si traduce quindi in corrispondente percezione da parte della clientela (Aksoy et al. 2022). Oltre a identificare le metriche per misurare la sostenibilità, le imprese dovrebbero essere in grado di comunicare la propria immagine e il proprio orientamento alla sostenibilità a tutti gli stakeholder, compresa la clientela attuale e potenziale, e la comunità locale. Esiste quindi un gap fra investimento dell'azienda in pratiche sostenibili e lo sviluppo della corrispondente comunicazione volta allo sviluppo della percezione di tali iniziative da parte della clientela (Peloza et al., 2012). Sul fronte della comunicazione, i clienti non riescono a cogliere il collegamento di come questi indicatori riflettano delle pratiche che impattano sulla loro effettiva esperienza (White et al., 2019). Inoltre, quando esistente, l'attività di comunicazione degli indicatori ESG è di tipo operativo e si concentra su singoli aspetti del servizio rispetto a considerare la sostenibilità come un elemento parte integrante dell'identità di un'impresa e di un territorio. Dall'analisi della letteratura, per quanto di nostra conoscenza, non esistono studi scientifici che applicano i concetti e le pratiche di comunicazione strategica alle imprese turistiche e alle destinazioni con particolare riferimento alla comunicazione della sostenibilità.

Obiettivo del paper. Alla luce delle considerazioni precedentemente esposte, il paper si propone di applicare l'approccio della comunicazione strategica, generalmente utilizzato dalle organizzazioni, alle imprese turistiche valutandone anche gli effetti sulle destinazioni turistiche. Una prima domanda di ricerca vuole comprendere la capacità di comunicare delle imprese che investono in sostenibilità.

RQ1: Le imprese che investono in sostenibilità (in particolare ESG) sono in grado di comunicare la propria immagine a tutti gli stakeholders compresa la clientela? La comunicazione adottata è adeguatamente percepita dalla clientela?

In particolare, con riferimento al tema della misurazione della comunicazione, partendo dai modelli di misurazione della comunicazione strategica esistenti per le organizzazioni, alcuni indicatori (KPI) sono applicati alla misurazione del valore generato dall'attività di comunicazione strategica delle imprese del turismo con riferimento ai valori quali la sostenibilità ambientale, sociale e agli elementi di governance (ESG).

RQ2: Quali indicatori sono utilizzabili dalle imprese del turismo per la misurazione degli effetti della comunicazione della sostenibilità?

L'applicazione dell'approccio della comunicazione strategica alle destinazioni risulta particolarmente complesso a causa della varietà degli operatori da cui è composta rispetto alla singola impresa, e alla multidimensionalità degli elementi oggetto di misurazione (Pike, 2005). Tuttavia, l'indagine vuole anche comprendere la ricaduta dell'investimento in comunicazione dei singoli operatori sull'immagine della destinazione nel suo complesso.

RQ3: Quale è l'impatto della comunicazione strategica della sostenibilità dei singoli operatori sulla destinazione turistica?

Il contributo intende evidenziare come il crescente interesse verso una rendicontazione strutturata dei rischi ESG da parte delle organizzazioni di impresa, in risposta anche al crescente interesse degli stakeholders, sia un elemento fondamentale nello sviluppo di strategie comunicative efficaci da parte del sistema della destinazione turistica. Ciò anche al fine di sviluppare leve di differenziazione, dei singoli operatori e del complessivo sistema di offerta turistica della destinazione. Al contempo l'obiettivo è definire le modalità di comunicazione della sostenibilità adottate, di norma più operative che strategiche e più rivolte ad interlocutori business che alla clientela finale (Aksoy et al. 2022). Risulta quindi interessante studiare le modalità di comunicazione adottate dalle imprese che investono in sostenibilità (ESG) per indagare le domande di ricerca precedentemente esposte e le potenzialità dell'adozione di un approccio di comunicazione strategica.

Metodologia. *In seguito alla revisione della letteratura è stato elaborato un questionario volto ad indagare le domande di ricerca (RQ1, 2, 3). In particolare, sono analizzate le pratiche ESG di un gruppo di imprese alberghiere che investe in sostenibilità e che ha integrato il concetto di sostenibilità nella propria cultura aziendale, e gli effetti in termini di percezione di tali pratiche da parte degli stakeholder. L'obiettivo come indicato precedentemente è comprendere l'efficacia della comunicazione nei confronti dei vari stakeholder e in particolare della clientela. Il questionario è suddiviso in tre parti: informazioni generali dell'intervistato, valutazione delle attività di comunicazione e delle attività di management suddivise nelle varie dimensioni ESG, effetti della comunicazione sulla destinazione turistica. I questionari sono stati testati su un gruppo di stakeholder e di clientela prima di procedere alla somministrazione.*

Risultati. *La ricerca si trova in fase di sviluppo e si trova ora nella fase di somministrazione dei questionari. Si prevede l'elaborazione dei risultati nel periodo giugno-luglio 2023. Possono quindi essere descritti in questa sezione i risultati che si prevedono di ottenere mediante l'analisi dei dati raccolti.*

Per quanto riguarda la RQ1 ci aspettiamo di riscontrare delle modalità di comunicazione più operative e rivolte maggiormente ad alcuni specifici stakeholder (bilancio di sostenibilità, bilancio integrato) con un gap quindi fra investimento in sostenibilità e rispettiva percezione della clientela. In merito alla domanda di ricerca RQ2 ci proponiamo di rilevare quali indicatori sono adottati dalle imprese per proporre opportuni metriche di misurazione della comunicazione adottando e applicando i modelli della comunicazione strategica con gli opportuni adattamenti. Infine, con riferimento alla RQ3, ci attendiamo un forte collegamento fra le azioni delle singole imprese e la destinazione turistica nel suo complesso con riferimento alle percezioni della clientela. La capacità di comunicare in modo strategico dei singoli potrebbe dunque impattare sull'immagine della destinazione turistica.

Limiti della ricerca. *Un primo limite della ricerca è la contenuta numerosità di imprese coinvolte nell'indagine dal punto di vista: del settore (imprese alberghiere); del livello qualitativo (generalmente di fascia alta); della collocazione territoriale (Nord Italia). Uno step di indagine successivo si propone di ampliare il numero di imprese coinvolte. Inoltre, la ricaduta delle attività di comunicazione sulla destinazione è studiata considerando la percezione che la clientela autonomamente indica nel questionario. Per il futuro potrebbero essere valutate impressioni più spontanee della clientela mediante l'analisi delle recensioni.*

Implicazioni manageriali. *I risultati di questo studio possono essere utilizzati dalle singole imprese del settore turistico per comprendere la percezione in merito alla propria attività di comunicazione, valutandone l'impatto strategico. In base ai risultati dell'indagine le imprese (sia quelle sotto indagine ma anche altre simili) potranno valutare l'efficacia della propria comunicazione strategica e decidere se adottare e comunicare gli indicatori proposti dallo studio.*

Dal punto di vista delle destinazioni turistiche, i risultati dello studio possono essere di interesse per i policy maker e per i responsabili delle attività di governance del territorio per comprendere l'impatto delle strategie dei singoli operatori sull'immagine della destinazione. L'idea del paper è anche quella di contribuire al dialogo fra operatori di un territorio in merito alle più opportune strategie di sviluppo.

Originalità del paper. *Un primo aspetto di originalità riguarda l'approccio multidisciplinare con cui il tema della comunicazione della sostenibilità è affrontato combinando gli studi sulla comunicazione strategica e quelli di management. Un secondo elemento riguarda lo studio della sostenibilità da un punto di vista multidimensionale che consideri non solo quella ambientale, come spesso accade, ma anche quella economica e quella sociale (Tölkes C.,*

2018, Franco et. al. 2021) e con particolare riferimento agli indicatori ESG. Un terzo aspetto riguarda lo studio degli effetti dell'azione dei singoli operatori sull'immagine della destinazione nel suo complesso, spostando quindi il focus dalle singole imprese alla destinazione. Infine, lo studio si focalizza sul ruolo degli elementi immateriali, non strettamente economici e correlati agli aspetti ambientali, sociali e di governance, che invece sembrano influenzare notevolmente le decisioni di consumo dei viaggiatori.

Parole chiave: sostenibilità; ESG; comunicazione strategica; turismo; bilancio di sostenibilità, integrated reporting; destinazione

Il ruolo dei big data nella costruzione della *brand identity*

FRANCESCA CONTE* ALESSANDRA BERTOLINI* ALFONSO SIANO[^]

Inquadramento della ricerca. *Le tecnologie 4.0 generano un'enorme quantità di dati, la cui corretta gestione impatta in modo significativo sulle dinamiche d'impresa (Mandelli, 2017). Controllare e interpretare i dati vuol dire, infatti, intraprendere azioni di digital analytics (Power, 2014; Wheeler, 2016), ovvero svolgere attività ed utilizzare strumenti che consentono la raccolta dei dati, al fine di sviluppare analisi, report, ottimizzazioni e previsioni, da cui discendono verifiche e valutazioni degli stessi, per la creazione del valore d'impresa (Phillips, 2014). In particolare, nell'attuale scenario imprenditoriale e competitivo, i big data si stanno configurando quale presupposto imprescindibile per il decision-making. Essi si riferiscono a grandi volumi di dati generati principalmente negli ecosistemi dei media digitali (Constantiou e Kallinikos, 2015).*

Basandosi sulla teoria della Resource-Based View (RBV), diversi studi evidenziano che i big data esprimono un potenziale per ciò che riguarda la loro funzione di risorse di valore per le imprese (Tien, 2013; Wamba et al., 2015). La corretta gestione, analisi e interpretazione dei big data, mediante strumenti di data mining (Liu e Shih, 2005) e con l'ausilio di machine learning (Bose e Mahapatra, 2001), rappresentano attività fondamentali per la competitività delle imprese (Sivarajah et al., 2017; Elia et al., 2019).

La crescente adozione dell'approccio data-driven nelle decisioni aziendali influenza inevitabilmente le pratiche di comunicazione strategica (Wiesenberg et al., 2017) e di brand management (Kallinikos e Constantiou, 2015; Mikalef et al., 2016). Nella nuova era di branding, focalizzata sempre di più sulla co-creazione negli ambienti digitali, l'ascolto strategico supportato dai dati fornisce importanti indicazioni sulla percezione del brand da parte degli stakeholder, nonché sulle loro aspettative e comportamenti. Tali informazioni consentono di sviluppare relazioni personalizzate tra il brand e gli stakeholder (Yan et al., 2022) e di orientare le strategie di brand building, influenzando la costruzione dell'identità del brand (da Silveira et al., 2013; Kornum et al., 2017; von Wallpach et al., 2017; Essamri et al., 2019).

In effetti, nel corso degli ultimi anni, le recenti ricerche sul branding hanno enfatizzato un approccio partecipativo e multi-stakeholder alla brand identity, interpretandola come un costrutto dinamico e multidimensionale (Kristal et al., 2020), facendone emergere la natura sociale (da Silveira et al., 2013; Wider et al., 2018; Essamri et al., 2019) e polisemica (Michel, 2017). È crescente la consapevolezza che i significati del brand sono il risultato di una varietà, in continua evoluzione e spesso ambigua, di interpretazioni che derivano da una moltitudine di attori coinvolti nel processo di costruzione del brand (Berthon, Pitt e Campbell, 2009). In questa prospettiva, sta emergendo la necessità di rivalutare i tradizionali framework di brand identity (Aaker, 1996; Kepferer, 1992), anche e soprattutto alla luce delle opportunità offerte dall'analisi dei big data.

Obiettivo del paper. *Sebbene nel corso degli ultimi anni la ricerca relativa al branding nell'era digitale stia ricevendo una crescente attenzione, sono ancora piuttosto limitati gli studi che approfondiscono il ruolo dell'approccio data-driven nei processi di cambiamento che coinvolgono il brand (McGuire et al., 2012; Aimè et al., 2022; Conte et al., 2022).*

Parallelamente, la letteratura sui big data si sta focalizzando sull'utilizzo degli strumenti di machine learning nelle pratiche organizzative da un punto di vista tattico (massimizzazione dei risultati di marketing operativo a brevissimo termine), trascurando l'impatto dei digital analytics sulle attività strategiche d'impresa (Grover et al., 2018) e sulla costruzione e gestione del brand (McAfee et al., 2012; Wiesenberg et al., 2017). Di conseguenza, si evidenzia un gap in letteratura su come la datafication possa influire sul processo strategico di brand building, tenuto conto dei cambiamenti che l'identità di marca sta subendo nei contesti digitali stakeholder-empowered.

Alla luce di tali considerazioni, il presente studio concettuale intende indagare il ruolo dei big data, e il loro impatto, nel processo di definizione della brand identity. Inoltre, il working paper si propone di approfondire in che modo i big data possano essere considerati una risorsa strategica per le imprese (Groover et al., 2017).

Metodologia. *Il presente studio si basa sul "theory synthesis design" di Jaakkola (2020). Attraverso la sintesi e l'integrazione di due flussi di letteratura, relativi al branding e ai big data analytics, vengono esplorate e ampliate le basi teoriche della brand identity, grazie all'adozione di un'unica prospettiva (MacInnis, 2011), ossia la teoria della*

Resource-Based View (Wernerfelt, 1984; Barney, 1991; Peteraf, 1993). Tale lente teorica, coniugando gli studi di branding e di big data analytics, consente di concepire non solo il brand, ma anche i big data, come risorsa strategica in grado di creare valore per l'impresa e di sostenere il vantaggio competitivo (Mata et al., 1995; Groover et al., 2017). In ottica delle caratteristiche individuate dalla RBV, i big data sono una risorsa aziendale (Grover et al., 2017; Zhang et al., 2020):

- preziosa: le informazioni di valore derivanti dai big data consentono all'organizzazione di sviluppare nuove opportunità di business;
- rara: l'integrazione dei diversi dati (esterni ed interni) sono difficilmente reperibili dai competitor;
- inimitabile: i competitor non possono imitare, acquistare o sostituire ad un prezzo ragionevole le informazioni ottenute dai big data a livello aziendale;
- incorporata a livello organizzativo (*embedded*) e non sostituibile: la combinazione dei big data con altre risorse e capacità è integrata nei processi aziendali e non può essere sostituita da una risorsa alternativa.

La sintesi teorica proposta nel working paper consente una rilettura della Corporate Brand Identity Matrix (CBIM) di Urde (2013), che funge da strumento per esaminare l'impatto dei big data sulla costruzione della brand identity. Il framework di Urde è stato selezionato per la chiara distinzione tra le componenti interne, centrali ed esterne dell'identità del brand. Come tale, permette di coniugare le prospettive "outside-in" e "inside-out" e consente un approccio di definizione e allineamento della brand identity orientato al mercato, al brand o combinato (Urde, 2013). L'approccio orientato al mercato viene avviato considerando gli elementi esterni, vale a dire la value proposition, le relationship e il position. Nell'approccio brand-oriented, gli elementi interni (mission e vision, culture, competence) e il core (brand value e promise) costituiscono la base e il punto di partenza del processo di brand identity building. Nell'approccio combinato, infine, si considerano in modo integrato tutte le componenti della CBIM di Urde, presupponendo che la definizione di ciascun elemento si rifletta su quella degli altri e sul core, posto al centro della struttura di brand identity.

Risultati. La rilettura del framework di Urde, alla luce degli studi relativi all'approccio data-driven, fa emergere il ruolo d'impatto dei big data, in quanto risorsa strategica secondo la RBV, sulla costruzione dell'identità del brand. Tale impatto supporta la definizione delle componenti esterne (value proposition, relationship, position) e interne (mission e vision, culture, competence) e si riflette sul core, elemento centrale nella CBIM.

Nel modello di Urde, la value proposition è "the combinations of appealing arguments directed to customers and non-customer stakeholders [...] that should lead, consistent with a brand core, to a favourable relationship between customers and a favourable reputation" (Urde, 2013, p.753).

Adottando la lente della RBV, le indicazioni derivanti dai big data rappresentano una risorsa preziosa in grado di creare valore aziendale, in quanto consentono il miglioramento dei processi organizzativi, dell'esperienza del cliente e delle performance dell'impresa (Grover et al., 2018). I big data supportano i processi di innovazione del business model, creando modelli di business data-driven (Urbini et al., 2019; Teng e Lu, 2016) e agendo sullo sviluppo di una nuova value proposition, considerata uno degli elementi chiave dello stesso (Chesbrough e Rosenbloom, 2002; Osterwalder, 2004; Johnson et al., 2008; Woerner e Wixom, 2015). I digital analytics consentono infatti di raccogliere i feedback dei clienti e di interpretare una serie di informazioni che, oltre a permettere le strategie di profilazione, forniscono alle imprese input utili per adeguare tempestivamente l'offerta del proprio prodotto o servizio sulla base della domanda attuale e potenziale (Feng e Guo, 2018). Pertanto, con il supporto dei big data, si possono creare e veicolare nuove proposte di valore più in linea con le esigenze dei consumatori e più attrattive per ciascuno dei segmenti serviti. L'analisi dei big data fornisce inoltre informazioni sui prodotti e servizi dei concorrenti del settore, sui benefici attesi e sui costi della proposta di valore ipotizzata (Teng e Lu, 2016)

L'elemento della relationship del framework di Urde si riferisce al "the way an organization with brand delivers service to its customer, works with them and relates to them needs to be reflected in the corporate brand identity" (Urde, 2013, p. 753).

Nel contesto dello stakeholder relationship management, i dati generati e ottenuti nelle relazioni con i dipendenti, clienti, fornitori, ecc. rappresentano una risorsa inimitabile, in accordo con la RBV (Grover et al., 2018), che favorisce la creazione di valore all'interno e all'esterno dell'impresa, permettendo di sviluppare relazioni più efficaci con gli stakeholder. Una maggiore e migliore analisi, interpretazione e adozione dei dati consente di migliorare la corporate communication (Invernizzi e Romenti, 2013; Siano et al., 2015), facendo emergere nuovi approcci: data-driven supply chain nella comunicazione di filiera (Yu et al., 2016); data-driven human resource/talent management nell'ambito della comunicazione interna e di reclutamento (Sparrow et al., 2015) e del data-driven marketing connesso ai flussi di comunicazione rivolti ai clienti (Garg et al., 2011). La comunicazione di marketing è sicuramente quella che appare più matura per quanto concerne l'adozione dei big data analytics e che sembra offrire maggiori prospettive di crescita futura in termini di personalizzazione delle relazioni con i clienti (customer relation) (Wedel e Kannan, 2016). Inoltre, i big data supportano i sistemi di Customer Relationship Management, facilitano l'ottimizzazione delle strategie di engagement, migliorano l'esperienza dei clienti, in particolare la personalizzazione dei servizi e dei customer service (Anshari et al., 2019.; Zhang et al., 2020), nonché il customer lifecycle value (Columbus, 2016; Lee, 2017).

Nella CBIM di Urde, l'elemento del position "defines how management wants the corporate brand to be positioned in the market, and in the hearts and minds of key customers and non-customer stakeholders" (Urde, 2013; p. 746).

I big data, in quanto risorsa rara nella prospettiva della RBV, agiscono sul posizionamento ricercato dall'impresa in duplice modo. Innanzitutto, essi supportano il processo di ascolto delle opinioni e del livello di gradimento dei consumatori rispetto ai benefici offerti dal brand, migliorando così il posizionamento competitivo dei brand (Tirunillai

e Tellis, 2014; Sheng et al., 2017). Il social listening, ovvero l'ascolto sistematico dei social media, ad esempio, consente una migliore comprensione di come gli stakeholder percepiscono i valori e gli attributi (significati) connessi al brand (Aimé et al., 2022). Grazie ai big data e al social listening, il monitoraggio dell'ambiente esterno (in particolare della rete) potrebbe perciò contribuire alla ridefinizione o al rafforzamento del brand position. Attraverso l'analisi dei big data, il brand può essere, dunque, posizionato in modo più accurato e dinamico (Feng e Guo, 2018).

In secondo luogo, l'adozione dei big data analytics costituisce un segnale dal punto di vista simbolico, in quanto comunica agli stakeholder l'innovatività del brand, migliorando la sua percezione e ottenendo sostanziali effetti reputazionali derivati dal "signaling effect" (Clemos et al., 2017; Grover et al., 2018).

I big data, considerati come risorsa incorporata nell'organizzazione non sostituibile in linea con la RBV, va a impattare anche sulle componenti interne necessarie alla costruzione della brand identity, ossia sulla mission e vision, sulla cultura e sulle competenze.

La mission è fondamentale per l'identità del brand (Urde, 2013), in quanto rappresenta la ragion d'essere di un'organizzazione, al di là degli obiettivi puramente economici (Collin e Porras, 1998). Nell'approccio orientato al brand, la mission rappresenta tipicamente un punto di partenza nel processo di definizione della brand identity (Urde, 1994). La vision estende la mission, illustrando i principi ispiratori dell'organizzazione nella proiezione futura (de Chernatony, 2010). Nella costruzione dell'identità del brand, la mission e la vision sono fattori di commitment (Senge, 1990). I big data sono risorse incluse nella strategia d'impresa a lungo termine (Grover et al., 2018), considerato che supportano la definizione della mission e della vision. Sfruttare il valore dei big data ai fini della comprensione dell'evoluzione del contesto e del mercato di riferimento, consente di trasformare la vision e la strategia dell'impresa (Jobs et al., 2016).

Prendendo in considerazione la prospettiva di Urde (2013) relativa alla cultura, essa può essere intesa come l'insieme degli atteggiamenti, dei valori, delle credenze e dei comportamenti dell'impresa (Hatch e Schultz, 2001; Schroder e Saltzer-Morling, 2006). Da un punto di vista strategico, la cultura rappresenta un elemento di differenziazione e un potenziale vantaggio competitivo, in quanto fonte di ispirazione del brand e dei suoi prodotti/servizi e mezzo di comunicazione (Brexendorf e Kernstock, 2007; Kapferer, 2012). Grazie all'integrazione strategica dei big data nelle dinamiche d'impresa, è possibile configurare una corporate culture data-driven (Zhang et al., 2020). In accordo con Kiron e Shockley (2011), una cultura data-driven si basa su presupposti quali: i dati vengono considerati come una risorsa intangibile che ha valore per l'organizzazione; i membri del top management enfatizzano e sostengono l'analisi dei dati quando assumono le decisioni; l'impresa utilizza la tecnologia dei big data per ottenere approfondimenti data-driven.

Infine, Urde (2013) include le competenze come elemento particolarmente importante nella definizione dell'identità del brand. Esse comprendono le conoscenze, le capacità, i processi di un'organizzazione e le core competence (Prahalad e Hamel, 1990). La combinazione dei big data con altre risorse e capacità organizzative (conoscenze analitiche, talento umano, competenze ed esperienze con gli strumenti avanzati di gestione e analisi) fornisce un nuovo modo di sostenere il vantaggio competitivo, in quanto costituisce anche una risorsa rara, specifica per ogni settore e unica per ogni contesto d'impresa (Grover et al., 2018). Inoltre, l'adozione delle tecnologie abilitanti e l'utilizzo dei big data analytics stanno cambiando i profili professionali ricercati nell'impresa e stanno comportando un ampliamento delle competenze che includono la data science (Loebbecke e Picot, 2015). Quest'ultima può essere descritta come un set di regole fondamentali che supportano e guidano l'estrazione delle informazioni e della conoscenza a partire dai dati (Provost e Fawcett, 2013).

I big data agiscono pertanto sulla componente interna ed esterna (extended identity) e, di conseguenza, tale impatto si riflette sul "core" che riassume l'essenza dell'identità del brand.

Limiti della ricerca. Lo studio presenta le limitazioni tipiche di un paper concettuale, costruito su base meramente deduttiva, a partire dalla letteratura disponibile in materia. Le future ricerche dovrebbero esplorare i risvolti empirici. Si rende opportuno perciò indagare, in modo più dettagliato e specifico, il legame tra big data e branding, approfondendo se e come le organizzazioni utilizzano i big data nei processi di costruzione della brand identity. Per tale scopo, si potrebbe adottare un approccio metodologico integrato quali-quantitativo, mediante web survey e interviste in profondità con i manager di branding. Inoltre, sulla base degli input proposti nella rilettura del modello di Urde, future ricerche potrebbero focalizzarsi su nuovi e innovativi modelli di brand identity in grado di valorizzare il set degli strumenti 4.0. Infine, future ricerche potrebbero indagare il ruolo della comunicazione strategica nei processi delineati, considerando l'importanza delle attività di ascolto organizzato e strategico-riflessivo, dirette ad orientare la corretta assunzione delle decisioni strategiche (Siano et al., 2015).

Implicazioni manageriali. Dallo studio possono derivare, sul piano delle implicazioni manageriali, indicazioni e suggerimenti per le pratiche di branding nell'era dei big data. Innanzitutto, la revisione del framework di Urde proposta può accrescere la consapevolezza nei manager che un utilizzo dei big data come risorsa strategica può impattare sui processi di costruzione dell'identità del brand. Il brand manager, infatti, può avere indicazioni su come i big data possano supportare la definizione delle componenti esterne ed interne e, di conseguenza, del core. In particolare, i brand manager, attraverso l'analisi dei big data derivante dall'ascolto degli stakeholder, possono sviluppare nuove proposte di valore per favorire business model innovativi e rafforzare il posizionamento competitivo del brand (Sorescu, 2017). Inoltre, analizzando l'insieme delle interazioni dell'utente con il brand (attraverso le e-mail, le newsletter, i canali social), l'impresa può trarre informazioni utili in tempo reale sul comportamento dei clienti, fondamentali per impostare campagne multicanale di marketing più puntuali e precise, nonché messaggi tarati sulle esigenze di specifici target (Cheung et al., 2003).

Con l'integrazione dei big data nel contesto organizzativo, i brand manager possono predisporre anche le basi di una cultura data-driven che può aiutare il top management ad assumere decisioni lungimiranti che migliorano la competitività dell'impresa (Gupta et al., 2018; Sistla e Babu, 2013). Infatti, la cultura data-driven consente al brand di fornire ai propri stakeholder servizi ed esperienze personalizzate, raggiungendo livelli superiori di fidelizzazione e, di conseguenza, sviluppando relazioni efficaci a lungo termine con i pubblici (Helfert et al., 2002; Iglesias e Saleem, 2015).

Infine, l'introduzione dell'approccio data-driven nella costruzione della brand identity mette in luce la necessità di condivisione dei big data nell'ambito di tutte le funzioni organizzative e di formazione di team collaborativi (Horst e Duboff, 2015; Taylor et al., 2017). Per facilitare l'integrazione dei big data nei processi di brand, infatti, è necessario un costante dialogo e cooperazione tra diverse figure professionali (Chen et al., 2012). Il brand manager necessita, pertanto, di essere supportato dal data-scientist e data-analyst nell'implementazione del framework della brand identity rivisto sulla base dell'impatto dei big data, al fine di riprogettare e ringiovanire i processi di gestione del brand, integrando gli strumenti 4.0 (Yen e Valia, 2013; Taylor, 2017).

Originalità del paper. Il working paper costituisce il primo step nell'ambito di un campo di ricerca non ancora indagato. Lo studio contribuisce ad ampliare il dibattito sullo sviluppo della brand identity multi-stakeholder-oriented supportata da un approccio data-driven. Il working paper, di taglio interdisciplinare, propone una prima rivisitazione della brand identity building nel contesto di trasformazione digitale 4.0. Inoltre, contribuisce a estendere gli studi che, sulla base della Resource-Based View, identificano i big data come una risorsa chiave per l'impresa nei processi di branding.

Parole chiave: brand identity, big data, Resource-Based View, approccio data-driven.

New Ecosystem view: made from the context or for the context

MARIA ANTONELLA FERRI* GIANPAOLO BASILE• MARIO TANI^

Framing of the research. *This work tries to consider and combine evidence such as previously developed concepts and theories on ecosystems that we have selected, acquired, and analysed in relevant literature. This work considers the development and application of this approach in the global context, characterized by an heterogeneous participation usually indicated as the ‘crowd’ phenomenon according to their values, knowledge and intelligence exchanges, and sharing processes between actors and organisations aimed at developing new answers to social and economic needs (Hirschheim, 2008).*

The current changes to the social and environmental dimensions are stimulating several players to activate their knowledge in many different places and from several different perspectives, advancing our learning, and helping us to face the issue at hand (Chesbrough, 2014; Chesbrough, 2020) in a resource-sharing process (Chesbrough, 2003; West & Gallagher, 2006).

The relationships between heterogenous actors have become a source of innovation and it helps the creation of a collaborative context that may favour win-win solutions.

Regarding this trend, the past few years present a literature gap on the motivation of the ecosystem that focuses, prevalently, on the territory structural conditions and on its capacity to create a system of actors and infrastructures able to support the creation and development of innovative business processes (Alvedalen and Boschma, 2017; Spigel, 2017; Nicotra et al., 2018).

Therefore, studies on the evolution of the ecosystem concept carried on focusing their efforts on the structural aspects determining two main perspectives: the ecosystem-as-affiliation and the ecosystem-as-structure.

Moreover, in the last decade, these structural views focused on the form of the ecosystem, recognising the differences between the ecosystems characterised by network and platform affiliations and those identified by the activities their actors carry on in order to create or capture value. Regarding this scientific scenario, the authors tried summarising the ecosystem views in table 1.

In this vein, the more involved researchers, such as Moore (1996), and Iansiti and Levien (2004), consider the ecosystem as a community composed of economic actors (affiliation motivation) promoted by a focal driver firm (defining the structure) to develop innovation for the components and capture value, producing goods and services for consumers who are themselves members of the ecosystem.

The Innovation Ecosystem field (see Adner (2006), Adner and Kapoor (2010), but even other, more recent researchers such as Neumeyer and Santos (2018)) do not see the networking as the structure main characteristic, but it looks at a main mutual objective to focus the actors’ value propositions and reached through the affiliation represented by a multilateral set of partners.

Regarding the relevance of reaching a mutual objective, Adner (2017: 40) argued that this approach focuses on the breakdown of traditional industry boundaries, highlighting the rise of industry’s interdependence and convergence, and pointing out the potential for symbiotic relationships in productive ecosystems. As such, it allows more reflective and inclusive analyses of the complex dynamics of innovation that can link different agents in heterogeneous contexts.

Tab. 1: different ecosystem studies

	<i>Affiliation</i>	<i>Structure</i>	<i>Objectives</i>
Business Ecosystem Moore (1996), Iansiti and Levien (2004)	community composed of economic actors	promoted by a focal driver firm	to develop innovation for the components and capture value
Innovation Ecosystem Adner (2006), Adner and Kapoor (2010), Neumeyer and Santos (2018)	a multilateral set of partners	focal objective to materialise	value proposition

our elaboration

In the authors' opinion, the recent pandemic crisis showed that an emerging social and/or economic ecosystem presents some new characteristics - e.g., it does not necessarily need a specific territory to support its innovations - and that the ecosystem motivation (i.e., its logic) development can be driven by, or it may be tightly related to, social, economic, and environmental needs of a specific territory, albeit a different one (Russell and Smorodinskaya, 2018).

So, considering that the relevant literature is prevalently based on two main concurring perspectives, the structuralist view versus the functionalist one, and the value-capturing (business ecosystems) versus value-creation (innovation ecosystem), in this work, the authors try to show that an ecosystem's ability to take form and create value in social, environmental and economic fields is impacted by the motivation/logic that lead the different ecosystem's actors to create relations between them.

Purpose of the paper. Borrowing from system theories, some researchers acknowledge "generativity" as the ecosystem property letting it show its capacity to produce unanticipated change through unfiltered contributions from broad and varied sets of audiences.

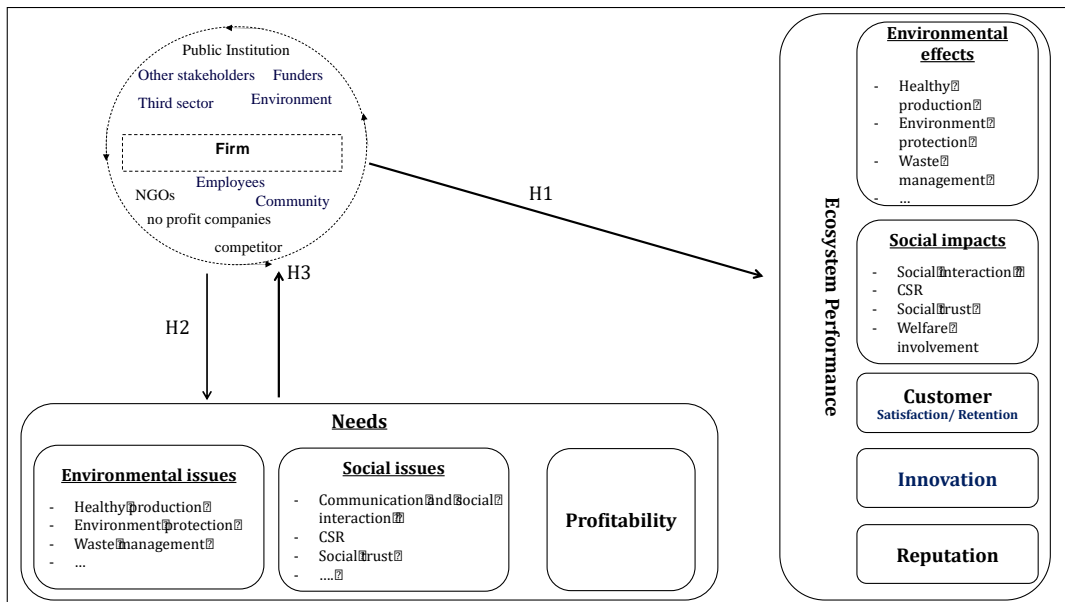

Regarding the system-producing capability, Adner (2017, pp. 42-43) argued that the different actors might have different plans and perceptions and they may use the joint value-creation effort as a general goal. Nevertheless, there are actors on whose participation the value proposition depends, regardless of whether or not they have direct links to the focal firm or the focal objective.

In this scenario, the authors synthesise the ecosystem role as a virtual or real context in which social and economic agents, in relations between them, create, through the interaction of basic activities, new opportunities to innovate to deliver new ways to respond to social, environmental and economic needs. These innovations will eventually lead to value-creation in society as the outcome of an ecosystem reached by intermediary outputs produced by the interaction of basic activities.

Considering that, increasingly, business is enlarging their role, showing social and environmental responsibilities/interests (Czinkota et al., 2020), the work aims to present the ecosystem as a virtual and/or real context where social and economic agents, and end-users share their knowledge to answer to both their own and the contextual social and economic needs by delivering completely new goods or services, or by adapting existing ones in new ways.

The study aims to claim the role of motivation in ecosystem development. The motivation could be based on needs deriving from the context or from the actors' commitment. This effort aims to fulfil a conceptual framework for scientific advancement to contextualise and match the ecosystem knowledge and the businesses' role in socio-economic change (see fig. 1).

Fig. 1: Conceptual framework

our elaboration

In a turbulent world, signed by a growing impact of the climate change and a higher risk of new pandemic crises, the firm's business model has to take into account the social, environmental and economic logic (D'Aveni et al., 2010; Minà et al., 2020). This changing model is fulfilled in strategic and competitive advantages based on shared resources, network externalities, knowledge spillovers, local endowments, and governmental support, creating a need for concepts beyond the firm-specific competitive advantage approach.

Regarding that, the authors argue that ecosystems must be conceptualised as open systems that are:

- hp1: capable of improving the state of another component through sharing or applying resources

On this trend, an ecosystem could be considered self-defined by boundaries, where the species live together in autarky. The boundaries could be physical or not, but they are associated with the engagement that connects the

components. The species, i.e., the agents, absorb both the needs and the necessary resources from the ecosystem and produce critical resources for others, which spillover within and beyond the ecosystem's boundaries.

- hp2: capable of improving the contextual state

Therefore, societal impacts refer to monetary and non-monetary outcomes, i.e., the social boundaries among entrepreneurial ecosystem actors. The social benefits can spillover into delivering new products and services that benefit society. The benefits and impacts may also relate to collective value creation and good public impacts (Cunningham et al. 2018).

- hp3: created according to bottom-up or stakeholdering motivations

The authors argue that the engagement between the different components with different motivations for value creating processes and to participate in the ecosystems processes characterises the ecosystem role as a whole within its specific context. These considerations could be connected to the more relevant business role in addressing social and environmental topics, highlighting two scenarios that differ in the ecosystem type according to the motivation.

Firstly, we could consider an ecosystem composed of related but heterogeneous agents, including businesses motivated by social, environmental and economic objectives. We can identify this scenario as an "ecosystem made for context".

Secondly, the pandemic era presented some cases in which different agents, such as when businesses, hospitals, public institutions and communities were subject to the same lack of surgical masks and/or intensive therapy ones, and they started sharing knowledge and skills to produce, and deliver, the needed answer. In this case, we consider an ecosystem created by a societal motivation that we can label as an "ecosystem made from the context".

Ecosystem made for the context

One of the most felt needs in the main works on the ecosystems as tools for value creation, prevalently the business ecosystem field, is the need for both theoretical and empirical research on entrepreneurs with economic, social, and environmental objectives (Lepoutre et al., 2013; Miller et al., 2012; Roundy, 2017; Thompson and Doherty, 2006).

In this trend, the entrepreneurs combine their multiple logics in strategies translated in different behaviours (ESG, CSR, for Benefit, and so on...), including both a market logic (i.e., an economic one), which emphasises generating profits through the sale of products or services that create value for consumers and a social-welfare logic, which emphasises creating value for groups of beneficiaries influenced by social problems (Dequech, 2013). Entrepreneurs, through the ventures they create in relationships with other social and economic actors, are addressing some of the most intractable problems facing society, such as homelessness, hunger, lack of access to education and medical services, and environmental degradation (Bornstein, 2007; Elkington and Hartigan, 2008; Czinkota et al., 2020).

Regarding those considerations, it could be useful to evoke Roundy's (2017) research that argued the following hypothesis: "As the density of entrepreneurs involved in social matters in an ecosystem increases, the attention to an entrepreneurial ecosystem will increase. So, we can consider that this ecosystem addresses neglected societal problems involving positive externalities".

This definition suggests that while business ecosystems (for example, Silicon Valley and other cases) may generate positive externalities to capture economic value, this type of ecosystem is addressed to the social, environmental and economic value creation.

The current most important case is represented by Openai, an AI research and deployment company aimed to ensure that artificial general intelligence benefits all of humanity.

Its mission is: "...We believe our research will eventually lead to Artificial General Intelligence (AGI), a system that can solve human-level problems. Building safe and AGI is our mission...." (<https://openai.com/research/overview>).

In this context, Openai developed a service produced by heterogeneous ecosystem components named ChatGPT (<https://openai.com/blog/chatgpt>):

hp1: capable of improving the state of another component through sharing or applying resources; "...We are governed by a non-profit, and our unique capped-profit model drives our commitment to safety. This means that as AI becomes more powerful...."

hp2: capable of improving the contextual state; "...we can redistribute profits from our work to maximize the social and economic benefits of AI technology..." that is summarised in the claim: Our mission is to ensure that artificial general intelligence benefits all of humanity (<https://openai.com/>)

hp3: created according to stakeholdering motivations: Developing safe and beneficial AI requires people from a wide range of disciplines and backgrounds linked by a mutual social aim.

Ecosystem made from the context

The current trend is progressively evolving toward a society in which social and environmental problems rise to greater importance: there is a growing wealth inequality, a relevant cutting phenomenon in the welfare field that declares failures at both the market and institutional level, and great advances are taking place in the field of technology and value co-creation.

In this trend, business social awareness arises as a possible solution to these obstacles, characterising a scenario in which critical events are drivers to stimulate different social and economic actors to create relations between them answering to contextual needs (Acs, et al. 2016; 2017; 2018).

Therefore, not only does the main objective of the sensitive to social and environmental issues entrepreneurs imply differences compared to the traditional trade-oriented ones but the reasons for this ecosystem motivation can be affected significantly by the context and provoke relevant stimuli regarding the creation of an ecosystem. Therefore, the determinants of ecosystem motivation are represented by critical events and different levels of social and economic development in the country (Adner, 2006; Adner and Kapoor, 2010; Iansiti and Levien, 2004; Moore, 1993, 1996; Iansiti and Levien, 2004; Teece, 2007; Guittard et al., 2015; Jacobides et al., 2018; Baldwin, 2008).

The cut in welfare expenses, especially in the last decades in capitalist countries, is stimulating the heterogeneous agents' involvement in developing social innovation processes that may help to answer the existing and the new social needs that the COVID-19 pandemic has brought (Mazzucato, 2011). For example, to deal with the COVID-19 pandemic, scientists, pharmaceutical companies, and government officials have launched several initiatives to find an adequate response to the pandemic evolution with an open stakeholder engagement process aimed at innovating and overcoming competitive challenges while satisfying social and environmental needs.

In the first months of the COVID-19 pandemic, Italian hospitals had to face a severe shortage of ventilators engaging several stakeholders, including companies, NGOs, universities, and even individual inventors to mass-produce a new "open" ventilator model, designed using a scuba-diving mask and 3d printing technologies, and tested leveraging not-medical technologies such as and the wind tunnels previously used for designing cars and planes.

In the concrete, Brescia Hospital didn't reach to recover new Covid infected because the intensive therapy respirators were insufficient and contacted an Italian company operating in the 3D printing industry named Isinnova. Innova produced a new respiratory capable of serving two patients supported by a doctor that projected a respiratory valve, Decathlon as a scuba drive masks supplier, and Brescia Hospital implemented the innovative respiratory mask.

hp1: capable of improving the state of another component through sharing or applying resources:

the spontaneous ecosystem improved the hospital's capabilities, increased the community's probability of receiving adequate healthcare, and improved the Isinnova reputation.

hp2: capable of improving the contextual state: *the ecosystem saved human lives even outside the initial territory.*

hp3: created according to bottom-up:

the various actors have started to answer to the local hospital needs and later on distributed the designs for the ventilators as patented-but open source models in order to let other actors in other places both starting producing and modifying it as needed

Methodology. *The research starts from the ecosystem focal literature highlighting gaps in some important aspects and then introducing other theories to bridge the observed gaps, showing the supplementary value (Jakkola, 2020).*

The present work represents a conceptual contribution to systematize the management and literature about ecosystem matter. The scientific effort produced a preliminary conceptual framework to consider how social and economic actors can tackle or be involved in critical events and can contribute to creating or participating in an innovation ecosystem.

Research limitations. *This paper is mostly a conceptual one that may be expanded, both considering more aspects, that the authors are not deemed as relevant and trying to use the resulting model to interpret some real cases.*

Originality of the paper. *The open processes described in this work sharply contrast with some of the rising nationalist trends we had seen in the first wave of the pandemic crisis when several countries did not have got easy access to vaccines, medical devices such as ventilators, masks, or even tests, so they were effectively excluded from participating in these processes. This may be considered as deeply short-sighted as trying to protect a single country may create an environment more sensitive to virus mutations while adopting a global perspective on public health works better - and faster (Chesbrough, 2020).*

Results. *Therefore, the authors argue that the post-pandemic era would imply more responsibilities for decision-makers in implementing new institutional arrangements and stimulating investments needed to drive social and economic trends towards fairer outcomes. Decision-makers must harness the momentum of the fourth industrial revolution to resolve pressing social, health, and environmental challenges, including climate change (Schwab and Malleret, 2020).*

Even if the conceptual framework presented in this paper highlights the benefits of the social open innovation processes, at the same time, it opens the road for some further research avenues. On one side, scholars should investigate how a company may and will implement these processes with a focus on the stakeholder engagement practices and how they can effectively enhance these companies' social role while creating win-win solutions in terms of new organisational forms and/or new business models that acknowledge the new roles of business in the modern society ever more characterized by a trend leveraging on collaborative intelligence and knowledge economy.

On the other side, scholars should look into the hindrances and the obstacles limiting the diffusion of these processes.

Managerial implications. *This is an open call to understand why managers neglect to consider as viable ones those planning approaches that take into account all the impacts derived by the production processes and by the use of the products and can tackle the value creation with a broader approach that is embedded in the vision of the various stakeholders that companies can engage.*

Finally, further research should look into new roles, such as those of the convenors, that may be needed to govern these new processes and to make them a viable option to meet economic goals without sacrificing the social ones at a broader scale.

Keywords: *ecosystem; ESG; engagement; stakeholder theory; innovation; social and environmental impacts*

Can HR analytics improve HR management practices impact on organizational performance? An empirical CB-SEM approach

CHRISTIAN DI PRIMA* ALBERTO FERRARIS*

Framing of the research. *In today's highly competitive business environment, organizations are constantly seeking ways to improve their performance and gain a competitive advantage (Abbate et al., 2019; Behl et al., 2022). To do so, one way that is increasingly deemed as crucial for organizations is to manage their human resources (HR) in a strategic way (Saviano, Maria Luisa et al., 2018; Ramos-González et al., 2022). In fact, to maximize their benefits, the HR practices implemented by organizations have to be aligned with their general strategy (Akwei and Nwachukwu, 2022). In order for this to happen, the HR departments of organizations are relying always more on new digital technologies. Among these, HR analytics has gained increasing attention in recent years (Di Prima and Ferraris, 2022; Margherita 2022). It is defined as «a proactive and systematic process for ethically gathering, analyzing, communicating and using evidence-based HR research and analytical insights to help organizations achieve their strategic objectives» (Falletta and Combs, 2021, p. 54). It is becoming an essential tool for HR professionals and business leaders alike, as it provides valuable insights into workforce trends (McCartney et al., 2021), identifies areas of improvement (Chalutz Ben-Gal, 2019), and helps to inform HR decisions (Marler and Boudreau, 2017). It also enables HR professionals and business leaders to understand employee behavior, to improve workforce planning, and to optimize HR practices to achieve organizational objectives (Tursunbayeva et al., 2018). By leveraging HR analytics, organizations can thus gain a competitive advantage by improving productivity (van der Togt and Rasmussen, 2017), employee engagement (Tursunbayeva et al. 2018), and retention rates (Chalutz Ben-Gal, 2019).*

In particular, HR analytics can positively moderate the relationship between HR management practices and organizational performance in several ways (Falletta and Combs, 2021). Firstly, HR analytics can provide organizations with real-time data and insights, which can help them to make more informed decisions about their HR practices (Cayrat and Boxall, 2022). This can lead to more effective HR practices, which in turn can lead to improved organizational performance (Rai and Singh, 2023). Secondly, HR analytics can help organizations to identify the specific HR management practices that are most effective in improving organizational performance. By analyzing HR data, organizations can identify which HR practices are most strongly associated with improved performance and focus their efforts on these practices (van der Togt and Rasmussen, 2017). This can lead to a more targeted approach to HR management, which can result in greater impact on organizational performance (Chalutz Ben-Gal, 2019). Thirdly, HR analytics can help organizations to identify areas for improvement in their HR practices. By analyzing HR data, organizations can identify areas where HR practices are not meeting expectations or are underperforming (Fernandez and Gallardo-Gallardo, 2021). This can help organizations to identify opportunities to improve their HR practices, which can lead to improved organizational performance. Finally, HR analytics can enable organizations to continuously monitor and evaluate the effectiveness of their HR practices. By collecting and analyzing HR data over time, organizations can identify changes in HR practices and their impact on organizational performance (Patre, 2016). This can help organizations to continuously improve their HR practices and maintain high levels of organizational performance over the long term. Overall, HR analytics can positively moderate the relationship between HR management practices and organizational performance by providing organizations with real-time data and insights, helping them to identify the most effective HR practices, identifying areas for improvement, and enabling continuous monitoring and evaluation of HR practices.

Despite the increasing interest in HR analytics by both academics and practitioners, some gaps can still be identified. First, previous research on HR analytics typically adopted a theoretical approach, without considering empirical evidence (Peeters et al., 2020). This is particularly true when it comes to HR analytics impact on organizational performance (Rasmussen and Ulrich, 2015; Marler and Boudreau, 2017; van der Togt and Rasmussen, 2017; McIver et al., 2018) thus calling for a more complete, evidence-based understanding of the link between the two constructs. A notable exception to this is represented by the recent contribution by McCartney and Fu (2022), who developed the first validated scale to measure HR analytics. However, as admitted by the two authors, their study presents some evident limitations which should be addressed by future research. In particular, they used a small sized,

* PhD Student in *Business and Management* – University of Torino and Vrije Universiteit Brussel

• Full Professor of *Business Enterprise and Management* – University of Torino
e-mail: alberto.ferraris@unito.it

context-limited sample, as all examined organizations came from Ireland, thus exhorting future scholars to replicate their analysis in multi-industry, multi-sector and multi-country data sets.

Purpose of the paper. The objective of this study is to investigate from an empirical point of view the effect of an HR analytics data-driven approach guiding the implementation of HR management practices on the performance of organizations. More specifically, we will investigate the positive effect of four HR management practices (employee rewards and incentives, employee training, talent acquisition and knowledge sharing) on organizational performance, and the moderating effect of HR analytics on these relationships. By drawing on contingency theory applied to HR analytics (Harney, 2016), which claims that the HR management activities will increase their effectiveness accordingly with their degree of fitness with the specific organizational context, we hypothesize that:

H1: Employee rewards and incentives are positively related to organizational performance;

H2: Employee training is positively related to organizational performance;

H3: Talent acquisition is positively related to organizational performance;

H4: Knowledge sharing is positively related to organizational performance;

H5: HR analytics activities positively moderate the positive relationship between employee rewards and incentives and organizational performance;

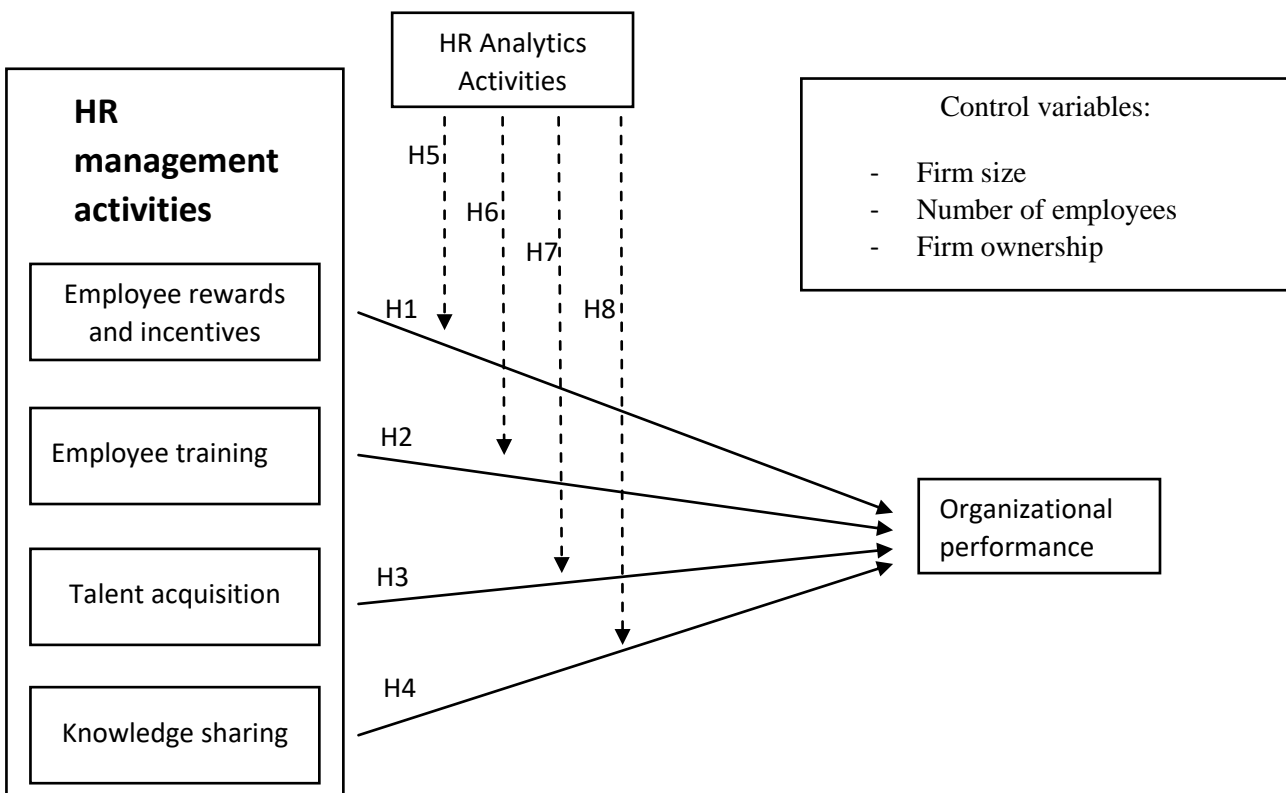

H6: HR analytics activities positively moderate the positive relationship between employee training and organizational performance;

H7: HR analytics activities positively moderate the positive relationship between talent acquisition and organizational performance;

H8: HR analytics activities positively moderate the positive relationship between knowledge sharing and organizational performance.

Our model and hypotheses are summarized in figure 1.

Fig. 1: Research Model and hypotheses

Methodology. We developed a self-administered survey to be completed by HR managers of European organizations which implemented HR analytics activities in the past three years. The online platform "Prolific" is being used to select participants which respect the aforementioned conditions and to deliver the questionnaire (Jabeen, et al. 2022).

Participants were informed that their answers will be anonymous, confidential, and used for scientific research exclusively. Attention check and reverse coded questions were inserted to assure answers' goodness. A pilot-test was conducted in collaboration with members of the Italian Association of Human Resource Directors (AIDP), from which emerged the need to rephrase the reverse coded questions to increase their clarity.

The questionnaire was developed by adapting items that had been previously validated in other studies to improve the validity and reliability of the study (Fink, 2003; Martin, 2005; Groves et al., 2013). For the same reason, each variable was assessed by using a multi-item structure, and their items were measured through a 5-points Likert scale

ranging from 1 (strongly disagree) to 5 (strongly agree), apart from organizational performance which will be measured through a 5-points Likert scale ranging from 1 (much worse) to 5 (much better) (Peter, 1979; Groves et al., 2013).

Employee rewards and incentives will be our first independent variable. It will be measured by 7 items taken from Heffernan et al. (2016). Employee training will be our second independent variable. It will be measured by a total of 8 items from Botelho (2020). Talent acquisition will be our third independent variable. It will be measured using 5 items from Mujtaba et al. (2022). Knowledge sharing will be our fourth independent variable. It will be assessed by 7 items all taken by Yang and Chen (2007)

Organizational performance will be our dependent variable. It will be analyzed based on two dimensions. The first will be operational performance and will be composed of two subdimension, product and service quality, which will be assessed by three items each, all taken by Akhtar et al. (2019). The second will be financial performance, and will be measured by three items taken by Kyrgidou and Spyropoulou (2013) and Real et al. (2014).

HR analytics will serve as the moderator of the relationship between the aforementioned HR management practices and organizational performance. It will be measured by a total of 14 items belonging to three main dimensions, namely high quality data, analytical competency and strategic ability to act. All items will be taken by McCartney and Fu (2022).

Finally, the model will include three control variables, which will be firm size (measured as the logarithm of sales) (Gimenez et al., 2012; Longoni and Cagliano, 2016), number of employees of the organization (Akhtar et al., 2019), and firm ownership (public vs private) (Do et al., 2018).

Data will be organized and processed through the IBM SPSS Statistics v.28 software, which will be used to derive the descriptive statistics and the correlation among variables, as well as to determine the normal distribution of data and that no multicollinearity or common method bias issues are present. SPSS AMOS v.28 will be then used to assess the validity and reliability of the measurement model, and to consequently verify the hypothesis. We will use the SEM technique to simultaneously assess multiple statistical relationship through visualization and model validation as, for example, in Chatterjee et al. (2022) or McCartney and Fu (2022). As it has been flagged as the most appropriate method for theory testing and confirmation in deductive studies (Hair Jr et al., 2017; Dash and Paul, 2021), a covariance based structural equation modelling (CB-SEM) will be used.

Results. As we are still in the data collection phase, analysis still have to be conducted. However, we can discuss about our expected results. First, we expect a positive relationship to exist between the aforementioned HR management practices and organizational performance. In fact, several studies already demonstrated the positive effect of employee rewards and incentives (Hussain et al., 2015), employee training (Omar and Mahmood, 2020), talent acquisition (Mujtaba et al., 2022) and knowledge sharing (Hsu, 2008) on organizational performance. More interestingly, we also expect HR analytics to positively moderate these relationships.

Regarding the relationship between employee rewards and incentives and organizational performance, HR analytics can provide insights into which rewards and incentives are most effective in motivating employees to improve their performance (van den Heuvel and Bondarouk, 2017). Through data analysis, organizations can identify which rewards and incentives are most effective for different employee groups and tailor their rewards and incentives programs accordingly (Chalutz Ben-Gal, 2019). This can lead to increased employee motivation, higher performance, and improved organizational performance. Consequently, we expect HR analytics to positively moderate the relationship between employee rewards and incentives and organizational performance.

In terms of employee training and organizational performance, HR analytics can provide insights into the effectiveness of training programs and identify areas for improvement (Barbar et al., 2019). By analyzing training data, organizations can evaluate the impact of training on employee performance and identify which training programs are most effective (Chalutz Ben-Gal, 2019). This can help organizations to design more effective training programs and ultimately improve organizational performance. Consequently, we expect HR analytics to positively moderate the relationship between employee training and organizational performance.

With regards to talent acquisition and organizational performance, HR analytics can help organizations to identify the best candidates for different job roles (Lam and Hawkes, 2017). By analyzing recruitment data, organizations can identify the most successful recruitment channels and recruitment sources for different positions (Chalutz Ben-Gal, 2019). This can help organizations to target their recruitment efforts more effectively and improve their recruitment and retention rates, which can lead to improved organizational performance. Consequently, we expect HR analytics to positively moderate the relationship between talent acquisition and organizational performance.

Finally, in terms of knowledge sharing and organizational performance, HR analytics can enable organizations to better manage their knowledge resources (Kashive and Khanna, 2022). By analyzing knowledge sharing data, organizations can identify knowledge gaps and opportunities for knowledge transfer and implement knowledge management strategies accordingly (Chaubey and Sahoo, 2019). This can lead to improved knowledge sharing and collaboration across different departments and teams, which can ultimately improve organizational performance. Consequently, we expect HR analytics to positively moderate the relationship between knowledge sharing and organizational performance.

Research limitations. This study presents some limitations which could be addressed by future research. First, our sample was composed of European organizations only. Future studies could replicate our research in other contexts to verify if some difference exist. Second, as our questionnaire was filled out by HR managers only, future studies could adopt a multistakeholder approach by taking into account the perspective of other HR analytics stakeholders as, for

example, the employees of the organization or the top management. Finally, as we adopted a cross-sectional design, future studies could adopt a longitudinal approach to collect data.

Managerial implications. This study will support practitioners from two main point of views. First, it will furnish them with useful insight regarding their HR management practices, as it will provide them with hints that will enable the maximization of their HR investments. Secondly, this study will provide HR professionals and business leaders with practical insights into how they can leverage HR analytics to improve the effectiveness of their HR practices and enhance organizational performance. In fact, the eventual confirmation of our hypotheses will further demonstrate the positive impact that HR analytics can produce not only within the HR management realm, but also on wider organizational outcomes as, in this case, organizational performance, thus furtherly increasing the acceptance of this practice at different organizational level. In fact, even if the popularity of HR analytics has been strongly increasing in the past years (McCartney and Fu, 2022), most organizations still not consider it as a relevant practice able to produce a real positive impact on them.

Originality of the paper. The contribution of this research will be threefold. First, it will contribute to HR management literature related to HR analytics by widening the number of studies that empirically investigated HR analytics impact on organizational performance. In fact, previous studies typically adopted a theoretical approach (Rasmussen and Ulrich, 2015; Marler and Boudreau, 2017; van der Togt and Rasmussen, 2017; McIver et al., 2018). By doing so, we will make a step forward towards a more complete, evidence-based understanding of the link between the two constructs. Secondly, we will answer the call by McCartney and Fu (2022), as we considered a larger, multi-industry, multi-sector and multi-country sample. By doing so, we will contribute to methodologically strengthen their conclusions, as we will demonstrate that they are generalizable not only to a wider, but also to a more heterogeneous sample. Finally, we will offer our contribution to contingency theory, as we will empirically demonstrate its applicability also with regards to a relative new topic as HR analytics.

Keywords: HR analytics; HR management; HR practices; CB-SEM; moderating effect

Come il network aziendale influenza la performance finanziaria? Il ruolo di mediazione della sostenibilità aziendale

FRANCESCA COLLEVECCHIO* GIANLUCA GIONFRIDDO* NICCOLÒ TODARO[▲]

Inquadramento della ricerca. *Nell'attuale contesto economico, sempre più interconnesso e veloce, le aziende si trovano di fronte a continue sfide che le spingono ad identificare nuove opportunità che le consentano di sviluppare e mantenere il loro vantaggio competitivo. In questo scenario, le aziende non possono operare in isolamento, bensì devono interfacciarsi sempre più con il contesto esterno di riferimento. Gli asset relazionali e le reti intra-aziendali risultano, dunque, cruciali per generare un vantaggio competitivo di lunga durata (Majchrzak et al., 2015; Melander, 2017).*

Secondo la prospettiva relazionale (Dyer e Singh, 1998), le relazioni che un'azienda instaura con l'ambiente esterno rappresentano risorse chiave che consentono di creare un forte vantaggio competitivo (Zaheer et al., 2010). In linea con questa prospettiva, la rete aziendale risulta essere un asset relazionale estremamente importante per le aziende, che grazie ad essa possono fare affidamento su risorse, informazioni e conoscenze esterne (Liu, 2020).

Tra gli attori organizzativi che favoriscono la creazione di reti aziendali è sempre più riconosciuta l'importanza del consiglio di amministrazione, in quanto meccanismo cruciale di governance aziendale. Più specificatamente, la teoria del capitale sociale e la teoria della dipendenza delle risorse (Pfeffer e Salancik, 1979) attribuiscono al consiglio di amministrazione un ruolo strategico nell'apertura delle frontiere aziendali e nel networking (Hillman et al., 2000). Infatti, attraverso gli incroci di amministratori, c.d. interlocking directorates, il consiglio di amministrazione instaura forti legami relazionali interaziendali. Studi precedenti hanno evidenziato che, sedendo contemporaneamente nel consiglio di diverse aziende, gli amministratori creano una rete esterna che può favorire la contaminazione tra aziende attraverso lo scambio di informazioni e risorse, accrescendo in tal modo il capitale a disposizione dell'azienda ed incidendo sulle performance aziendali (Hauser, 2018; Larcker et al., 2013; T. Zhao, 2021). Lo stesso amministratore che lavora contemporaneamente per due aziende diverse A e B ha, infatti, una maggiore probabilità di trasferire informazioni tra queste, creando così un collegamento diretto.

La ricerca sugli interlocking directorates è cresciuta notevolmente negli ultimi anni, anche grazie alla crescente quantità di fonti di dati che rendono tali informazioni più facilmente accessibili e maggiormente affidabili (Garcia-Bernardo e Takes, 2018). La letteratura si è concentrata in particolare sugli effetti di tali incroci sulle performance aziendali, mostrando una relazione positiva tra i due fattori (Hauser, 2018; Larcker et al., 2013; Martin et al., 2015; Smith e Sarabi, 2021; Zaheer et al., 2010; Zhao, 2021; Zona et al., 2018). Tuttavia, si conosce ancora poco in merito ai meccanismi sottostanti in grado di spiegare tale relazione. Sono pochi, infatti, gli studi empirici che hanno tentato di andare oltre lo sviluppo di un quadro concettuale per testare empiricamente come le reti aziendali, derivanti dalla condivisione di almeno un amministratore, impattino sulle diverse performance dell'impresa (Smith e Sarabi, 2021).

Obiettivo del paper. *Il nostro studio si propone di colmare questa lacuna ed estendere la letteratura sull'associazione tra rete aziendale e performance aziendale focalizzandosi su uno dei possibili meccanismi che può spiegare tale relazione, ovvero la sostenibilità aziendale (Broman e Robèrt, 2017; Centobelli et al., 2020). La transizione sostenibile rappresenta una sfida importante per le aziende, ma anche una scelta strategica per prosperare nel contesto competitivo in rapida evoluzione (Franco, 2021; Harrison et al., 2010; Mio et al., 2020). Gli studiosi hanno riconosciuto la sostenibilità aziendale come fonte di vantaggio competitivo (Bhuiyan et al., 2023; Walsh e Dodds, 2017) e hanno evidenziato la rilevanza delle risorse relazionali e dei fattori di rete quali driver delle performance di sostenibilità aziendale (Amui et al., 2017; Harjoto e Wang, 2020; Juo e Wang, 2022).*

Pertanto, la nostra ricerca mira ad analizzare l'effetto di mediazione della sostenibilità aziendale nella relazione tra la rete aziendale e la performance finanziaria, rispondendo alla domanda: "come interviene la sostenibilità aziendale nella relazione tra centralità della rete aziendale e performance finanziaria dell'azienda?"

Rete aziendale e performance finanziaria

Diversi studi hanno analizzato il legame tra la rete aziendale e le performance finanziarie, dimostrando un'associazione positiva (Hauser, 2018; Smith e Sarabi, 2021; Zaheer et al., 2010; Zhao, 2021). In particolare, le reti aziendali fornendo l'accesso a nuove informazioni e risorse, che vengono scambiate tramite le interconnessioni dei consigli di amministrazione (Smith e Sarabi, 2021), la rete aziendale permette alle aziende di gestire e ridurre l'incertezza informativa, generando un impatto positivo sulle performance aziendali (Martin et al., 2015; Zona et al., 2018). Inoltre, l'aumento della disponibilità di risorse consente alle aziende di rispondere tempestivamente alle opportunità di investimento (Larcker et al., 2013), aumentando l'efficienza degli investimenti e portando a performance aziendali migliori (Zhao, 2021).

I benefici derivanti dalla rete saranno tanto più notevoli quanto più l'azienda occupa una posizione centrale all'interno della rete (Larcker et al., 2013). Infatti, un'azienda centrale ha più (o migliori) connessioni con altre aziende, beneficiando così maggiormente dei legami relazionali rispetto alle aziende che occupano posizioni più marginali nella rete. Il concetto di buona interconnessione è multidimensionale e la teoria delle reti sociali ha sviluppato diverse connotazioni di centralità, individuando quattro misure principali: centralità di grado (degree), centralità di vicinanza (closeness), centralità di autovettore (eigenvector) e centralità di intermediazione (betweenness) (Jackson, 2010; Larcker et al., 2013).

Sulla base di quanto sopra, ipotizziamo che la centralità della rete aziendale abbia un effetto positivo sulle performance finanziarie dell'azienda, come segue:

Ipotesi 1 - La centralità della rete aziendale ha un effetto positivo sulle performance finanziarie dell'azienda.

Rete aziendale e sostenibilità aziendale

Le aziende ben collegate possono accedere e facilitare la diffusione di informazioni più preziose sulle pratiche di sostenibilità (Homroy e Slechten, 2019). Attraverso le relazioni, le aziende possono accedere a risorse e informazioni esterne per superare la mancanza di risorse e competenze specifiche necessarie per garantire che l'impegno sostenibile delle aziende non sia solo simbolico ma si traduca in azioni concrete (Amui et al., 2017). Inoltre, le aziende ben collegate possono acquisire conoscenze sulle migliori pratiche di sostenibilità, favorendo così lo sviluppo sostenibile dell'azienda (Homroy e Slechten, 2019). Infatti, la rete svolge un ruolo essenziale come facilitatore della comprensione cognitiva nella condivisione delle best practice (Corazza et al., 2022). Le aziende centrali nella rete godono anche di una maggiore reputazione e fiducia. Pertanto, saranno proattive nell'adottare pratiche sostenibili per mantenere il loro status quo e aumentare i benefici dalla loro posizione centrale nella rete (Chahine et al., 2019). Inoltre, le aziende con reti più ampie possono avere una maggiore comprensione delle esigenze di una più ampia varietà di stakeholder e rispondere prontamente ad esse, raggiungendo così una maggiore performance sostenibile (Harjoto e Wang, 2020).

In linea con questi argomenti, recenti ricerche hanno evidenziato l'esistenza di una relazione positiva tra network aziendale e sostenibilità aziendale (Ding et al., 2022; Nandy et al., 2020; Harjoto e Wang, 2020).

In linea con tali ricerche, si ipotizza quanto segue:

Ipotesi 2 - La centralità della rete aziendale ha un effetto positivo sulla performance di sostenibilità aziendale.

Sostenibilità aziendale e performance finanziaria

La crescente attenzione verso le questioni di sostenibilità ha portato la ricerca accademica a concentrarsi sui benefici che essa può apportare alle aziende e un ampio filone di letteratura si è concentrato sulla relazione tra la sostenibilità aziendale e la performance. Sebbene alcuni studi abbiano dimostrato che la sostenibilità può danneggiare la performance finanziaria, la maggior parte della letteratura concorda sui benefici finanziari ne derivano (Atz et al., 2023; W. Lu et al., 2014; Miroshnychenko et al., 2017; Van Beurden e Gössling, 2008).

Precedenti ricerche hanno dimostrato, infatti, che privilegiando la sostenibilità le aziende possono migliorare la loro reputazione e immagine (Vishwanathan et al., 2020), creare nuove opportunità (Keskin et al., 2013), ridurre costi e rischi (Hockerts, 2015; Walsh e Dodds, 2017) e aumentare l'efficienza (Caiado et al., 2017). Inoltre, poiché i consumatori sono sempre più sensibili all'ambiente e alle questioni sociali, le aziende sostenibili hanno maggiori potenzialità di attrarre nuovi clienti (Walsh e Dodds, 2017; Testa et al., 2021).

Pertanto, ipotizziamo quanto segue:

Ipotesi 3 - La sostenibilità aziendale ha un effetto positivo sulla performance finanziaria dell'azienda.

Il ruolo di mediazione della sostenibilità aziendale

Ricerche precedenti hanno dimostrato che la sostenibilità aziendale può essere un meccanismo attraverso cui la rete aziendale può portare a una maggiore performance finanziaria (Chahine et al., 2019; Zhao, 2021). La posizione centrale nella rete consente all'azienda di sfruttare meglio il proprio capitale relazionale e sociale, ma è necessario ottenere legittimità per far sì che tale posizione di potere si traduca in un vantaggio competitivo (Di Maggio e Powell, 1983). Gli studiosi dell'istituzionalismo sostengono infatti che il successo e la longevità di un'azienda sono legati non solo alle sue pratiche commerciali interne, ma anche agli sforzi dell'azienda stessa per ottenere legittimità nel proprio ambiente istituzionale (Di Maggio e Powell, 1983). La sostenibilità aziendale diventa, quindi, un fattore importante per acquisire legittimità e trarre riconoscimento pubblico attraverso la creazione di valore ambientale e sociale (Ahn e Park, 2018). Sulla base di questi argomenti, ipotizziamo che quando il capitale relazionale si traduce in una sostenibilità aziendale elevata, l'azienda è in grado di stabilire la legittimità necessaria per ottenere una maggiore performance finanziaria. Questo ci porta a ipotizzare che la sostenibilità aziendale medi l'effetto del grado di centralità della rete aziendale sulla performance finanziaria. Pertanto, proponiamo la quarta ipotesi come segue:

Ipotesi 4 - La sostenibilità aziendale media l'effetto del grado di centralità della rete aziendale sulla performance finanziaria.

Metodologia.

Campione e dati

Lo studio è stato condotto su un campione di 958 aziende quotate europee, selezionate adottando un approccio di campionamento intenzionale, in cui i membri della popolazione vengono selezionati quando le loro caratteristiche corrispondono allo scopo della ricerca. In particolare, il nostro studio si è concentrato su tutte le aziende europee i cui direttori hanno ricoperto contemporaneamente una posizione in consigli di amministrazione di almeno due aziende diverse, e per le quali sono disponibili dati sulle performance finanziarie (misurate attraverso Tobin's Q) e sulla sostenibilità aziendale (misurate attraverso gli indicatori ESG). A tal fine, il campione è stato creato incrociando le aziende presenti in due database distinti, ovvero BoardEx e Refinitiv Eikon, con riferimento al periodo 2015-2020.

I dati sugli interlocking degli amministratori sono stati raccolti dal database BoardEx, mentre i dati sulle performance finanziarie e ESG sono stati raccolti tramite il database Refinitiv Eikon. Altre informazioni utilizzate come controlli nell'analisi sono state recuperate sia dal database BoardEx che dal database Refinitiv Eikon.

I dati di BoardEx sui network aziendali, generati dagli incroci tra consigli di amministrazione, sono stati utilizzati per mappare gli amministratori che hanno ricoperto contemporaneamente posizioni in più di un consiglio di amministrazione. Questi dati sono stati utilizzati per costruire una rete di aziende che hanno condiviso almeno un amministratore nel periodo 2015-2020, in cui le aziende europee costituiscono i nodi della rete. I nodi isolati, ovvero le aziende senza incroci di amministratori con altre aziende, sono stati esclusi dalla rete.

I dati di rete sono stati analizzati utilizzando il software UCINET per l'analisi delle reti sociali (social network analysis) al fine di calcolare quattro misure di centralità, ovvero degree, closeness, eigenvector e betweenness, come dettagliato in seguito.

Variabile dipendente

In linea con studi precedenti, abbiamo misurato la performance finanziaria delle aziende utilizzando l'indice Tobin's Q , uno degli indicatori finanziari più utilizzati e completi per descrivere la performance dell'azienda (Awaysheh et al., 2020; S. Kim et al., 2021; Minutolo et al., 2019).

Variabili indipendenti

Le misure di centralità della rete aziendale sono le variabili indipendenti nello studio. Basandoci sui dati della rete recuperati da BoardEx, ci siamo concentrati sulle quattro misure di centralità più comunemente utilizzate (Jackson, 2010; Larcker et al., 2013): (i) degree centrality; (ii) closeness centrality; (iii) eigenvector centrality; (iv) betweenness centrality.

La degree centrality misura il numero totale di connessioni dirette uniche che ogni nodo ha con gli altri nodi nella rete, fornendo indicazioni sul numero di canali di informazione disponibili. La closeness centrality misura la distanza di un nodo da tutti gli altri nodi nella rete sommando la lunghezza dei percorsi più brevi tra il nodo e gli altri nodi. Questa misura ci dice quanto facilmente un'azienda può raggiungere tutte le altre aziende nella rete. L'eigenvector centrality è una proxy della qualità delle connessioni di un'azienda nella rete, poiché misura la centralità di un nodo come funzione delle centralità dei nodi a cui è connesso. Essa indica, dunque, l'influenza dell'azienda nella rete, poiché considera la rete delle aziende correlate. Infine, la betweenness centrality misura il numero di volte in cui un nodo si trova sui percorsi più brevi (cioè la distanza geodetica) tra due altri nodi ed è una proxy del controllo dei flussi informativi di un'azienda nella rete o del suo potenziale di agire come intermediario nella sua rete.

Variabile mediatrice

In linea con le ricerche precedenti, abbiamo misurato la sostenibilità aziendale utilizzando gli indicatori di performance delle prestazioni ambientali, sociali e di governance (ESG) forniti da Refinitiv Eikon. Essi rappresentano una buona proxy per misurare la sostenibilità aziendale in quanto consentono di considerare la multidimensionalità delle questioni di sostenibilità, comprendendo diverse dimensioni.

Variabili di controllo

Abbiamo incluso diverse variabili di controllo nelle nostre analisi: (i) la dimensione dell'azienda, misurata attraverso il logaritmo naturale del totale degli asset aziendali; (ii) la dimensione del consiglio di amministrazione, ovvero il numero di amministratori presenti nel consiglio; (iii) il numero di amministratori indipendenti non esecutivi; (iv) il numero di donne nel consiglio di amministrazione; (v) l'età media del consiglio di amministrazione; (vi) l'età dell'azienda. Inoltre, abbiamo incluso le variabili dummy per paese e settore. I dati a livello di consiglio di amministrazione, nonché il settore e il paese sono stati recuperati da BoardEx, mentre la dimensione e l'età dell'azienda sono state ricavate da Refinitiv Eikon.

Risultati. *Per testare le nostre ipotesi, abbiamo eseguito un'analisi cross-sectional utilizzando un modello di equazioni strutturali (SEM). Infatti, nell'analisi di mediazione, la SEM è considerata un'ottima tecnica di regressione poiché consente di testare i vari modelli simultaneamente e consente controllare l'errore di misurazione (Iacobucci et al., 2007). Le analisi sono state condotte separatamente per ciascuna misura di centralità della rete, cioè degree, closeness, eigenvector e betweenness. Per migliorare l'interpretabilità dei coefficienti, tutte le variabili sono state standardizzate.*

I risultati mostrano un effetto diretto positivo e statisticamente significativo di tutte le variabili di centralità sia su ESG sia su Tobin's Q . Inoltre, si è riscontrato un effetto diretto positivo e significativo di ESG su Tobin's Q . Sebbene un effetto diretto significativo sia una conditio sine qua non per testare un effetto di mediazione, esso non è sufficiente per concludere che esista un'effettiva mediazione ed è necessario che anche l'effetto indiretto sia significativo (Rucker et al., 2011). Abbiamo dunque scomposto l'effetto totale delle variabili indipendenti sulla performance finanziaria mediata da ESG, evidenziando così gli effetti indiretti delle misure di centralità della rete su Q .

di Tobin. I risultati mostrano che l'effetto indiretto di tutte le misure di centralità della rete su Tobin's Q è significativo in presenza di ESG, sebbene sia inferiore rispetto ai rispettivi effetti diretti. Pertanto, possiamo concludere che ESG media parzialmente la relazione tra la centralità della rete aziendale e la performance finanziaria.

Limiti della ricerca. Dimostrando che la sostenibilità aziendale media parzialmente l'effetto della rete aziendale sulla performance finanziaria, contribuiamo ad approfondire la conoscenza dei meccanismi che spiegano il potenziale di creazione di valore della rete aziendale. Tuttavia, poter affermare che la mediazione è solo parziale significa che il lavoro deve ancora essere completato e che altri meccanismi potrebbero essere rilevanti (Hayes, 2018). Pertanto, ulteriori ricerche potrebbero esplorare altri meccanismi diversi che possono spiegare il legame tra rete aziendale e performance finanziaria.

Inoltre, abbiamo effettuato un'analisi sull'effetto della posizione di centralità della rete per ciascuna azienda all'interno della rete. Altri studi possono adottare una prospettiva di rete completa. Inoltre, mentre abbiamo effettuato un'analisi trasversale, ulteriori ricerche potrebbero applicare metodologie diverse per tenere conto dell'effetto temporale. Ad esempio, estendendo il periodo di indagine e utilizzando un'analisi dinamica delle reti sociali, gli studi futuri potranno analizzare se e come l'evoluzione delle reti aziendali modifichi i nostri risultati.

Inoltre, abbiamo utilizzato i punteggi ESG di Refinitiv Eikon per la sostenibilità aziendale. Pur essendo una fonte affidabile, le ricerche future potrebbero esaminare altre fonti di punteggi ESG, come Sustainalytics e MSCI.

Implicazioni manageriali. Lo studio fornisce diverse implicazioni manageriali. In primo luogo, i nostri risultati evidenziano i benefici derivanti dall'apertura dei confini organizzativi sia per la performance finanziaria sia per i risultati di sostenibilità delle aziende. Il successo della sostenibilità aziendale richiede, infatti, che le aziende partecipino a sforzi collaborativi, stabiliscano partnership e coinvolgano diverse parti interessate. Inoltre, lo studio suggerisce che le interconnessioni tra i consigli di amministrazione costituiscano una via preziosa per promuovere gli sforzi collaborativi per una maggiore sostenibilità. I risultati indicano che la qualità delle interconnessioni tra i consigli di amministrazione e la posizione nella rete svolgono un ruolo importante per le prestazioni finanziarie e di sostenibilità delle aziende. Le implicazioni manageriali suggeriscono di monitorare la posizione delle aziende nelle reti di interconnessioni dei consigli di amministrazione al fine di valutare le implicazioni strategiche delle diverse configurazioni di relazioni interorganizzative. I risultati suggeriscono, inoltre, di promuovere iniziative congiunte di sostenibilità nello sviluppo di interconnessioni tra i consigli di amministrazione, al fine di migliorare le prestazioni di sostenibilità, rafforzare le relazioni di rete e migliorare i vantaggi delle risorse. Inoltre, i risultati mostrano come la sostenibilità aziendale sia un meccanismo rilevante per tradurre i vantaggi delle interconnessioni tra i consigli di amministrazione in una migliore performance finanziaria.

Originalità del paper. I nostri risultati indicano che la performance dell'azienda, sia in termini di sostenibilità che di performance finanziaria, può essere migliorata attraverso una maggiore centralità nella rete aziendale e che la performance di sostenibilità può ulteriormente influenzare la performance finanziaria.

La nostra ricerca contribuisce ad ampliare la conoscenza sull'associazione tra la rete aziendale e le performance aziendali, analizzando uno dei possibili meccanismi che spiegano come la rete aziendale influisca sulle performance finanziarie. In particolare, il nostro studio dimostra che la sostenibilità aziendale interviene nella relazione tra la rete aziendale e le performance finanziarie, introducendo così un nuovo mediatore nella relazione e ampliando la ricerca precedente che si è concentrata sulla relazione diretta. Nello specifico, i risultati della ricerca mostrano che quando il capitale relazionale si traduce in alta sostenibilità aziendale, esso conduce a performance finanziarie superiori. Infatti, l'elevata performance di sostenibilità conferisce all'azienda la legittimità necessaria per crescere nel tempo, dimostrando il suo impegno verso la società e l'ambiente in cui opera (Ahn e Park, 2018).

Inoltre, studiando diverse misure di centralità, il nostro studio dimostra che diversi aspetti della centralità della rete sono rilevanti per conseguire un vantaggio competitivo.

Infine, introducendo l'effetto di mediazione della sostenibilità aziendale, il nostro studio espande la conoscenza sull'associazione tra sostenibilità e performance finanziarie, suggerendo che le aziende che si impegnano nella sostenibilità hanno un valore di mercato più elevato (Miroshnychenko et al., 2017). In questo senso, i nostri risultati avvalorano il "business case" della sostenibilità (Dyllick e Hockerts, 2002), evidenziando l'importanza della sostenibilità non solo come antecedente diretto delle performance finanziarie, ma anche come meccanismo cruciale per convertire i rendimenti relazionali in rendimenti economici.

Parole chiave: rete aziendale; interconnessioni del consiglio di amministrazione; sostenibilità; vantaggio competitivo; analisi delle reti sociali.

Consiglio di amministrazione e sostenibilità aziendale: l'effetto dell'esperienza in sostenibilità e dell'età degli amministratori sulla performance ESG

FRANCESCA COLLEVECCHIO* VALERIO TEMPERINI*
VIRGINIA BARBA SANCHEZ* ANGEL MESEGUER MARTINEZ**

Inquadramento della ricerca. *La sostenibilità aziendale ricopre un ruolo di particolare importanza nella pratica manageriale e nel dibattito accademico, rappresentando una delle principali sfide per le aziende che sono chiamate a rispondere attivamente ai problemi sociali e ambientali che caratterizzano il contesto socioeconomico contemporaneo (Broman e Robèrt, 2017; Centobelli et al., 2020; Mio et al., 2020). Gran parte della letteratura ha posto l'attenzione sul ruolo della governance aziendale nel guidare le aziende verso una transizione sostenibile e particolare enfasi è stata posta sul ruolo del consiglio di amministrazione (CdA) (Aguilera et al., 2021; De Masi et al., 2021; Karpoff, 2021; Konadu et al., 2021; Liao et al., 2021; Naciti et al., 2022). Ricerche precedenti hanno infatti dimostrato che, grazie alla sua triplice funzione, il CdA influenza le strategie e i risultati aziendali, tra cui la performance sostenibile (Homroy e Slechten, 2019; Hussain et al., 2018; Walls e Hoffman, 2013). La letteratura ha studiato l'impatto di diverse caratteristiche del CdA sulla sostenibilità aziendale, privilegiando le caratteristiche facilmente osservabili, come il numero di amministratori, il genere, l'indipendenza del consiglio (Chams e García-Blandón, 2019; Cosma et al., 2021; De Masi et al., 2021; de Villiers et al., 2011; Naciti, 2019). Tuttavia, pochi studi si sono concentrati sulle caratteristiche più difficilmente osservabili, come l'esperienza pregressa degli amministratori, che possono influenzare in modo ancor più significativo l'orientamento sostenibile del CdA (Hashmi et al., 2022; Nathalia e Setiawan, 2022). L'esperienza rappresenta, infatti, un filtro cognitivo cruciale per l'elaborazione e la comprensione delle informazioni (Hambrick, 2007; Starbuck e Milliken, 1988), che influisce sul processo decisionale. Poiché l'impegno sostenibile implica che le aziende siano consapevoli della sostenibilità e sappiano come muoversi verso di essa, riteniamo che la precedente esperienza in materia di sostenibilità del CdA sia particolarmente rilevante nel guidare la performance di sostenibilità.*

Tra le caratteristiche dei consigli di amministrazione, la diversità in termini di età rappresenta un attributo importante che merita un'attenzione specifica data l'attuale tendenza a promuovere attivamente l'ingresso di amministratori più giovani nei CdA (Gardiner, 2022). Come riportato dal Census of Directors 50 and Under di PWC (PWC, 2018), nonostante siano ancora sottorappresentati nei consigli di amministrazione delle aziende, la presenza di giovani amministratori è aumentata negli ultimi anni ed essi sono particolarmente coinvolti nei comitati più innovativi, come quelli per la tecnologia e la sostenibilità. Tuttavia, l'età del CdA non è stata oggetto di attenzione in letteratura al pari di altre caratteristiche del consiglio, e le ricerche precedenti hanno prodotto risultati contrastanti sul suo effetto sui risultati aziendali, suggerendo un effetto contingente dell'età del CdA (Gardiner, 2022; Kagzi e Guha, 2018). In particolare, mentre i consiglieri più giovani sono più dinamici e proattivi nell'introdurre innovazioni, quelli più anziani sono meno disposti ad avviare cambiamenti strategici (Wiersema e Bantel, 1992). Pertanto, riteniamo che i consigli di amministrazione più anziani possano essere meno favorevoli a sfruttare l'esperienza degli amministratori in materia di sostenibilità per muoversi verso lo sviluppo sostenibile, indebolendo così la relazione tra l'esperienza dei consigli di amministrazione in materia di sostenibilità e la performance di sostenibilità dell'impresa.

Obiettivo del paper. *Questo studio si propone di ampliare la conoscenza sull'impatto del CdA sulla sostenibilità aziendale focalizzandosi su una caratteristica non ancora esaminata: l'esperienza pregressa in sostenibilità del CdA. In particolare, lo studio intende rispondere alle seguenti domande di ricerca: (1) Esiste una relazione tra l'esperienza*

pregressa in sostenibilità del CdA e la performance sostenibile dell'azienda? (2) Tale relazione dipende dall'età del CdA?

Metodologia. Per rispondere alle domande di ricerca, abbiamo condotto un'analisi panel su un campione di 510 aziende europee quotate, analizzate nel periodo 2014-2020, per un totale di 1587 osservazioni. I dati sono stati raccolti tramite i database Refinitiv Eikon e BoardEx.

In linea con la ricerca precedente (Disli et al., 2022; Dremptic et al., 2020), abbiamo misurato la performance di sostenibilità aziendale attraverso gli indicatori ESG forniti da Refinitiv Eikon. Le informazioni sulle esperienze passate degli amministratori sono state ricavate dal database BoardEx. In particolare, l'esperienza in sostenibilità del CdA è stata misurata tramite gli anni di esperienza cumulativa degli amministratori in ruoli legati alla sostenibilità. Per individuare tali ruoli, in linea con lo studio condotto da Fu et al. (2020) abbiamo condotto un'analisi del contenuto della descrizione del ruolo fornita da BoardEx, utilizzando le seguenti parole chiave: sostenibilità/sostenibile, etica, responsabilità, ambiente/ambientale, ESG e CSR. Per testare la seconda ipotesi, abbiamo incluso nell'analisi la variabile moderatrice "età" del CdA, misurata come età media degli amministratori. Inoltre, abbiamo incluso nella nostra analisi diverse variabili di controllo relative ad aspetti del consiglio di amministrazione e dell'impresa, in linea con le ricerche precedenti: (1) la dimensione del consiglio di amministrazione, misurata come logaritmo naturale del numero totale di amministratori nel CdA; (2) l'indipendenza del CdA, misurata sia come percentuale di amministratori non esecutivi sia come dualità del CEO tramite una variabile dummy che misura il valore di 1 se il Presidente è anche CEO della società e 0 altrimenti; (3) la tenure del CdA, misurata come il numero medio di anni in cui gli amministratori hanno fatto parte del CdA; (4) la diversità di genere, misurata come percentuale di amministratori di sesso femminile; (5) la diversità di nazionalità, ossia la percentuale di nazionalità diverse all'interno del consiglio di amministrazione; (6) la dimensione dell'azienda, misurata tramite il logaritmo naturale dell'attivo totale dell'impresa; (7) il debito dell'azienda; (7) l'età dell'impresa.

Studi precedenti hanno dimostrato che le aziende assumono gli amministratori in base alla loro precedente esperienza (Harford e Schonlau, 2013). Pertanto, i CdA con esperienza in materia di sostenibilità non sono selezionati in modo casuale. Per risolvere questo problema di endogeneità, abbiamo applicato il propensity score matching (PSM) (Rosenbaum e Rubin, 1983), che consente di garantire che le aziende siano simili su tutte le variabili, tranne la variabile dipendente (ESG) e le variabili indipendenti di maggiore interesse (esperienza in sostenibilità ed età del CdA). In questo modo, il PSM permette di neutralizzare l'effetto di altre variabili e di dimostrare che l'esperienza in sostenibilità del CdA è associata alla performance sostenibile (Lu e Herremans, 2019). In linea con le ricerche precedenti, abbiamo adottato la tecnica di matching one-by-one nearest neighbor senza sostituzione con caliper 0,01 (Oyotode-Adebile e Raja, 2019). I risultati del test di bilanciamento del PSM confermano la validità del matching, risultando in campioni trattati (CdA con esperienza in sostenibilità) e non trattati (CdA senza esperienza in sostenibilità) comparabili dopo l'abbinamento. Inoltre, per risolvere il problema di potenziale causalità inversa, abbiamo utilizzato variabili esplicative ritardate al tempo $t-1$ (Joecks et al., 2013; Liu, 2018).

Per verificare le nostre ipotesi, abbiamo dunque condotto un'analisi di regressione panel sul campione abbinato risultante dall'analisi PSM. Poiché in un modello pooled OLS per dati panel può esserci eterogeneità non osservata, a prescindere dal numero di caratteristiche specifiche dell'azienda aggiunte, con conseguenti stimatori OLS distorti e incoerenti (Wooldridge, 2010), abbiamo testato il modello utilizzando un modello a effetti fissi, che il test di Hausman ha confermato essere preferibile rispetto a un modello ad effetti variabili.

Risultati. I risultati mostrano che l'esperienza pregressa in sostenibilità del CdA ha un effetto positivo e statisticamente significativo su ESG. In particolare, le aziende con CdA con grande esperienza in materia di sostenibilità raggiungono, in media, livelli ESG superiori dell'11% rispetto alle aziende con CdA meno esperti in materia di sostenibilità. Inoltre, i risultati evidenziano che l'età del CdA modera negativamente la relazione tra esperienza in sostenibilità e ESG. Complessivamente, i risultati mostrano che l'effetto dell'esperienza in sostenibilità del CdA sulla performance sostenibile dipendono dall'età del CdA. Infatti, tale relazione è positiva per le imprese con un CdA giovane, ma diviene negativa per le aziende con un CdA anziano.

Limiti della ricerca. Questo studio presenta alcune limitazioni che offrono spunti per sviluppi futuri. Per misurare l'esperienza in materia di sostenibilità, abbiamo considerato il totale degli anni di esperienza nei ruoli legati alla sostenibilità precedentemente ricoperti dagli amministratori. Tuttavia, l'esperienza in materia di sostenibilità può derivare anche da studi intrapresi o da esperienze personali, come attività volontariato, ecc. Pertanto, ulteriori studi potrebbero prendere in considerazione questi aspetti aggiuntivi. A tal fine, le ricerche future potrebbero integrare i nostri dati reperiti tramite BoardEx con fonti alternative, quali LinkedIn o altri social network.

Per valutare la performance sostenibile delle aziende, abbiamo utilizzato gli indicatori ESG forniti dal database Refinitiv Eikon. Sebbene si tratti di una fonte autorevole e ampiamente utilizzata in letteratura, la ricerca futura potrebbe esplorare altre fonti di dati ESG, come Bloomberg, Sustainalytics o MSCI per convalidare i nostri risultati. Inoltre, gli indicatori ESG rappresentano solo una delle possibili misure di sostenibilità e studi futuri potrebbero utilizzare misure alternative.

Infine, nel nostro studio ci siamo focalizzati esclusivamente sulle società quotate in borsa. Pertanto, studi futuri potrebbero espandere la ricerca valutando l'impatto dell'esperienza in sostenibilità del CdA delle società non quotate in borsa.

Implicazioni manageriali. I nostri risultati sottolineano il valore dell'esperienza specialistica degli amministratori e forniscono una guida adeguata per gli azionisti e gli investitori nell'adozione di una politica di selezione degli amministratori. In particolare, dimostriamo che i consigli di amministrazione con un'esperienza cumulativa sostanziale

in materia di sostenibilità producono performance di sostenibilità più elevate. Tuttavia, l'esperienza in materia di sostenibilità non è sempre utile per raggiungere gli obiettivi di sostenibilità e in alcuni casi può risultare addirittura dannosa. Pertanto, l'esperienza degli amministratori deve essere esaminata insieme ad altre caratteristiche del consiglio nelle politiche di assunzione, avendo particolare riguardo all'età degli amministratori. Infatti, i consigli di amministrazione più anziani sono meno disposti ad avviare cambiamenti strategici (Wiersema e Bantel, 1992), ostacolando l'innovazione dell'impresa (Chindasombatcharoen et al., 2023). Pertanto, potrebbero essere riluttanti a sfruttare l'esperienza dei consiglieri in materia di sostenibilità per implementare i cambiamenti che si muovono verso strategie sostenibili.

Inoltre, i nostri risultati sono rilevanti per le autorità di regolamentazione, in quanto le norme relative alla composizione dei consigli di amministrazione, in termini di diversità di background, o all'età degli amministratori (come le politiche di pensionamento) possono avere effetti significativi sulla performance delle imprese, come quella sostenibile.

Originalità del paper. Il nostro studio analizza una caratteristica del consiglio di amministrazione poco esplorata, ossia l'esperienza pregressa in sostenibilità degli amministratori, dimostrando che essa gioca un ruolo chiave come motore della performance di sostenibilità aziendale. In questo modo, rispondiamo alla richiesta di esplorare gli attributi cognitivi del consiglio di amministrazione (Kent Baker et al., 2020; Zattoni et al., 2022), che sono poco esplorati in letteratura perché più difficili da osservare.

Inoltre, in questo studio abbiamo combinato per la prima volta l'effetto dell'esperienza e l'effetto dell'età del consiglio di amministrazione sulla performance sostenibile, che in precedenza erano stati studiati in modo indipendente, esaminando l'effetto moderatore dell'età del consiglio di amministrazione sulla relazione tra esperienza in sostenibilità del consiglio di amministrazione e performance di sostenibilità dell'impresa. Dimostrando che l'impatto dell'esperienza di sostenibilità del consiglio di amministrazione dipende dall'età del consiglio, abbiamo contribuito a fare luce sui risultati inconcludenti relativi all'effetto dell'età del consiglio (Gardiner, 2022; Kagzi e Guha, 2018). In particolare, abbiamo evidenziato che l'età del consiglio di amministrazione non ha un effetto diretto sulla performance di sostenibilità, ma è un importante moderatore di altre caratteristiche del consiglio.

Parole chiave: Cda; Esperienza del Cda; Sostenibilità; Età del Cda; ESG.

Investigating Knowledge Sharing Microfoundations: Exploring the Role of Job Satisfaction and Knowledge Sabotage

FRANCESCO ANTONIO PEROTTI* ALBERTO FERRARIS*

Framing of the research. Drawing on the theoretical milestone offered by the knowledge-based view of the firm (Eisenhardt and Santos, 2002; Grant, 1996), in the current changing and digitized economic landscape the role of knowledge management is more important than ever as a critical factor driving business success and long-term sustainability (Deng et al., 2023; Matarazzo et al., 2020; Vallat et al., 2017). While considering knowledge management processes, intra-organisational knowledge sharing is certainly one of the most discussed due to its role in promoting information circulation and the transfer of know-how and skills, in order to create new knowledge and feed the company's intellectual capital (Bock et al., 2005; Presenza et al., 2017; Radaelli, 2011; Wang and Noe, 2010; Wang et al., 2014). From the dark side area of the subject, knowledge sharing has been shown to be hampered by a number of counterproductive workplace practices (Afshar-Jalili et al., 2021; Serenko and Bontis, 2016). One of these detrimental behaviours is knowledge sabotage, in which employees purposefully conceal critical information or share wrong knowledge to harm the organization or its members for a selfish purpose (Crino, 1994; Perotti et al., 2022; Serenko, 2019). It has been highlighted as the most extreme counterproductive behaviour against knowledge sharing due to its negative consequences on people who have been targeted and the direct or indirect impact on organization's knowledge management practices, business processes, or capacity to innovate (Analoui, 1995; Bennet et al., 2018; Santoro et al., 2019; Serenko, 2020; Serenko and Choo, 2020). However, this phenomenon remains murky in the knowledge management literature and requires to be further explored to unveil the unwholesome mechanisms that threaten knowledge sharing environments in companies, as well as to effectively face them.

The present study stands as a response to several literature gaps outlined previously thus raising the need of exploring those factors that may condition intra-organizational knowledge sharing in economic organizations, besides dealing with its counterproductive knowledge behaviours in more detail (Afshar-Jalili et al., 2021; Serenko and Bontis, 2016). In particular, it is highly required to shed light on the knowledge sabotage occurrences focusing on its individual and organizational antecedents and consequences (Ferraris and Perotti, 2020; Perotti et al., 2022; Serenko, 2019; Serenko and Choo, 2020). As such, this research also rides the call for supplementary studies that disclose knowledge sharing from a multilevel perspective (Foss et al., 2010; Radaelli et al., 2011).

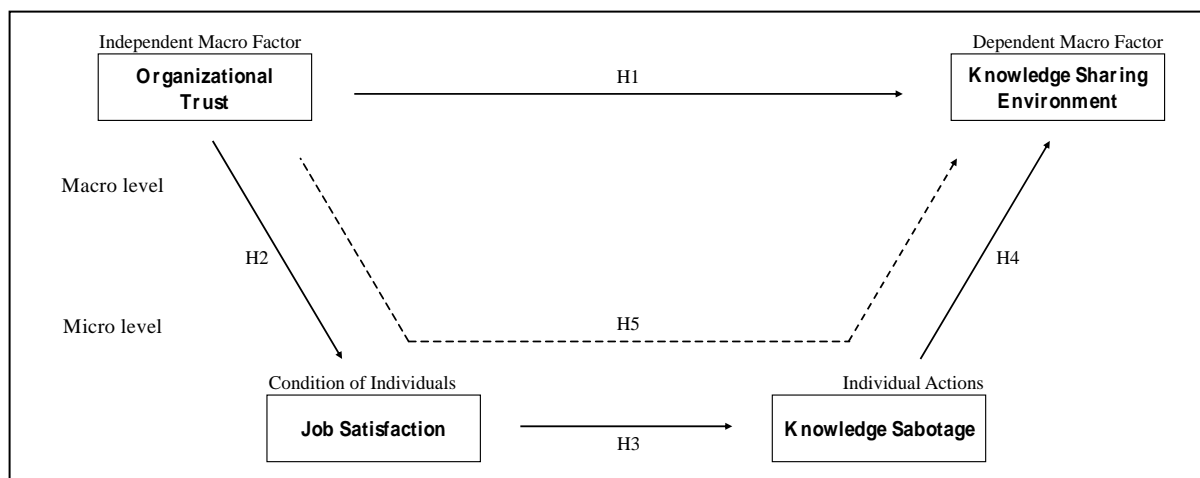

Purpose of the paper. Drawing on the microfoundations literature (Barney and Felin, 2013; Coleman, 1990; Felin et al., 2015), based on the theoretical framework offered by the rational choice theory (Boudon, 2003; Scott, 2000), this study elaborates on a multilevel conceptual model adapted from Coleman's bathtub to explore knowledge sharing microfoundations looking into knowledge sabotage incidents (see Figure 1). Arguing about the interplay of collectivism and methodological individualism (Durkheim, 1962; Udehn, 2002), this research is based on the interaction between the macro level comprehension of social facts and the micro level understanding of people's behaviours in the workplace. First, we advance the impact of organizational trust, as a social fact, on knowledge sharing, as a social outcome (Foss et al., 2010; Foss and Pedersen, 2019). In fact, a knowledge sharing environment can be established by leveraging a set of conducive factors that foster a culture of sharing, such as trust (Berraies et al., 2021; Levin and Cross, 2004). At the organizational level, a trust atmosphere plays a critical role in shaping the behavior of employees and influencing their attitude towards knowledge sharing (Foss et al., 2010; Hosen et al., 2022; Radaelli et al., 2011). As a consequence, we aim to test the positive relationship between organizational trust and knowledge sharing as a social outcome (HP1). Then, we aim to explore the microfoundations of knowledge sharing by taking into consideration the role of job satisfaction as an individual condition that predicts employees' knowledge sabotage actions in workplaces. According to Mayer et al. (1995) and Dirks and Ferrin (2001), when employees feel that their company and colleagues are trustworthy, they tend to experience greater security and support in their roles. As a result, they may be more motivated and productive, and may also experience a greater sense of personal fulfilment and achievement, which is translated into higher job satisfaction. Therefore, we advance a positive relationship between organizational trust and job satisfaction (HP2). In turn, work satisfaction can operate as a mitigating factor by lowering the chance of sabotage incidents. Knowledge sabotage is based on gratification drivers, personal retaliations against employees or malicious attitudes of the perpetrators (Serenko, 2019; Serenko, 2020), which are represented by situations where the

saboteur puts their own interests ahead of those of the target or the organization. From this perspective, knowledge sabotage has been examined as a counterproductive workplace behaviour arising from the low level of satisfaction in the workplace. We thus investigate the negative relationship between these two variables (HP3). Finally, this conceptual model aims to measure knowledge sabotage impact on knowledge sharing as a social outcome, i.e. on a knowledge sharing environment. Drawing on microfoundations theorists (Barney and Felin, 2013; Coleman, 1990; Foss & Pedersen, 2019), we consider the individual behaviour of people as an element that contributes to defining a given social outcome. Knowledge sabotage leads to a loss of trust between employees, where individuals are not willing to share knowledge with others. This can create a culture of suspicion that corrupts a knowledge sharing environment and make employees less likely to share information and know-how in the future, based on the expectation of certain positive behaviours in the working environment (Nguyen, et al., 2020; Gold et al., 2001). As a result, we assume knowledge sabotage negatively affect a knowledge sharing environment (HP4). Overall, the objective of the study is to outline a mediating indirect effect of individual level variables on the baseline relationship, as noted by microfoundation theorists (Barney and Felin, 2013; Coleman, 1990; Foss and Pedersen, 2019). We, therefore, advance how the positive relationship between organizational trust and knowledge sharing environment is sequentially mediated by job satisfaction and knowledge sabotage (HP5).

Fig. 1: The multilevel conceptual model

Methodology. This cross-sectional quantitative study follows a deductive theorising approach. It has employed nonprobability sampling to gather data from employees of for-profit companies in Europe, as in previous studies they have been outlined as typical targets and perpetrators of sabotage behaviour related to knowledge in the workplace (Serenko, 2020; Serenko and Abubakar, 2022). Managers and subordinates represent a suitable sample to investigate knowledge sharing microfoundations in terms of knowledge sabotage individual behaviour. According to the research design adopted by other actors in the microfoundations research domain (e.g. Cautela et al., 2022; Gray and Meister, 2004; O'Brien et al., 2019), the sample can also provide an assessment of the specific activities that occurred in the workplace to measure social facts and outcomes.

The authors took certain precautions to ensure the validity and reliability of the empirical observation during the survey arrangement. To address concerns related to data collection and possible bias, or inattentiveness among respondents, attention check filters and reverse-coded items have been inserted in the questionnaire (Fink, 2002; Groves, 2011). Also, the items employed for variables measurement have been adapted from previous highly ranked studies (i.e. Nyhan and Marlowe's, 1997; Berraies et al., 2021; Gold et al., 2001; Bock et al., 2005; Radaelli et al., 2011; Netemeyer et al., 1997; Lei et al., 2022; Serenko and Choo, 2020; Serenko and Abubakar, 2022). The questionnaire was administered through Prolific, which is an online platform employed for data collection in academic and market research (e.g. Tandon et al., 2022).

Following recommendations of previous studies on microfoundations (e.g. Foss et al., 2010; Distel, 2019; O'Brien et al., 2019) and recent research on knowledge sabotage (e.g. Serenko and Abubakar, 2022), the hypotheses advanced in our study have been assessed through a covariance-based structural equation modelling technique (CB-SEM). The choice of analysing data via a CB-SEM is motivated by the method's known reliability in proving relationships between theoretical constructs defined in the literature (e.g. in deductive studies), as well as the nature of the data obtained during empirical observation. A multilevel path is recommended when the units of observation belong to different levels, hierarchically clustered, and the measurement of latent variables can be interpreted as unobserved heterogeneity at the different levels inducing dependence among all lower-level units in the same higher-level unit (Rabe-Hesketh et al., 2004; Rabe-Hesketh et al., 2007). However, this research is based on the empirical observation of employees' working environment, their perceived conditions and individual actions. It does not involve a statistical

inference when the units of observation belong to a hierarchy of nested clusters, thus we can rely on a CB-SEM technique to assess the multiple statistical relationships among variables.

Results. At first, the eligibility of data has been ensured by the authors carrying out some diagnostics that include the assessment of data normality, common method variance, and multicollinearity (Alin, 2010; Hair et al., 2019; Harman, 1976; George and Mallery, 2018). Data validity and reliability are then verified through confirmatory factor analysis (CFA), to report the model fit, item’s factor loading, variables’ average variance extracted (AVE) and composite reliability (CR). These results fall within the threshold values recommended by the literature (Hair et al., 2019; Kline, 2015). Then, hypothesis testing gave empirical support to our assumptions advanced previously. All relationships showed to be significant and reported a satisfactory estimates value (see Table 1).

Tab. 1: Results

Hypothesis	Path	Estimate (β)	Significance (p)	R ²	Result
HP 1	OT → KSHE	.618	.000	.364	Supported

HP 5	Moderating indirect effect	.015	.000	-	Supported

Source: Authors’ elaboration.

Research limitations. Despite the authors' attempt to develop as reliable and representative a study as possible, it presents some limitations. According to the microfoundations perspective (Coleman, 1990; Foss et al., 2010), sabotage occurrences in the workplace have been observed as deliberate acts deriving from individuals’ rational behaviours (Boudon et al., 2003; Scott, 2000). However, Serenko (2023) outlined how some counterproductive knowledge incidents may be associated with causes unrelated to the individual’s rationality, such as personality disorders. In this study, we supposed knowledge sabotage occurrences as a volitional act of individuals, although there are also unwilling conditions that could provoke knowledge sabotage in the workplace. Furthermore, whereas our study succeeds in offering an excellent overview of the antecedents and consequences of the phenomenon of knowledge sabotage, it fails to study the behaviour of individual actors in great detail. This issue may require qualitative investigations to be integrated into the quantitative analysis, in order to enrich such results with deeply observed experiences and target/perpetrators’ testimonies.

Theoretical contributions and managerial implications. This study delivers some interesting contributions to the knowledge management literature, in terms of exploring the counterproductive workplace behaviour related to knowledge sharing (Afshar-Jalili et al., 2021). It furthers academics and practitioners’ awareness of knowledge sabotage, as extreme counterproductive behaviour that can potentially harm people and companies (Perotti et al., 2022; Serenko, 2019). From a practical perspective, organizational trust and job satisfaction showed to be two important factors to take into account while assessing knowledge sharing practices (Lei et al., 2022; Radaelli, 2011; Wang and Noe, 2010; Wang et al., 2014). Our results supported how a climate of trust lay the ground for a knowledge sharing environment and also conditions employees’ satisfaction, which can be translated into less common sabotage incidents when high job satisfaction is perceived by people in the workplace. In conclusion, this study also enriches the literature on microfoundations by providing a deeply explained blueprint to support future quantitative research in this domain.

Originality of the paper. The present research represents an original contribution to the knowledge management literature since it furthers academics and practitioners’ knowledge of counterproductive knowledge behaviours, specifically taking into consideration the most extreme one (Serenko, 2019; Serenko, 2020). Knowledge sabotage, indeed, needs to be further explored in order to shed light on this phenomenon and promote knowledge sharing in companies. Furthermore, this study offers an original contribution in terms of methodology. While it is not common to find conceptual models in the field of microfoundations that provide a comprehensive overview of the whole Coleman's bathtub, the authors managed to propose a model that could be considered as blueprint to support structuring future works on the topic.

Keywords: knowledge sharing; knowledge sabotage; knowledge management; job satisfaction; trust; microfoundation

Almost-invisible firms and the COVID-19 crisis: An exploratory analysis and a research agenda

ANNA MENOZZI*

Framing of the research. *Italian economy is continuously marked by weak productivity growth and large productivity differentials across firms, which compromise improvement in living standards and wellbeing: in Italy, prior to the Covid-19 crisis, labor productivity of firms was 17% lower than OECD best performers, GDP per capita was 26% lower than the same benchmark and the poorest 20% of households earned 6.6% of total income (OECD, 2021). The Covid-19 3-month lockdown generated an aggregate yearly drop in profits of about 10% of GDP and many firms, especially small and medium-sized enterprises (SMEs) and those belonging to the Manufacturing and Wholesale Trading sectors, became financially distressed (Carletti et al, 2020). The severe recession experienced by SMEs is especially important if we consider that the development of SMEs is a priority for policymakers in many countries across the world (Cowling and Mitchell 2003), where they have become the focus of governmental economic policies. Addressing Italy's weak economic growth requires tackling long-standing structural challenges including low levels of investment, productivity and employment. To embrace these challenges would improve the economy's resilience to shocks and reverse the trend of stagnating GDP per capita.*

It is demonstrated that SMEs capacity to face systemic downturns and grasp growth opportunities increases when they take advantages of the economic returns of cooperation and interactions with their business counterparts. Entrepreneurial association might give access to knowledge and resources at lower costs whose benefit represent a source of competitive advantage (Gulati and Higgins 2003; Zaheer and Bell 2005). Evidence for Italian SMEs over the period 2008-2014 shows that establishing a formal business network has a positive effect on a firm's gross margin ratio and exports, even if it has no effect on profits (Cisi et al., 2020). The advantages of this type of networking are stronger for smaller firms, firms operating in traditional and in turbulent markets, and firms that are not part of an industrial district. Associations and chambers of commerce and industry play a role also in innovative milieus through the building and maintaining the relational capital that represent a factor of success of the milieu itself, and SMEs appear to benefit from the existing milieus more than large firms (Maennig and Ölschläger, 2010). Previous evidence had raised doubt on these results and argued that the contribution given by associations through the specific services offered to individual companies appears to be relatively limited (Bennet, 1998) so that further research on the subject is highly valued, given the significance of SMEs and the diffusion of business associations in the Italian and international economic context.

Purpose of the paper. *The paper aims at providing an analysis of the economic performance, including productivity, of firms that for their size and governance constitute the majority of businesses in the country but usually escape the scientific analysis because of lack of information. Most firms in the sample are not required to fill-in and deposit their financial statements at the Chamber of Commerce by virtue of their dimensional and corporate governance characteristics: they would be "invisible" to researchers without a direct access to their accounts. We are able to get such access thanks to the information granted by the entrepreneurial association Confartigianato Imprese and the accounting services it provides to them. The focal point of this paper is to show the potential of this information for scientific purposes and for supporting firm management in the strategic decision-making process. First, the paper illustrates the source and the characteristics of the data, which include performance indicators such as revenues, net income, invested capital and, most important, labor and labor productivity, a difficult variable to retrieve for micro and small firms. The focus on productivity is motivated by the explicit intention to contribute to the II pillar "Global Challenges and European Industrial Competitiveness" of Horizon Europe, which acknowledges how productivity weak growth marks the Italian economy and compromises improvement in living standards. A descriptive analysis is offered to examine different trends in the variables across industries. In addition, the paper includes an empirical analysis of the effects of the Covid-19 pandemic on the performance of firms in different industrial sectors. In its future development, the paper may address the question whether the business association they adhere to, Confartigianato Imprese, provides the same advantages as a formal network contract.*

Methodology. *The analysis exploits a unique, manually compiled dataset of economic data concerning 1262 self-employed and non-listed micro, small and medium Italian firms located in the Eastern Piedmont region and observed during a 3-year period, from 2018 to 2020. Data were provided by the sub-regional entrepreneurial association*

* Associate Professor of *Strategic Management* - University of Piemonte Orientale
e-mail: anna.menzozi@uniupo.it

“Confartigianato Imprese Piemonte Orientale”, that gathers firms from different sectors and of different size and organizations, in the Novara, Vercelli and Verbanio-Cusio-Ossola provinces of North Italy. The Association provides tax and labor consultancy services and opportunity of networking to its members. It is an autonomous organization embodied in a larger national entrepreneurial association, Confartigianato Imprese, operating in the Italian territory through a capillary distribution of territorial bodies and with a central research institute and managing directorate.

Accounting and governance information is available only for firms to which Confartigianato Imprese Piemonte Orientale provides tax and labor consultancy services (and not for the entire population of associated firms): as of today, 7170 firms. Firms have different juridical forms (limited liability company, sole proprietorship, partnerships, corporations) and are subject to different fiscal rules concerning the obligation to deposit their financial statements at the Chamber of Commerce. Consequently, the accounting and governance information is not publicly available for certain firms or, when available, difficult to compare for different kinds of firm. To overcome the absence of official and comparable data, the dataset was compiled by relying on the so-called “fiscal compliance synthetic indexes” (in Italian, “Indici Sintetici di Affidabilità fiscale”, or “ISA”) that Confartigianato submits to the Revenue Agency on behalf of its associates as part of the tax consultancy services provided to them. The ISA are part of the reward system introduced by Law 225/2016 and officialized by the Ministerial-Decree 28 December 2018 with the aim to increase voluntary tax compliance especially among small firms and self-employed, by granting them audit exemption benefits based on their average performance on a broad set of accounting indices. Regardless the type of submitting firms, the ISA always include the same schema for reporting the essential accounting and personnel information (in sections “Quadro F” and “Quadro A”, respectively). The available ISA allow constructing profitability indexes as well as to assess tax rate, the cost of capital, labor and other direct and indirect costs. A complete set of 3-year ISA was extracted for 1262 firms, which represent the final sample employed in the empirical analysis, a strongly-balanced panel data of 3786 observations.

We estimate the model:

$$Y_{it} = \alpha + \gamma_{2019} + \delta_{2020} + \beta_{2020} * Industry_{it} + \psi_i + \varepsilon_{it}$$

where Y_{it} is the performance of firm i in year t , measured by revenues, net income, labor and labor productivity, 2019 and 2020 are the dummy variables indicating that observations refer to the years 2019 and 2020, respectively, and $Industry$ is a binary indicator for the industry to which firm i belongs, and takes value 1 in correspondence of firms belonging to each macro-sector. The focus is on the dummy variable 2020: the model estimates how firms operating in different sectors reacted to the crisis, or, in other words, coefficient β captures the average effect of operating in the Industry during the Covid-19 period (in 2020), with respect to other industries.

Results. Table 1 shows the descriptive statistics of sample firms’ economic results in terms of revenues, net income, total invested capital and value added, by industry, over the sample period 2018-2020. The ATECO sectors are grouped into macro-sector for the sake of analysis: Construction, Logistics, Tourism and hospitality, Manufacturing of consumer products, of vehicle and machinery and of wood and petrochemical products, Services, Specialized construction, Commerce, Transportation and a residual category Other including less represented sectors, like agriculture and public utilities. Associated firms mainly operate in services (financial services, social and health assistance, communication, education, sport) and in the manufacturing, logistics, commerce, construction and hospitality sectors.

Figures eloquently describe the peculiarity of firms represented in this sample, which are micro and small businesses whose revenues are, on average of the three-year period, equal to 156,900 euros and invested capital is 95,631 euros.

Likewise, the descriptive statistics testify the losses experienced from 2018 to 2020, when the effect of pandemic started to show up: both added value and net income are, at their minimum level, negative (and equal to -2,968,936 euros and to -3,143,675 euros, respectively).

The analysis of performance through time shows that the Covid pandemic interrupted a slight trend of economic growth: for all sectors, a plot of revenues through the period 2018-2020 has a “reverse V” shape. The most affected sectors are Tourism and Hospitality (firms in this industry lost about 30% of their income) and Transportation. The differences among industries are more evident when we consider changes in net income, since some sectors were able to limit the losses while others recorded a dramatic diminution of their profits, like Construction and in Tourism and Hospitality. The combined analysis of revenues and net income suggests a positive correlation between the two metrics and highlight that the most affected firms are in the sectors that most suffered from the negative demand shock caused by the lockdown policies. Firms in Construction reveal a peculiar behavior, since they experienced a huge reduction in profits without a relevant decrease in revenues. This change in profitability is cost driven and might be caused by the characteristic of their business: the forced blockade of the shipyards could have had problematic effects linked to the lack of inputs and it might play a role in inflating costs, in addition to the effect of fixed, sunk and start-up costs, typical of these businesses.

The analysis of labor shows a similar, “reversed V” shape for this variable through time and for all sector. The Covid-19 pandemic has a lower impact on employment in terms of percentage variation in 2019 and 2020 since the decision of downsizing is often restricted by the law. There is a strong correlation between loss in revenues and decrease in labor force: industries with the highest downsizing rate are indeed the same with highest loss in revenues. Revenues per worker provides a proxy for labor productivity, on which the effect of Covid-19 is ambiguous. The

diminishing marginal productivity of labor suggests that a decrease in labor should cause an increase in productivity. On the other side, the loss in revenues could undo or reverse this effect. Potentially, also capital could play a role: the classic economic theory suggests a positive relation between capital per worker and productivity of labor, so it is important to control for it. Generally, Covid-19 had a negative impact on productivity performance, therefore the loss in revenues is the dominant effect. Tourism and Hospitality, which is the most affected sector, shows a very negative performance in both metrics. Nevertheless, for other industries, a negative correlation between labor and labor productivity rate seems to exist.

The comparison between productivity rates, measured by revenues per worker and added value per worker, reveals that the decrease in added value is negative and stronger with respect to the variation in revenues due to the pandemic. In general, most sectors have recorded similar values for both variables. Nevertheless, that added value reflects also changes in inventory, which have a different impact depending on the business characteristics. Covid-19 had the effect of decrease the quantity of available products in the warehouses, so that when productivity is measured through different metrics, results could also be different: indeed, firms in Constructions are the ones most affected by the restrictions imposed to the inventory management.

Covid-19 had a tremendous effect on all the performance variables considered. The coefficient of the dummy variable 2020 is negative and strongly significant in every specification. When Y_{it} equals revenues, the coefficient β associated with the interaction term is significant and negative for all industries (Table 2, for the sectors Tourism and Hospitality, Transportation and Manufacturing of vehicle and machinery). In the model where net income is the dependent variable (Table 3), instead, β is negative and significant for Construction only, but the result is conditioned by the uneven distribution of firms across industry, with Constructions being over-represented and showing the worst performance in the sample.

As far as labor is concerned, the descriptive analysis pointed out that the drop in labor could be driven by the loss in revenues so that when the dependent variable Y_{it} is represented by labor force (number of employees), revenues are added within regressors to better control their explanatory value (Table 4). The estimation of this modified model shows that β is negative and strongly significant for all considered sectors and its value increases when revenues are added as control variable. This means revenues explain some of the effect that would be otherwise attributed to the industry. Moreover, the coefficient of revenues is positive and significant, meaning that the correlation between revenues and labor actually exists.

Interpreting the effect of Covid-19 becomes more challenging when we consider labor productivity, because labor and capital play a role in affecting it and must be included in the analysis as control variables. Table 5 presents the results of the estimated model for the Tourism and Hospitality and the Logistics sectors. When controls variables Labor and Invested Capital are added as regressors, the coefficient of interest β decreases in magnitude and becomes significant for the Tourism and Hospitality sector, while it is not significant for the Logistics sector. Furthermore, the relation between labor and capital, on the one side, and labor productivity, on the other side, is strongly significant and the coefficients' signs (negative for labor, positive for capital) are consistent with the economic theory.

Research limitations. The availability of ISA limits the sample period's lower bound to 2018 and the upper bound to 2020, the most recent fiscal period accessible when data were collected. The paper has the potential to lead to new results concerning the benefits that non-listed micro, small and medium firms perceive and obtain from adhering to an association of enterprises. The goal may be reached by extending the sample to firms that are not part of a formal business association, although building a dataset that includes a balanced control group might be difficult due to the usual lack of information. Furthermore, the analysis might benefit by adopting a mix (quantitative and qualitative) method to take advantage of the already available information and by collecting additional, primary information from the associated firms. New data would be gathered through a questionnaire sent to the firms with the support of Confartigianato Imprese Piemonte Orientale, in the hope that the Association's consent would increase the response rate.

Managerial implications. The National Recovery and Resilience Plan offers a unique opportunity to transition to higher productivity by combining an ambitious structural reform agenda and large investments. The scientific research may contribute to making this opportunity effective and indicating the strategies to growth. The paper aims at providing business associations, entrepreneurs and the management of non-listed micro, small and medium firms a fresh, up-to-date comparative analysis of these companies, that for their legal, dimensional and organizational characteristics are usually impermeable to the scrutiny of markets and of researchers.

Originality of the paper. Up to our knowledge, this paper is the first one using the information extracted from ISA to assess the firm economic performance. By exploiting a unique, manually compiled dataset of economic and organizational data referred to the period before and during the COVID-19 pandemic, this paper sheds some light on the results, the resilience and the growth potential of firms that would be "otherwise invisible" to researchers, market analysts and institutions. The analysis based on the dataset used in this paper provides an original contribution to the research of non-listed SMEs for Italy and, in general, for countries and sectors where these firms represent the majority of enterprises. The peculiar time span and the specific, sub-regional geographical context considered in the empirical analysis do not restrict the external validity of the results: on the contrary, they permit controlling for the exogenous factors that possibly affect the performance and behavior of firms and isolating the value of networking through the entrepreneurial associations.

Analisi dell'impatto di nuove forme di gestione della proprietà intellettuale: il caso dell'Open COVID Pledge nella lotta contro il COVID-19

GINEVRA ASSIA ANTONELLI* GIOACCHINO ILARIO GARGIULO* MARIA ISABELLA LEONE*

Introduzione

L'Open Covid Pledge¹ (OCP) è uno dei progetti di maggiore visibilità internazionale di patent pledge che ha lo scopo di favorire il libero utilizzo da parte del pubblico della proprietà intellettuale afferente alle soluzioni tecnologiche che ruotano intorno alla risoluzione delle complessità generate dalla pandemia da COVID-19. La pandemia ha impattato non solo i sistemi sanitari dei vari Paesi ma anche le corrispettive economie globali. Allo stesso tempo, l'urgenza di trovare mezzi e soluzioni che facilitassero la riduzione degli effetti generati dal COVID-19 ha condotto ad eccezionali progressi nelle pratiche tecnologiche ed innovative. Le organizzazioni, infatti, hanno sperimentato che la loro sopravvivenza ed il loro successo sono fortemente legati alla loro capacità di destreggiarsi in situazioni di incertezza e cogliere nuove opportunità, assumendo un atteggiamento più collaborativo e sbloccando l'innovazione collettiva. Pertanto, diversi attori, tra cui governi, scienziati, educatori ed aziende di diversi settori si sono impegnati - in alcuni casi per la prima volta - in una collaborazione globale senza precedenti per affrontare gli effetti della pandemia nella modalità più efficiente e rapida possibile. E, grazie all'impegno di alcune grandi aziende (es. Facebook, Intel, Microsoft, Amazon), l'OCP ha avuto un grande risalto mediatico su tutto il web.

Lo scopo del seguente lavoro di ricerca è di analizzare i brevetti messi in campo dalle imprese partecipanti (i pledgor) e stimare la loro ricaduta, in termini di impatto sui brevetti successivi. A tale scopo, partendo dalla pagina web ufficiale del progetto², e in particolare dalla vetrina del sito intitolata "Featured IP"³, si è indagato sulla natura della proprietà intellettuale messa a disposizione dai pledgor facendo riferimento, come campione per l'analisi, ai soli brevetti. Sulla base delle statistiche brevettuali, patent statistics, generalmente utilizzate in letteratura (Nagaoka et al., 2010), si è poi costruito un campione di controllo di brevetti non aderenti all'iniziativa OCP, ma aventi la stessa data di priorità, la stessa sottoclasse internazionale IPC e la stessa nazione di pubblicazione. Di entrambi i gruppi è stato analizzato l'andamento nel tempo (marzo 2020-giugno 2022) del numero di citazioni ricevute dai brevetti successivi (forward citation). Il confronto dei due trend è stato compiuto attraverso il metodo della differenza-nelle-differenze (difference-in-differences). I primi risultati dimostrano che la partecipazione all'iniziativa Open Covid Pledge abbia avuto ricadute positive in termini di diffusione delle tecnologia oggetto di pledge.

Il remainder del paper è il seguente: in primis, verrà presentato il contesto di riferimento dell'iniziativa OCP e gli obiettivi della ricerca; successivamente, si descriverà nel dettaglio la metodologia utilizzata per poi passare all'analisi descrittiva e ai risultati empirici dello studio, per concludere, infine, con la presentazione delle conclusioni, limitazioni ed implicazioni future di ricerca.

Analisi del contesto ed obiettivi della ricerca. L'OCP è un progetto che invita le organizzazioni di tutto il mondo a rendere liberamente disponibili i propri brevetti e diritti d'autore nella lotta contro la pandemia di COVID-19. Il progetto è stato guidato e gestito dal Program on Information Justice and Intellectual Property presso l'American University Washington College of Law. È considerato il progetto di patent pledge di maggiore visibilità durante il Covid, avendo ottenuto successo a livello internazionale attraverso il coinvolgimento delle maggiori aziende di tecnologia con un elevato numero di depositi brevettuali. Lo scopo è quello di favorire l'utilizzo libero della proprietà intellettuale afferente alle soluzioni tecnologiche che ruotano intorno alla risoluzione dei problemi generati dalla pandemia da COVID-19. Infatti, un numero sempre maggiore di aziende note nel mondo dell'innovazione (per esempio Facebook, Intel, Microsoft, Amazon) ha pubblicamente sposato la causa. Il loro impegno ha spronato molti programmi complementari ed iniziative simili all'OCP (es. OPEN COVID Declaration, firmata da un gruppo di aziende giapponesi per permettere la libera disponibilità della loro tecnologia a supporto della lotta al COVID), dimostrando quanto il

² <https://opencovidpledge.org/>

³ <https://opencovidpledge.org/partner-ip/>

senso di urgenza - generato da alcuni scenari atipici - può veramente alimentare l'Open Innovation (Chesbrough, 2003) e stimolare le organizzazioni ad aprire i loro confini per affrontare in modo congiunto le sfide della società (Antonelli et al., 2021; Chesbrough, 2020).

Se da un lato le aziende hanno partecipato all'iniziativa OCP per offrire al pubblico strumenti volti alla riduzione degli effetti negativi generati dal Covid-19, allo stesso tempo, la messa a disposizione di un certo numero di brevetti proprietari, in un'iniziativa di risonanza globale, può aver generato un effetto positivo per i pledgor che si concretizza in un accrescimento indiretto del valore dei brevetti concessi, ravvisabile in un maggior numero delle forward citation ottenute - rispetto a quelle che vi sarebbero state in assenza della partecipazione all'iniziativa - e quindi, nell'accrescimento dell'impatto di quest'ultimi nella generazione di nuove innovazioni oggetto di successivi brevetti. A tal proposito, questo studio ha l'obiettivo di stimare il trend di crescita delle forward citation dei brevetti del pledge, attraverso l'analisi dei dati dei documenti brevettuali in esame, confrontandoli con il trend riscontrabile per brevetti, con caratteristiche simili e confrontabili, non partecipanti all'OCP.

Metodologia

Variabili, metodo e campioni di analisi

Misura di impatto: le forward citations

Le forward citation (citazioni in avanti, ossia che sono nate successivamente, in contrapposizione alle backward citation, ossia le citazioni indietro che sono preesistenti a quelle a cui la documentazione brevettuale fa riferimento) rappresentano una delle misure più diffuse per rappresentare l'impatto/valore di un brevetto (Aristodemou & Tietze, 2018). Numerosi studi hanno utilizzato le informazioni sulle citazioni per stimare il valore del brevetto in termini di influenza, nonché per stimare la diffusione della conoscenza all'interno e al di là dei confini istituzionali, geografici e persino culturali (Jee et al., 2019).

Il rationale alla base dell'analisi delle forward citation è che se un brevetto è citato spesso da altri brevetti, è più probabile che altre entità si basino sulla tecnologia brevettata e che i brevetti altamente citati siano più rilevanti, costituendo una base di conoscenza per le future innovazioni. Infatti, pur non costituendo una misura perfetta del valore dei brevetti in termini di importanza, il numero delle citazioni in avanti viene spesso utilizzato in letteratura come guida per individuare i brevetti che possono essere considerati più significativi e d'impatto. Considerato l'obiettivo di questo lavoro di valutare quanto la scelta di mettere a disposizione un brevetto nell'OCP abbia contribuito a rendere quella tecnologia più conosciuta e quindi anche più utilizzata nel mondo, la stima del trend delle citazioni in avanti può costituire una buona guida per individuare l'eventuale presenza di tale pattern di diffusione.

Il metodo differenza-nelle-differenze (DID)

Per poter fare una valutazione quanto più possibile oggettiva delle ricadute in termini di ulteriore diffusione dei brevetti aderenti all'iniziativa Open Covid Pledge, è stata adottato il metodo differenza-nelle-differenze (DID, difference-in-differences).

Il metodo DID, nella sua versione più semplice che prevede quattro dati osservazionali, consiste nell'effettuare una osservazione nel momento immediatamente precedente all'attuazione della politica di intervento e una nel momento immediatamente successivo per poi operare un confronto tra i trend del fenomeno di interesse osservato sul gruppo di dati trattati ed il trend dei dati non trattati. L'effetto è identificato appunto da una differenza (trend) tra due differenze, ossia le differenze tra prima e dopo osservate nei due gruppi.

L'assunto arbitrario su cui si basa il metodo DID è che le differenze tra i due gruppi siano costanti nel tempo. L'assunzione alla base è che se non ci fosse stata la politica di intervento non ci sarebbero stati differenze nei trend dei due gruppi ("parallelismo dei trend").

Nell'ambito di questo lavoro, utilizzeremo un'applicazione semplice del metodo DID, con quattro osservazioni e l'utilizzo delle medie dei valori della serie (ossia il numero di forward citation). Pertanto, lo studio prenderà in considerazione i seguenti dati:

- Citazioni in avanti dei brevetti appartenenti al pledge esattamente prima del periodo pandemico e quindi dell'iniziativa Open Covid Pledge;
- Citazioni in avanti dei brevetti appartenenti al pledge dopo il periodo pandemico;
- Citazioni in avanti dei brevetti appartenenti all'insieme di controllo dei brevetti (dello stesso settore tecnologico) non aderenti all'iniziativa, nel periodo esattamente prima del periodo pandemico;
- Citazioni in avanti dei brevetti appartenenti all'insieme di controllo dei brevetti (dello stesso settore tecnologico) non aderenti all'iniziativa, dopo il periodo pandemico.

Per le citazioni in avanti si opererà per la media come dato statistico da utilizzare nelle analisi con il metodo DID.

Creazione del campione di analisi e di controllo e definizione della finestra di osservazione

La pagina ufficiale del progetto Open Covid Pledge permette agli utenti di identificare, tra l'insieme dei brevetti del pledge, quali sono i più attinenti ad una determinata soluzione. Tale funzionalità ha lo scopo di mettere a disposizione la tecnologia individuata, sotto licenza Open Covid, a chiunque avesse necessità di risolvere problemi di varia natura che ruotano intorno al contrasto degli effetti pandemici. Nei fatti, attraverso la versione beta del servizio ipscreener della Automatch Technologies⁴ è possibile risalire ai documenti brevettuali del pledge, fatto salvo fornire una descrizione sufficientemente accurata di quanto si sta ricercando. Il sito [openCovidpledge.org](https://my.ipscreener.com/login/openCovidpledge) prevede inoltre una

⁴ <https://my.ipscreener.com/login/openCovidpledge>

pagina "Featured IP" che ha la funzione di messa in vetrina di una serie di diritti di Proprietà Intellettuale messi a disposizione da pledgor durante il periodo pandemico.

Per costruire il campione brevettuale di questo studio, dato che la piattaforma opencovidpledge.org non fornisce un set esaustivo dei brevetti, sono state prese in considerazione le soluzioni riportate nella pagina di vetrina. In particolare, andando ad analizzare la pagina di "Featured IP", vengono mostrati in vetrina un totale di 26 titoli di privativa⁵. Per gli scopi di questo lavoro, sono stati selezionati le sole tecnologie coperte da diritto di privativa brevettuale (20 brevetti), e per i casi in cui la pagina Featured IP non ha fornito il numero del documento brevettuale della tecnologia, attraverso il servizio [ipscreener](https://www.ipscreener.com/) è stato identificato il numero di deposito (tramite la descrizione della tecnologia riportata nella stessa pagina di vetrina) permettendone comunque l'inclusione nel campione.

Successivamente, per ognuno dei brevetti della vetrina viene identificato un set di brevetti di controllo aventi stesso anno di priorità, stessa sottoclasse tecnologica IPC, stessa autorità di concessione brevettuale.

Per ogni set di brevetti (di osservazione e di controllo), tramite [Google Patents](https://patents.google.com/)⁶, si raccolgono almeno i seguenti parametri: titolo, data di priorità, anno di applicazione, classe tecnologica IPC, numero di rivendicazioni, numero di citazioni forward, numero di citazioni backward, nazione di deposito, inventore, descrizione, applicant.

Per identificare le due date di riferimento dell'analisi oggetto di questo studio, occorre stabilire una data subito prima dell'avvio dell'iniziativa Open Covid Pledge ed un'altra successiva alla stessa. A tal proposito, viene identificata la seguente finestra di osservazione temporale con queste date:

- Marzo 2020, data convenzionale di inizio della pandemia, eletta come data pre-pandemica;
- Giugno 2022, data di osservazione post-pandemica.

Anche se le licenze Open Covid Pledge iniziano formalmente alla data del 1 dicembre 2019 per tenere in considerazione delle attività già avviate, la consapevolezza dell'iniziativa è maturata subito dopo marzo 2020 (l'OMS ha dichiarato la pandemia 11 marzo 2020, la prima licenza Open Covid è stata pubblicata il 30 marzo 2020).

Queste due date rappresentano l'orizzonte temporale in cui vengono confrontati i dati dei set di brevetti di osservazione e di controllo.

Stima delle medie del numero di citazioni sia del set di osservazione che del set di controllo all'interno della finestra di osservazione

Per conteggiare le forward citation viene utilizzato [Google Patents](https://patents.google.com/). Il numero delle citazioni in avanti alla data di giugno 2022 sono quelle mostrate dall'interrogazione di [Google Patents](https://patents.google.com/) per ogni singolo documento brevettuale dei due set. Per stimare invece il numero di citazioni in avanti alla data di marzo 2020 sono stati selezionati, tra i brevetti citanti presenti nelle forward citation alla data di giugno 2022, quelli che sono stati pubblicati in un periodo precedente a [marzo 2020 + 18 mesi], settembre 2021, per tenere in considerazione il periodo di segretezza dopo il deposito dei brevetti. In mancanza di dati sulle citazioni in avanti alla data marzo 2020, questa può rappresentare una buona approssimazione per stimare il numero di citazioni in avanti.

In particolar modo, viene stimato il numero medio di forward citation per i due set di brevetti e per le due date di osservazione (4 dati osservazionali). Come anticipato, utilizzare la media costituisce una prima buona approssimazione di analisi.

Nello stimare il numero di forward citation del set di controllo, per ogni insieme di brevetti associato ad un brevetto del set di osservazione, vengono presi in considerazione i primi 3 brevetti con il maggior numero di forward citation, quale criterio più consistente per semplificare l'approccio metodologico. Questa semplificazione di carattere puramente operativo è la stessa per ogni brevetto, pertanto è come se stessimo conducendo il confronto con i top performer in termini di forward citation. A questo punto, si valuta la media delle forward citation per entrambe le date e per entrambi i set di brevetti secondo le modalità e le ipotesi precedentemente illustrate.

Nel valutare le medie delle forward citation vengono eliminate dal campione di dati i valori max e min in modo da minimizzare la dispersione e restituire una stima di media più plausibile.

Analisi descrittiva del campione

In Figura 1 è riportata la distribuzione dei brevetti in vetrina tra i vari *pledgor*. La società con il numero maggiore di brevetti messi a disposizione nella vetrina dell'*Open Covid Pledge* è la *Mitsubishi Electric* con il 27.3 %, seguita da *IBM* con il 13.6 % ed a seguire *Uber*, *Fujitsu*, *AT&T* e *Sandia* con percentuali intorno ai dieci punti.

Conducendo un'analisi di *text clustering*⁷ sui campi di applicazione dei brevetti si ottiene la rappresentazione riportata in Figura 2, generata considerando la descrizione della tecnologia inserita e la tipologia di problemi che va a risolvere rilevati nel titolo, nell'*abstract* e nella descrizione della stessa.

Andando a esaminare il dettaglio dei singoli brevetti, i campi di applicazione possono essere riassunti nelle seguenti categorie:

- soluzioni utili per ricalcolare il percorso ottimo da parte dei robot mobili;
- soluzione per la determinazione della posizione sul globo attraverso tecnologia wifi o cellulare senza l'utilizzo del GPS;
- soluzioni attinenti i cosiddetti canyon urbani (luogo in cui la strada è fiancheggiata da edifici su entrambi i lati

⁵ Dati raccolti fino al 25/06/2022

⁶ <https://patents.google.com/>

⁷ Analisi condotta sui brevetti della vetrina del *pledge* con la funzione "Analysis, text, field of invention" dello strumento *patentinspiration* (<https://www.patentinspiration.com/>)

- creando un ambiente simile a un canyon, in altri termini le strade che separano i grattacieli);
- soluzioni per mitigare la trasmissione di patogeni attraverso i dispositivi di input sensibili al tatto oppure sistemi di rivelazione delle proteine come metodo diagnostico per assistere il personale medico;
- soluzioni eterogenee che vanno sotto diversi argomenti per campi di applicazione differenti (categoria residuale).

Analizzando le *forward citation*, alla data del mese di giugno 2022, i *pledgor* con il maggior numero di citazioni in avanti sui brevetti messi a disposizione in vetrina sono *Intel e Mitsubishi Electric*. Quest'ultima, in considerazione del numero maggiori di brevetti messi a disposizione ha minore importanza in questa classifica. Ad ogni modo questo dato preso singolarmente non ha particolare significato se non quello di evidenziare come la tecnologia di *Intel* abbia, confrontandola con le altre messe a disposizione, un buon grado di diffusione.

Effettuando un confronto *pre vs. post* del set di brevetti della vetrina del *pledge* tra la data prima dell'intervento della politica e quella successiva, si evince come il *pledgor* con il maggior incremento di citazioni in avanti è *Uber* seguito subito da *Mitsubishi Electric*. Il fatto che buona parte dei brevetti della vetrina abbiano avuto un incremento del numero di citazioni nel confronto *pre vs. post* non permette di correlare assolutamente tale dinamica con l'effetto dovuto all'adesione all'iniziativa *Open Covid Pledge*, se non altro per la dinamica naturale che le *forward citation* presentano (aumentano con il passare del tempo) e per l'intervallo temporale di osservazione abbastanza ampio che lascia presumere che un incremento di citazione sia lecito aspettarselo. Il confronto *pre vs. post* del set di brevetti di controllo (*top performer*) mostra che nonostante il numero già elevato di citazioni, alcuni documenti brevettuali manifestano incrementi percentuali nel periodo *pre vs. post* che arrivano anche all'80 % (Appendice 1).

Fig. 1: Distribuzione dei brevetti della vetrina tra i *pledgor*, elaborazione degli autori, 2022

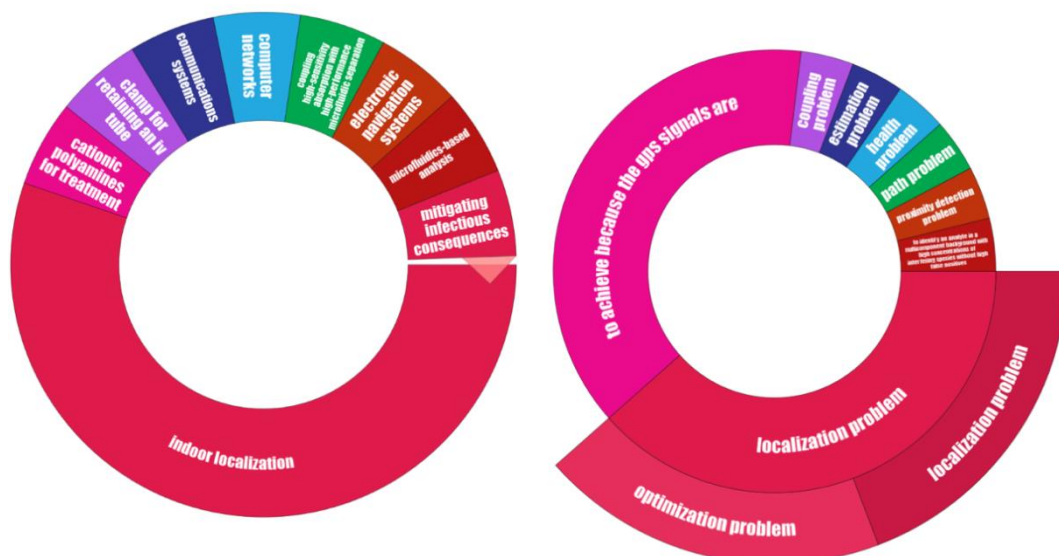

Fig. 2: Text Clustering brevetti dei *pledgor*, figura generata con *patentinspiration*, elaborazione degli autori, 2022

Risultati del modello differenza-nelle-differenze. Procedendo con l'analisi dei brevetti ed applicando il metodo differenza-nelle-differenze, la stima delle medie dei due set e per le due date di osservazione a cavallo dell'intervento della politica conduce ai valori riportati nella Tabella 1.

Tab. 1: metodo differenza-nelle-differenze, valori medi delle citazioni in avanti dei due set di brevetti, elaborazione degli autori, 2022

valori medi di <i>forward citation</i>			
Set di brevetti	PRE-COVID	POST-COVID	Trend (differenza periodo)
Osservazione	9.93	11.29	1.36
Controllo	113.47	124.49	11.02
Trend (Differenza)	103.54	113.20	9.67

Il valore numerico positivo (9,67) della doppia differenza è una indicazione di come la dinamica delle citazioni in avanti dei brevetti della vetrina abbia un trend favorevole rispetto ai brevetti più performanti appartenenti al set di controllo. Da un punto di vista grafico, il trend favorevole è rappresentato dalla maggiore pendenza della retta della dinamica delle citazioni in avanti medie del set di osservazione (di colore blu) rispetto alla retta omologa del set di controllo (di colore arancione), come rappresentato nella Figura 3.

Il fatto che il numero di citazioni in avanti medie dei brevetti della vetrina abbiano un trend favorevole rispetto al trend dei brevetti di controllo lascia presagire come l'intervento della politica di partecipazione al progetto Open Covid Pledge possa aver avuto ricadute positive in termini di diffusione della tecnologia.

Fig. 3:- Metodo differenza-nelle-differenze applicato ai brevetti della vetrina, elaborazione degli autori, 2022

Fatte salve le opportune considerazioni circa le semplificazioni operative adottate, lo strumento DID permette di analizzare quanto possa essere importante la partecipazione da parte di alcune organizzazioni a questo tipo di iniziative, in termini di potenziale diffusione dell'innovazione, generando un rilevante contributo nello studio delle politiche di patent pledge.

Conclusioni, limitazioni, implicazioni future. Dall'analisi condotta è possibile evincere che entrambi i set di brevetti (quello di osservazione e quello di controllo) dimostrano una naturale tendenza all'incremento delle citazioni in avanti. Questa caratteristica intrinseca dei brevetti non permette di utilizzare la metodologia di confronto semplificata pre vs. post in quanto esiste una dinamica naturale che si confonde con l'eventuale effetto della politica di

intervento OCP che vogliamo stimare. Allo stesso modo, anche se si effettuasse il solo confronto tra i due set di brevetti a una data post pandemica, per quanto siano stati selezionati i documenti brevettuali più simili (stessa classe IPC, stessa data di priorità, stessa nazione di deposito), sarebbero presenti comunque delle differenze naturali tra i due insiemi (dovuta al fatto che naturalmente non esistono due brevetti identici) che renderebbe la stima poco affidabile. Pertanto, la sola metodologia di confronto dati trattati vs. dati non trattati, sarebbe stato poco applicabile per le finalità di questo lavoro in quanto sarebbe venuta meno l'assunzione alla base di tale metodologia: l'identità strutturale dei due set (osservazione e controllo).

Per questo motivo, per stimare gli effetti dell'intervento della politica Open Covid Pledge il metodo differenza-nelle-differenze si è mostrato quello più attendibile per utilizzare l'andamento delle citazioni in avanti come proxy della diffusione delle tecnologie prima e dopo la partecipazione al progetto. L'impatto è stato valutato confrontando la dinamica naturale delle forward citation nel periodo pre-covid (marzo 2020) e post-covid (giugno 2022) tra l'insieme dei brevetti della vetrina dell' Open Covid Pledge (set di osservazione) e l'insieme di brevetti aventi natura e caratteristiche simili (set di controllo). Il metodo DID è stato applicato nella forma semplificata che prevede 4 dati osservazionali (le medie delle citazioni in avanti pre e post applicate ai due set). Il risultato dell'applicazione del metodo produce una doppia differenza positiva, lasciando presagire che la partecipazione all'iniziativa Open Covid Pledge abbia dato un slancio ulteriore in termini di diffusione e quindi citazione dei brevetti della vetrina.

Consapevoli della portata della sfida a causa delle numerose variabili che possono influenzare la dinamica naturale delle citazioni, si è scelto di intraprendere un'analisi con un modello semplificato che può fornire una stima orientativa iniziale in grado di aprire la strada ad indagini future più approfondite.

La limitazione principale di questo studio è aver scelto come set di controllo, per motivi di opportunità operativa e semplificazione del modello, i soli documenti brevettuali top performer) in termini di citazioni in avanti (per il set di controllo). Ciononostante, il confronto tra le medie ha condotto ad un trend favorevole in termini di aumento di citazioni in avanti per i brevetti dell'Open Covid Pledge in vetrina.

Studi futuri potranno eliminare tale ipotesi di lavoro ed analizzare l'intero set di controllo per stime più rappresentative grazie ad una maggiore quantità di dati di analisi. Allo stesso modo, estendere il numero di dati osservabili del metodo differenza-nelle-differenze può rendere sicuramente la stima dell'effetto più veritiera. Ad esempio, si potrebbe considerare due date pre-pandemiche in modo da valutare il trend delle citazioni in avanti con il metodo DID e verificare se viene rispettata l'assunzione di parallelismo. Si potrebbe ancora estendere la valutazione utilizzando, oltre alla media delle citazioni in avanti, anche ad altri parametri statistici come, per esempio, la varianza. Anche estendere il set di osservazione a tutti i brevetti dell' OCP può condurre ad una stima ancor più rappresentativa degli effetti della politica di intervento Open Covid Pledge. Un modo per poter identificare il set esaustivo di brevetti - al momento non disponibile - potrebbe essere quello di condurre una survey con i pledgor per giungere al set di tecnologie messe a disposizione. Infine, un ulteriore spunto di studio e riflessione potrebbe essere identificare quanto la dinamica di maggiore citazioni dei brevetti del pledge possa essere comunque stata influenzata dallo stato di attenzione generale che la pandemia ha innescato per certi tipi di tecnologie, indipendentemente dal fatto che il pledgor abbia partecipato all'iniziativa Open Covid Pledge.

Exploring the Role of Intrinsic Motivations and Organizational Context in Fostering Individual Ambidexterity: Manager vs. Employees Analysis

DOMENICO DE FANO* ROSAMARTINA SCHENA* ANGELOANTONIO RUSSO[▲]

Abstract

The concept of individual ambidexterity refers to a combination of exploring new activities and exploiting them. Although individual ambidexterity has emerged as a recent research area that demonstrates people's crucial role in organizations, little is known about the underlying determinants and consequential effects of the exploration-exploitation activities and whether significant differences exist between them. Therefore, to bridge this gap, this study adopts and tests an original conceptual framework that envisages intrinsic motivations and the organizational context - defined as a reflexive second-order construct composed of stretch, disciplines, support, and trust - as antecedents of individual ambidexterity and how it impacts on the innovative performances of the organization. Based on a sample of 136 individuals from 14 different industries worldwide, two different analyses revealed that motivation and organizational context positively influence individual ambidexterity, and individual ambidexterity positively impacts performance innovation. Moreover, a PLS-MGA analysis shows that intrinsic motivations are the primary source for carrying out exploration and exploitation activities for employees. On the other hand, managers recognize individual ambidexterity when influenced by organizational context.

Framing of the research. *In competitive contexts where organizations must operate, the key to long-term success lies in innovating and redefining internal products or processes. Therefore, the ability to innovate is a function of promoting internal knowledge and filtering external knowledge, both with performing outputs (Tushman and O'Reilly, 1996). In other words, the balance of ambidexterity - the equilibrium developed between exploring new possibilities and exploiting old certainties (March 1991) - is the best approach organizations can adopt to innovate. Based on this perspective, the research stream on ambidexterity at the organizational level has identified a positive relationship between exploration-exploitation activities and firm performance (Blindenbach-Driessen and van den Ende, 2014; Russo and Vurro, 2010). The same insights were also confirmed when the focus occurred on the business unit (Gibson and Birkinshaw, 2004). Nevertheless, given that organizational ambidexterity depends on all human resources and managers and employees simultaneously explore and exploit their daily tasks (Schultz et al., 2013), the analysis shift on the granular level of ambidexterity is necessary and worthwhile (Pertusa-Ortega et al., 2021).*

The concept of organizational ambidexterity has been intensely developed in previous research, leaving more space to the need for shedding light on what happens in the exploration-exploitation activities at the individual level (Bonesso et al., 2014; Brusoni and Rosenkranz, 2014; Gurtner and Reinhardt, 2016), and which are the antecedents that affect ambidexterity. Furthermore, previous research on individual ambidexterity has shown how motivational antecedents and determinants relating to the organization's structure and environment affect exploration and exploitation activities (Sitkin et al., 2011). Thus, although ambidexterity at the individual level has appeared as a recent investigation field that demonstrates the crucial role people play in organizations (Mom, Fourne, and Jansen 2015), covering individual-level ambidexterity via managerial (Mom et al., 2007, 2009) and network means (Rogan and Mors, 2014), psychological characteristics and traits (Good and Michel, 2013; Laureiro-Martinez et al., 2015), behavioral traits (Keller and Weibler, 2014), and neuroscience approaches (Laureiro-Martinez, Brusoni, and Zollo 2010), a specific framework that incorporates both personal and organizational antecedents is flawless.

Furthermore, there is an apparent dichotomy in the target's definition to be examined to extrapolate knowledge about the source of individual ambidexterity in the scientific literature. For example, empirical studies differ markedly between analysis of managers' ambidexterity (Mom et al., 2007, 2009), focusing on the definition at the entrepreneur level (Yeganegi et al., 2018) or the employee level (Kao and Chen, 2015). However, a study identifying the possible

thematic and structural differences between different categories of human resources has yet to be defined. These two categories of stakeholders are managers and employees, and the focus on these stakeholders is worthwhile for several reasons. First, it is known that managers need to perceive changes in the competitive environment, including changes in technology, competition, customer needs, and regulatory changes. At the same time, they must be able to exploit their tangible and intangible resources to survive in the market successfully. Secondly, the relevance of investigating organizational ambidexterity with a focus on managers is underlined by studies that question the ability of a company to pursue ambidexterity considering their decision-making processes (Rivkin and Siggelkow, 2003) and their engagement in business, both routine and non-routine (Adler et al., 1999) or preferring creative rather than mere routine actions (Sheremata, 2000).

Conversely, some authors have demonstrated that employee orientation increases firms' propensity to explore and exploit. Thus, it positively impacts the firm's financial performance (Zhao et al., 2019) and non-financial performance (Skena et al., 2021). Finally, O'Reilly and Tushman (2004, p. 81) conclude that "one of the most important lessons is that ambidextrous organizations need ambidextrous teams and managers". Thus, these arguments illustrate the importance of an increased understanding of ambidexterity at the manager and employee levels of analysis.

Purpose of the paper. Although several empirical studies have examined individual ambidexterity's role and influence (Schnellbacher et al., 2019; Gibson and Birkinshaw, 2004), a model still needs to be developed that encompasses psychological and organizational factors influence individual ambidexterity. Furthermore, although there are studies that analyze exploration and exploitation activities using both employees (Kao and Chen, 2015) and managers (Mom, Van Den Bosch, and Volberda, 2009) as a unit of analysis, there is still no study that allows a comparison between these two clusters of human resources. Therefore, in line with the theoretical framework outlined above, the objectives of this research work are summarized in defining and testing a conceptual framework combining psychological and organizational variables and exploring these variables based on two clusters of human resources.

Specifically, the characteristics of individuals necessary for the implementation of ambidextrous practices within an organization are related to their ability to interact in different heterogeneous activities, their ability to resolve contradictions, and finally, their attitude toward redefining and renewing practical and complex skills (Mom, Van Den Bosch, and Volberda, 2009). Furthermore, it has been defined that the combination of these characteristics leads to the enunciation of the individual ambidexterity that allows for obtaining a better performance of the team and the department (Schnellbacher et al., 2019; Alexander and van Knippenberg, 2014), the performance of the service (Kao and Chen, 2016) and performance related to incremental innovation (Gupta et al., 2006; Jansen et al., 2006). Relying on this literature considering individual ambidexterity as a vector of superior performance also at the innovation level, the following hypothesis is defined:

H1. Individual ambidexterity has a positive effect on innovative performance.

Moreover, motivations are crucial in implementing daily HR tasks within organizations. For example, they encourage people to increase their time to conduct a given activity (Caniëls et al., 2017) by increasing the output quality (Starbuck and Webster, 1991). Furthermore, previous findings show that motivational orientations, such as the demand for ambidextrous activities, contribute to greater self-regulation in complex and challenging efforts (Pierro et al., 2006). Similarly, it was defined by Gupta et al. (2006) that intrinsic motivations appear to be the underlying determinants of discovering new solutions and processes. However, this activity is expressly declined in the exploration activities. Conversely, motivations also impact exploitation activities because they lead to searching for solutions that improve internal processes and methods and seeking inspiration in other efficient realities.

Moreover, according to Yu et al. (2015), frontline service employees' learning goal orientation positively influences their ambidexterity because adopting mastery goals prompts greater intrinsic motivation. Finally, intrinsic motivations have been defined as a determining factor in creating individual ambidexterity (Kao and Chen, 2016). Therefore, the following hypothesis is formulated:

H2. Intrinsic motivation has a positive impact on individual ambidexterity.

Finally, since Gibson and Birkinshaw's (2004) seminal work, the organizational context has been defined as an essential source of implementing individual ambidexterity. Prior literature on organizational ambidexterity has emphasized the value of stretch, discipline, support, and trust as confident underlying determinants in defining the organizational context.

Specifically, Simsek (2009) defines stretch as an incentive to voluntarily aim towards ambitious goals or accomplish more than before to create contextual ambidexterity. Discipline refers to an atmosphere that encourages individuals to strive to fulfill others' expectations. On the other hand, support is the framework in which the various human resources are available to assist and support other peers. In contrast, trust is understood as an exogenous factor that allows the work to be carried out in a non-competitive but collaborative way. Analyzing in detail the dimensions belonging to the conceptual framework of the organizational context, the identification and obtaining of stretch within the organizational context, declined in the form of the establishment of long-term objectives, is a precursor of the engagement of people in exploration and exploitation, resulting in incremental and radical improvements (Sitkin et al., 2011).

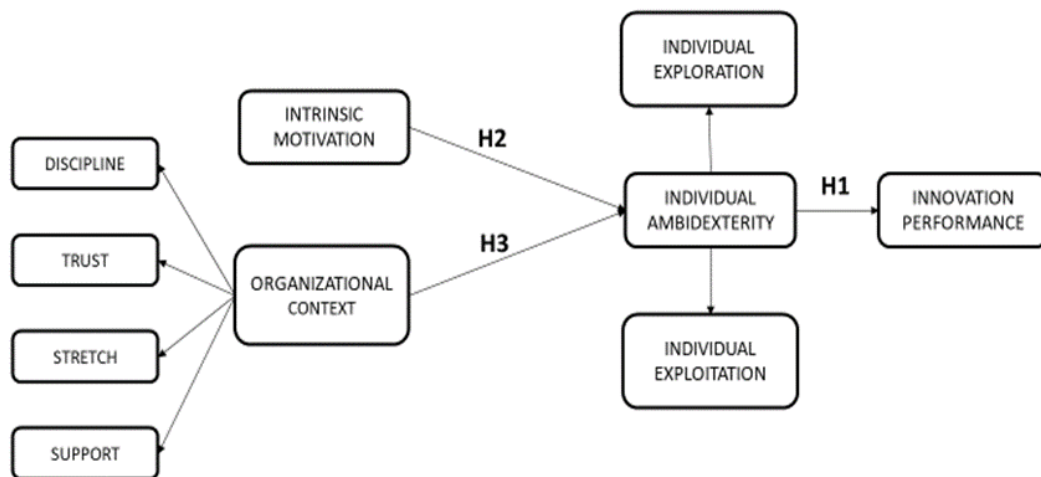

On the other hand, the stretch factor can only be employed with organizational discipline. The ability to monitor results with managerial practices to provide control is a direct function of the long-term objectives. Thus, in the context of exploration, discipline combined with constant guidance - in the form of a consistent accomplishment of actions and

success standards - significantly decrease any bias resulting from participating in exploration activities and, thereby, guarantees that human resources do not shy away from exploratory behaviors that primarily require a high degree of uncertainty and ambiguity (Andriopoulos and Lewis, 2009).

Furthermore, the organizational context's conceptual composition also requires the definition of support and trust, attributes linked to the interaction between human resources and their willingness to share knowledge. First, as Ghoshal and Bartlett (1994) defined, support is the possibility of interacting with human resources of all hierarchical levels - above all higher - to exchange different resources to approach exploration or exploitation activities. Conversely, trust relates to the willingness to share knowledge, as it "reduces barriers to knowledge flows and consequently fueling exploitation and exploration activities" (Schnellbacher et al., 2019, p.445). For this reason, based on previous studies that investigated the formal relationship between organizational context and individual ambidexterity, the following hypothesis is defined:

H3. An organizational context with more significant stretch, discipline, support, and trust positively affects individual ambidexterity.

Fig. 1: Conceptual Framework

Methodology. The research hypotheses are tested using Partial Least Squares Structural Equations Modeling (PLS-SEM). The sample of this empirical research is composed of one hundred and thirty-six human resources (female 42.6%, 30-39 years old 42%), divided into managers and employees, who refer to fourteen categories of different innovative industries distributed all over the world to allow a higher generalization of the results. The data are primarily collected from an online panel (Amazon Mturk) and through email, targeting individuals from 20 to 65 years old. A pre-test was conducted to test the efficiency and the likelihood that the hypotheses defined will be accepted and gauge the structure and content. The data from the pilot survey are included in the primary survey.

Participants had to confirm the section relating to the processing of sensitive data, ensuring this study from any problems of ethical conduct. Furthermore, a test for verifying the Common Method Bias (or Common Method Variance) was performed through the multicollinearity test. Since the values of the VIFs are lower than 3.3 when only the second-order constructs are adopted, the outcome is, therefore, satisfactory (Kock, 2015). Furthermore, participants rate their level of agreement on a scale from (1 = Strongly Disagree to 9 = Strongly Agree or 1 = Very Low Extent to 9 = Very High Extent). Finally, regarding the development of the survey architecture, to reduce the question order bias (Weinstein and Roediger, 2010), the questions are randomized for each respondent. In contrast, some questions with a defined response will be inserted (e.g., "push the bottom 4") to avoid the attention issue during the investigation.

The measurement items have been detected from studies on individual ambidexterity and innovation management in general. This study adopts the unique relationship that Schnellbacher et al. (2019) present, which positions the organizational context as the antecedent of the individual ambidexterity, both adopted as second-order constructs. The twelve items used for the organizational context (Gibson and Birkinshaw, 2004) are declined in the four related categories, stretch, disciplines, support, and trust, understood as first-order constructs. Furthermore, the dimension related to individual ambidexterity is operationalized as a second-order construct, having individual exploration and individual exploitation as first-order constructs (Mom et al., 2015). The motivational dimension was measured using a three-item scale developed by Tierney et al. (1999) and tested by Kao and Chen (2015). Finally, the dependent variable of this study, innovation performance, was measured through an operational assessment, asking the managers and employees involved how far they agreed with statements on aspects of innovations their firm had introduced within the last three years (Liu et al., 2011; Chen et al., 2011). Different control variables were also included, such as the age of the organization, nationality, gender, and education, which did not improve the percentage of variance explained.

The research hypotheses are tested using Partial Least Squares Structural Equations Modelling (PLS-SEM) using SMART-PLS 3 software. This statistical technique estimates causative relations by combining statistical data and

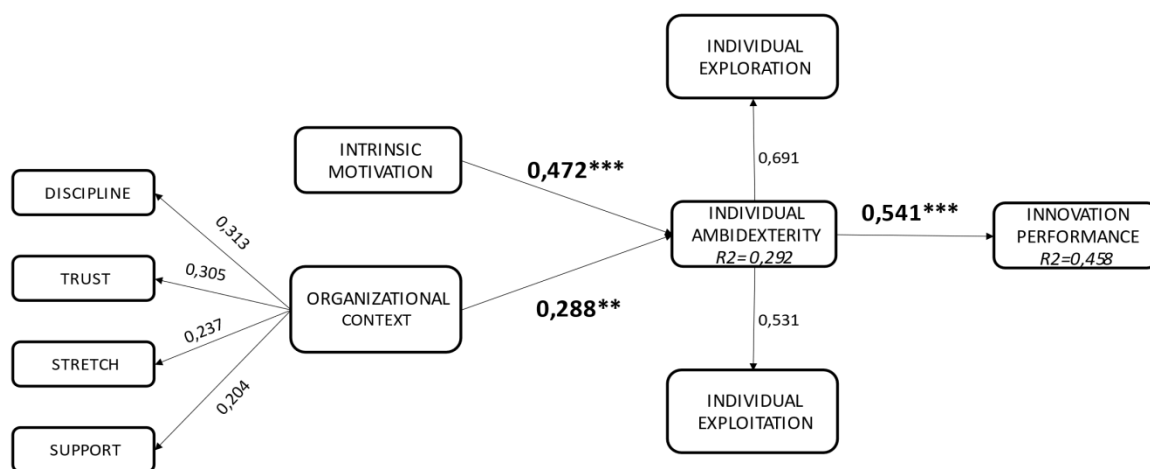

qualitative causal hypotheses (Dijkstra and Henseler, 2015). For this analysis, the partial least squares (PLS) have been employed, a variance-based technique, because it does not require a large sample and has no restriction on a normal distribution. In addition, as the second hierarchical constructs have been examined (i.e., organizational context and individual ambidexterity), the repeated indicators approach has been applied to determine their exact impact (Becker et al., 2012; Wold, 1982). This approach implies the collapse of the first hierarchical constructs into a single item deriving from the values of the latent variable relative to the second-order construct (Wetzels et al., 2009). In other words, the evaluation of the model and structure measurements is first performed with only the second-order constructs, calculated based on their respective latent variable values, and then with the implementation of the complete model with the first-order constructs. (Stretch, discipline, support, and trust).

Furthermore, this approach allows the evaluation of the model fit. In fact, by adopting the second-order constructs exclusively, the overall model fit is $\chi^2 = 135,626$, $p < 0.0001$, SRMR = 0.124.68. However, when the sample size is $N \leq 250$, the combinational rules based on SRMR reject more straightforward and complex true-population models under the non-robustness condition. Hence, while the model is not optimal, the other measurements support adequate goodness-of-fit according to the two-index combination rule. (Hu and Bentler, 1999).

The data analysis is then executed by adopting a two-step development. First, the measurement model is examined to ensure the research instrument's reliability and validity, and then the structural model is analyzed to test the hypotheses. Further, the multi-group analysis (MGA-PLS) is adopted to capture the differences between two different clusters: managers and employees.

Results. This study explores the influence of specific antecedents of individual ambidexterity, namely, organizational context and intrinsic motivation, which led to higher innovation performance. Furthermore, this study adopts a multi-group approach to identify differences between two clusters: managers and employees, in the abovementioned relationships. First, based on a sample of 136 individuals from 14 different industries, two different analyses revealed that the PLS-SEM results show how motivation and organizational context positively influence individual ambidexterity, and individual ambidexterity has a positive impact on performance innovation. Second, through an MGA-PLS analysis, a significant difference in the role of intrinsic motivations in balancing exploration and exploitation activities between managers and employees is figured out. The results show that intrinsic motivations are the primary source for employees' exploration and exploitation activities. On the other hand, managers recognize individual ambidexterity when influenced by the organizational context.

NOTES: ***p < 0.01; **p < 0.05; *p < 0.1;

Research limitations. The notion of individual ambidexterity is currently in its nascent stages, and as such, a quantitative study may encounter issues of response bias. However, subsequent studies could circumvent this problem by adopting a quantitative approach with a qualitative methodology.

Moreover, it is essential to note that limited sample size may impede the generalizability of the findings to the larger target population. Nevertheless, as per the work of Hair (2014), the results of Partial Least Squares Structural Equation Modeling (PLS-SEM) remain valid even with small sample sizes. Future investigations could consider using more substantial samples with a greater population representation. Additionally, it is imperative to comprehend how disparate countries and cultures could yield compelling results and augment theoretical contributions.

Finally, the aforementioned theoretical framework could be enriched by introducing new variables about absorptive capacity or by evaluating different outcomes related to specific innovative activities. Only through such endeavors can we develop a more comprehensive understanding of individual ambidexterity and its impact on innovation.

Managerial implications. *The results of this study have significant implications for managers from an operational perspective. Firstly, the study provides empirical evidence of the positive interaction between individual ambidexterity and innovative performance. Consequently, managers must prioritize stimulating exploration and exploitation activities within their organizations to enhance innovative production outcomes and processes.*

Secondly, the study highlights the importance of specific touchpoints that managers must follow to foster individual ambidexterity within their human resources. For instance, identifying resources that exhibit greater motivation in their work increases the likelihood of their active involvement in exploration and exploitation activities, leading to positive outcomes in innovation performance. Furthermore, the study underscores the critical role of the organizational context in determining the expression of individual ambidexterity. Therefore, managers must create a conducive working environment that fosters support and mutual trust to enable their workforce to engage in ambidexterity activities effectively.

Thirdly, the study differentiates the effects of the various determinants on managers and employees. As a result, it suggests that managers focus on fostering employees' intrinsic motivation to encourage their participation in exploration and exploitation activities. In contrast, the organizational context must focus on increasing functional and social aspects to promote managers' engagement with ambidexterity activities. This managerial implication underscores the importance of recognizing and balancing the different determinants influencing individual ambidexterity to achieve optimal innovation performance.

Originality of the paper. *The originality of this work lies in its contribution to understanding the determinants and consequences of individual ambidexterity. Although previous research has focused on the importance of individual ambidexterity, more is needed to know the factors that influence it and its effects on organizational performance. This study addresses this gap by proposing an original conceptual framework that considers intrinsic motivations and the organizational context as antecedents of individual ambidexterity. Additionally, the study uses a PLS-MGA analysis to investigate the primary source of exploration and exploitation activities for employees and how managers recognize individual ambidexterity when influenced by organizational context. In other words, the results suggest that while intrinsic motivations are the primary source for exploring and exploiting employees, managers recognize individual ambidexterity when influenced by the organizational context. These findings highlight the importance of considering employee and manager perspectives when promoting individual ambidexterity in organizations. By understanding the different perspectives and the role of intrinsic motivations and organizational context, managers can create an environment that supports and encourages individual ambidexterity, leading to improved, innovative performance. This unique approach of exploring the views of both employees and managers provides novel insights that can help organizations effectively promote and benefit from individual ambidexterity.*

It's a long way to the top if you want to be sustainable!

A structured literature review and bibliometric analysis on sustainable intermodal transportation systems (SITs)

ANNUNZIATA TARULLI * ANGELOANTONIO RUSSO * MICHELANGELO STRIGNANO ^

Framing of the research. Besides being fundamental for the socio-economic development of countries, it is well known that transport is one of the most energy-consuming and polluting activities, whose impact is bound to increase in future (Epicoco and Falagario, 2022). Indeed, industrialisation and globalisation led to massive shipments of goods and materials over large distances, thus generating higher GHG emissions, especially when road transport is considered. To address this problem, scholars initially focused on the selection of the best single-mode transport means to evaluate the efficient transport solution that maximizes utility for decision-makers (Bask and Rajahonka, 2017). After examining the various solutions to improve efficiency, essentially based on technological development, they concluded that improvements in single-mode alone were not sufficient to obtain substantial results (Nocera and Cavallaro, 2017). Therefore, different concepts of freight transportation systems have been proposed over the last decades, including multimodal, intermodal, combined, and synchromodal transport. Despite their peculiarities, these transportation modes are based on combinations of different transportation modes and routing options in integrated and coordinated transport chains to increase the system's overall efficiency (Fitzová et al., 2021). In detail, Reis (2015) defined multimodality as the combination of different transportation modes through interconnected and coordinated networks. Intermodality, on the other hand, occurs when commodities are transferred into the same loading unit, using multiple nodes but without transshipment. Filippova and Buchoud (2020) introduced combined transport as a form of intermodal transportation in which roads are used at the start and/or endpoints while rail, sea, or both are used to cover the major distances. Co-modal transport also developed from intermodal transport, but differs from it in its emphasis on efficiency rather than sustainability. Lastly, synchromodality is characterised by more reliable and adaptive decision-making processes based on real-time information on the current conditions of the transportation system (such as actual price, congestion, and delays), thus combining organisation and coordination of the transport chain (Epicoco and Falagario, 2022; Reis, 2015). However, although its benefits, these combined transportations have also drawbacks. Compared to unimodal transportation systems, indeed, combined networks are more complicated due to the involvement of multiple nodes, resources, and actors. Moreover, they suffer from limited infrastructure, the integration of different planning levels, a lack of clear decision-making structure, the absence of global interoperability at the technical, operational, and legal levels, as well as different regulations (Dotoli et al., 2017). Some of these problems can be overcome through information and communication technologies (ICT) solutions, making operation and management more efficient through proper strategic planning and real-time information provision at an operational level (Epicoco and Falagario, 2022). Although the adoption and advances of ICT in intermodal transportation have been slow due to many barriers (such as economic factors, reluctance to change, lack of interoperability, uncertainty, rapid technological obsolescence, etc.) (Dotoli et al., 2017), it emerges the need to investigate this topic from a broad perspective, unravelling its potentials and convey the transportation system towards the paradigm of sustainability.

Purpose of the paper. The aim of this study is threefold. First, it seeks to extend the research in green logistics literature focusing on sustainable intermodal freight models and their applications. Secondly, it attempts to identify the key research blocks related to this topic to make a complete picture of the phenomenon under investigation. Finally, it delivers recommendations and insights on developing efficient sustainable intermodal transportation systems, setting the ground for a future research agenda for scholars and practitioners.

Methodology. To better address the study aims, the structured literature review (SLR) approach was selected for its ability to identify new research areas and domains as well as trends, potentials, and implications for both theory and practice (Del Vecchio et al., 2021; Grant and Booth, 2009; Vrontis et al., 2021; Vrontis and Christofi, 2021). According to Massaro et al. (2016), the first step in performing a systematic, transparent and replicable study is to establish the research questions, which we formulated as follows:

-
- * Ph.D. Candidate and Research fellow of *Management* – LUM University, Italy
e-mail: tarulli@lum.it
 - Full Professor of *Management* – LUM University, Italy
e-mail: russo@lum.it
 - ^ Technical assistance and process improvement manager – Molino Casillo S.p.A.
e-mail: michelangelo.strignano@molinocasillo.it

RQ1: What is sustainable intermodal transportation systems' state of the art in management research?

RQ2: What are the key research blocks related to this subject area?

RQ3: What guidelines for future research can be derived to open new avenues for management researchers?

In particular, the first research question seeks to outline the state of the art in the current literature dealing with this topic and explain to what extent scholars are considering it. The second research question attempts to identify the key research blocks related to sustainable intermodal transport systems' subject area, while the third one offers recommendations for future research as well as the identification of possible developments and implications. Next, the research protocol must be specified (Petticrew and Roberts, 2008; Secundo et al., 2020). The articles were retrieved from the Scopus database, which is recognised as the most comprehensive database for research assessment and evaluation purposes, providing extensive coverage of academic journals (Schotten et al., 2017; Snyder, 2019; Yaghmaie and Vanhaverbeke, 2019). To select appropriate papers to include in the study, keywords such as 'intermodal transportation', 'multimodal transportation', 'logistics', 'environmental sustainability' and 'sustainability' were considered. As a result, a sample of 73 articles published from 2007 to 2023 was retrieved from the Scopus database. Next, a set of exclusion criteria based on subject area, publication type, stage, and language was used to reduce and evaluate the sample. After reading the title, abstract and keywords (Kauppi et al., 2018), articles that were not completed (e.g., abstract or other fundamental information not available) or inconsistent with the research topics were removed, thus resulting in a final sample of 41 published articles.

Following others' contributions (Del Vecchio et al., 2021; Eck and Waltman, 2009; Khan et al., 2020; McAllister et al., 2022; Secundo et al., 2020; Shah et al., 2019; Van Eck and Waltman, 2017), data was processed through the VOSviewer software using different bibliometric analysis techniques: bibliometric co-citation analysis for interconnections between articles and research topics, bibliometric co-occurrence analysis for the relatedness of articles, bibliographic coupling for the relevance of articles, and content analysis for presenting trends, research gaps, and future directions. The analysis was developed in three stages. First, a descriptive analysis is used to present the publication and citation structure of the sample, as well as the most influential contributions. Then, cluster and content analyses were performed using a bibliographic coupling (Kessler, 1963), highlighting exciting research areas.

Results. *The descriptive analysis was used to categorise the sample by the number of yearly publications, geographical analysis of authorship and data, number of citations, common keywords as well as the most influential authors. Figure 1 displays the trend of publications and citations from 2007 to 2022. The distribution shows that the first article dates back to 2007, but it's from 2012 onwards that interest in green logistic studies flourished. Indeed, these ten years highlight a constant production of published articles, with moderate peaks recorded in 2017, 2019 and 2021, and an average of three articles published per year. Similar considerations emerge from the observation of the citations' trend: it shows a volatile tendency, with peaks in 2015 (i.e., 98), 2019 (i.e., 172) and 2021 (i.e., 49), and an average of 64 citations per year over the last decade. It should be noted that a drop in publications and citations was recorded in 2022, with four documents and thirteen citations only. However, looking at the historical distribution of these data, it is possible to state that this decline may be associated with a potential future upturn, thus anticipating another peak in the coming years. Moreover, contributions in sustainable intermodal transport systems have increased only recently, and, therefore, their effect may not yet have been fully absorbed by the citations. Overall, these findings demonstrate the growing topicality of the subject, which needs deep exploration in future studies.*

Fig. 1: Trend of publications and citations over the timeframe 2007-2022

Source: Authors' elaboration.

As for the distribution of articles and citations per country, Italy represents the most influential (with 6 published papers and 167 citations), sharing the podium with India and Sweden in terms of documents (with 5 and 4 scientific articles, respectively) and with Belgium and the United Kingdom in terms of citations (with 116 and 93 citations, respectively) (Tab. 1). Focusing on the number of documents, there is not much difference between the countries as they differ by only a few papers. Differently, the ranking in terms of citation appears to be sharper. India and Belgium offer a curious fact. These two countries hold chiasm positions, both placing - in reverse - second and sixth in the two

rankings. Table 1 shows that no other country specialises in this topic except Italy, thus crowning the Mediterranean's boot as a leading country in the green logistic literature field.

Tab. 1: Top ten Countries per documents and citations

No.	Country	Documents	No.	Country	Citations
1	Italy	6	1	Italy	167
2	India	5	2	Belgium	116
3	Sweden	4	3	United Kingdom	93
4	China	3	4	Sweden	88
5	United Kingdom	3	5	Spain	71
6	Belgium	3	6	India	66
7	Brazil	3	7	Turkey	66
8	Turkey	3	8	Denmark	54
9	Denmark	2	9	Japan	54
10	Spain	2	10	Netherlands	41

Source: Authors' elaboration.

As for the scientific journals in which the papers included in the sample were published, Table 2 highlights the top five rankings. Sustainability (Switzerland) conquers the first position with eight documents, followed by four journals specialising in transportation and logistic research, which count two papers each. This result confirms the dual perspective approach used by scholars when referring to this topic, matching logistics with sustainability issues, as well as a high level of heterogeneity, as topics range from its management, impact, applications, policy and practice.

Tab. 2: Top five Scientific Journals

No.	Scientific Journal	Documents
1	Sustainability (Switzerland)	8
2	Transportation Research Part A: Policy and Practice	2
3	International Journal of Physical Distribution and Logistics Management	2
4	Transportation Planning and Technology	2
5	International Journal of Logistics Research and Applications	2

Source: Authors' elaboration.

As for citations, following previous research (Del Vecchio et al., 2021; Massaro et al., 2015, 2016; Secundo et al., 2020), the articles were ranked using citations and citation per year index (CPY). Table 3 highlights Iannone (2012) as the most cited document, followed by the publications of Ambra et al. (2019) and Qu et al. (2016) in the second and third positions. However, if time is considered, citations must be normalised by the time elapsed between the publication date and the end of the analysis period (Dumay, 2014). Here, Iannone (2012) moved from first to fourth position, replaced by Ambra et al. (2019), which took the first place in the CPY ranking. Next, Qu et al. (2016) rank second in terms of CPY, while Baykasoğlu et al. (2018) close the top three podium, moving from fifth to third place. These changes confirm the importance of considering the time effect when classifying scientific articles in terms of citations, bringing unexpected outcomes to light.

Tab. 3: Top ten author and article per citation and per CPY

No.	Authors	Title	Year	Cited by	CPY	Ranking CPY
1	Iannone, F.	The private and social cost efficiency of port hinterland container distribution through a regional logistics system	2012	84	7,64	4 (↓)

Table 4 sets out the analysis of keywords' occurrences authors used to classify their articles. Results show five clusters with a total of 17 items, graphically distributed in a network as displayed in Figure 4. The most common keywords resulted in 'sustainability' (with 16 occurrences), followed by 'logistics' (with 9 occurrences) and 'intermodal transportation' (with 8 occurrences), among others.

Tab. 4: Groups of keywords occurrences

	Keywords (Occurrences)
Cluster 1 (5 items - red)	Freight transport (2), Multimodal transport (3), Optimisation (2), Supply chain management (2), Synchronomodality (3)
Cluster 2 (4 items - green)	CO2 emissions (2), Environmental sustainability (2), Logistics (9), Transportation (3)
Cluster 3 (4 items - royal blue)	Freight transportation (2), Mixed integer linear programming (2), Network design (2), Sustainability (16)
Cluster 4 (3 items - yellow)	Intermodal terminal (2), Intermodal transportation (8), Service network design (2)
Cluster 5 (1 items - lavender)	Intermodal transport (6)

Fig. 2: Keywords network visualisation

Source: Authors' elaboration using VOSviewer.

A cluster analysis using bibliographic coupling (Kessler, 1963) was then performed using the references included in each paper of the sample. The analysis, which included only papers having two references in common at the minimum, gave us seven clusters with 32 related items. Figure 3 displays the clusters arising from the bibliographic coupling analysis after running 10 interactions, showing the strength of the closeness according to the number of references in each paper (Del Vecchio et al., 2021). Although articles of the same cluster belong to common research areas, the cluster analysis performed using VOSviewer is not without imperfections. Actually, a better representation of the research areas discussed in the literature is illustrated in Table 5, in which authors are classified according to the content of the study and their focus, which extends beyond the evidence indicated by the bibliographic coupling analysis.

Fig. 3: Bibliographic coupling: cluster grouping items with intersected literature

Source: Authors' elaboration using VOSviewer.

An in-depth content analysis was performed by reading the 32 papers to understand the main research areas. As a result, seven thematic areas emerged from the analysis (Tab. 5), briefly explained as follows. The first group mainly proposes an integrated model framework (i.e., road, rail, and waterways) based on several methodologies (such as MCDA, BNs, mixed-integer linear optimisation model, among others) to mitigate the negative effects of logistic operations on the environment and human health. The second cluster focuses on the supply chain actors - considering the impact multiple stakeholders have in the intermodal business - and the useful practices to manage this sector sustainably. In detail, the third cluster explores these practices by offering combined solutions between intermodal, multimodal, and synchromodal networks. The fourth and fifth research areas, on the other hand, present the benefits and risks associated with sustainable intermodal transportation systems. Benefits include efficiency, higher performance, and reductions in costs, damages, emissions, and traffic congestion, while the main risks are associated with economic, social, and ecological factors. The sixth cluster outlines some best practices for governing intermodal logistic networks. In particular, it stresses the importance of location, accessibility, and efforts to lower the environmental and social burden. Finally, the last research area delves into the importance of information exchange mechanisms driven by digitalisation and decision-support tools to solve everyday tasks. These features are paramount in nowadays decision-making processes and ensure effective interoperability.

7 Decision support tools for developing sustainable intermodal transportation systems (SITSSs) (2 items - orange)	Epicoco and Falagario (2022), De Andres Gonzalez et al. (2021)

Source: Authors' elaboration.

Research limitations. *The study is not free from limitations. First, it examines only articles published in journals, thus excluding the grey literature or books that might provide additional contributions to the topic. Second, although the sampling procedure relies on keywords selected through a rigorous analysis of previous literature, the final selection might not be exhaustive and omits exciting research. Third, the classification and discussion of the identified thematic areas are inevitably influenced by the researcher's bias. Despite these limitations, which may serve as the basis for further research on this subject, this study contributes to the debate on sustainable intermodal transport systems and their implications for business research.*

Managerial implications. *The analysis suggests that a connection between intermodal logistics and sustainability exists, is topical and requires attention from supply chain actors and policymakers. This result appears relevant for theoretical development and practical implications for business managers, policymakers, institutional actors, and society. It provides comprehensive knowledge of the opportunities associated with this practice, enabling stakeholders to understand better how to respond strategically to related environmental and social concerns. For this purpose, policies aimed at regulating supply chain relationships and improving the services of multimodal networks must be delivered.*

Originality of the paper. *This study seeks to provide the state of the art on sustainable intermodal transportation systems, identifying the research areas currently covered in literature as well as envisaging its future developments. Despite its relevance and increasing interest, research in this area still needs to be expanded. Indeed, only a few literature reviews are counted, and the novelty of this work is to use a bibliometric approach to complement the traditional literature review methodology. Therefore, future research should focus more on these unexplored topics theoretically and empirically.*

Keywords: *green logistics; sustainability; intermodal transportation; multimodal transportation; supply chain management; structured literature review.*

Sustainable supply chain and logistics' decarbonization: a literature review analysis

SILVIA BLASI* CHIARA SGUIZZARDI[•] IVAN DE NONI[▲] IVAN RUSSO^{**}

Abstract

Over time, sustainable supply chain management (SSCM) has become a relevant research area and a number of literature reviews has been published. Extant literature has highlighted the need for further examination of relationships among specific aspects of SSCM with the aim of theory-building. Increased public awareness regarding carbon emissions levels and the urgency of climate change made decarbonization of processes a central aspect of SSCM. Indeed, companies have been facing rising requests to address global warming by reducing emissions. Companies are directing efforts towards this aim; however, they are also becoming increasingly aware that the greatest part of their impact is not under their direct control, but it derives from activities along their entire value chain. It follows that measures to tackle global warming along a company's supply chain are of primary importance, with an additional difficulty: very few have the visibility needed to make a difference with regards to decarbonization.

As a result, a bibliometric literature review using networks analysis and topic modelling has been developed and examined, using a full sample of 2503 documents from the Scopus database to build a detailed map of the literature on SSCM and the specific domain of decarbonization.

Our goal is to provide insights into not only which relationships among specific aspects of SSCM have been examined in extant research, but also to define what could be the next evolution of inquiry in this niche.

Framing of the research. Over time, sustainability has become a relevant research area within the macro-area of supply chain management research. Indeed, a number of literature reviews regarding sustainable supply chain management (SSCM) has been published (Carter and Washispack, 2018). However, extant literature calls for further examination and encourages deeper understanding of relationships among specific aspects of SSCM with theory-building as the ultimate aim (Marculetiu et al, 2022). Particularly, increased awareness regarding the carbon emissions levels produced within the entire business ecosystem led to the surfacing of decarbonization of processes as a relevant aspect of SSCM (Ellram et al, 2022; Eggert and Hartmann, 2021). Companies have been facing rising requests coming from society at large (governments and regulators, shareholders, customers and other stakeholders), that urges them to address global warming and to reduce greenhouse gases (GHG) emissions against climate change (George et al., 2016; Rowlett, 2021).

"Carbon" is often used as a shorthand for GHGs, as carbon dioxide is the main GHG released by human activities. Still, organizations need to balance these requests with their financial stability, in a turbulent business environment that presents, on one side, the need for redundancy and resilience to address disruptions and, on the other side, a demanding customer seldom over- and fast-consuming.

To add a point, despite increasing efforts towards emissions reductions, companies are becoming increasingly aware that the greatest part of their impact is not under their direct control, on the contrary it derives from activities and processes - such as production, transport, inventory management - that happen along their entire value chain (Eggert and Hartmann, 2021; Sundarakani et al, 2010). According to the GHG Protocol, this type of indirect emissions is defined as Scope 3 and, for many companies, they account for 80 percent of a firm's overall climate impact (McKinsey & Company, 2021). It follows that the implementation of measures to tackle global warming along a company's entire supply chain is of primary importance. However, part of the problem is that while sustainability is already widely discussed and is top of mind for most organizations, few have complete visibility into all their supply chain processes to begin to make a difference with regards to decarbonization. As a matter of fact, Deloitte's Global 2021 Chief Procurement Officer study found that only 18 percent of chief procurement officers were monitoring their risks and only 15 percent had full visibility into their supply chains.

Thus, the objective of this article is to explore the extent to which the literature on sustainable supply chains has explored the related topic of decarbonization for a better understanding of critical issues as well as possible areas for action to decrease the carbon footprint of supply chains.

Purpose of the paper. This paper reviews and maps sustainable supply chain management (SSCM) literature with the aim of revealing relationships among various underlying topics as well as identifying emerging ones. Particularly, this bibliometric literature review investigates convergence areas between SSCM and the topic of decarbonization, in order to gain insights into this research niche and disentangle the theoretical linkage between the two concepts. This theoretical overview introduces a clear picture of trends and developments, together with insights into not only which relationships have and have not been adequately examined in extant research, but also what could be the next evolution of inquiry in this domain. In fact, it allows to provide academic implications on future research directions on emerging topics in the field of SSCM aligned with decarbonization as well as promotion of further theory-building regarding specific aspects of SSCM. Moreover, the selected analysis can provide guidance as well as sparks for reflections to managers that need to cope with challenging regulatory initiatives and pressing consumers' expectations. To accomplish the desired objective of current research, a mixed-method methodology has been employed, including bibliometric analysis, network analysis and topic modelling.

Methodology. This paper aims at investigating and mapping the development of topics related to decarbonization within the literature on sustainable supply chain management (SSCM). To this end, we have implemented a three-steps methodology, summarized in Figure 1, including both network analysis and topic modelling. First, we defined the SSCM literature through Scopus database, by searching all the articles in the categories business, sociology, or economics, responding to a number of search queries related to sustainable supply chain management. We ground our initial themes and choice of keywords consistent with Zhang et al (2022), thus the search queries involved sustainable, closed-loop (circular), green and environmental supply chain (with different syntaxes)¹. Indeed, the inclusion of keywords that are both explicitly and implicitly related to SSCM allows for the provision of a more accurate and holistic understanding of the SSCM research domain. The presence of these search queries was limited to title and authors' keywords fields. Abstracts were not considered in order to obtain a more consistent sample with respect to the focal topic.

The aforementioned search returned a sample of 4470 articles, published from 1996 to 2023, that were all extracted. However, out of the 4470 articles, 257 do not present author keywords and only 2503 present indexed keywords. Author keywords are chosen by the author to best reflect the content of the document, while indexed keywords are chosen by Scopus and are standardized to vocabularies derived from thesauri that Elsevier owns or licenses. Unlike author keywords, indexed keywords take into account synonyms, various spellings and plurals. Thus, the analysis performed on the full sample takes into consideration 2503 documents.

Fig. 1: Study process

The second step consisted of a network analysis, that was developed on all the indexed keywords of the full sample. Although indexed keywords are already supposed to be ready for analysis, an additional data wrangling process was manually developed to further clean the keywords and aggregate them into relevant macro topic clusters. For instance, decarbonization (which is the focal topic of the analysis) includes several keywords such as carbon emission, carbon reduction, emission control, carbon footprint, carbon dioxide, low carbon, carbon policies. The process of

¹ (TITLE ("circular supply chain") OR KEY ("circular supply chain") OR TITLE ("Sustainable supply chain") OR KEY ("Sustainable supply chain") OR KEY ("Green supply chain") OR TITLE ("Green supply chain") OR TITLE ("Closed loop supply chain") OR KEY ("Closed loop supply chain") OR TITLE ("Closed-loop supply chain") OR KEY ("Closed-loop supply chain") OR TITLE ("Environmental supply chain") OR KEY ("Environmental supply chain")) AND (LIMIT-TO (SUBJAREA, "BUSI") OR LIMIT-TO (SUBJAREA, "SOCI") OR LIMIT-TO (SUBJAREA, "ECON")) AND (LIMIT-TO (LANGUAGE, "English"))

homogenization of synonymous keywords has been extensively discussed between authors. Finally, network analysis has been performed as in Wasserman & Faust (1994) by looking at co-occurrence of indexed keywords across all the 2503 articles of the full sample.

This preliminary investigation addresses two main points. On the one hand, it highlights the relevance of decarbonization for policy and managerial implications from a supply chain perspective, thus legitimating the need for deepening the analysis. On the other hand, it operationally supports the identification of a sub-sample of studies that specifically deal with the topic of decarbonization within SSCM literature.

Specifically, the sub-sample of decarbonization-related articles, within SSCM literature, is formed by 297 documents out of the initial 2503 ones. *Journal of Cleaner Production* has published the most articles (27%) and it is followed by *Sustainability* (Switzerland) (14%), *International Journal of Production Economics* (10%), and *International Journal of Production Research* (8%).

Figure 2 shows the publication trend of both SSCM literature and decarbonization-related articles over the years. While the first studies on SSCM date back to 1996 but research was limited until 2005, when publications started to increase consistently, with a spike near 2020. Differently, literature focusing on decarbonization in the context of sustainable supply chains registers its first articles much later, in 2008, and it has started increasing since 2014 without relevant spikes.

Fig. 2: Evolution of full and decarbonization-related SSCM literature over time

The third step of this analysis aims at exploring more in detail the sub-sample where decarbonization emerges as a macro-topic. In fact, while network analysis is appropriate for a preliminary investigation of a vast extant literature, it can be complemented with further research. Specifically, this last step is performed on the sub-sample of 297 documents and it provides two levels of analysis: the first level points to investigate more deeply these articles by replicating the previous analysis, based on indexed keywords co-occurrence. In this case, however, indexed keywords are not further clustered but they are introduced in their original form. The purpose of this step is to deepen investigation into the facets of the connection between SSCM and decarbonization, with the aim of exploring the underlying keywords linked with decarbonization, together with the most related relevant topics. Moreover, this serves as basis to offer the ground for the development of future research in the field of decarbonization along the supply chain

The second level is complementary to the first one and focuses on the abstracts of the articles in the sub-sample. In this case, a topic modelling analysis is performed to improve and to deepen the understanding of results obtained from the first level of analysis. The use of abstracts is expected to extend linkages with minor or emerging topics which may be less represented in keyword analysis. This technique is chosen as recent review papers (Ali and Kannan, 2022; Sharma et al., 2021) have shown that topic modelling can handle a very larger number of articles, when manual coding is not practically feasible, as in this study. Topic modelling has been performed as suggested in Bansal et al., 2020.

Results. Network analysis assesses and visually represents relationships between keywords: it allows to identify patterns or clusters of related terms emerging from the literature. As a result, drawing on the preliminary step analysis, figure 3 shows decarbonization (colored in red) as one of the most relevant issues, being strongly related to sustainable, closed-loop and green supply chain management, as well as to environmental impact and decision-making. Since only keywords with at least 100 co-occurrence are represented, the resulting network (fig. 3) leads to the identification of the most relevant topic clusters. First of all, and not surprisingly, the figure reveals that extant literature abundantly deals with the general topic of supply chain management and highlights the search queries (colored in blue) on which the research is drawn: sustainable, closed-loop (circular), and green (environmental) supply chain management.

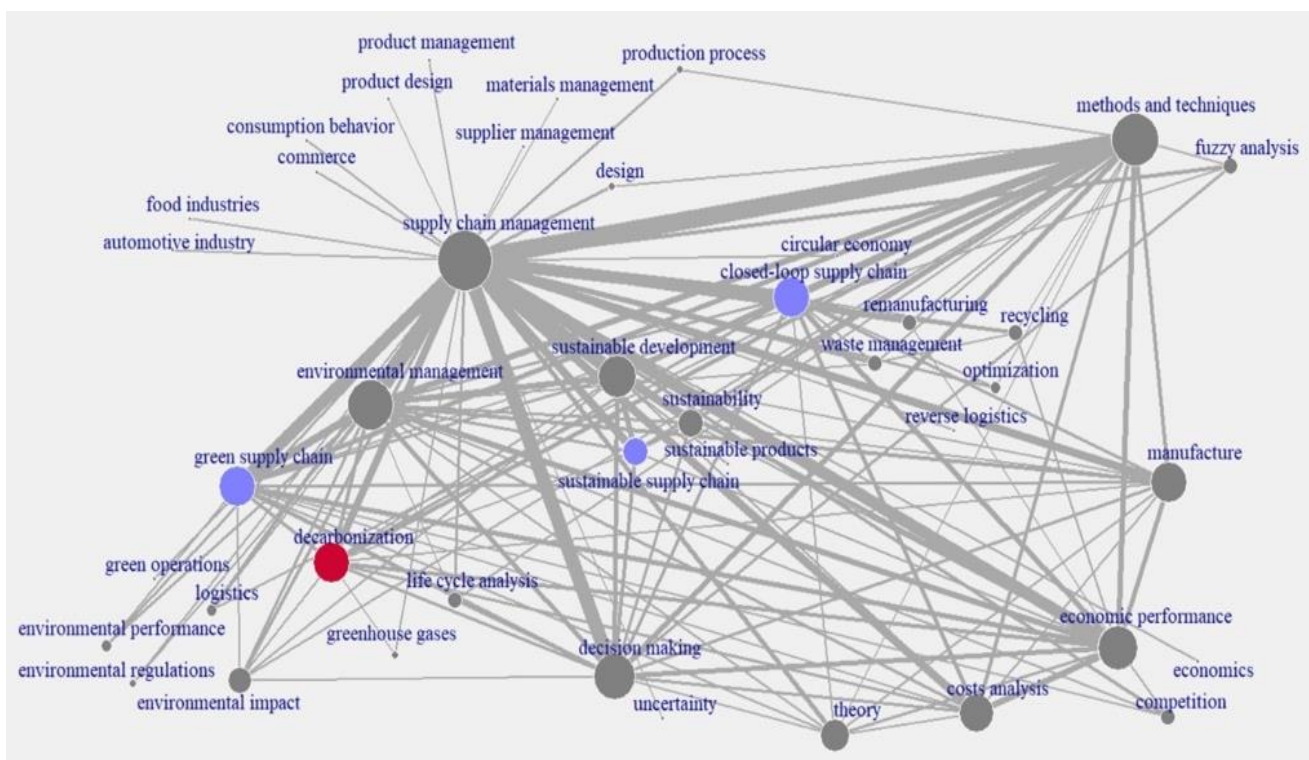

The analysis of the network map highlights some main cross-cutting topics, to which the sustainable supply chain literature is strongly related: sustainable development, environmental management and economic performance (the

latter also includes other words such as costs analysis and competition). These concepts suggest an interest towards the need to rethink the supply chain considering social (Kuiti, 2020), environmental (Graham, 2018; Diabat, 2015) and economic (Khan, 2018; Chen, 2017) aspects together with challenges related with its overall impact. In turn, this set of clusters suggests a linkage with the triple bottom line perspective, even though the social line still remains underdeveloped with respect to the other two, configuring an opportunity for future research.

The first network map also identifies three other relevant topic clusters. Specifically, there are two clusters that are concerned with methods and techniques and with theories. The first one includes a wide range of both qualitative and quantitative research methods that emerged from the literature and particularly the fuzzy approach, that is broadly used in this domain (Ghomi-Avili, 2018; Govindan, 2017). The second cluster regards theories, with an intensive use of game theory (Qin, 2020; Jamali, 2019), that drive the studies within this literature review. The third cluster stresses the relevance of sustainable supply chain management in the decision-making process (Zeng, 2022; Wang, 2021) at both regional and organizational levels; furthermore, it underlines the central role of managers above all in automotive (Lee, 2011) and food industries (Ala-Harja, 2015) when deciding to focus on sustainable issues to optimize the upstream and downstream supply chain.

From a more detailed point of view, it is interesting to observe the extent to which the concept of sustainable supply chain is less recurring compared to closed-loop (Wang, 2021) and green supply chains (Ramanathan, 2014). Sustainable supply chain mainly refers to concepts like sustainability (including sustainability issues, practices and operations) and sustainable products. On the other hand, green supply chain is strongly linked to environmental impact, environmental performance and green operations, while closed-loop supply chain deals with manufacturing/remanufacturing, recycling, optimization, reverse logistic, product design and life-cycle analysis. Moreover, both of them take attention to decarbonization, waste management and logistic. Additionally, decarbonization is also related to greenhouse gases and environmental regulations.

Fig. 3: Result from network analysis

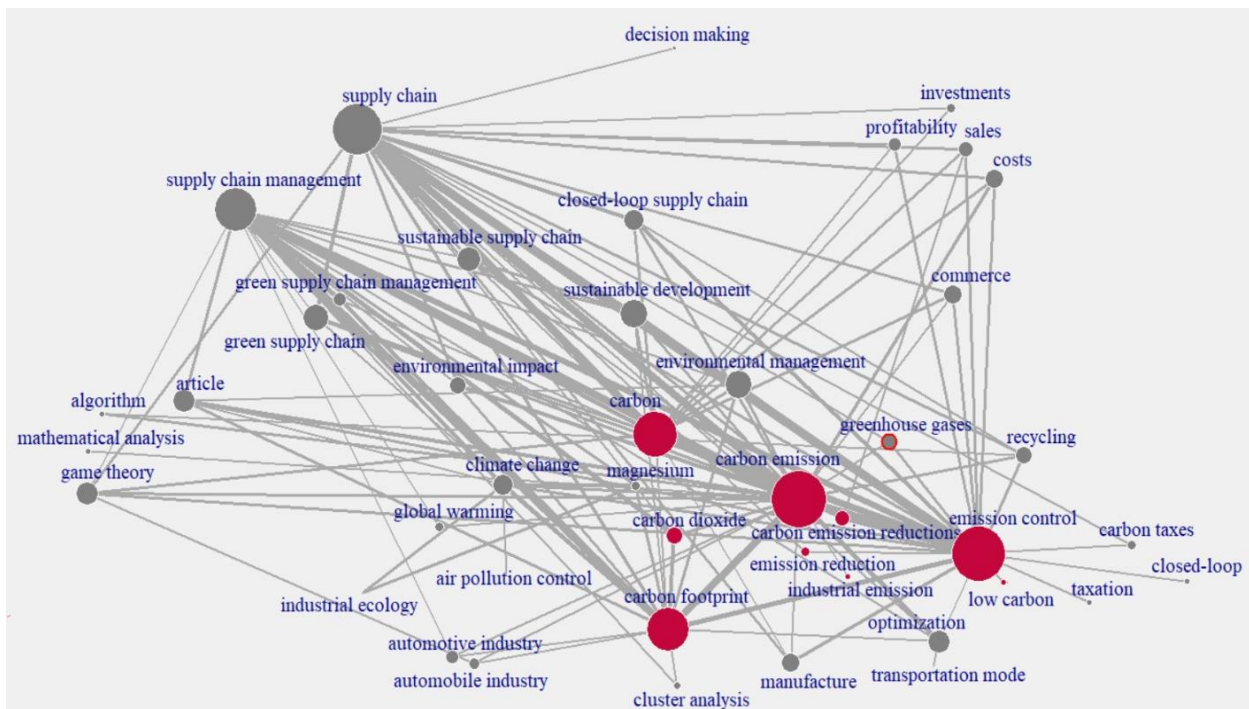

As the aim of the research is to investigate the specific connections between SSCM and decarbonization, the second step analysis is based on the sub-sample of papers clustered by referring to decarbonization-related keywords and in turn potentially addressing some decarbonization issues.

Fig. 4 shows the original index keywords that are semantically related within the decarbonization cluster, that has been used as an umbrella word in the previous network analysis. Fig. 4 supports a better understanding of themes that are developed and discussed within the niche of SSCM literature about decarbonization. It shows that the main issues concern emission reduction and emission control. Both of them are strongly related to climate change, global warming and greenhouse gases. However, the first focuses on environmental impact, industrial and manufacturing emission, transportation mode, and economic and social effects, while the second one is mainly connected to business management (profitability, sales and investments) and regulations and policies, through keywords such as carbon taxation and environmental regulation (Zhang, 2022; Yu, 2018). On the other hand, carbon footprint is more related to

carbon emission than emission control, and mainly refer to automotive industry and supply chain, industrial ecology, and global supply chain.

Fig. 4: Network analysis close-up

Finally, the last step of analysis, that is work-in-progress and still needs to be implemented, will further explore the sub-sample of decarbonization-related papers by applying a topic modelling approach to abstracts. The purpose of the analysis is to identify what are the themes coherently developed by most of the studies and to investigate whether specific actors or processes, within the supply chain, are most dealt with while others are absent. Synthesizing the extent to which specific relationships have been examined in extant literature is an essential outcome useful for the identification of the main research trajectories as well as to try and direct future efforts towards efficient theory building and fruitful research pathways. In fact, bibliometric analysis is very efficient in suggesting and guiding the future research direction of any field by providing a comprehensive evaluation of identified relationships among different topics.

Research limitations. The study has some limitations that should be acknowledged, such as the choice of the initial set of keywords used in the search query that, even if justified by previous literature reviews on the theme, inevitably affects the resulting sample of documents. Moreover, this bibliometric analysis is limited to articles retrieved from Scopus database and published in English, so future research may include other sources as different databases as well as other types of publications such as book chapters and conference proceedings, given that decarbonization along the supply chain is still an emerging topic and the number of publications is still low. For this same reason, there may be the need to update the research in the future, as both SSCM literature and decarbonization are very active fields and they represent trending topics not only for academia, but also for practitioners and regulatory entities. Finally, a possible way forward to further test the validity of this three-steps analysis may include a systematic, in-depth analysis of a subset of the articles. Moreover, a reversed analysis to check for the presence of supply chain management discourse within decarbonization literature could be performed to verify the linkage.

Managerial implications. This bibliometric analysis not only sheds light on and describes an emergent stream of literature, but it also reveals some managerial implications linked to the decarbonization of supply chain activities. Indeed, this theoretical overview can foster reflections on different perspectives that underlie the concept of sustainable supply chain management. Moreover, it can open the road to discussion and inclusion of a greater variety of initiatives that aim at reducing the environmental impact of human, economic activities and particularly of slowing greenhouse gases - and carbon dioxide, above all - emissions. This scope has become of primary importance for lots of organizations in recent years, not only thanks to the increasing public debate regarding climate change, but also as a consequence of regulatory initiatives such as the European Green Deal. Thus, this paper - offering a broad overview of extant literature - can offer guidance to properly intervene and comply with these regulations, avoiding legal consequences. By monitoring and managing emissions throughout the supply chain, companies can reduce their impact and stay compliant with regulatory requirements.

Originality of the paper. To the best of our knowledge, this is one of few papers that explore, on a theoretical level, the intersection between sustainable supply chain management literature and the topic of carbon emissions reductions, i.e. decarbonization. It highlights an emergent stream of literature regarding decarbonization in the specific context of

sustainable supply chain management and it offers insights into existing patterns and connections in SSCM literature. This allows for the definition of future research directions as well as for the recognition of emerging topics. This contribution answers to a call coming from previous literature review works, that called for further examination with the aim of gaining deeper understanding about specific aspects of SSCM, such as decarbonization, with theory-building as the ultimate aim.

Finally, with regards to the method adopted, topic modelling (Bansal et al., 2020) is a relatively new method for qualitative data analysis and specifically for literature reviews, thus representing an element of originality itself.

Keywords: Circular supply chain; decarbonization; sustainable supply chain; bibliometric analysis

Enhancing proactivity with digitalization in the shopfloor: the role of the organizational context

AMBRA GALEAZZO* ANDREA FURLAN* LUCA VENDRAMINELLI* ANDREA VINELLI**

Abstract

Digital transformation spawned by the Industrial Industry of Things (IIoT) is spreading across many industries. However, how new digitalized jobs influence the proactivity of workers (proactive work behaviors-PWB) remains unexplored. We hypothesized that PWB is higher in contexts with high IIoT than in contexts without IIoT and that the IIoT-PWB relationship is mediated by job design characteristics (i.e., job autonomy and performance feedback). Drawing on social constructivist literature, we further hypothesized that high performance work systems (HPWS) enable employees to better reap the benefits of IIoT, strengthening its effect on PWB. Using a sample of 440 shop-floor employees working in 101 work units of manufacturing firms, we employed a multilevel moderated mediation structural equation model to test our hypotheses. The findings showed that IIoT has a countervailing effect on PWB creating a trade-off between the two job characteristics of job autonomy and performance feedback. Organizations can moderate the effect of this trade-off by situating shop-floor employees in contexts shaped by HPWS, thus reinforcing the net positive effect of IIoT on PWB.

Framing of the research. Employees performing proactive work behaviors (PWB) are inclined to get to the root causes of problems, develop creative ideas, take charge of changes, and voice up (Furlan et al., 2019; Letmathe et al., 2012; Onofrei et al., 2019). Proactivity enables employees to draw on their skills, knowledge, and competencies to contribute more effectively to solving operational problems, identify opportunities for improvement, take risks, and help others (Galeazzo and Furlan, 2021; Letmathe et al., 2012). This fosters organizational learning (Tucker Edmondson and Spear, 2002), continuous improvement (Morrison, 2015), and decreased resistance to change (Amarantou et al., 2018). Achieving high PWB is particularly relevant in manufacturing plants, where the workforce assumes a key role in increasing efficiency, flexibility, and quality of production processes (Galeazzo and Furlan, 2021).

The increase in the adoption of digital technologies such as the Industrial Internet of Things (IIoT) in recent years has the potential to profoundly affect proactivity by reshaping job design (Brynjolfsson and McAfee, 2014). IIoT generates a high volume and variety of rapidly refreshing data, fosters knowledge generation within plants (Wang et al., 2020), and introduces algorithms capable of complex cognitive tasks, which, subsequently, promote work automation. As a result, both performance feedback and job autonomy are extensively changed by IIoT. In particular, job autonomy reflects the degree to which an individual has control over her work activities. Performance feedback is defined as an information processing system between a sender and a recipient. Even though previous research has argued that job autonomy and performance feedback positively affect PWB (Carpini et al., 2017), recent literature suggests that the effects of digital technologies such as IIoT on these job characteristics may be either positive or negative (Cagliano et al., 2019; Parker and Grote, 2020; et al., 2020). With the term IIoT, we refer to four classes of technologies: sensors, interfaces, connectivity components, and Artificial Intelligence (Iansiti and Lakhani, 2014).

IIoT adoption is likely to constrain employees' job autonomy for at least three reasons. First, the increased decision-making capabilities of IIoT reduce employees' decision-making autonomy (Balasubramanian et al., 2020). AI can autonomously crunch data flowing from sensors and interfaces to provide useful insights to guide workers in their jobs. The centralization of data streams can ensure sufficient volume, variety, and frequency of data to allow algorithms to make decisions, and workers are merely required to act according to the information they receive from algorithms.

Second, as production processes are equipped with more digitally advanced technologies, the standardization of work tasks increases (Wang et al., 2020). Most of the digital interfaces provided to workers guide employees in the

activities they can perform. Employees using a digital tool need to choose from the options that the tool provides while following the procedures embedded in the software operations.

Third, IIoT increases the employers' control over employees' job (Kellogg et al., 2020). Due to the presence of sensors and interfaces, firms consolidate stock of multiple data that describes how employees are performing tasks, including errors, actual productivity, and positive achievements. Therefore, IIoT acts as a means of directing, evaluating, or disciplining employees' performance (Kellogg et al., 2020), forcing them to abide by the organizational routines and procedures.

When IIoT is implemented, feedback provided to shop-floor employees is likely to increase. Production processes equipped with sensors and connectivity provide a higher volume, variety, and frequency of that deliver feedback to employees more frequently, with more detailed content and more easily accessible knowledge.

In line with the theory we delineated above, as we argue that employees who work on shop floors equipped with IIoT will make less decisions, are more disciplined by standardized procedures, and are subject to greater control from the employer than traditional shop floors that do not use IIoT, we expect that IIoT negatively affects job autonomy and this reduced job autonomy negatively affects PWB. Moreover, as IIoT will produce feedback of better quality in terms of frequency, content, and accessibility, shop-floor employees are likely to leverage the increased knowledge stemming from IIoT-supported feedback to suggest improvements, thus fostering PWB. Therefore, we propose that job autonomy and performance feedback act as mediators with opposite signs in the relationship between IIoT and PWB.

We argue that plants developing an organizational context where employees gain higher levels of ability, feel stronger motivation, and have more opportunity to participate are more likely to reap more benefits from technologically assisted jobs to foster PWB, compared to employees with lower levels of ability, motivation, and opportunity to participate.

We conceptualize the organizational context using HPWS (Datta et al., 2005; Jensen et al., 2013), whose primary objectives are to enhance employees' ability (A), motivation (M), and opportunity to contribute (O) (Appelbaum et al., 2000). HPWS can be seen as an investment that plants purposely make to convey a message of organizational support, trust, and commitment to their employees (Blau, 1964). HPWS are perceived as a signal indicating the extent to which the plant values employees and cares about them. Employees reciprocate with increased motivation, commitment, and engagement (Bos-Nehles and Meijerink, 2018). This implies that the perceptions of employees working in contexts with high HPWS might strengthen the beneficial effects of job autonomy and performance feedback on PWB. On the one hand, positive perceptions of HPWS help autonomous employees to draw on enhanced competencies and increased self-esteem to adopt PWB. On the other hand, positive perceptions of HPWS endow employees with more abilities, motivation, and opportunities to articulate, interpret, and internalize the knowledge coming from the performance feedback. As a result, employees working in contexts perceived as having high HPWS are more likely to adopt proactive initiatives.

Purpose of the paper. Although IIoT brings opportunities to companies both in terms of operational excellence and business models revolution (Vendraminelli et al., 2022; Verganti et al., 2020), the relationship between IIoT and PWB is still empirically unexplored. The need for implementing IIoT while fostering PWB calls for a careful investigation of how jobs are redesigned, and consideration of potential job design issues that could prevent digital transformations from achieving desired performance outcomes.

Furthermore, instead of adopting the deterministic approach of earlier research that framed the technology as an organizational contingency that is independent of the user (Emery, 1959; Barley, 1990), we aimed to understand not only if the changes in job design caused by IIoT effect on employees' PWB, but also if the extent to which employees engage in the patterns of use and work behaviors encouraged by IIoT depends on the organizational context. In doing so, we bridge job design and organizational behavior literature with the social constructivist literature that highlights how employees engaged in similar work tasks may enact technologies in different ways in different organizational settings, despite technical similarities (Leonardi & Barley, 2010; van Zoonen et al., 2021).

In particular, we argue that when the organizational context is shaped by high-performance managerial practices or high-performance work systems (HPWS) (Datta et al., 2005; Jiang et al., 2012), employees are better endowed with the ability, motivation, and opportunity to reap the benefits of changes in job design and convert such benefits into proactive initiatives. We focused on two essential job-design characteristics, job autonomy and performance feedback, that are likely to act as mediators between IIoT and PWB, and we investigated whether these job characteristics are moderated by HPWS.

Methodology. To test our theoretical framework, we collected data from a sample of 440 shop-floor employees in 101 work units of 33 plants. We measured IIoT by assessing the presence of 26 technologies identified based on a structured literature review. These technologies were directly observed in the field, thus overcoming limits in past measurements related to the use of perceptible scales and continuous variables. The variables related to job design, PWB, and HPWS were made into questionnaire-based scales answered by shop-floor employees. The survey measures were based on previously validated scales coming from organizational-behavior and job-design literature. As employees were nested in work units of different plants and individual-, group- and plant- level variables were used, we ran a three-level, second-stage moderated mediation structural equation model (MSEM in STATA 17 to test our theoretical model and, finally, we performed a series of supplemental analyses to check the robustness of our findings.

Results. Our results empirically demonstrated that there were two countervailing pathways from IIoT to PWB, meaning that technological advancements were likely to create trade-offs between desirable and undesirable working experiences that affect PWB. On the one hand, IIoT stimulated PWB because shop-floor employees became more

knowledgeable and confident about the tasks they are performing and the related consequences due to higher levels of performance feedback. On the other hand, IIoT decreased PWB because shop-floor employees have less control and feel they have less responsibility for their jobs due to reduced job autonomy. Overall, we found a positive net effect of IIoT on PWB, indicating that the greater knowledge acquired from performance feedback outweighed the reduced use of personal discretion that results from lower job autonomy. We also found that HPWS played a central role through performance feedback but not job autonomy. Specifically, HPWS positively moderate the relationship between IIoT and PWB, proving that, for higher levels of HPWS, the presence of IIoT is linked to increased PWB.

Research limitations. First, past research highlights the point that technologies, especially digital ones, are not standalone and they are interdependent, consisting of assemblages of distributed, networked technologies. However, our study focused on work units that were only equipped with IIoT technologies. Second, this study drew on information systems literature to describe IIoT as a set of discrete technologies that were either present or absent in the work units under study. We assessed their presence by using dichotomous variables. In so doing, we did not assess the technological advancement of these technologies, nor their qualitative properties, which may include easy-to-deploy artificial intelligence or user-friendly graphical interfaces.

Managerial implications. First, our findings are important in a practical sense because they help managers to better understand the antecedents of employees' proactivity and how these antecedents are related to each other. Second, our findings suggest managers to focus on the social context and where it can be shaped to enhance proactivity among shop-floor employees. We maintain that HPWS practices, i.e., ability-enhancing practices, motivation-enhancing practices, and opportunity-enhancing practices, are key to taking full advantage of behavioral opportunities provided by IIoT. Third, as the implementation of digital technologies is mostly incremental, our findings provide managers with a set of practical insights on the stepwise effect of digitalization on job characteristics and employees' proactivity.

Originality of the paper. Our research contributes to answering the question, "How does digitalization affect shop-floor employees' proactivity?" by empirically testing a theoretical model that relates the effect of the adoption of IIoT on employees' PWB through the contrasting effects of job autonomy and performance feedback. Though our findings point to the existence of contrasting effects, we demonstrated that the positive effects outperform the negative effects, showing that employees' proactivity is empowered by IIoT adoption because of enhanced performance feedback, despite the negative mediating effect of job autonomy. Our research further answers the above question by testing whether the organizational context shaped by HPWS encourages social dynamics that strengthen or weaken the positive relationship between IIoT and PWB. Our findings suggested that when the organizational context is shaped by HPWS, the positive total effect of IIoT on PWB is stronger. Overall, our study highlights how modern technological advancements such as IIoT affect shop-floor employees' PWB and helps to explain why some plants outperform others even when they have adopted the same technological pattern.

Keywords: Digital transformation, Industrial Internet of Things, proactive work behavior, job design, HPWS

Artificial Intelligence and Medical Devices Distribution in the Business-to-Business Market

NICOLA COBELLI*

Framing of the research. Artificial Intelligence (AI) breathes new life into digital business, facilitating the creation of smart services and promoting digital transformation. When organizations strive to execute the digital first approach, AI is now regarded as one of the top five developing technologies (Madhav & Tyagi, 2022, pp. 411-452). Because of the rising maturity and availability of AI technology, it is expected that 70% of enterprises will create AI architectures (Simon, 2019). Without a doubt, the age of AI is approaching (Meske et al., 2022). AI has recently piqued the interest of many scholars in their respective domains. Many researchers have examined the use of AI in many contexts (Ahmed et al., 2022; Wang, 2019), including information systems (Gursoy et al., 2019), tourism and hospitality (Li et al., 2019), marketing (Syam & Sharma, 2018; Vlačić et al., 2021), logistics and supply chain (Belhadi, 2021), and financial management (Culkin & Das, 2017; Popkova & Parakhina, 2019, pp. 939-946). According to research findings, AI has the ability to revolutionize the way enterprises and customers interact, resulting in greater commercial advantages, such as increasing efficiency, increasing effectiveness and decreasing cost (Kuzior et al., 2019).

Medical device industry, a subset of the healthcare business encouraging the use of medical equipment to improve people's quality of life, is experimenting with a large use of AI-related tools (Muehlemaette et al., 2021). One of these tools is linked to the distribution of medical devices themselves (Dash et al., 2019). The distribution of medical devices is regulated during its full life cycle (Lee et al., 2018). Because medical devices directly or indirectly influence the human body and pose possible dangers, quality control is critical at all stages of the process, from production and import through ultimate use. However, management requirements for medical device distribution are inadequate, as are standards for medical device storage facilities and medical device technology management (Nayeri et al., 2022). Methods of information and communication technology (ICT) such as artificial intelligence, big data, and supplying the items consumers require at the right place at the right time are becoming prevalent. As a result, medical device distributors anticipate that the fourth industrial revolution will boost productivity in the medical device sector while also altering the distribution system (Soosay, 2008).

Regardless of the countless possible benefits, AI has unquestionably many undesirable repercussions. We cannot only look at AI's bright possibilities (Floridi et al., 2018). Alt (2018) underlines that AI may pose significant hazards at the human, organizational, and societal levels. Importantly, these three characteristics are regarded as the most critical for digitization (Alt, 2018).

From an organizational standpoint, the launch of AI-enabled goods is likely to have an impact on a company's reputation and eventual profit. AI also impacts on relationships in distribution channels (Chen et al., 2022), mainly on relationships between manufacturers and distributors, but studies on this topic are limited.

Purpose of the paper. Despite these significant advantages for businesses, Tarafdar et al. (2013) have cautioned of the negative aspects of information technology. AI technology is no different. It is acknowledged that AI has the potential to introduce hazards at the individual, organizational, and society levels (Alt, 2018). However, much emphasis is placed on the good features of AI, while the negative aspects of AI receive little attention, particularly from the academic community. Given the significance and universality of AI, the considerable negative repercussions brought about by AI to individuals, organizations, and society warrant more investigation. Given the scarcity of studies on the dark side of AI, we intend to investigate key concerns in the AI arena.

Our investigation perimeter refers to companies based in the European Union that produce medical devices and specifically companies operating in the audiology industry. The supply chain of this industry is made up of a few manufacturers (7 in all) operating globally and are present in the major countries with subsidiaries that relate to independent retailers. The specificity of this industry is linked to the fact that the products have to be customized for each end-user. In the Eighties, therefore, manufacturers operating in this industry have set up subsidiaries in all major countries where their business was based. These sister companies were nationally managed realities with the sole constraint of being aligned with their headquarters on the launch of new products.

On the contrary, since 2007 these companies have strongly delocalized their production to non-European countries, with the aim of significantly reducing power and costs of the national sister companies. All this is not surprising, since many companies have operated similarly, but in very different industries (Gwosdz & Domański, 2019). What makes this industry peculiar is the fact that the product is sold to retailers on the basis of an order formulated following an

* Assistant professor of Management – University of Verona (Italy)
e-mail: nicola.cobelli@univr.it

impression taken of the customer's ear. It is therefore a highly professional and relevant process from an anatomical point of view.

The manufacturers in question, aware of the risks associated with the relocation of such a customized product, have decided to keep only customer services in the countries where they sell their products and to entrust them to AI systems: precisely to the so-called Machine Learning.

Machine learning is a statistical approach for fitting models to data and 'learning' from data through training models. Machine learning is one of the most widespread types of AI (Davenport & Kalakota, 2019); 63% of companies questioned in a 2018 Deloitte survey of 1,100 US managers whose organizations were already exploring AI used machine learning in their operations (Deloitte, 2018). It is a wide technique at the heart of many AI techniques, and there are several variations on it (Davenport & Kalakota, 2019). These companies have therefore strongly believed that an AI system could replace the manual work of technicians, categorizing the most frequent errors made by man in manufacturing of the product. Furthermore, Machine Learning systems have led to standardization choices regarding logistics and supply processes, accepting a certain margin of approximation in the error made by AI systems regarding the supply requests of different countries.

In this exploratory research, therefore, we aim to understand two aspects: (a) Can delocalization lead to a decrease in trust in the business-to-business market? (b) Can the use of AI tools compensate for the lack of trust and of a human relationship between customer and supplier specifically referred to the need for technical support?

Methodology. *Data will be gathered and analyzed in order to identify groupings of medical device retailers whose main supplier is one of the companies that have delocalized their production plants using AI. As a result, cluster analysis (CA) using the R statistical computing and graphics package (R Core Team 2020) will be applied. CA is the process of grouping a set of items so that objects in the same group (known as a cluster) are more similar to those in other clusters. CA is often used for statistical data analysis in various domains, including machine learning, pattern recognition, image analysis, information retrieval, bioinformatics, data compression, and computer graphics (Anderberg 2014). CA denotes a generic problem to be tackled rather than a specific algorithm. It may be carried out utilizing a variety of methods that differ greatly in their definition and efficient cluster identification. Popular cluster concepts include clusters with low distances between members, dense regions of data space, intervals, and specific statistical distributions. As a result, clustering may be expressed as a multi-objective optimization problem. The best clustering technique and parameter settings (including distance function, density threshold, and expected number of clusters) are determined by the unique dataset and intended application of the findings. Thus, CA is not a task that can be completed automatically, but rather an iterative process of knowledge discovery or interactive multi-objective optimization that involves trial and error (Driver and Kroeber, 1932; Zubin, 1938; Cattell, 1943). In the light of the radical changes in the supply chain of this industry, it is interesting to understand the perception of the customer, i.e. the retailer, in a business-to-business logic.*

Going into the specifics of how the study is to be conducted, a questionnaire will be sent by certified e-mail to all entrepreneurs who own a retail center in the audiology industry. This questionnaire will be in digital format and self-completed. The database of companies operating in the industry is public and is provided by the Italian Audiologists Association. The questionnaire will consist of some specific sections that aim to investigate mainly whether:

- *the retailer has a main supplier of the medical devices it resells and to what extent the relationship between the two players is strong,*
- *there is some form of co-creation of value between the manufacturer and the retailer (e.g., shared promotional campaigns, specific commercial agreements, organization of courses by the manufacturer, according to the Continuing Medical Education program aimed at doctors who prescribe the medical device),*
- *there are specific product customization needs for which a direct relationship between the technician who produces the goods, and the retailer is crucial, and*
- *there are product return policies which are often given to the end-user with 30-days vision account formulas, after which the end-user decides whether or not to buy the product.*

In short, through this survey we wish to understand the dimensions that customer relationship management has within this industry among the various players operating in the distribution channel in question.

Results. *Since this is still ongoing research, it is not possible to draw up a list of scientifically proven results. However, it is possible to list some hypotheses. As mentioned above, we intend to investigate the opinions of a large number of retailers operating in Italy, one of the most promising countries for manufacturers of these medical devices (Cobelli et al., 2014).*

In the awareness that many retailers will not be fully aware of the phenomenon of their suppliers' delocalization, given that customer service, their point of reference, remains in their country, it is possible to identify some hypothetical conditions. Retailers whose main suppliers has delocalized may be divided into relatively homogeneous groups. Alternatively, at least two distinct groups of retailers can be identified: indifferent and, on the contrary, concerned retailers. Possibly, Indifferent retailers do not perceive relocation as a process that could create difficulties for their work; concerned retailers, on the contrary, show discomfort in knowing that they cannot rely on a production center in their own country; finally, a cluster is made up of individuals who are particularly attentive to customer relationship management.

Once the CA has been conducted and the results confirmed or disconfirmed the hypotheses proposed, it will be interesting to see if the phenomenon of delocalization is perceived as a problem by some of the retailers. These retailers, as demonstrated in other studies, tend to have a high degree of trust in a few manufacturers. This largely

depends on the fact that the product is not a commodity and that it often requires remakes or adjustments, which in the past were possible in national laboratories. If it is true that AI, and specifically Machine Learning, should progressively reduce the margin of error in production, to allow products to be ever more precise despite the need for customization, it is equally true that delocalization could lead to a contraction of revenues for manufacturers or a decrease in retailer satisfaction, with the possibility that they feel more alone and less technically supported.

Research limitations. This work, like every research, has limitations. First, convenience sampling is going to be employed to maximize the survey response rate; consequently, it might be claimed that only respondents interested in the study contacted the researchers, thus introducing selection bias. Second, criteria for selecting participants are going to be restrictive, which may influence the findings from the studied sample.

As a result, certainly there is of room for future research. It would be fascinating, for example, to compare comments from companies that have implemented AI technology with those from non-adopters. To determine the generalizability of our findings, studies should be done in other places and nations using alternative sampling approaches.

Extending findings to additional empirical situations would also give a better understanding of how AI tool adoption should be encouraged in the context of increasing the quality of life for a big portion of organizations. Further studies are also needed to test an expanded model that considers other possible relevant factors that may be related to AI adoption. In particular, it would be interesting to investigate how to foster interprofessional cooperation to develop a service network among professionals based on a holistic perspective.

Managerial implications. From a managerial and societal social standpoint, AI could have negative consequences ranging from data security concerns to employment substitution and ethical concerns (Boyd & Wilson, 2017; Larsson, 2020). The deployment of AI has caused significant worry among human workers (Danaher, 2019). Indeed, the fear that AI would leave humans unemployed prevails not only in e-commerce, but in other aspects of life. Other issues include AI legislation and regulation, as well as AI ethics such as moral quandaries, AI discrimination, and AI fairness (Wirtz et al., 2020). As a result, these potential issues offer obstacles for AI governance at the societal level (Wirtz et al., 2020). In addition, although it is clear that phenomena such as delocalization are established in many industries especially in industrialized countries, scientific literature has often highlighted the risks associated with delocalization, with a particular focus on the ethical aspects (Kalogeris & Labrianidis, 2010; Ballestar et al., 2022; Raj & Seamans, 2018, pp. pp. 553-565). The present study instead aims to verify whether in the medical devices industry turbulent phenomena can be created in the relationship between manufacturers and retailers which lead to distrust and the risk of replacing the supplier with a competitor. In an exploratory key, the aim is also to understand which mistakes producers must be careful not to make, because if the economic advantages of delocalization are clear and if it is equally clear that new AI tools can better perform the activities in the past made by man, it has not yet been sufficiently well investigated how much the human manufacturer-retailer relationship weighs with respect to the benefits associated with delocalization and the use of AI.

Originality of the paper. To the best of our knowledge, this is the first work analyzing delocalization together with AI in relation to medical devices that require a high level of customization. Another new element is the willingness to keep track of any side effects related to delocalization in this specific industry.

Balancing sustainability performance dimensions: A system dynamics perspective

MARCO F. MAZZU^{*} GUIDO NOTO[•] ANGELO BACCELLONI[♦] FABRIZIO CESARONI^{**}

Framing of the research. During the last decades, the topic of sustainability has increasingly attracted the attention of management scholars and practitioners, such that pursuing a sustainability strategy and generating sustainability value has become a key concern for firms. As broadly argued by prior literature (e.g., Morioka et al., 2017), sustainability is based on three main pillars (the so-called “triple bottom line dimensions”) as it concerns the simultaneous pursuit of economic, social, and environmental goals, for the benefit of current and future customers and society at large (Elkington, 1994, 1997). In this sense, sustainability draws its theoretical foundations in the stakeholders’ theory (Freeman, 1984; Parmar et al., 2010), according to which the satisfaction of diverse stakeholders’ expectations should represent the primary objective for firms (Upward & Jones, 2016).

Being sustainability a multidimensional concept (Stubbs and Cocklin, 2008), it entails the alignment of interests of multiple stakeholders, and its achievement remains problematic for firms. Specifically, two main challenges impact the real possibility of adopting a sustainable behavior. On the one side, not necessarily the expectations and satisfaction of one stakeholder overlap with those of the others (Adams et al., 2016; Breuer et al., 2018; Schaltegger and Wagner, 2011). For instance, pursuing waste reduction may imply the adoption of green and automated processes that negatively affect the recruitment of the labor force. Similarly, the fight against economic and social inequality may imply the adoption of wage management practices that negatively affect the economic sustainability dimension for firms. In turn, the sustainability value generated by firms necessarily represents a balance among contrasting drivers associated with a broad plethora of diverse stakeholders (Jay and Gerard, 2015; Lüdeke-Freund and Dembek, 2017).

On the other hand, it seems unrealistic to believe that the set of stakeholder relationships that a firm establishes in a given period of time remains stable over time and valid in the long term. In this sense, sustainability has to be interpreted as a dynamic concept, where the objective of achieving a balance between the contrasting interests of stakeholders has to be revised every time a new stakeholder manifests its interests or existing stakeholders modify their own goals. Thus, while the long-term perspective of sustainable development for the firm and society at large remains valid (Evans et al., 2017; Morioka et al., 2017; Searcy, 2016), the sustainability value generated by the firm in the short term has to be constantly assessed. In the same sense, the analysis of the firm’s business model for sustainability has to incorporate a dynamic perspective (Cosenz et al., 2020).

Purpose of the paper. Against the background depicted in the previous section, this study aims at exploring the challenges that firms face when having to find a balance between the different components of sustainability. The problem is twofold. On the one side, due to the multiplicity of stakeholders, firms’ sustainability performance can be thought of as a composite construct, which depends on several drivers. Therefore, by deciding which stakeholders (interests) to prioritize, firms could obtain different sustainability performance levels. However, such drivers may interact with each other, thus making the assessment of sustainability performance quite problematic. On the other side, the inner dynamic nature of sustainability requires a dynamic perspective and the need to assess sustainability performance over time. Therefore, firms should adopt adequate analytical methodologies that would take care of the temporal dimension of sustainability.

In performing our analysis, we also aim to study the role that firms may play at the local level. Provided that some of the stakeholders the firm should respond to are embedded in the surrounding local context, the pursuit of sustainability strategies that pay more or less attention to local stakeholders may result in stronger or weaker social acceptance of the firm by the local community, thus affecting its reputation (Alcorn, 2003; Assefa and Frostell, 2007). Therefore, it is important to study whether and how the consideration of the local context for firms enters into the design of firms’ sustainability strategies.

Methodology. *In order to address the research question, we adopted a system dynamics perspective applied to the real case of a famous fast-food restaurant chain (here called ABC) located in the area of Rome (Italy). The choice of this company has been driven by the need to analyze a significant business case that generates social implications at the local level by providing employment opportunities for many residents of the city, especially those with limited education and skills. In fact, the analyzed fast-food chain owns 52 restaurants located in different neighborhoods in the area of Rome and has a significant impact on the social and economic landscape of the city. The company has also created jobs for immigrants, whose integration process into Italian society has been supported by the focal firm. Some restaurants belonging to ABC constitute specific micro-markets, where people consume food and spend their free time. Furthermore, ABC also has significant economic implications for the city of Rome. In fact, the company pays taxes, hires local workers, and contributes to the local supply chain, providing benefits to local businesses.*

The analysis has been conducted by employing both primary and secondary data. Specifically, the research has been conducted based on data collected through a structured questionnaire divided into four parts: (i) preliminary data about the company, (ii) economic-financial indicators, (iii) organization and employees, (iv) information about suppliers and the organization of the value chain.

The sections of the questionnaire allowed us to: (1) observe the investments made in the area where each restaurant is located, including the part related to the requalification of the areas surrounding the restaurant, such as parks, parking, and services; (2) clarify how the restaurants have effectively improved the area on which they are located - from differentiated waste collection to renewable energy, from rental costs to requalification costs of the area presided over; (3) investigate the organizational structure of the company, the employees, the diversity, and the restaurant's indirect social impact; (4) understand the extension of supply chain and its pervasiveness in the local area. The questions employed were adapted to the standards provided by the Global Reporting Initiative (2022) and data were collected for each individual restaurant over a time span of four years (2018, 2019, 2020, 2021).

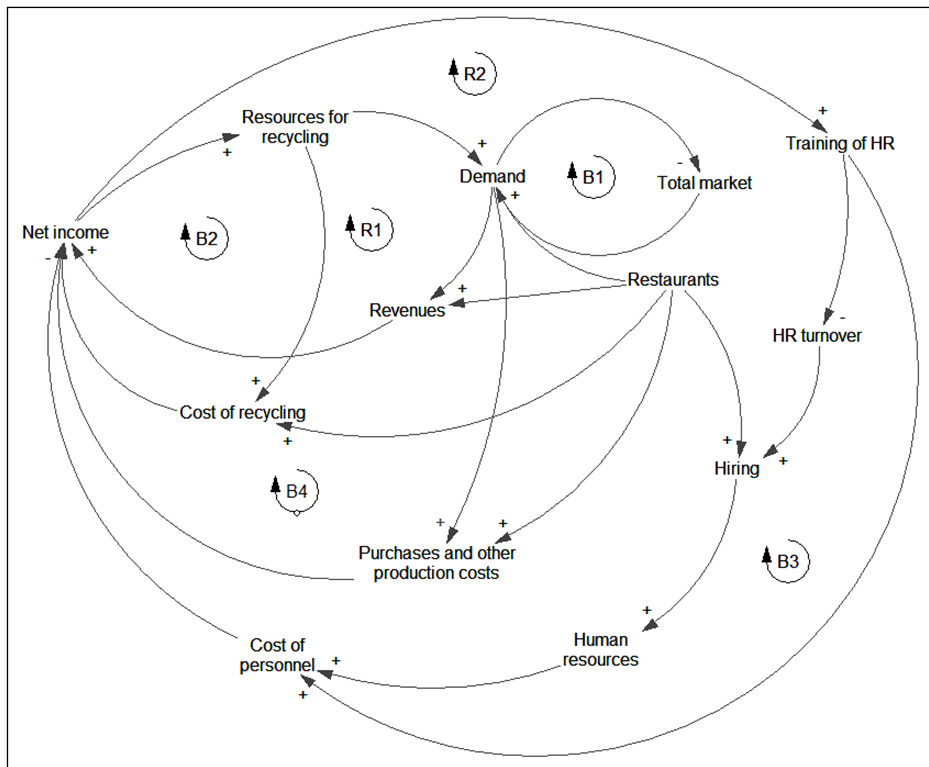

The research adopts System Dynamics (SD) modeling as the methodological approach to develop the ABC case study. SD is a simulation technique primarily conceptualized by Forrester (1958) for modeling and simulating complex physical and social systems and experimenting with the models to design strategies for management and change (Bianchi, 2016; Torres, Kunc, and O'Brien, 2017), also in the case of sustainable value creation processes (Videira et al., 2010; Cosenz et al., 2020). SD is a useful tool that can help understand the complex behaviors of systems over time, especially when such systems are characterized by a strong dynamic complexity and certain levels of instability. The underlying assumption of the SD approach is that these complex behaviors arise from the system's causal structure, which is considered a closed boundary incorporating all relevant variables related to the phenomenon of interest (Sterman, 2000). By adopting this perspective, analysts can construct closed chains of causal relationships, known as 'feedback loops', which are interconnected to explain and describe how and why the system behaves according to certain observed patterns. Therefore, organizational SD models consist of multiple feedback loops that contribute to understanding the reported trends of the organizational system. Feedback loops can be reinforcing - when variables are related to each other by direct (or positive) relationships or an even number of indirect (or negative) relationships exists - or balancing - i.e., an odd number of indirect (or negative) relationships exists. Reinforcing loops generate exponential growth behaviors; balancing loops generate exponential decay behaviors. The interplay and dominance of the different loops characterizing a complex system explain the overall system behavior (Sterman, 2000).

SD models are distinct from other simulation methods - such as agent-based modeling or discrete event simulation - in that they clearly show the structures that are responsible for producing specific behaviors within a system (Noto and Cosenz, 2021). This attribute is especially significant in the context of strategic management processes, as it enables a researcher to investigate the causal dynamics that underlie the creation and utilization of an organization's strategic resources (Morecroft, 2007; Warren, 2008; Bianchi, 2016; Cosenz and Noto, 2016).

To develop the SD model of ABC, we collected data through multiple meetings and through a questionnaire administered to the whole set of restaurants operating in the urban area. The resulting model was validated according to the SD literature's requirements (Barlas, 1996; Sterman, 2000; Homer, 2012) - i.e., structure validation tests, extreme condition tests, and partial modeling tests.

Results. *The structure of the ABC model is represented in a causal loop diagram (CLD) in Figure 1. CLD is a graphical syntax allowing the identification of the main feedback loops characterizing the analyzed system.*

Fig. 1: ABC's CLD

As one may notice, the ABC model is characterized by the presence of two reinforcing loops and three balancing loops.

The first reinforcing loop (R1) portrays the dynamic according to which the net income positively influences the amount of resources devoted to recycling and other environmental initiatives. We expect that these initiatives have a positive impact on the demand since the more the company invests in pollution reduction actions, the more the customers may be willing to purchase from the company restaurants. An increase in the demand for ABC products means an increase in revenues which are the positive components of the net income. Recycling and other environmental initiatives do represent in this case a first sustainability dimension for the company.

The second reinforcing loop (R2) shows that the greater the net income is, the greater the expenditure on human resource training, which, in turn, decreases the firm's turnover. Then, a lower turnover reduces the hiring processes, which are positively related to the number of human resources; moreover, lower employee turnover is also an antecedent to employee sentiment and improved customer satisfaction levels (Hurley & Estelami, 2007). Simultaneously, the number of human resources impacts the cost of personnel which represents one of the negative components of the firm's net income. The number of human resources, along with the investments in training and retention, represents a second relevant sustainability dimension for the company.

The first balancing loop (B1) shows that an increase in the demand for ABC products reduces the potential total markets - since it is not potential anymore but effective. Of course, the greater the total market is, the greater the demand for ABC products will be.

According to the second balancing loop (B2), the increase in the amount of resources devoted to recycling related to the net income (see R1) influences the cost of recycling which is a negative component of net income.

The third balancing loop (B3) assumes that a higher training activity, fostered by the net income (see R2), impacts the cost of personnel, which represents a negative component of the net income.

Last, the fourth balancing loop (B4) shows that the demand, connected to the investment in recycling and thus to the net income, is directly related to the purchases of raw materials. As such the level of demand influences the production costs which are a negative component of the net income.

Based on the model portrayed above, we computed three sustainability key performance indicators (KPIs):

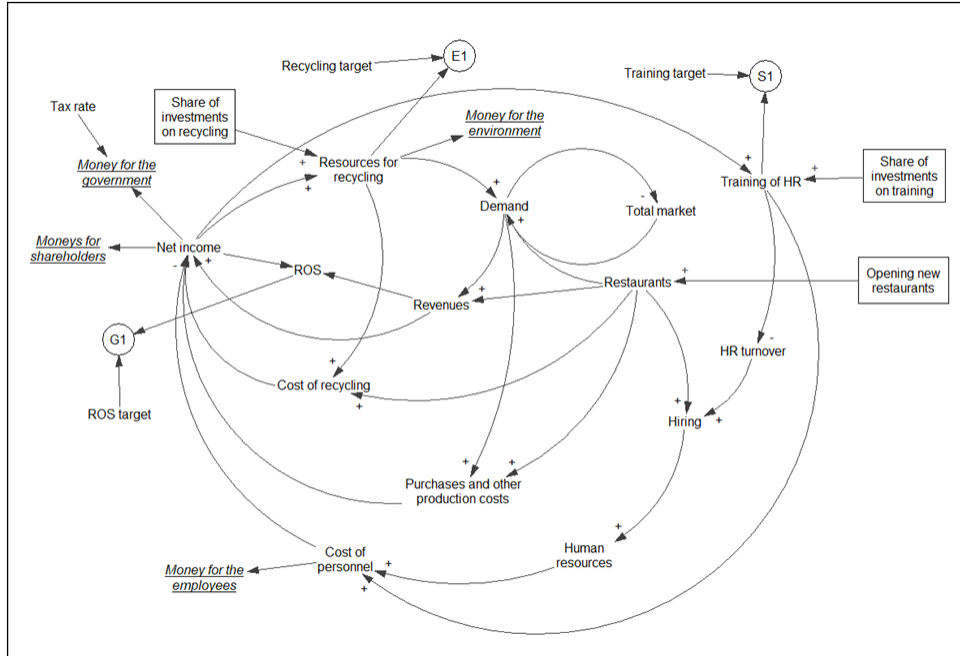

- the first one assesses the environmental performance (E1) and puts the investment in recycling in relationship with a target value (the historical one).
- the second one aims at assessing the social performance (S1) and puts the overall number of human resources in relationship with the permanent employees - i.e., those with greater seniority. As such, the indicator evaluates the organizational climate.
- the third one, addressing governance performance (G1), benchmarks the effective return on sales (ROS) with a target value.

These indicators allowed us to analyze the firm's overall sustainability performance based on different scenarios developed around a few key company strategies: i) the opening of new restaurants, ii) the decision on how much to

invest in recycling activities, and iii) the share of investments in HR training. These hypothetical strategies represent possible leverages that ABC may use to improve its sustainability performance overall.

Figure 2 shows the model structure identifying both performance indicators (circled variables) and strategic levers (squared variables). Moreover, in italics and underlined we highlighted the variables representing the accumulation of financial resources for different categories of stakeholders, i.e., the shareholders, the government (in terms of tax collected), the employees, and the community (in terms of financial resources devoted to the environment safeguard).

Fig. 2: KPIs and strategic levers

Based on the identification of the strategic levers and the related performance indicators, it has also been possible to experiment with the model in order to design strategies and assess the related expected performance in environmental, social, and governance (ESG) terms.

Table 1 summarizes some potential scenarios based on the combination of these three strategic levers. Clearly, the scenarios represented in Table 1 only represent a subset of all possible combinations that the company might choose from, some of them have been selected on purpose as “extreme” cases, and are shown here just for demonstrative purposes.

Tab. 1: Scenarios experimented

	<i>Opening of new restaurants</i>	<i>Share of investments in recycling</i>	<i>Share of investments in training</i>
Scenario 1	0 per semester	1% of net income	10% of net income
Scenario 2	12 per semester	10% of net income	50% of net income
Scenario 3	1 per semester	5% of net income	25% of net income

Figure 3 shows the KPIs dynamics under the different scenario conditions, while Figure 4 reports the accumulation dynamics of financial resources for the different stakeholders.

Scenario 1 replicated the current level of investments in the training and recycling of ABC. As such, it represents the benchmark for our scenario analysis. In this scenario, the KPIs report constant behaviors.

Scenario 2 hypothesizes a massive opening of new restaurants and important investments in recycling and training. As we may notice such a strategy report an initial improved performance in E1 and G1. However, this scenario resulted in being non-sustainable in the long run since the market does not support the demand for such an amount of new restaurants (which inevitably have fixed costs such as personnel and rents).

Scenario 3 reported the best performance overall since it accounts for a sustainable strategy of growth that allows the achievement of better results than the current scenario. This scenario also better contributes in terms of stakeholders’ remuneration.

Fig. 3: KPIs scenario analysis

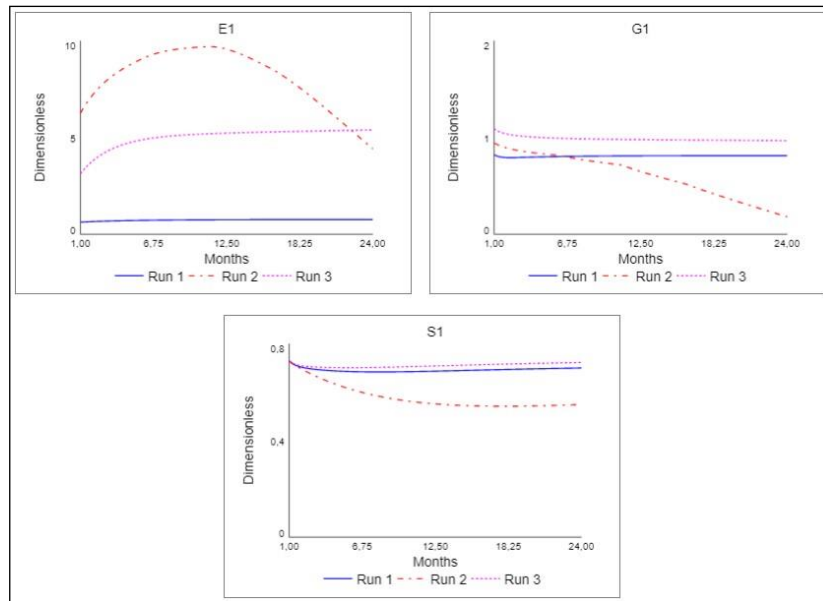

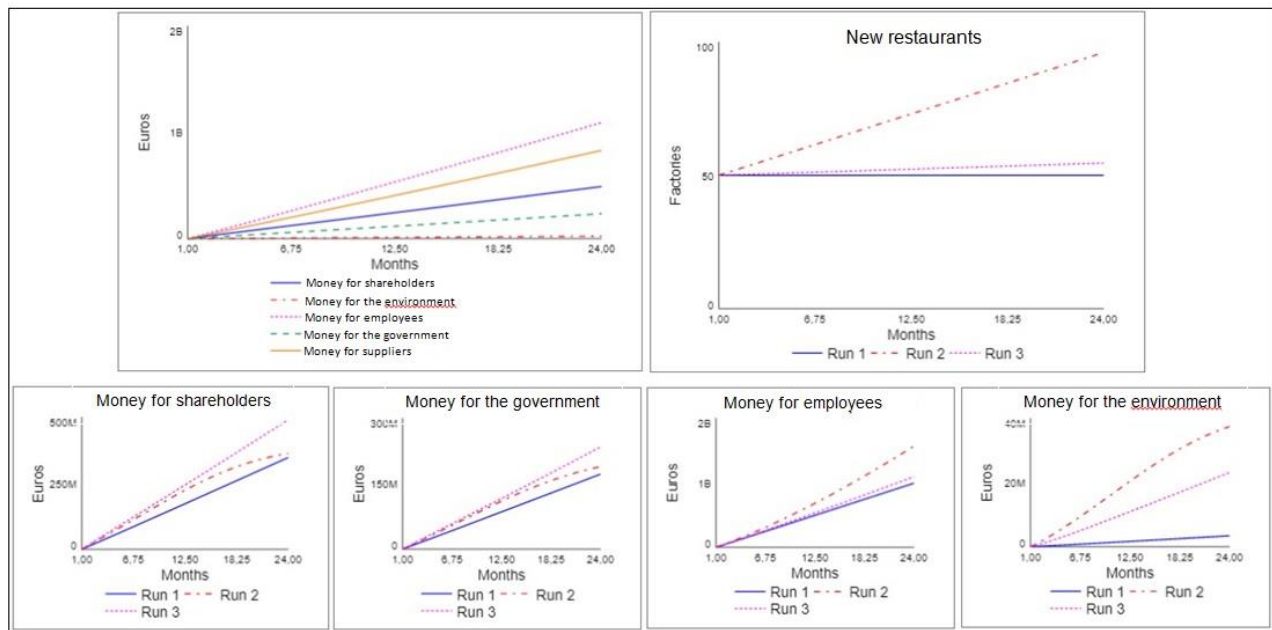

Fig. 4: Scenario analysis of financial resources generated for the stakeholders

Research limitations. The findings of this study offer interesting opportunities for future research. The study was focused on a specific fast-food restaurant chain in the Greater Metropolitan Area of Rome. Future research could explore the effects of other chains, or replicate the analysis for the same company but in other cities. Moreover, other studies could extend such findings by observing and modeling how related perceptions of relevant stakeholders of the investigated area might affect the expected evolution of the results.

Managerial implications. The balance between the economic and social impact of companies is a topic of great interest to both academics and practitioners in the field of business and economics. While companies strive to achieve financial success and maximize profits, there is a growing recognition of the importance of social responsibility and the impact that businesses have on society. In this study, we have explored the relationship between economic and social impact and the challenges of balancing the two, in a stress-test case of a company operating in the fast food market, an industry sometimes associated with negative perceptions by groups of activists and stakeholders (Govindan, 2018). The balance between the economic and social impact of companies has important managerial implications for businesses. Managers might benefit from the proposed approach, by guiding their investments toward actions that generate a better engagement with multiple stakeholders, thus building trust and support. Company leaders should then identify and engage with stakeholders such as employees, customers, suppliers, and the community, and seek their input on social and environmental issues that are relevant to the business. Those inputs, consistent with our findings, might be of help

to companies in order to develop business strategies that balance the social, environmental, and economic impact of their actions. We observed that the latter is functional for improving the former.

Also, managers should work to foster a culture that values social impact, and that empowers employees to make a positive impact on society and the environment. This can include providing training and education on social and environmental issues, and recognizing and rewarding employees who contribute to the company's social responsibility goals.

Finally, companies should measure and report their social and environmental impact to stakeholders, to demonstrate their commitment to sustainability and social responsibility, and the positive long-term effect on economic performance. Proper utilization of the proposed approach would then generate and balance environmental, social, and governance impact, enabling the company to develop clear engagement strategies with its stakeholders.

Originality of the paper. The study offers two main contributions to the literature focused on sustainability. First, by accepting the view that sustainability is a multidimensional concept (Stubbs and Cocklin, 2008), we show that firms struggle to find a balance between diverse stakeholders' interests. The problem is accentuated by the existence of strict interrelations and interconnections among sustainability dimensions (Lüdeke-Freund and Dembek, 2017), such that the pursuit of one sustainability goal often affects - either positively or negatively - the pursuit of others. In order to navigate such a complexity, firms need adequate analytical tools that are able to disentangle the complex network of connections between sustainability dimensions, and the direct and indirect effects that originate from one to the others. The system dynamics approach adopted in this study may represent a viable solution in this respect.

Second, this study also shows that the inner long-term perspective of sustainability (Evans et al., 2017; Morioka et al., 2017) can be fully explored only if dynamic effects are considered in the analytical process. Provided that the implementation of a comprehensive sustainability strategy may take years, intermediate (short-term) outcomes have to be fully assessed by firms, as they may differ from the final long-term goal. Some known real cases represent critical and anecdotal examples in this respect (Lai et al., 2019). Again, the methodological approach proposed in this study may help firms monitor the evolution of sustainability performance over time, thus providing useful insights in the design and planning of effective sustainability strategies.

Are ESG Factors Value Relevant?

MARGHERITA MIETTO* ANNA GERVASONI* MICHELE LERTORA[▲] CRISTINA DE SILVA**

Framing of the research. *There is broad consensus among scholars and practitioners that the past half-century wide gains in global economic development and human wealth creation have been achieved at the cost of environmental and social degradation (Millennium Ecosystem Assessment, 2005; Dean and McMullen, 2007). Due to this, international organizations and local governments are increasingly compelling entities to rethink their business models such that a more sustainable development can be undertaken by the global economic society. Over time, the concept of sustainable development has been synthesized into the ESG (Environmental, Social and Governance) acronym, which describes the integration of environmental, social and governance concerns into investment decisions by investors and corporations.*

With the growing amount of money and attention that firms and financial operators are dedicating to ESG initiatives, it becomes fundamental to understand whether and how ESG factors have value-enhancing or value-destroying effects on companies (Zheng et al., 2022). This would allow capital providers to channel financial resources towards the best-awarding and most economically, environmentally, and socially profitable projects. The relationship between ESG factors and firm value is extensively investigated in existing literature. However, no clear and common answer can be derived by present studies on the significance, magnitude, and direction of this association (Fatemi et al., 2018). Moreover, limited effort has been put into systematically reorganizing such a variety of diverse and frequently divergent findings.

Purpose of the paper. *The present systematic review, which is still a work in progress, moves initial steps in systematically reorganizing existing literature by detecting thematic connections and overlapping areas among extant studies and highlighting uncovered issues deserving further attention. More specifically, this work aims at investigating whether and how ESG factors have relevant influence on companies' value according to two different perspectives. On the one hand, academic findings examining the impact of sustainable strategies and conducts on firms' intrinsic value are analyzed. Such an association is inspected by detecting how the former affect the components of traditional financial valuation models, such as the Discounted Cash Flow (DCF) method. On the other hand, research focusing on the influence ESG factors exert on companies' market value is reviewed and organized. This review takes into consideration both the intrinsic and the market layers of corporate value, with the final goal of providing a comprehensive and detailed overview of what has already been studied in this field of research and which areas deserve more attention in future qualitative and empirical studies.*

Methodology. *The research question is answered by conducting a systematic literature review. To perform the analysis, top journals published between January 2004 and December 2022 are retrieved from the Elsevier Scopus database, the largest database including over 57 million records of journals, books, and conference proceedings. The sample is, then, defined using a multi-step process (Tranfield et al., 2003) to identify and evaluate relevant research articles on ESG factors and firm value to the research question.*

First, a broad search is conducted on Scopus to capture all relevant articles on the topic, inputting a combination of keywords the database automatically detects in titles or abstracts and adjusting the search by means of Boolean operators. The keywords string input in the search is the following: (“ESG” OR “CSR”) AND (“Firm valuation” OR “Firm value”).

In our search string we used ESG and CSR (Corporate Social Responsibility) as synonyms for environmental, social and governance corporate practices, as these terms, even if they show some tiny differences (Chang et al., 2022), are closely related, and used extensively and interchangeably in both the academic literature and corporate practice (Gillan et al., 2021; Fatemi et al., 2018). Overall, Scopus provided us with a final output amounting to 476 papers with publication year starting from 2004, the year in which the ESG term was officially introduced with the birth of the “Who cares wins” United Nations (UN) initiative, up to recent times. Of this initial set, only papers written in English

are selected to ensure a better understandability and quality of publications and a filter by subject area is applied, excluding Engineering, Art and Humanities, Mathematics, Computer Science areas.

Secondly, manual elaborations are conducted on the obtained output to exclusively select papers consistent with the research question. For this reason, only the studies analyzing the impact of ESG factors on firm value both at the market and intrinsic value levels are considered in the final sample. In this sense, literature adopting different conventional financial valuation frameworks is included in the analysis as well as empirical research on the role of ESG disclosure. However, papers focusing on the relationship between ESG factors and company operating performance, as well as works on asset management and the impact of ESG on stock portfolios are excluded from the review, because of the low contribution of their findings to forming the answer to the research question of the present research.

Subsequently, the above presented results are integrated with manual research on Scopus as well as alternative sources, such as Google Scholar, citations and bibliography of identified articles in our sample. We also considered relevant grey literature referring to publications by the international valuation standard setters and international organizations, due to the corroborated reliability of these institutional bodies.

The final sample consisted of 55 studies on ESG factors in firm valuation published in the time span 2004-2022. To gain a comprehensive view of the present literature, the papers are analyzed by keeping the thematic classifications that emerges from the aggregate reading. More precisely, key findings are discussed by the following thematic areas: ESG performance and firm market value; ESG performance, firm market value and information disclosure; and ESG criteria incorporation in valuation models.

Results. From extant literature, it emerges that a consistent group of studies has analyzed the impact of ESG policies on firm market value. On the other side, a less substantial strand of literature has focused on the valuation methods and approaches adopted by financial operators to measure companies value and how they should be adjusted to incorporate the value-creating or value-destroying potential of sustainable strategies. Key findings of the sample papers are discussed by these two thematic areas, further divided into the following subsections.

1. ESG performance and firm market value

While in the past a large group of academics used to argue that ESG policies bring about substantial additional costs, placing firms at an economic disadvantage (Aupperle et al., 1985), a significant number of recent studies claim, instead, that these costs are relatively small compared to the potential benefits they can generate. Among the beneficial effects, scholars report the alignment of social and corporate goals (Malik, 2014), improved corporate image and reputation among the public (Luo and Bhattacharya, 2009; Eccles et al., 2014), increased employees' productivity and satisfaction (Valentine and Fleischman, 2007; Treviño and Nelson, 2021), and relevant intangibles accumulation (Hawn and Ioannou, 2016). All the above-mentioned effects contribute to indirectly increasing firm market value, which displays indeed a strong positive association with environmental, social and governance policies (Flammer, 2013).

A further set of studies contribute to the debate digging deeper in the relationship between ESG performance and firm value from specific perspectives. For instance, Jitmaneeroj, (2017) find that, when the three main elements of the concept are separately investigated, socially responsible policies significantly impact firm value rather than environmental ones. In addition to this, the value-enhancing effects of ESG performance are recorded to be lesser for listed firms operating in environmentally sensitive industries, and higher in presence of looser regulatory settings and weaker institutions (El Ghouli and Karoui, 2017; Yoon et al., 2018). Moreover, higher ESG ratings - a proxy for ESG activity level - are found to increase the probability of deal completion as well as post-acquisition stock and operational performance (Zheng et al., 2022). Finally, Xu et al., (2022) proves that sustainability enhancing proposals passage at the board level bring about significant abnormal returns in the short-term only, suggesting that investors are skilled and knowledgeable enough to recognize proposals bringing about truly impactful actions from the misleading ones.

To conclude, a wide number of scholars agree on the fact that disclosure plays a fundamental role in the ESG-market value relationship. Proper ESG initiatives reporting, and disclosure allows companies to strengthen their reputation (Aouadi and Marsat, 2016), increases transparency and reduces agency costs and information asymmetry between insiders and external stakeholders (Yu et al., 2018), resulting in a boost of valuation metrics such as the Tobin's Q index and market value (Oh et al., 2020).

2. ESG criteria incorporation in valuation models

It has been extensively claimed that ESG initiatives impact firm intrinsic value (EL GHOUL et al., 2011; GREGORY et al., 2014). It is, therefore, of extreme importance to take into consideration environmental, social and governance policies when it comes to estimating the intrinsic value of a company. Typically, there are two main transmission channels through which companies' strategies may impact the DCF valuation model: by impacting the numerator, namely the cash inflows or outflows produced by the company, or affecting the denominator, namely the risk-adjusted return rate at which those cashflows are discounted. Existing studies claim that both sides of the ratio are influenced by ESG initiatives according to well defined mechanisms.

Results suggest that a significant set of papers have analysed how ESG activities affects cashflows generation (the numerator of the DCF equation). For instance, sustainable initiatives are reported to increase operating margins and profitability, reduce taxes, lower reinvestment needs and enhance long-term growth (GREGORY et al., 2013; CORNELL and DAMODARAN, 2020; CHANG et al., 2022). In addition to this, GODFREY et al., (2009), OIKONOMOU et al., (2012), and JO and NA, (2012) suggest that the positive impact of environmental, social and governance policies on cash flows act through the "idiosyncratic risk channel". In essence, companies with stronger ESG attributes typically report above-average risk control and compliance standards across the firm and within their

supply chain. Hence, they suffer from severe incidents less frequently with respect to rivals, and are, hence, less exposed to a deterioration of their value as well as to a downside or tail risk in their stock price (Hong and Kacperczyk, 2009). This resilience is reinforced by the fact that socially and environmentally active firms are claimed to have stronger competitive advantage with respect to competitors (Gregory et al., 2013; Giese et al., 2019).

A plurality of papers empirically test the effect of ESG strategies on the cost of capital. In general, most researchers report greater ESG scores to be associated with a lower cost of equity financing (El Ghoul et al., 2011; Gregory et al., 2013; Giese et al., 2019). More specifically, firms with stronger sustainability profiles are more resilient and less vulnerable to market shocks, showing a lower level of systematic risk. According to the CAPM model, investors will require lower returns for these companies, which display lower betas and decreased equity risk premia. Besides this, cost of equity and debt are reported to be smaller in companies undertaking ESG policies due to greater information transparency and the resulting facilitated access to financial resources (Crifo et al., 2015; Hong and Kacperczyk, 2009). Last but not least, divergent findings are present in existing literature regarding the magnitude and direction of the influence each of the three pillars of the ESG concept exert on the cost of capital (Sassen et al., 2016; Ok and Kim, 2019; Tharavanij, 2019).

A modest group of researchers has specifically focused on the appropriateness of traditional valuation methods and approaches in measuring the value impact of ESG strategies and whether some adjustments to these models are needed to boost their prediction capabilities with respect to sustainability related concerns. In this sense, key findings highlight the need for the development of consistent and standardized ESG metrics to effectively quantify the impact of material ESG issues on the value drivers embedded in the DCF model (Schramade, 2016; International Valuation Standards Council, 2021). Finally, a few scholars have attempted to integrate to traditional valuation models methodologies future cash flows generated by ESG opportunities and how they might change according to different scenarios (Zeidan and Spitzbeck, 2015).

Taking the findings at the aggregate level, it can be stated that ESG factors are value relevant, and the sign of the relationship seems to be positive.

As far as the impact of ESG practices on firm market value is concerned, most studies report a significant positive association. However, inconsistent, and insufficient evidence is, instead, reported regarding the significance and the sign of the relationship between each of the three ESG pillars and corporate market value. Connected to this strand of literature, insightful studies report ESG disclosure level to have a beneficial effect and strengthens the positive effect of ESG activities on companies' value.

On the other side, evidence suggests that ESG policies bring about a reduction in the cost of equity financing and cost of capital, and, consequently, an increase in firm intrinsic value. Moreover, sustainable corporate conduct is reported to be associated with increased profitability, larger dividends, greater long-term growth and reduce a firm's exposure to severe costly incidents both at the tangible and intangible level. Hence, ESG opportunities are claimed to lead to larger future cash flows and higher company's intrinsic value.

Finally, a limited number of studies attempt at developing comprehensive valuation frameworks able to incorporate financially material ESG opportunities and concerns in a company's true value estimation.

However, further research shall be undertaken to explore to a greater extent some fundamental aspects of this relationship. For instance, insufficient effort has been put in separately examining the effect of environmental, social and governance practices on firm market and intrinsic value. Additionally, an extremely scarce number of scholars have analysed the impact of macroeconomic, institutional, and regulatory conditions on the magnitude and sign of this relationship. Moreover, research on intrinsic value has mostly focused on the impact of ESG initiatives on risk and cost of equity financing. Future studies may investigate and test more deeply how the former affects expected future cash flows, growth opportunities as well as the cost of debt financing components in the DCF model. Lastly, additional effort might be undertaken to develop new models and approaches to integrate the financial impact of sustainable policies on traditional valuation methods, including alternative methods to the DCF approach.

Research limitations. As reported by Migliavacca et al., (2022), literature reviews typically require balance between focusing on specific issues while keeping the most comprehensive possible selection criteria. In this sense, the present paper excludes some topics, as explained in the section above, to avoid dispersion while recognizing that this decision represents a constraint and limitation. Moreover, articles in languages different from English could have been included and alternative databases could have been consulted. Overall, two main limitations emerge from the analysed content.

First, the most relevant shortcoming emerging from the analysis is the lack of standardization and consistency in the measurement and reporting of ESG factors. While there are various frameworks and guidelines for ESG assessment and disclosure that have emerged from the literature, there is not a universal methodology that companies, investors, and academics resort to when measuring and evaluating environmental, social and governance factors. This hinders comparability of ESG data and performance across companies and sectors and may limit the accuracy and reliability of academic research addressing ESG concerns and their effects on companies and society. In addition to this, relevant and material ESG factors may vary depending on the specific industries and business contexts, which may further complicate the interpretation and generalizability of research results.

Finally, a further limitation lies in the fact that the impact of ESG factors on firm value can be influenced by several other endogenous and exogenous factors, such as macroeconomic conditions, industry trends, and regulatory changes, which can be difficult to measure and control, consequently limiting the inference-related processes of the empirical studies in the analysed sample.

Managerial implications. *From the above reported findings, it emerges that ESG factors shall be given substantial attention in strategy-setting processes within corporations due to their corroborated potential to enhance value creation. More specifically, managers should take steps to integrate these factors into their decision-making processes to ensure long-term financial and sustainable competitive advantage and success. This, in turn, would enable corporations to optimize resources allocation among alternative projects and maximize the resulting returns from investments. In addition to this, ESG-active firms are claimed to access capital at favourable conditions. Sustainable initiatives shall be considered by businesses in need for capital.*

Private capital providers are increasingly aware of the opportunities hiding behind sustainable policies, as well as of the resilience to crises and recessions implied in high corporate ESG scores. This study suggests that they shall integrate reliable measures of environmental and social business conducts undertaken by potential targets when evaluating the economic convenience of investments as well as to effectively choose where to channel their funds.

Finally, assuming value creation in companies imply beneficial effects on the plurality of stakeholders businesses interact with, international organizations, governments and the society as a whole shall encourage the financing and success of truly impactful corporate actions while supporting the sustainable transition of economic actors who are being left behind.

Originality of the paper. *Governments and financial and corporate actors are increasingly aware of the need for actively contributing to the sustainable transition introduced by the UN Agenda. Due to the manifold stakeholders involved in their daily activities, companies themselves are urgently required to change their business models. However, because of strong budget shortfalls, national authorities are progressively acknowledging the fundamental role private capital actors will play in providing the resources needed to successfully translate ideas in concrete environmentally and socially sustainable corporate actions. In such a complex framework, it becomes of extreme importance to understand whether environmental and social actions and conducts materially impact firms, to what extent and through which channels, so that financial resources can be targeted towards projects truly benefitting society. The research question to be answered is, hence, are ESG factors value relevant? And in this sense, what is the magnitude and direction of their effects on firms' value, and, consequently, on the stakeholders directly and indirectly impacted by businesses activities?*

Extant literature has deeply investigated the effect of environmental and social factors and ethical business conduct on firm value. However, to date, no attempt has been made to systematically organize and interpret existing findings to detect thoroughly investigated areas and research gaps. The present systematic literature review aims at originally contributing to the research strand by highlighting overlapping conclusions among often inconsistent and divergent results and bringing to light weak strands deserving greater attention and further research effort.

Keywords: *ESG; CSR; Firm value; market value; DCF; cost of capital.*

Do Company Valuation Methods Incorporate ESG Factors? Exploring an Italian Industrial Panel

SEBASTIAN PUSCEDDU* LUDOVICA BARRACO• CORRADO GATTI▲

Framing of the research. *In recent decades, the interaction between sustainability and firm value has become a major issue for academics, managers, investors, and policymakers. Companies have paid growing attention to sustainability aspects in order to consolidate their credibility and reputation among stakeholders, pursuing a long-term value creation perspective with the inclusion of ESG issues in their strategic declination (Freeman, 1984; Ziolo et al., 2019).*

Sustainability recalls the remarkable and long-lasting academic debate regarding the purpose and role of the company in the context in which it operates, where different purposes correspond to different roles.

Traditionally, academic literature on the subject is divided into two main theoretical strands: neoclassical and institutionalist. The transition from the property theory (neoclassical) to the entity theory (institutionalist) highlights a profound change in the purpose and role assumed by the company as a passage from the exclusive (or priority) objective of creating value for shareholders (Friedman, 1962; Friedman, 1970; Rappaport, 1986; Steward, 1991) to a broader vision, which considers the survival of the firm as strictly dependent on the management's ability to adequately respond to the requests of the stakeholders (Freeman, 1984; Evan and Freeman, 1988; Clarkson, 1995).

However, the contrast between the different purposes attributed to the company tends to vanish as the time horizon expands. In the long run, there is a convergence between the interests of the shareholders and stakeholders, given the circumstance that the value of the shares is equal to the present value of the future cash flows that the company can generate, which in turn depends on the ability to satisfy stakeholders' expectations. On this point, the theory of creation-diffusion of value acts as a "bridge" between the two visions, identifying a rational and measurable objective of the company to maximize the economic value for all the stakeholders (Guatri, 1991; Sciarrelli, 1997).

The close interrelationship between shareholder and stakeholder satisfaction – and the consequential interpenetration between different dimensions (economic, financial, and sustainable) – has led to the emergence of a new "philosophy" of corporate governance, i.e., sustainability as an element included in the system of essential principles and doctrinal and methodological foundations on which corporate governance must be based (Golinelli and Volpe, 2012). In this sense, sustainability aspects have led to the assumption of a holistic approach that transversally involves, starting from corporate culture, (i) corporate governance, (ii) strategy definition and implementation, (iii) business model, (iv) organizational structure, and (v) internal and external reporting system (Ansoff, 1957; Ansoff, 1969; Sciarrelli, 2004; Campbell et al., 2011; McDonald and Hugh, 2011; Rutigliano, 2020).

In light of the above, scholars have paid growing attention to the effects consequent to the adoption of sustainability principles into the company's value creation process, which depends on the size of the monetary (or income) flows, time profile, discounting rate (and therefore risk) (Colombi, 2003). In particular, Cornell and Damodaran (2020) argue that the value created by a company depends on growth, profitability, investment, and risk levers.

Fig. 1: The drivers of value

Source: Cornell and Damodaran (2020)

The academic literature highlights that the implementation of good sustainability practices has the effect of better access to the capital market (Cheng et al., 2014), a lower cost of capital (Diamond and Verrecchia, 1991; Sengupta, 1998; Botosan, 2006; Goss and Roberts, 2011; Witold and McGlinch, 2019), increased demand for products and services (Dorfman and Steiner, 1954; Milgrom and Roberts, 1986; Gangi et al., 2019), with consequent greater competitiveness of the firm (Porter and Van Der Linde, 1995; Wu and Shen, 2013; Bocken et al., 2014; Boccuzzi, 2021), and an increase in economic-financial performance (Eccles et al., 2014; Cornett et al., 2016).

In light of the above, sustainability represents an unavoidable and undeferrable issue considering that it influences the greater or lesser availability of resources (i.e., financial, economic, know-how, accreditation, image, opportunity, or chance resources), which, consequently, support and nourish the process of technological innovation which is indispensable for the achievement of competitive advantage and, ultimately, survival (Vicari, 1991; Mintzberg, 1994).

Moreover, the pervasiveness that sustainability has gradually taken on in business activity should also be seen as a result of the growing interest on the part of financial market operators in the issues in question to increase the degree of efficiency of the capital allocation process, i.e., assuming long-term investment strategies that consider ESG factors and related risks in portfolio choices (Hebb, 2011; Ailman et al., 2017; PRI, 2017) to “enhance long-term value by using ESG factors to mitigate risks and identify growth opportunities” (Boffo and Patalano, 2020, p. 15).

This interest has given rise to the progressive expansion of the economic-financial disclosures of companies with qualitative and quantitative elements of a non-financial nature (mainly driven by the evolution of the regulatory context) and the spread of ESG rating judgments issued by qualified independent operators, which enhance the sustainability profile of a specific company, namely the potential adverse effects resulting from ESG factors (Avetisyan and Hockerts, 2017).

It follows that ESG analysis (also through synthetic rating judgments) allows for a greater and deeper understanding of the profile of a specific company; it does not replace traditional financial analysis but is rather complementary to it, as it allows to expand of the information available at the basis of investment decision-making processes and to appreciate all the material driver to assess the corporate financial performance (De Jong and Nguyen, 2016).

Even so, including those kinds of information in traditional financial analysis is not straightforward as it has to deal with data availability (i.e., lack of standardized data and risk metrics), modeling, and valuation technicalities issues (OECD, 2017).

Purpose of the paper. Defining the value of a company involves estimating the economic capital of the entity considered according to criteria established in doctrine and professional practice. The critical variables of the estimation process are jointly represented by the consistency of the corporate assets, in the broadest sense referring to both tangible and intangible elements, and by its ability to generate income/cash flows.

Among the various criteria available for the evaluation of companies (equity, financial, income, mixed, etc.), the majority doctrine and practice favor the Discounted Cash Flow (DCF) method based on the discounting of future cash flows and the use of multiples, calculated as the ratio between market values and book values (Bellavite Pellegrini et al., 2020; Koller et al., 2020).

The DCF method requires the valuer to use internal (as well as external) information, mainly contained in the company’s forecast plans (Rutigliano, 2022), on the assumption that the use of historical and outlooks data makes it possible to reach adequate and sufficient picture of the company to estimate the expected cash flows. In addition, it is necessary to determine the cost of capital, which measures the concept of risk and must be used as a discounting parameter to discount future cash flows at the reference date. Thus, the DCF involves a considerable effort to the extent

that it is necessary to acquire numerous internal and external information, but it is undoubtedly one of the most reliable methods, or in any case, less approximate.

The use of multiples, instead, is the primary tool (if not the only one) in evaluation contexts where the expected results are difficult to predict, placing the comparison with other comparable companies at the center of determining the economic value of the capital. The selection of the group of comparables is the most sensitive process, as only companies that investors may consider substitutable within a portfolio are truly comparable (Guatri and Bini, 2009). In this sense, belonging to the same sector may not be sufficient, but other comparability factors must be considered, including size, productive capacity, products, internationality, geographical location in similar countries, management, governance, etc. Simplicity in using the methods represents a strength (ease of use) and a weakness (stillness).

In this context, sustainability is looming a growing complexity not only for businesses but, by extension, for investors, as a new element grafted into decision-making processes and in the features prodromal to formulating strategies for efficient capital allocation.

Sustainability presents companies with new opportunities and challenges, prompting them to pursue objectives of consistency between different performance types within the context of their strategic declination. Sustainability, therefore, represents an element which, on the one hand, constitutes the potential source of a corporate competitive advantage (through consensus, accreditation, and trust among stakeholders) and, on the other, severe threats to the company's going concern when unable to respond to requests arising from the external context adequately (Porter and Kramer, 2006; Crespi and Migliavacca, 2020).

In a nutshell, sustainability constitutes a multidimensional phenomenon of extreme complexity that is a source of opportunities and threats for the company.

Therefore, investors must consider sustainability's positive and negative effects on individual companies in the context of their decision-making processes and capital allocation strategies. In other words, the extent of the phenomenon in question implies that the appreciation of the degree of risk-return of a given investment cannot ignore the assessment of the new non-financial aspects relating to sustainability issues.

In this context, sustainability issues have led to new and insightful challenges, considering the reflection of investors' changed attitudes regarding integrating sustainability aspects into decision-making processes and capital allocation strategies to appreciate the ESG-specific profile (and related risks) of an asset (Ailman et al., 2017).

Considering what has just been represented, it seems legitimate to ask whether the traditional methodologies for appreciating the value of a company should be refined through the inclusion of new elements relating to sustainability issues or whether they are already implicitly appreciated by the current specific underlying factors.

The question is of undoubted interest but also not easy to resolve.

If sustainability is a new element but already included in the bed of traditional factors underlying the valuation of a company, implicitly, the further non-financial information relating to sustainability would not prefigure a methodological issue. However, we must also ask ourselves what the traditional element concerning sustainability is already implicitly valued.

Conversely, if sustainability were not implicitly reflected in the traditional elements underlying the valuation, the same would require a review of a company's valuation methodologies. This perspective would require expanding the current portfolio of indicators and methods available to investors with general and specific hands that allow for assessing the company's conduct and impacts on the environmental, social, and governance spheres as objectively and accurately as possible. However, we must also ask ourselves what the magnitude of this inclusion is and how it should take place, e.g., in terms of a simple add-on, a recalibration of cash flows, and the cost of capital.

The answers to these questions are complex.

The inclusion of sustainability aspects implies the assumption of a broader perspective that considers, within the traditional valuation concepts, techniques, and factors, new kinds of non-financial information to gradually sharpen the risk-return performance appraisal methodologies (Ailman et al., 2017; Paolone and Pozzoli, 2021; Prall, 2021).

However, the implementation in question brings the following three main issues:

- *data availability: the expansion of the plethora of indicators relating to sustainability aspects (internal and external to the company), inspired by the transformation of information into knowledge, requires a leap in quality rather than quantity to avoid in a context of information opulence, phenomena of information overloading (Rutigliano, 2020). The metrics in question, characterized by a lack of standardized data and risk metrics, must respond to a constraint of appropriateness and materiality concerning the indications provided (Amaduzzi and Paolone, 1986) to identify sin and "best-in-class" firms (Amel-Zadeh and Serafeim, 2018);*
- *modeling: an additional element worthy of note is the time factor. The time variable has two main implications since, on the one hand, traditional financial models are based on historical data and, therefore, challenging to integrate with ESG elements, for which there is no sufficient historical depth; on the other hand, strategic planning considers short-medium term time intervals, where the effects of ESG elements are based on a long-term horizon with uncertainty about the an and the quantum;*
- *valuation techniques: equity investors can adjust traditional valuation methods by including ESG aspects differently, e.g., cash flow forecasts or cost of capital estimates (OECD, 2017; Amel-Zadeh and Serafeim, 2018).*

Considering the latter, scholars highlight different forms that ESG integration can take into the DCF method to assess a company's value properly, taking into account economic trends, competitive environment, products' market potential, and, in general, ESG opportunities and threats (in terms of materiality):

- *future cash flow*: future cash flows can be adjusted according to ESG factors, considering the fact that sustainability aspects can have an impact on revenues, revenues growth rate, operational expenses, and capital expenditures (Bos, 2014; PRI, 2017);
- *terminal value*: the time horizon to determine future cash flows may not coincide with the company's life. In this sense, the final value expresses a synthetic expression of the current value of the financial flows that the company can produce in times after the time horizon subject to analytical determination and appreciated through explicit future cash flows (Damodaran, 2011). In this regard, considering that the terminal value can also have significant effects on the overall value and that the same appreciates the company's ability to produce cash flows in a long-term period, it seems appropriate that the same considers the effects of the medium-long term of ESG factors on the company. Therefore, the sustainable growth rate in the estimate of the terminal value is closely correlated with the ESG profile of the specific company (in terms of opportunities and threats) and the reference sector to which it belongs (Rutigliano, 2022);
- *discount rate*: the discount rate can be adjusted (directly or indirectly, through the beta) according to ESG factors, so ESG-friendly companies could see a downward adjustment of their cost of capital due to a lower risk profile and vice versa (Bos, 2014).

However, the inclusion of ESG elements within the scope of the DCF company valuation methodologies is not free from application difficulties in consideration of potential errors relating, e.g., to the magnitude of the cash flow or discount rate adjustments and double counting, which can influence all the underlying elements of the calculation. On this point, Rutigliano (2022) argues that the application of a specific adjustment of the discount rate or the growth rate in the estimation of the terminal value while entailing inevitable higher margins of a subjective and lower degree of transparency concerning the adjustment of future cash flows, appears to be the preferable solution to take into account a possible poor ESG profile of the company.

The literature on the effect of ESG on firm value is rich but mixed (Whelan et al., 2021), with studies highlighting a positive (Miralles-Quiròs et al., 2018; Buallay et al., 2020; Nguyen et al., 2020; Prol and Kim, 2022), negative or mixed (Buallay, 2019; Buallay et al., 2019; Miralles-Quiròs et al., 2019a; Miralles-Quiròs et al., 2019b; La Torre et al., 2021) relationship, where the use of multiples can be partially more simplistic for the abovementioned reasons about the difficulties of the ESG inclusion into the DCF method.

In light of the above, we develop the following hypothesis to test:

H1: The ESG score (and each pillar score) is positively associated with firm value.

Methodology. To test our hypothesis, we used multiple regression analysis with panel data run on *n.* 115 observations. In this context, we applied a modified version of the model proposed by Ohlson (1995), widely used in valuation research (Paolone and Pozzoli, 2021).

$$Price_{it} = \alpha + \beta_1 X_{it} + \beta_2 EPS_{it} + \beta_3 BVPS_{it} + \beta_4 Size_{it} + \varepsilon_{it}$$

In the company valuation model proposed by Ohlson (1995), the market value of equity is a function of firms' financial and non-financial information.

In this regard, considering the findings of previous studies, independent variables are (i) ESG overall score and each pillar (i.e., considering that only material issues are relevant for investors, each ESG pillar is not equally important (Friede et al., 2015)), (ii) earnings per share (EPS), (iii) book value per share (BVPS), and (iv) company's size.

In the table above (Table 1), we assign names based on the characteristics of the indicators related to the factors.

Tab. 1: Measurement of variables

Variable	Definition
<i>Dependent variable</i>	
Price	The latest available closing price at the end of the year
<i>Independent variables</i>	
ESG score	Overall company score based on the self-reported information in the E, S, and G pillars
Environmental score	Company's score in the environmental pillar
Social score	Company's score in the social pillar
Governance score	Company's score in the governance pillar
EPS	Normalized net income divided by the number of basic weighted average shares
BVPS	Shareholders' equity divided by total common shares outstanding
Size	Natural logarithm of the amount of total asset

Our sample consists of *n.* 20 Italian industrial firms (belonging to *n.* 15 industries) listed on the Stoxx Europe 600 over 2016-2022 to gain heterogeneous panel data that allows us to look for robust results.

Refinitiv Eikon has been used as a database, which, widely adopted internationally in management studies, has proved to be among the most complete in terms of data collection (i.e., financial and social performance indicators) and provides a large combination of variables beneficial to perform our analysis. Data analysis has been performed using STATA 17 software package.

The ESG score has been taken from Refinitiv Eikon for each company as the weighted average of the scores achieved in different key sustainability performance indicators, and it may assume a score between 0 (weak) and 100 (strong). Figure 2 illustrates the composition of our panel by industry.

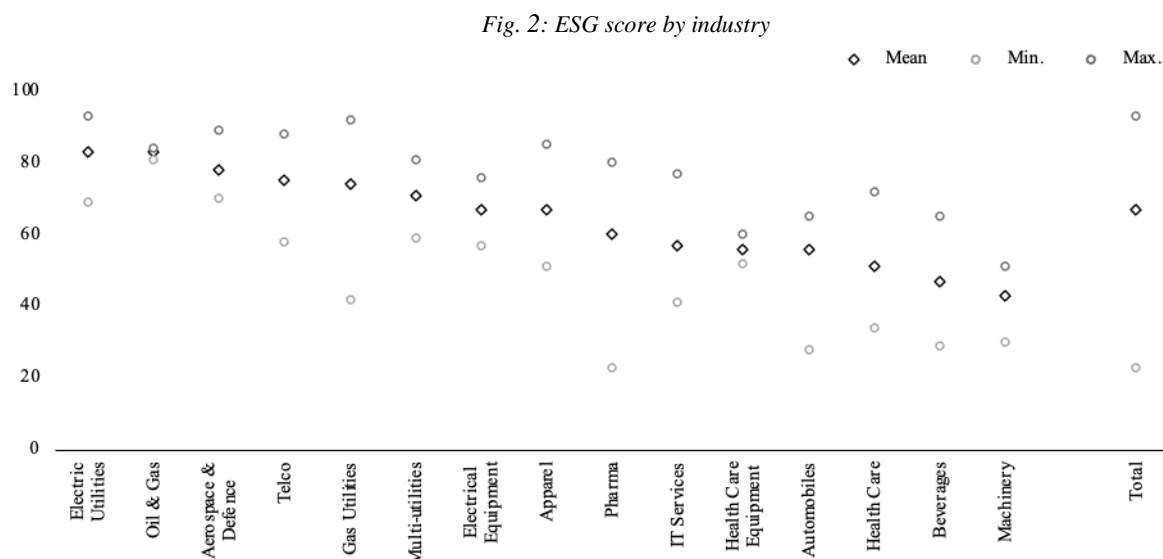

Figure 2 summarizes the mean, minimum, and maximum values of the overall ESG score of our panel over 2016-2022 by industry.

The average ESG value is good, with the Electric Utilities and Oil & Gas industries registering the highest values. Considering these scores range from 0 to 100, our panel's overall corporate social performance is not so exceptionally high, i.e., firms have good social responsibility practices and disclosure but are not excellent.

Results. Table 2 illustrates the descriptive statistics for dependent and independent variables. The descriptive statistics table includes statistics, such as mean, standard deviation, minimum, and maximum.

Tab. 2: Descriptive analysis

	Mean	SD	Min	Max
Price	31	44	-	228
ESG score	67	17	23	93
E score	63	24	-	98
S score	72	18	20	96
G score	65	19	16	97
Size	23	2	20	26

To test our hypothesis, we used multiple regression analysis with panel data that considers both time series and cross-sectional data, allowing the identification of specific parameters without making any restrictive assumptions (Verbeek, 2008; Cucari et al., 2018).

We apply a fixed effect regression model to test our hypothesis based on the Hausman specification test (Hausman, 1978).

We present below the results of the estimations described previously.

Tab. 3: Panel regression analysis

	(1)	(2)	(3)	(4)
ESG score	0,467**	-	-	-
E score	-	0,304*	-	-
S score	-	-	0,414**	-
G score	-	-	-	0,173
EPS	-0,237	-0,356	-0,316	-0,292
BVPS	4,874***	5,023***	4,481***	5,453***
Size	-14,03	-10,57	-9,634	-12,03
Cons.	295,4	227,4	198,4	266,3
Obs.	115	115	115	115
Groups	20	20	20	20
R-sq				
- Within	0,2818	0,2669	0,2881	0,2544
- Between	0,6148	0,583	0,5467	0,6199
- Overall	0,4971	0,4652	0,4289	0,5028

(Note: * $p \leq 0,1$; ** $p \leq 0,05$; *** $p \leq 0,01$)

Table 3 shows a positive and significant relationship between price and ESG score, confirming the results of previous academic studies (Paolone and Pozzoli, 2021).

Moreover, considering each ESG pillar, a positive and significant relationship exists between price and environmental and social scores. At the same time, there is no significant relationship with the governance score, partially confirming our hypothesis.

In a nutshell, investors seem to appreciate sustainability aspects and related reputation effects and the additional and complementary disclosure provided.

Notwithstanding the results of our analysis, it is necessary to conclude that, due to a lack of standardized data and risk metrics regarding sustainability issues, it is difficult to draw a robust conclusion on the topic and that the relationship between firm value and ESG performance is complex and needs more research.

Research limitations. From a methodological point of view, more variables may be included in the econometric model, considering, for example, differences among industries.

From a theoretical perspective, the lack of comparability of ESG data (and ratings) due to different methodologies applied by different providers (Billio et al., 2020) could influence the reliability of the results and lead to materially different conclusions.

Future research directions should address further improvements of the identified framework by extending the observed period, including other variables, and performing the analysis with different data from a different provider. Moreover, future studies could enrich the current literature, considering specific ESG profile effects on the DCF valuation methodology in terms of adjustments of the discount rate or growth rates in estimating the terminal value into the DCF valuation methodology.

Managerial implications. Results have important practical implications for practitioners, managers, policymakers, and stakeholders, contributing to enriching the literature on the influence of ESG variables on firm strategies and values and highlighting the dynamic aspects of this issue in the present and the near future. Future research could strive to overcome or lower those limitations.

Originality of the paper. Our paper provides several contributions to the ESG and company valuation field. In particular, from a theoretical point of view, we contribute to the literature seeking to understand the relationship between ESG and firm value. The evidence suggests that existing studies on company valuation and ESG issues are limited, but greater transparency and performance about sustainability practices are expected and positively valued by shareholders, which could impact company valuation methodologies.

Keywords: sustainability; ESG; company valuation.

Determinants of Environmental Social and Governance (ESG) Performance: A Systematic Literature Review

ALICE MARTINY^{*} FRANCESCO TESTA[•] JONATHAN TAGLIALATELA[▲] FABIO IRALDO^{**}

Framing of the Research: *The contribution of the private sector and the introduction of new business paradigms is incredibly important in the journey towards a sustainable society. By leveraging their influence and resources, companies can play a crucial role in promoting sustainable practices and driving positive change. Hence, understanding the determinants of firms' sustainable performance is not only a key goal of the strategic management field, but it is also fundamental for addressing the world's most pressing environmental and social challenges. In recent years, the concept of sustainable performance has been expanding towards the concept of implementation of the E (environmental), S (social), G (governance) criteria.*

Commonly linked to ethical or socially responsible investment (Galbreath, 2013), ESG criteria have become key indicators of management competence, risk management, and non-financial performance. Furthermore, contrary to the concepts of Corporate Social Performance (CSP) or Corporate Social Responsibility (CSR), ESG explicitly covers a large variety of issues and their impact on finance and the economy is rapidly growing. According to a 2018 global survey, more than half of global asset owners are currently implementing or evaluating ESG considerations in their investment strategy (Ahlström and Monciardini, 2022). The notable rise of ESG is demonstrated by the fact that socially responsible investment has risen more than 34% since 2016 globally, and "in the last two decades ESG integration has grown by 60%" (Umar et al., 2020).

The topic of ESG performance and its determinants emerges from the historical debate on internal and external factors that influence when and why some firms outperform others over time (Crace and Gehman, 2022). Evidence suggests that external factors can set the context and provide the incentives for a company to prioritize ESG practices. Not only have regulatory frameworks (Ahlström and Monciardini, 2022), economic development (Foo Nin et al., 2012) and industry (Short et al., 2015) prompted companies to reorient their sustainability strategies, but also country-specific cultural beliefs have shaped ESG performance (Foo Nin et al., 2012; Ortas et al., 2015; Cai et al., 2016). In addition, the company's internal decision-making processes and practices are also fundamental to implement and execute effective ESG strategies. A strong commitment to ESG principles from the top leadership related to its observable and unobservable attributes (Crace and Gehman, 2022; Garcia-Blandon et al., 2019; Kang, 2017), integrated ESG considerations in the company's overall strategy (Maniora, 2015; Mervelskemper and Streit, 2017), and robust risk management processes influenced by corporate governance characteristics (Beji and Loukil, 2021; Disli et al., 2022) are all crucial to ensure that a company is effectively managing its ESG risks and opportunities.

However, evidence suggests that existing academic studies on the determinants of ESG performance are limited and "the literature on ESG performance, with CSR issues being renamed in the finance-oriented literature, has evolved slower than practice" (Garcia et al., 2017). Besides, even when addressed, the topic detains several gaps that if not correctly addressed can refrain the comparability of the results:

- 1) Contrarily to firm performance, there is a lack of standardization in the measurement of ESG performance, which can lead to inconsistencies in research findings as well as difficulty to compare companies from different industries and synthesize the results of multiple studies.*
- 2) If developed economies have received significant attention in research on ESG performance, emerging markets have been relatively understudied (Khaled et al., 2021). Therefore, there might be there may be instances where it is impossible to generalize certain findings.*
- 3) In general, most studies focus more on internal determinants of ESG performance than external ones. This may be because internal determinants are easier to measure and control, while external determinants may be more complex*

and difficult to quantify. Neglecting external determinants of ESG performance can be problematic because it may lead to an incomplete understanding of the factors that drive long-term sustainable performance.

- 4) Limited focus on the singular pillars can weaken the value of a research, as the “factors influencing various dimensions of corporate practices and performance to E, S and G components can differ” (Mooneepen et al., 2022).

Overall, there is not yet a study that aims to provide an overall and comprehensive picture of the determinants that have the greatest impact on ESG criteria.

Purpose of the paper: This study identifies and analyses the internal and external determinants influencing the fostering of real, sustainable change within firms. To fill gaps in the literature, the SLR focuses on why and how the literature shows discrepancy on the role and impact of the determinants on ESG performance, and which are the factors that might explain this phenomenon. In addition, the SLR aims at understanding the complex interplay between internal and external determinants. The present study analyses how factors such as country or industry effects diversify the importance of internal factors as well as how company’s governance or characteristics may affect its ability to respond to regulatory frameworks or stakeholder demands. The ESG analysis was performed at both the aggregated and disaggregated levels to determine whether the impact of the determinants varied between the three pillars and sub-dimensions. Finally, in this study, we assessed the ability of different theoretical frameworks to better explore the drivers of ESG performance and presented the paper’s theoretical contributions.

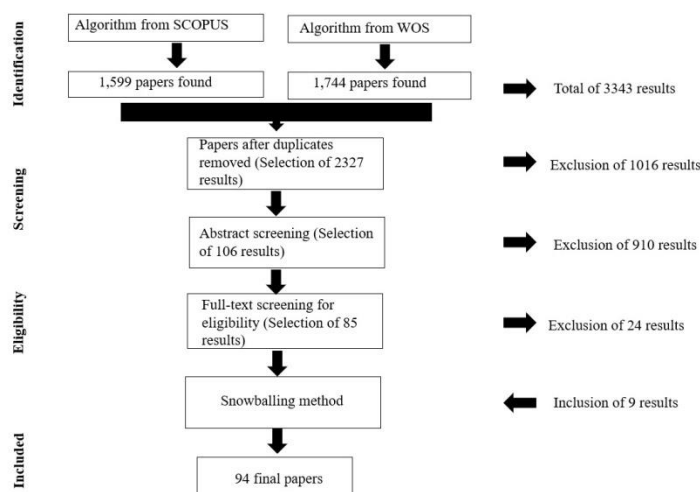

Methodology: With this aim in mind, the Systematic Literature Review was developed in accordance with the PRISMA guidelines (2020). First, we started with a search using SCOPUS and Web of Science (WOS) databases, focusing on peer-reviewed academic journal papers written in English and published until July 2022. The process began with a quest for a general exploratory algorithm to screen for articles on the internal and external determinants of ESG performance. Fourteen trials were made for SCOPUS as well as WOS, and the final decision was based on the appropriate number of papers found.

The algorithm used was focused on ESG performance for both databases, but in SCOPUS index terms were used. The main goal of index terms is to improve the accuracy and efficiency of searches, by providing a standardized vocabulary that allows users to retrieve relevant articles more easily. Sustainable Finance was included in the algorithm to have in the net also the papers that dealt with the policies that pose interesting questions that reflect broader debates about the role of finance in society (Ahlström and Monciardini, 2022). Indeed, ‘Sustainable finance’ is an umbrella term for a variety of terms that are mostly interchangeable: social finance; ethical-sustainable investment; socially responsible investment; sustainable responsible investment (Rizzi et al., 2018). Sustainable finance also involves the first idea of ethical investment: the investment should adhere to the same ethical principles as the investor (Drempetic et al., 2020). Because the research is based on the assumption of sustainable finance as a “virtue-ethical approach” and intergenerational justice as an aim of sustainable finance, we decided to include the “ethical” in our algorithm (Soppe, 2004). Environmental, Social and Governance Corporate Performance were also included as singular pillars in the algorithm.

Hence, the algorithms used were:

- 1) SCOPUS: Index terms (“Sustainable Finance” OR “ESG Performance” OR “ESG Indicator*” OR “Green Investing” OR “Corporate Environmental Performance” OR “Corporate Social Performance” OR “Corporate Ethical Governance Performance *”) OR TITLE-ABS-KEY (“Sustainable Finance” OR “ESG Performance” OR “ESG Indicator*” OR “Green Investing” OR “Corporate Environmental Performance” OR “Corporate Social Performance” OR “Corporate Ethical Governance Performance*”)
- 2) (“Sustainable Finance” OR “ESG Performance” OR “ESG Indicator*” OR “Green Investing” OR “Corporate Environmental Performance” OR “Corporate Social Performance” OR “Corporate Ethical Governance Performance*”) AND (“Firm*” OR “Compan*” OR “Business”)

Fig. 1: PRISMA flow diagram modified from Page et al. (2020)

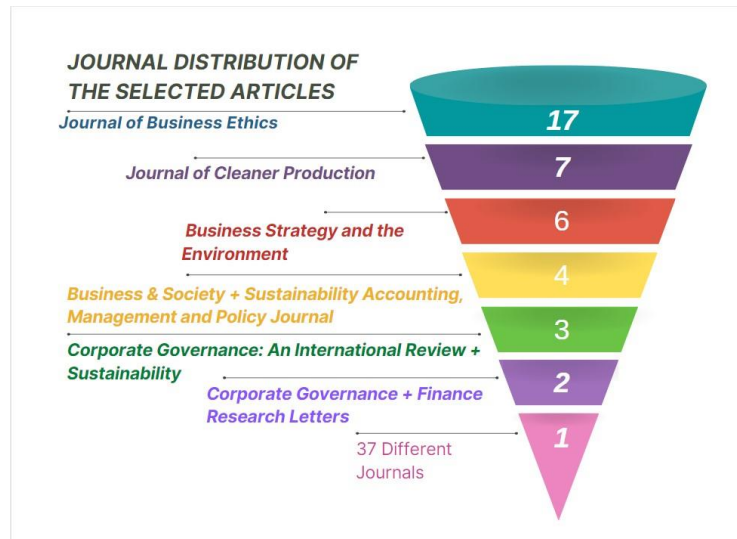

The two algorithms from SCOPUS and WOS returned 1,599 and 1,744, respectively.

After removing duplicate papers (1016), we proceeded with the inclusion and exclusion criteria of the 2327 papers selected.

First, we started including the papers published in journals with chartered Association of Business Schools (ABS) journal ranking >1, which is used as a proxy for minimum quality level. We also included papers published in journals outside the list, in order not to exclude ex-ante papers outside the management/business field. Appendix A shows the journals that the papers were selected from.

Fig. 2: Journal Distribution of the Selected Articles (before snowballing)

Secondly, the analysis of titles and abstracts was evaluated to exclude those that were either irrelevant or had just rudimentary relevance, while inclusion criterion for the abstract screening consisted of those manuscripts that put relevance on ESG performance and its determinants. The first step of this analysis began by including the papers that dealt with at least two of these elements: ESG aggregate, only environmental pillar, only social pillar, only governance pillar, internal determinants, external determinants, theoretical frameworks, and firms/business units' level. This initial reasoning for discarding papers led to a number of 396 results. Among these, we then used another filter to include only the papers that explicitly mentioned ESG and CSP. The latter was included to keep all the papers that used this term but used ESG rating agencies' scores in practice. Among these, 70 papers used CSP measurement with only E&S considered, yielding a total of 106 papers based on title and abstracts analysis.

Finally, we undertook the Full Text Review with specific attention to methods, results, and discussion to understand whether the papers fit the study's research questions. Attention was given to the papers published in journals that are not present in the ABS ranking: we included papers that presented diverse topics from the previous selected articles, such as the impact of Islamic label (Qoyum, Prima Sakti, Thas Thaker, and AlHashfi), or deepened other topics that needed further analysis (Castillo-Merino and Rodriguez-Pérez, 2021). With the final number of 85 papers, to which 9 articles are added throughout a snowballing procedure, we concluded the process with a content analysis to give an interpretation of the results and propose original findings.

Findings: The findings of this SLR revealed that most of the literature had demonstrated what we expected: the scores increase with firm size (whether measured by total assets or number of employees), which is determined by the data availability and resources for providing ESG data (Drempetic et al., 2020). The second set of findings suggests that firm effects represented strong determinants in explaining ESG performance, and they represent by large - together with corporate governance effects - the most debated factors in academic papers on the topic of firms' ESG variance. Our study found a shared agreement that over time the nonfinancial internal effects - which comprise resources, and mindsets, attributes, actions - have been responsible for the largest proportion of variance in net ESG. Regarding other internal determinants, high women participation on boards has a positive effect on ESG-performance sensitivity and this positive relationship is one of the strongest predictors of ESG performance. Board racial diversity was found to be positively associated with the sub-dimensions of community, environment, and diversity, suggesting that increasing minority representation on a board help "enhance a firm's legitimacy in the eyes of institutional stakeholders" (Zhang, 2012). Besides, increasing nationality and educational diversity positively impact social performance (Harjoto et al., 2019). Results also demonstrate a general agreement that, thanks to more diversity on boards, non-family-controlled firms have better CSR performance than family-controlled firms (Beji and Loukil, 2021; Ari and Youkyoung, 2018). Strategic orientations based on stewardship (Chevrollier et al., 2019) and emulation of just organization (Gerde, 2001), internalization activities, mergers & acquisitions and investment in research and development (R&D) and technological innovations, explicit sustainable governance - including stakeholder orientation, the presence of a CSR/Sustainability Committee or Management Systems - have all a positive influence on ESG performance. Nonetheless, our findings discovered results discrepancies on the effect of financial performance, diversity of boards, cross-listing, the activities of

the boards and investor role in determining ESG performance. Our first interpretation is that scholars' different usage of providers available in the market to measure ESG performance (see figure 3) diversifies the impact of financial performance, board diversity, and cross-listing. While some studies have demonstrated the positive impact of profitability on ESG performance (Khaled, Ali, & Mohamed, 2021), others show its secondary role when compared to country effects (Arminen, Puumalainen, Pätäri, & Fellnhöfer, 2017), or even a trade-off between financial and ESG performance (Garcia-Blandon, Argilés-Bosch, & Ravenda, 2019). Indeed, providers that place greater emphasis on governance factors - like MSCI - may be more likely to find a positive relationship between financial performance and ESG performance, as effective governance practices can contribute to both. Regarding the analysis of corporate governance diversity of boards, our study could implement a much deeper analysis of the role of ESG performance indicators given by the different providers, thanks to the numerous publications on the topic. We were not only confronted with similar papers that used different methodologies to calculate ESG performance, but we were also able to elaborate a more historical review of the evolution of the databases over the last decade, determining whether corporate governance has evolved its determinacy in influencing ESG performance over time. Our findings demonstrated that the relevance of board independence has however increased over the last years, most likely due to the providers' shift in priorities from the social (typical of KLD) to governance and environmental pillars, which strengthened the positive relationship between composite ESG score and board independence.

Figure 3 Distribution of Providers used among the Selected Articles

Also, cross-listing reveals contrasting results. According to Del Bosco and Misani, when the degree of investor protection of stock exchanges in which a firm cross-lists its shares is high, a cross-listed firm earns lower environmental and social scores than firms that cross-list in countries with a low level of investor protection (2016). Conversely, Cai et al., have demonstrated that ESG performance is higher among companies that have traded American Depositary Receipt (ADR), used as an indicator of cross-listing in the United States, a country with a very strong regime in investor protection (2016). We focused on the governance dimension of MSCI and Thomson Reuters Asset4, used by Cai et al. and Del Bosco and Misani respectively, and we found the answer in the different approaches to defining and measuring corporate governance factors. In fact, MSCI is famous for placing more emphasis on the governance factors, and its approach is more focused on internal governance structures and processes. On the other hand, Asset4 takes a broader view that includes the company's impact on stakeholders beyond just its management. Hence, results vary depending on whether governance is intended to ensure that a company is being run in the best interests of its stakeholders or when is more directly related to financial performance and regulatory compliance.

Our second interpretation is that the role of the activities of the board and of investors vary among countries. Indeed, Corporate governance structures are important to safeguard minority shareholders and other stakeholders' interests in jurisdictions where the shareholders' view prevails (common-law countries) (Castillo-Merino and Rodríguez-Pérez, 2021). In civil law, regulations aiming to protect stakeholders' interests are more determinant (Castillo-Merino and Rodríguez-Pérez, 2021).

Concerning investors, their role in Anglo-Saxon countries is fundamental as much as Japanese companies tend to be more active in their CSR strategies when firm's investors expose a negative outlook (Vuong and Suzuki, 2021). Overall, the engagement from the activist investor seems most beneficial for firms with ex-ante low ESG performance,

suggesting that these ethical investors play an important role in assisting firms in understanding how they can improve outcomes for all their stakeholders (Barko et al., 2022). Studies on institutional investors, whose attention has been given by Anglo-Saxon and Nordic countries and Japan, have affirmed that “companies must improve engagement with institutional shareholders” (Eccles and Klimenko, 2019). Pension funds, as powerful institutional shareholders, despite detaining limited influential capacity, are capable of modifying ESG firm practices (Alda, 2019) and firms that borrow from banks with relatively better ESG profiles are more likely to improve their own ESG performance over time (Houston and Shan, 2022). The landscape of the role of investors changes in the EU, particularly in French-civil law countries. Companies selected by the European Socially Responsible Funds (SFRs) exhibit worse social performance than companies selected by Conventional Funds, especially for large and medium-sized companies and manufacturing and financial sectors (Gangi and Varrone, 2018). Besides, in France corporate sustainability appears negatively related to investors activist engagement (Crifo et al., 2018).

To conclude, our findings on the significant role of CEO observable and unobservable features in shaping companies' sustainable strategies and ESG performance, are limited to the United States.

ESG reporting/disclosure represents the key bridge internal and external determinants. Literature has demonstrated that reporting firms significantly develop higher values of ESG performance, especially for the environmental and social pillar (Mervelskemper and Streit, 2017) and when subject to mandatory reporting requirements (Graafland and Smid, 2015). However, the continuous quality improvement of ESG reporting has not been followed by a substantial improvement. According to Arvidsson and Dumay EU Directive on non-financial and diversity reporting (2014/94/EU), with its regulated disclosure requirements, has not, in the short term, improved performance and thus, “any future developments in ESG reporting will not greatly enhance ESG performance” (2022). Of course, this is a single study on the subject based in Sweden, where companies already tend to perform well in ESG ratings and reporting. Therefore, it might be interesting to investigate whether these findings are applicable to other countries or whether the development of the EU sustainable finance agenda have been enhancing ESG performance of instead, has been pushing the negative impact on ESG rating industry (Ahlström and Monciardini, 2022).

In general, our findings demonstrated that although global and regional efforts have been fulfilled, national differences still explain most of the ESG variance. In fact, the adoption of voluntary CSR initiatives, like UNGC by Spain, France, and Japan, may put on the same level the companies ESG performance. Still, their variance depends on countries' institutional and social schemes (Ortas et al., 2015). Although the level of economic development is positively related with overall ESG performance (Foo Nin et al., 2012; Cai et al., 2016) and we can state that generally there is not a significant mean difference in the ESG of the developed economies (Rajesh et al., 2022), companies still present differences that can be better explained by country effects. Country effects not only refer to formal structures such as the institutional quality of a country (Arminen et al., 2017), but also to informal institutions, legal origin, cultural elements and even religion (Qoyum et al., 2022), that represent the key drivers that shape attitudes and the modes in which companies respond to formal external pressures and induce different priorities in how to re-orient their internal resources. Legal origin is intended not only as a set of binding legislations that set the boundaries of companies' actions, but also as laws that shed light on the underlying cultural values and norms on how societies behave and dispose their social norms. The findings of this research showed that firms based in civil-law countries present higher ESG scores than companies located in common law countries (Castillo-Merino and Rodríguez-Pérez, 2021). In fact, civil-law countries tend to prioritise elements like stakeholder orientation (Labelle et al., 2018), harmony, egalitarianism, autonomy (Cai et al., 2016), which all are proven important factors to improve ESG performance. As a matter of fact, among developed countries, European Countries tend to perform better than individualistic cultures - like the United States (Foo Nin et al., 2012).

Our understanding of industry relevance is that it has been greater for firms operating in developed countries. Firms in sensitive sectors, in particular, have better ESG performance (Garcia and Orsato, 2020), while there is no significant association among emerging countries (Garcia et al., 2017). The only exception is represented by the Australian case, whose characteristics differ from those of other developed countries (Rajesh et al., 2022), and in fact, impact industries in Australia do not reflect stronger ESG performance (Galbreath, 2013).

To conclude, our take on the different roles of the drivers on the ESG at the disaggregate level, is that external determinants have been assuming a far more fundamental role when only considering the environmental pillar. The environmental performance of the companies is the pillar that varies the most between countries (Mooneepen et al., 2022), due to cultural differences - for instance Shintoism/Buddhism traditions mainly focus on nature and the environment (Ortas, Álvarez et al., 2015) - but especially due to industry effects. In truth, industry is proven the strongest external effect on the environment by several studies (Crace and Gehman, 2022; Arminen et al., 2017; Orlitzky et al., 2017), even when considering emerging countries and sensitive industries (Garcia et al., 2017).

Finally, the theoretical perspectives of stakeholder, institutional, agency and resource-based view have been mostly used and confirmed throughout the studies and our analysis expands the viewpoints of the interdependence among the different theoretical frameworks.

Research limitations: The study's main limitation has taken its roots from the same ground where the major strength stands. Because the papers have analyzed different ESG rating agencies, often contrasting among each other, studies with similar topics have shown different results. Furthermore, variability among ESG definitions and measurement has been also present when considering historical data within the same providers. At the same time, because it is still unclear which method is best for measuring ESG, it is preferable to have a comprehensive overview, which this study has accomplished.

Managerial implications: *This framework's results have implications on several levels: at the policy-making level, as a proof that the recent efforts to regulate disclosure quality need to be accompanied by even stronger alignment between shared taxonomies; concerning managerial implications, the study could serve as a guidebook for firm strategies to increase ESG performance as an aggregate or when focusing on singular pillars; finally, within academia, this may represent the first SLR giving a pioneering framework for future research.*

Originality of the paper: *As already mentioned, the topic of ESG criteria is relatively new in the world of academia as well as among practitioners. Therefore, a SLR on the topic is much needed to organize and clarify the fundamental concepts. The study may help to highlight the gaps in the scientific literature, which we hope it will direct the development of questions for future research. In addition, at our current knowledge, our SLR is the first research to explore the potential causes of discrepancies in research findings about ESG performance related to the usage of the different providers as well as proving the interdependence of external and internal determinants on composite ESG and its singular pillars. Most importantly, it can help creating the basis of a comprehensive overview of the ESG Framework.*

Green HRM Practices and Creativity in Hotel Industry in Saudi Arabia: the impact of Green Transformational Leadership on Environmental Performance

FABRIZIO BALDASSARRE* SHAHBAZ SHARIF*
MUHAMMAD AKRAM NASEEM* VERA AMICARELLI**

Framing of the research. Saudi Arabia, the world's biggest oil exporter, is rapidly transforming its economy as it aims to reduce its dependence on oil, nurture domestic industries, boost jobs and diversify revenue. The tourism sector's targets of Saudi Arabia according to Vision 2030 include attracting 100 million tourists a year, creating 1.6 million jobs and increasing the industry's contribution to gross domestic product to more than 10 per cent. The kingdom is developing a number of tourism projects, including Neom, a \$500 billion futuristic city featuring a nature reserve, coral reefs and heritage sites on several islands along the Red Sea, and Qiddiya, a huge entertainment and sports project in Riyadh. Tourism is a central plank of the country's diversification drive and it will be a main non-oil growth driver, providing investment opportunities for private local and international investors as Saudi Arabia aims to attract 100 million visitors per year by 2030, S&P Global Ratings (2022) said in a recent report.

As a consequence of this strategy, a growing expectation is placed on hotel businesses to adhere to environmentally friendly business practices to maintain a sustainable competitive advantage (Hsieh et al., 2012; Park and Kim, 2016). Sustainable growth has become the new standard. In today's modern work environments, companies are being subjected to a significant amount of pressure from various interest groups to lessen the negative impact their organizational operations have on the environment (Longoni et al., 2018; Singh et al., 2019; Yu et al., 2017). The development and maintenance of an organization's internal capacities and competencies should be a central focus of environmental frameworks across all companies (Biscotti et al., 2018; Russo and Civita, 2009; Talbot and Boiral, 2018). Regarding hospitality, it has become abundantly clear that a critical defaulter arose from the lack of employee competencies and resilience paired with the required organizational capacity to solve challenging environmental sustainability concerns (Talbot and Boiral, 2018). In addition, the majority of the focus in the existing body of research on organizational longevity and the adoption of environmentally friendly resources is placed on the production and non-manufacturing industry sectors (Fassin et al., 2011). Additionally, the tourism and hospitality sectors continue to be a category that receives insufficient attention from academic researchers (Talbot and Boiral, 2018; Tang et al., 2012). Therefore, concerning both industrial and academic realms, the research paradigm is shifting from broad deliberation about the green economy into developing green operations and maintenance domains, including green creativity (Awan et al., 2019), green human resource management (Yong et al., 2019), green finance (Przychodzen et al., 2018), and green innovation (Zailani et al., 2015).

Since 1950, the tourism sector across the globe has kept growing with the pace of 3% to 4% of global tourist arrivals to foreign regions in 2015, coupled with 4% to 5% in the region of Asia Pacific per year (Almuhzzi and Al-Azri, 2019). The recent literature indicates that the hotel industry in the South Asian region, particularly Saudi Arabia, is currently experiencing internal and external pressure to place more emphasis on the conservation of the environment (Barney, 2001) via pro-environmental hospitality services that do not pollute the environment and are secure for clients. Such pressures are more compelling against the hospitality sector that significantly contributes to environmental concerns, which include waste management, energy and water (Zailani et al., 2015). It has been asserted by Gössling et al. (2019) that the hotel industry across the globe generates an average of 20.6 kg of carbon emissions per organization per night. It utilizes 130 Megajoules in terms of energy relative to per bed per night in one hospitality sector organization (Gössling and Michael Hall, 2019). The hospitality sector has caused a rise in the per year consumption of energy to USD 3.7 billion (Brunns-Smith et al., 2015).

Moreover, the global hospitality sector also generated wasteful material, a minimum of one kilogram each day for one client (Bohdanowicz et al., 2005). It utilized 218 water gallons per room daily concerning the typical hospitality sector organization (Bruns-Smith et al., 2015). Hence, resulting from the many environmental challenges described earlier, we may argue that the hospitality industry across the globe has been confronted with an increasing number of compelling forces to pay attention to environmental challenges (Erdogan and Baris, 2007). In light of the ever-shifting environmental conditions and the ever-increasing intensity of competition all over the world, the capacity of an organization to shift its course of action and strategically rethink its priorities is necessary for achieving sustainable environmental performance in the hospitality sector.

Purpose of the paper. As a result, this study try to focus on reviewing a substantial amount of theoretical and empirical information addressing the role of green HR practices on the environmental performance of organizations. The research approach is presented in the following portion of this investigation, which is followed by the hypothesis we want to check in this investigation. This research also takes into consideration the suggestions asserted by Pham et al. (2019) that give strong pieces of evidence from developing regions like Saudi Arabia, and this evidence also validated the findings asserted by Yong et al. (2019) and Yusoff et al. (2020) relative to futuristic recommendations.

Literature review. GTFL in the workplace is referred to as a leadership structure where leaders execute the required transformation and directly employ it via motivation and inspiration to accomplish a particular vision (Avolio et al., 1999). They stimulate the group members and elevate the awareness among incumbents resulting from greater standards, including freedom, justice, and transparency in the workplace (Woods, 2007). Such specific hallmarks significantly contribute toward employing innovation and creativity, which coupled be further segregated into four categories: charisma, intellectual stimulation, individualized consideration and inspirational motivation (Avolio et al., 1999). Past studies recommend that GTFL is significantly contributed to aggregate firm performance (Ng, 2017) as their appointees are more strong and efficient at all organizational levels (Barrick et al., 2015) as they shine in terms of creativity, innovativeness, in-role and extra-role job behaviors (Chen and Chang, 2013; Choi et al., 2009).

Research Hypotesis. Green Transformational Leadership (GTFL) and Environmental Performance

GTFL is described as a leadership behavior in this study as one in which the primary goal of leadership is to distribute clear vision, encouragement, and inspiration to the employees, as well as assist their learning requirements towards the accomplishment of the environmental company's objectives (Chen and Chang, 2013; Mittal and Dhar, 2016). GTFL is also referred to as GTFL. GTFL encourages employees to obtain new information (Marcus and Fremeth, 2009; Le and Lei, 2018), involves, and involves them in green product and process development activities. This enables the company to put sustainable goods and services on the marketplace (Gotsi et al., 2010) and to improve its environmental performance (Dranev et al., 2018). Thus, previous studies imply further investigation into the factors that function as mediators between transformational leadership (Heffernan and Dundon, 2016; Gumusluoglu and Ilsev, 2009; Le and Lei, 2018; Martinez-Conesa et al., 2017) and human resource practices and business success (Le and Lei, 2018; Para-González et al., 2018). Using the Resource-Based View (RBV) as a foundation, the organization's leadership is recognized as a crucial resource for the organization's environmental sustainability (Guest and Teplitzky, 2010). Among the many forms of leadership, a transformational leader entails the creation of an innovative environment, empowering, inspiring, and enabling work colleagues to trust and recognize the sight of the leader (Mittal and Dhar, 2016; Ng, 2017). This type of management affects the technology and performance of the company. Previous research suggests that GTFL is essential and pertinent to firms' performance (Ng, 2017). Their supporters are more constructive at the participant, team, and company levels (Barrick et al., 2015) due to their excellence in innovative behavior, extra-role, and in-role task behaviors (Backhaus et al., 2002; Chen and Chang, 2013). In the sense of stakeholder pressure on the company to undertake environmental performance (Mittal and Dhar, 2016; Song and Yu, 2018), various previous studies direct businesses to practice GTFL because it inspires and motivates colleagues to display green job behaviors to gain green performance (Chen and Chang, 2013; Eiadat et al., 2008). In addition, the GTFL encourages and helps to foster green company performance (Chen and Chang, 2013), green employee enthusiasm (Jia et al., 2018), green employee creativity (Chen and Chang, 2013; Jia et al., 2018), and green employee innovation (Chen and Chang, 2013; Zhou et al., 2018). Therefore, the study proposes a research hypothesis:

H1: Green transformational leadership significantly affects environmental performance in the hotel industry of Saudi Arabia.

Green Transformational Leadership and Green HRM

It was discovered that the intellectually inspired dimension of transformational leadership contributed significantly to the maxims of personal performance, talent recruitment and management, and firm performance (Jia et al., 2018; Zhou et al., 2018). This was particularly the case concerning the intellectually inspired aspect. At the same time, corporate GHRM, which corresponds to the green side of GHRM practices and aims at facilitating organizations to acquire, develop, grow, inspire, and maintain green habits among organizational personnel, relates to the green side of green HR management functions (Dumont et al., 2017; Haddock-Millar et al., 2016; Renwick et al., 2013). In other words, the key focus of the organizational GTFL is considering individual employees' needs and requirements, which could affect them to nurture and cultivate green practices relative to HRM in such a way that enables organizations to sustain their personal more empowered and empowered inspired. Green transformational leadership at the workplace leverages GHRM in such a way that elevates employs competencies and motivations and gives them chances to indulge in environmental sustainability and processes associated with management (Berrone and Gomez-Mejia, 2009; Eiadat et al., 2008; Haddock-Millar et al., 2016) for a greater level of organizational environment performance (Dumont et al.,

2017; Chen and Chang, 2013; Haddock-Millar et al., 2016). Consequently, it can be interpreted so the study proposes a research hypothesis:

H2. Green transformational leadership significantly affects green HRM practices in the hotel industry of Saudi Arabia.

Green Transformational Leadership (GTFL) and Green Creativity

When applied to the workplace, the terms “green innovation” and “green creativity” relate to the generation of original concepts involving “green practices,” “green operations,” “green products,” and “green goods,” all of which are judged to be productive, “original,” and “authentic” (Chen and Chang, 2013). By conceptualizing employs requirements, capacities and motivations, this leadership style directs employees to contribute significantly towards budding and futuristic green ideas. In reality, GTFL in the workplace enables followers to think innovatively, investigate challenges from diverse perspectives, and recognize novel solutions for environmental challenges (Chen and Chang, 2013). They stimulate group members and elevate the employees’ awareness based on a greater level of convictions and ideas such as freedom, justice and transparency in the workplace (Woods, 2007). In addition, leadership defined by customized consideration and charisma can better comprehend the particular requirements and motivations that each employee brings to an organization. They exhibit a crystal-clear vision to elevate the level of organizational dedication they have (Li et al., 2020; Lin and Ho, 2011). This kind of leadership, by conceptualizing, employs requirements, capacities, and stimulators and guides them towards adopting green ideas in the future. The mantra of GTFL in the workplace undoubtedly enables employees to think creatively, investigate problems from diverse perspectives, and examine novel solutions for environmental issues (Chen and Chang, 2013). Hence, organizational employees indulge in new and novel approaches relative to their green responsibilities and environmental challenges. For example, it has been found only one research that demonstrates that GTFL at the workplace tends to optimize green innovation among employees in the tourism sector across India (Mittal and Dhar, 2016). Another research reveals that the GTFL approach elevates green product development and green innovation and performance across Taiwan’s electronics sector (Chen and Chang, 2013). Hence, from the arguments mentioned earlier and discussions, the study proposes the hypothesis as follows:

H3. Green transformational leadership significantly affects green creativity in the hotel industry of Saudi Arabia.

Environmental beliefs & values (EBV) and environmental performance

Corporate culture comprises organizational employees’ beliefs, values and attitudes (Schein, 1992). Beliefs, behaviors and values become embedded in an organizational core philosophy or a vision, which serves as a guiding framework to manage the unforeseen circumstances or complexities that happen through the organizational life cycle (Lin and Ho, 2011; Schein, 1992). Organizational vision and core philosophy manifest in the individual incumbent’s attitudes and behaviors. Over time, such behaviors transform into behaviors embedded in routine organizational operations, thereby formulating a workplace culture (Schein, 1992). Corporate culture could be regarded as “green” when organizational employees go beyond profit-seeking motives to mitigate the adverse repercussions and elevate the favorable repercussions on organizational environmental sustainability activities (Sroufe et al., 2010). Earlier research documented by Attaianese (2012) demonstrated that when organizational employees developed and rewarded to engage in pro-environmental activities eventually supported optimize a green culture across the organizational work settings. Arda et al. validate this assertion (Cordeiro and Sarkis, 2008), who noted that both environmental and quality management are two autonomous frameworks that, once consolidated, can significantly affect organizational performance. More importantly, it has been asserted that GHRM significantly contribute toward the formulation of four factors of transformational leadership. Pro-environmental organizational leadership focus refers to the formulation of an environment a leadership emphasize, where leadership demonstrates pro-environmental behaviors in their routine operations and assesses organizational employs based on environmental performance (Bowen, 2000; Madsen et al., 2015).

As a result, HR professionals in organizations are responsible for selecting environmentally conscious employees and elevating such employees into leadership positions (Egri and Herman, 2000). Also, the organizational HR unit could be rewarded leaders for executing environmental initiatives via rewards contingent upon environmental enhancements (Fernández et al., 2003). A pro-environmental rewards structure is specifically designed to target executive-level organizational employees and trickles down as leaders formulate environmental preferences for each organizational unit and its incumbents (Zhu et al., 2008). In addition, HR professionals could motivate their incumbents to address environmental challenges through the mantra of green teams, where group members contribute significantly to recognizing and resolving problems through collaboration (Daily et al., 2012). Now, the study realizes how GHRM validate the organizational HR units’ development by recruiting environmentally aware incumbents and instilling eco-friendly beliefs and norms through training, rewards and leadership development programs. Such beliefs and values manifest as eco-friendly behaviors in an incumbent’s routine tasks. As incumbents coordinate and interact to handle environmental challenges, such behaviors become conduct with time, and an eco-friendly culture emerges in the workplace. Based on the arguments above and discussion, we recommend that the mantra of GHRM practices significantly impact the environmental performance in the hotel industry. Therefore, the study proposes a research hypothesis:

H4: Environmental beliefs and values significantly affect environmental performance in the hotel industry of Saudi Arabia.

Green HRM practices and Environmental Performance

Many studies have analyzed how pro-environment GHRM practices enhance environmental performance (Daily et al., 2012; Jabbour, 2011; Jabbour and Santos, 2008). Environmental performance refers to the organizational engagement to securing the environment and exhibiting measurable functional benchmarks inside the prescribed jurisdiction of environmental care (Montabon et al., 2007; Paillé et al., 2014). Montabon, Sroufe and Narasimhan (2007) give a detailed analysis of environmental performance, including continuous improvements, accidental reduction, recycling efficiency, interest-groups perception, waste management, independent evaluations, cost reduction and resource conservation. HR professionals significantly contribute to accomplishing these environmental outcomes via effective staffing, robust training, dynamic appraisals and state-of-the-art rewards structures relative to a pro-environment human capital (Daily et al., 2012; Harvey et al., 2013; Jabbour, 2011; Jabbour and Santos, 2008).

During the hiring process, many HR managers actively advertise their organization's environmental qualities to evaluate possible incumbents to exhibit their ideas and values about the issue of environmental sustainability (Renwick et al., 2013). To be more specific, the students entering the labor market are searching for businesses with sceneries and environmentally friendly graphics (Backhaus et al., 2002). Only a few HR managers are currently incorporating awareness-building benchmarks into the job role and interview processes to ensure that future organizational incumbents are committed to achieving corporate environmental objectives (Renwick et al., 2013). Organizational HR professionals significantly contribute to employee training and development relative to the organization's environmental priorities (Daily et al., 2012). Therefore, the study proposes a research hypothesis:

H5: Green HRM practices significantly affects environmental performance in hotel industry of Saudi Arabia.

Green Creativity and Environmental Performance

Daily et al. (2012) have suggested it that environmental enablement enhances environmental performance among organizational employees. Both managers and incumbents become empowered based on HR-driven policies such as performance evaluations and training (Daily et al., 2012). The empowered organizational professional led by example is more likely to have employed that can accept environmental transformations and proactively eliminate dangerous firm activities (Daily et al., 2012). Organizations' employees go beyond expected and could receive supplementary rewards during performance appraisals (Daily et al., 2012; Yong et al., 2019). In addition, these characteristics make a substantial contribution to the application of innovation and creativity. They can be transformed into four focal aspects: individualized consideration, intellectual stimulation, charisma, and inspirational motivation (Avolio et al., 1999). The mantra of intellectual stimulation allows staff to comprehend things from various perspectives, gather insights, and find solutions to problems (Khalili, 2016). Based on idealized influence, green leadership inspires and raises employees' exuberance to think more green creatively (Avolio et al., 1999). Therefore, the study proposes a research hypothesis:

H6: Green creativity significantly affects environmental performance in the hotel industry of Saudi Arabia.

Green HRM mediates the green transformational leadership and environmental performance

The training and development of firm objectives regarding the environmental effects of business activities are claimed to heighten employees' care regarding environmental challenges (Daily et al., 2012). This is another factor that contributes to employees' anxiety regarding environmental challenges. In most cases, the primary purpose of training and development is to foster and teach green skills and knowledge among the employees of a firm. This is done so that the employees will focus more on mitigating the effects of processes that unnecessarily produce hazardous waste substances (Simpson and Samson, 2010). In addition, much organizational personnel will be performing operational roles, which puts them in an excellent position to identify and eradicate actions that produce dangerous waste and greenhouse gas emissions (Renwick et al., 2013). Therefore, a training program characterized by environmental consciousness could help employees improve their abilities to eliminate industrial effluents and greenhouse gas emissions and, consequently, increase their emotional involvement in enhancing a firm's environmental performance (Egri and Herman, 2000).

HR professionals at the workplace nurture operational level employees and supervise leadership and management development programs. HR practices significantly contribute to recruiting and advancing environmental developed organizational incumbents for leadership positions (Egri and Herman, 2000). Leadership in environmentally centric corporations is often required to perform both transactional and transformational leadership roles (Li and Ho, 2016). This demonstrates that HR managers need to staff and retain leadership with the capability to swiftly switch between operational and strategic level decision formulation activities (Egri and Herman, 2000). Once in authority-level positions, leaders will be environmentally sound by emphasizing initiatives in elevating the organizational environmental performance (Erdogan and Baris, 2007; Haddock-Millar et al., 2016). In addition, HR professionals also significantly contribute to analyzing employee performance resulting from the accomplishment of the environmental objectives. HR professionals could also nurture and develop organizational-wide pro-environmental performance indicators and assessment frameworks (Marcus and Fremeth, 2009). HR professionals can discuss with employees, as part of performance reviews, whether the employees have achieved their environmental goals and any suggestions they may have for improving waste management and elevating their performance (Renwick et al., 2013). On the other hand, employees of organizations are typically driven by the desire to cause less damage to the environment, and their views can be further controlled through the use of compensation and reward structures (Daily et al., 2012; Jabbour and Santos, 2008). According to the findings of a previous study conducted by Cordeiro and Sarkis (2008), it has become abundantly clear that businesses that have an explicit connection between the level of rewards given to the CEO and the achievement of organizational environmental goals are characterized by higher levels of environmental performance than those that do not have such a connection. Likewise, it has been asserted by Fernández, Junquera, and Ordiz (2003) that organizations that had executive level employs with rewards contingent upon

delivering environmental performance also had a greater level of environmental performance in comparison to the firms giving fixed rewards. Drawing from the green HRM literature, it is evident that HR practices such as staffing, firm performance and appraisals and retention are positively related with the firm environmental performance. Hence, the study proposes a research hypothesis:

H7: Green HRM significantly mediate the link between green transformational leadership and environmental performance.

Green creativity mediates the green transformational leadership and Environmental performance

Organizational employees adopt novel and fresh methodologies relative to their green responsibilities and environmental issues. Organizational transformational leadership is a leadership style where leadership executes desired transformation and guides employees through motivation and inspiration to pursue shared organizational vision and objectives (Avolio et al., 1999). Such GTFL stimulates employees to value corporate goals over personal objectives, guides incumbents in all circumstances, help when required, and instils resilience into incumbents to generate novel ideas for environmental sustainability (Guest and Teplitzky, 2010). Furthermore, from the viewpoint of stockholder stress, the study argues that this kind of stress on agencies to continue pursuing sustainable development and environmental performance (Song and Yu, 2018), plenty of earlier studies claimed that for the firms to rehearse GTFL as it helps promote and incites organizational employs to prove green behaviors and attitudes at worksite approach that aims to achieve green firm performance (Chen and Chang, 2013). The study argues that this kind of tension on entities to undertake environmental sustainability and environmental performance (Chen and Chang, 2013; Zhou et al., 2018). In addition, the practice of GTFL in the workforce encourages and fosters green environmental performance (Chen and Chang, 2013), green innovation (Chen and Chang, 2013; Zhou et al., 2018), green passion (Jia et al., 2018), and green creativity (Chen and Chang, 2013; Jia et al., 2018). Therefore, the study proposes a research hypothesis:

H8: Green creativity significantly mediate the link between green transformational leadership and environmental performance

Environmental beliefs and values moderate between green transformation leadership and green HRM

The environmental attitudes and values held at the highest levels of organizational leadership have substantial implications on the ability of an organization to implement GHRM concerning the HR management of human resources in work (Jia et al., 2018; Renwick et al., 2013). As a result, the study proposes that to foster and inculcate green performance and innovation within the workplace, GTFL substantially participated in creating green HR management handbooks and processes (Jia et al., 2018). The goal of these contributions was to enable businesses to efficiently disperse their goals and objectives to their staff and employees (Marshall et al., 2005) to pursue total green performance. As a result, the study hypothesized that GHRM significantly contributed to facilitating GHRM practices in company work settings. For example, hiring and selection, training and advancement performance appraisal and HR management, and rewards and compensation frameworks as a tool by which GTFL at the workplace attachment theory enhance, inspire, and cultivate employees to efficiently pursue the cumulative level of firm performance (Yusof and Jamaludin, 2018). Therefore, the study proposes a research hypothesis:

H9: Environmental beliefs and values significantly moderates the relationship between green transformational leadership and green HRM

1.10 The Moderating role of environmental beliefs and values

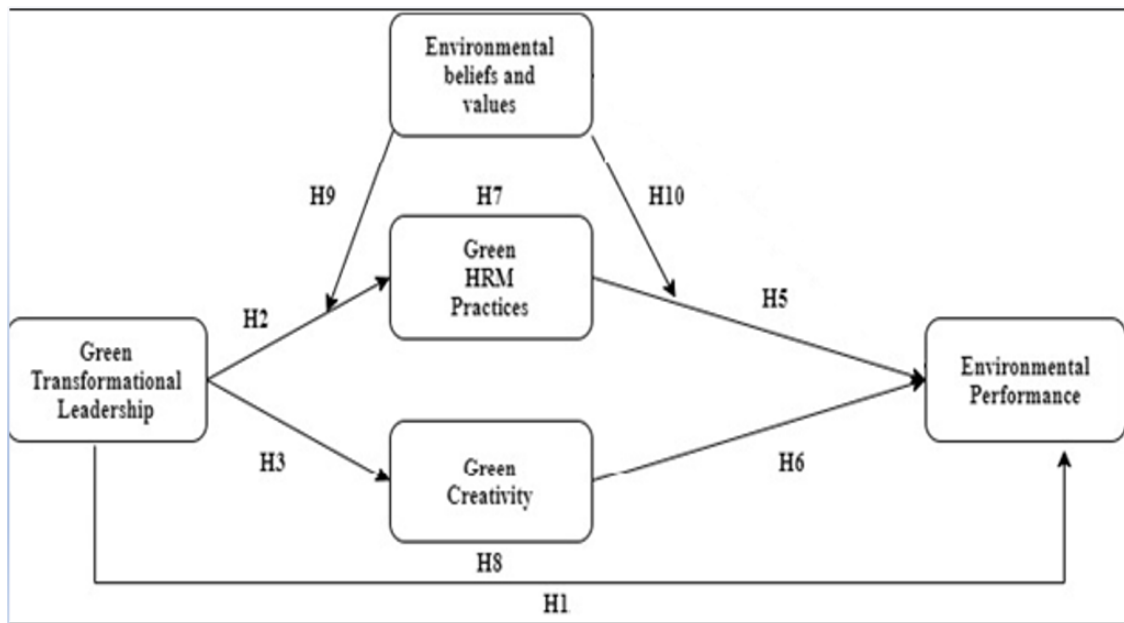

It has been suggested by Montabon, Sroufe and Narasimhan (2007) that it uses peer engagement and empowers the individuals involved. The legitimacy of the message and the emphasis placed on leadership could have a considerable impact on environmental performance standards. For instance, it has been proved that a proactive story regarding environmental issues (leadership emphasis) can enable organizational employees to effectively understand environmental issues and give members of the firm the ability to implement effective environmental remedies, such as recycling and stakeholder involvement proposals. This is because a proactive plot focuses on the future rather than the past (Bowen, 2000; Sharma and Ruud, 2003). Pagell and Wu (2009) that environmentally aware leadership teams could aggressively execute pro-environmental policies by integrating environmental and financial objectives have suggested it. Proactive environmental policies are dispersed by top organizational leadership to operational level incumbents and, over time, will become routine operations (Bowen, 2000). Hence, formulating the environment leadership preference exhibited in the eco-friendly behaviors exerted by the organizational employees enables incumbents to emphasize elevating activities, including eradicating wasteful processes from the manufacturing process (Simpson & Samson, 2010). This, in turn, decreases and recycling of raw materials and engender organizational environmental performance, decreasing consumption of resources and costs as well (Dranev et al., 2018). Moreover, reputed eco-friendly messages from top organizational leadership stimulate eco-friendly awareness among organizational employees to perform pro-environment activities (Lin and Ho, 2011). More specifically, messaging that harmonizes and is compatible with the employs desire to mitigate environmental harm could formulate how employees disseminate eco-friendly performance accomplishments to different interest groups (Madsen and Rodgers, 2015). Elevating the perceptions of organizational stakeholders about the organizational environmental performance could help in rankings in sustainability indices, for instance, Dow Jones Sustainability Index and entice further venture in this regard (Teodosiu et al., 2018). Peer participation could nurture teamwork exertions about the accomplishments of the environmental performance of the organization (Daily et al., 2012). Environmentally aware group work is said to significantly mitigate waste and optimize the organizational environmental performance in return (Brunns-Smith et al., 2015). For instance, Jabbour (2008; 2011) that only when groups incorporate an eco-friendly mentality can enable the

organization to reach the proactive phase concerning environmental management has asserted it. Finally, organizational employees could be given the maximum autonomy to execute assessments of their activities and their peers to stimulate the culture of continuous eco-friendly enhancements. Undoubtedly, it has been evident by Daily et al. (2012) that organizational employees' empowerment at the workplace significantly contributed to their environmental awareness and could positively manipulate organizational environmental performance (Daily et al., 2012). Based on the assertions mentioned above and arguments, we propose employing empowerment at the workplace, messages credibility, leadership emphases and peer participation as the focal predictors of the framework. Hence, we hypothesize that the EB & V mediate the nature of interdependence between GHRM practices adopted by the organization and its environmental performance. Therefore, the study proposes a research hypothesis:

H10: Environmental beliefs and values significantly moderates the relationship between green HRM and environmental performance.

Theoretical model. According to the resource-based view (RBV), strategic organizational resources are the most crucial factor in maintaining a competitive advantage. RBV interprets and analyzes organizations' strategic resources to comprehend how such firms might achieve a competitive advantage by utilizing those strategic resources. The idea that RBV is "impossible to duplicate" serves as the company's guiding principle, and it is this principle that gives the company its competitive edge or superior performance (Barney, 2001; Conner and Prahalad, 1996). Resources that can easily transfer or imitated were not seen as strategic resources. Resources that cannot be transferred, available in the market, or transformed into unique resources through organizational culture, the environment was considered a strategic resource. The competencies and strategic resources that are unique to a company can significantly impact its performance and its position in the market (Conner and Prahalad, 1996). It was believed that these imperfectly substitutable and easily imitated or unique resources were the primary source of a consistently better performance level and a competitive nature (Peteraf and Barney, 2003).

Fig. 1: Theoretical Model

Methodology. To accomplish the research objectives of this research, this research is following the quantitative method approach. The current research will survey a questionnaire to collect the primary data for quantitative analysis. Recent research confirms that methodologies based on surveys are suitable for elaborating on underlying phenomena or investigating the causal interaction among the measurement scales (Zikmund et al., 2013). Additionally, Voss (2010) stated that the survey-based technique is adequate and most appropriate for the researchers to collect and assess many variables and test hypotheses to meet the research aims. This was found to be the case in the study. Furthermore, as mentioned earlier, the body of research demonstrates that the findings from the qualitative analysis can validate the results. As a result, the mixed method technique was utilized in the study to accomplish the research objectives of the current research. The unit of analysis is considered under investigation, or research and variables are being measured to test the theoretical models (Zikmund et al., 2013). The nature or context of research will be considered a basis for selecting units of analysis, which can be organizations, groups, and individuals (Sekaran et al., 2007). The population being studied is represented by Saudi Arabian hotels that were part of hotel chains to manage the cascade effect. Additionally, these hotels needed more than 50 employees and a three-star classification or higher to avoid being classified as firms that lacked structured HRM practices (Sekaran et al., 2007). Respondents for organizations will be regarded as managers and owners of those businesses. As a result, the hotels of Saudi Arabian were considered delegates of the hotel industry in Saudi Arabia for the research. These hotels were evaluated regarding their Green transformational leadership (GTFL), environmental beliefs and values, green HRM, and environmental

performance. In the current study, we will be measuring latent components with the help of the five Likert scales. There will be no variance between any of the items that are used to assess the latent concept. The scale was adapted for this research from one used in prior studies; it had also undergone testing to ensure its reliability and validity. 5 Likert scales of current research will be as follows; 1 SD (Strongly Disagree), 2 D (Disagree), 3 N (Neutral), 4 A (Agree), and 5 SA (Strongly Agree). To achieve the current research objectives, the researcher will use quantitative analysis. For the quantitative analysis, the current research will employ structural equation modelling to test reliability, validity, and hypothesis.

Research limitations. This study is an ongoing project which is currently under empirical investigation in order to check and prove the research hypothesis, therefore this is the main limitation of our paper. Yet, we are trustful that empirical evidence will help us to understand the future directions of our research, helping the hospitality industry management in Saudi Arabia (and in other countries) to develop sustainable practice in order to implement the Tourism Development Plan.

Keywords: Green creativity; green HRM; environmental performance; green transformational leadership; environmental beliefs and values.

Does the Greenium in Green Bond still exist? Empirical analysis in a sample of international Green Bond¹

MARIANTONIETTA INTONTI* MATTEO DE LEONARDIS*
CANDIDA BUSSOLI[▲] LAURA SERLENGA**

Abstract

The green bond market has seen exponential growth since the issuance of the first sustainable bond by the European Investment Bank (EIB) in June 2007. The increase in market size and interest in sustainability topics, in particular green, in the financial field, has led to the dissemination of many studies on the topic. Among these, studies focused on the relationship between Corporate Social Responsibility (CSR) and the Financial Performance of an issuing company have mainly shown a direct and significant positive relationship between the two dimensions (Yu-Shang Wang Yi-Jie Chen, 2018, Attig, N. et al, 2013, Ajan, Y. Et al. 2016). The literature on sustainable investor behavior (Flammer C., 2021) has shown, on the other hand, the presence of the so-called Green Bond Premium (or greenium), a negative difference in yield (or positive in price) between Green Bonds and Traditional Bonds that can be considered as equivalent, except for the green component. It therefore seems that for financial products, investors are willing to pay a higher price in order to obtain the sustainable green product, in this case green bonds. The literature in recent years has been characterized by the presence of many works on the subject based on very different methodologies of analysis, with non-homogeneous results and, consequently, with a lack of clarity on the dynamics and determinants of this particular phenomenon. The work, therefore, is aimed at investigating the presence of greenium in the financial market, using a large sample of Green Bonds and Traditional Bond counterparts, applying analysis methodologies shared in the literature (Zerbib, 2019), also in order to evaluate the persistence of the effect in periods of high growth in emissions and market turbulence due to the crises related to the pandemic, the war in Ukraine, the rise in gas prices and inflation. The paper also intends to highlight what the determinants of greenium are, identifying some independent reference variables that can also allow to highlight the effect of greater transparency in terms of sustainability of the issuer on the value of greenium.

Framing of the research. *The research is part of the existing literature on the theme of greenium, on the importance of developing projects of environmental, social and governance sustainability in companies, and on the methods of financing these projects. Among the latter, the decision to issue GB has shown its importance for both issuers and investors.*

The numerous empirical evidence on GB issues have shown the existence of a greenium, i.e. a negative yield premium, which investors are willing to accept in the presence of a bond that has a high impact in terms of environmental sustainability. Studies on the existence of the phenomenon show interesting and significant results. However, despite the greater precision and increasingly refined methodologies, a univocal vision on the topic has not yet been reached as the results are often conflicting. Moreover, the pandemic and the war in Ukraine made it more difficult to evaluate the results, due to the sudden succession of market shocks and instability.

The literature developed over the years highlights the presence of a negative yield premium for green bonds, the implications of which can be analyzed both from the point of view of the issuers and from that of the investors.

In the context of the literature that analyzes the phenomenon from the point of view of the issuers, in terms of analysis of the relationship between Corporate Social Performance (CSP) and returns on securities, many studies show a positive relationship between the CSP and the return on shares (Konar and Cohen , 2001; Derwall et al., 2005;

Kempf and Osthoff, 2007), with a consequent lower cost of capital for issuing companies characterized by a sustainable approach in the ESG, environmental, social and governance dimensions. The company's commitment to complete sustainability projects or to transform the production chain to make it less polluting seems to be rewarded on the stock market. Many studies address the issue of the applicability of the results indicated above also to the cost of debt that the company has to face with a bond issue, considering that the investor in debt securities has a different profile than the shareholder (Oikonomou et al., 2014; Ge and Liu, 2015, Russo et al., 2020). The presence of a lower cost of debt linked to the issue of sustainable bonds can be measured by comparing it with traditional type bonds, which differ only in the greenness typical of Green Bonds. Among the reference papers, Zerbib (2019) analyzes a sample of 110 Green Bonds, compared with a double amount of Traditional Bonds. The methodology applied uses the matching method to link two traditional bonds to each green bond and, from this comparison, calculate any differences in terms of yield. The particularity of the model is related to the use as a dependent variable of a liquidity proxy (the Bid-Ask Spread): the constant of the model is identified in the greenium as the "time invariant" effect of the panel fixed effect regression. The result is significant and shows a negative greenium of around 2bps in the secondary market. In Bachelet (2019), on the other hand, both a Pooled OLS and a panel fixed effect regression are used, and the value assumed by the constant is both negative and positive depending on the type of issuer, with non-univocal results on the existence of greenium.

In the studies that look at investors, however, the definition of the model and the choice of variables is linked to the Willingness to Pay (WTP) for green products. A large branch of literature from the 90s to today has analyzed the WTP for green products and found in many cases positive and significant values for investors (Louriero M., 2003, Thompson D., 2010), showing how the price for a green financial product that consumers are willing to pay for is superior to that of traditional bonds, all other things being equal. A higher price is linked to a lower yield, with a consequent lower cost of the debt for the issuer. In Agliardi & Agliardi (2019) the case of the issue of a green bond by an Italian company is analyzed in depth. The GB, compared with a previous traditional bond, not only shows a price in the primary market clearly higher than the traditional one but also a negative greenium of 86bps in the secondary market. This paper also specifies the still current tendency to find themselves in situations of oversubscription in the issuance phase of Green Bonds in the primary market. This trend, which could have effects on the composition and existence of greenium, is certainly a consequence of the very large interest that these financial instruments have created among investors.

The literature also focuses on the importance of the green project linked to the bond, which would make the investment more attractive. In this context, Bour (2019), based on the methodology used by Zerbib (2019), expands the potential of the model by inserting a proxy variable of non-financial disclosure. The results are very interesting and show a significant greenium of -23 bps, which increases dramatically if it is accompanied by a second party opinion and CBI certification (respectively -111 bps and -110bps). Therefore, greenium is influenced by the transparency of the security, which reduces the possibility of greenwashing, and by the perception of the final consumer/investor regarding the correctness of the issuer. In this context, however, the literature had also verified rather anomalous cases of significant positive greenium, as in the case of Karpf and Mandel (2018) who used the quantity of transactions carried out in the previous 30 days as an approximation of liquidity.

Among the most important studies we also find the research by CBI (2016) and Barclays (2015) which, applying an analysis by indices in the first case and an OLS regression in the secondary market in the second case, found respectively insignificant results and a greenium of -1.1bps.

Gianfrate and Peri, in 2019, analyzed a sample of about 120 Green Bonds, which, compared through an OLS, show significant results especially for corporate issuers. In Ehlers (2017) a greenium of -18 bps emerges in both the primary and secondary markets, using an initial matching method and a subsequent analysis of the yield curve of the green and brown bond pairs. The aforementioned Baker (2018) uses a large sample consisting of 2083 GB in a period between 2010 and 2016 and, through a regression on bond yields, arrives at an interesting result of -5.7 bps in the primary market, and at a similar result in the secondary. Finally, Fatica, Panzica and Rancan (2021), with a dataset containing 1397 GB and the same methodology used by Baker in the previous year, obtained non-homogeneous results for the whole sample. For this reason, the authors conclude that greenium does not appear to be present for all categories of issuers and explain that in non-financial corporations the use of bond proceeds is more transparent about the greenness of projects than in financial institutions.

The most recent research has refined the compositions of the models, reaching further and interesting results. Koziol et al. (2022) carry out an experiment on greenium through a sentiment analysis, including in the panel regression model three variables representing searches on Google for the terms ESG, Green Bonds and Sustainability. The results show an increase in greenium when interest and searches are greatest. Sergei (2022) applies a matching method similar to the one constructed by Zerbib and, through a fixed effects panel regression, finds a greenium of about -38 bps on a sample of over 2000 bonds (of which 12% belong to the green category).

In summary, based on Bhutta (2022), we can state that the literature, in 56% of cases, sees a greenium with a statistically significant negative value in the primary market and in 70% of cases sees a negative greenium statistically significant in the secondary market. The most important literature is summarized in Table 1.

Tab. 1: An overview of the greenium literature

AUTHORS	DESCRIPTION	GREENIUM	METHODOLOGY and MODEL	SAMPLE SIZE
Bachelet et al. (2019)	A sample of 89 private and institutional green bonds to which a pooled OLS and panel analysis was applied	Between 2.06bps and 5.9 bps	Pooled OLS e Fixed Effect $\Delta y_{i,t} = a_0 + a_1 \Delta Liquidity_{i,t} + a_2 \Delta ZTD_{i,t} + a_3 \Delta \sigma_{i,t} + \sum_j \beta_j \Delta B_{ji} + \eta_i + \epsilon_{i,t}$ Dependent Variable: Yield differential Regressors: liquidity difference, zero trading day, 20-day yield difference, amount issued, coupon and maturity	89 green bond (2013-2018)
Ehlers & Paker (2017)	Greenium estimation on a 21 green bond sample	-18bps	Greenium estimation using a regression on yield curves	21 green bonds (2013-2017)
Zerbib (2019)	Greenium estimation on 110 green bonds and 220 traditional bonds	-2bps	Panel Regression Fixed effect, control liquidity $y_{i,t} = \pi_i + \beta Liquidity_{i,t} + \epsilon_{i,t}$	110 green bonds, 220 traditional (2013-2017)
Gianfrate & Peri (2019)	Investigation of green bond premium in Euro-Dominated primary market	Between -18bps and -21 bps	Propensity score matching and OLS regression of spreads (on variables used to estimate the PSM)	121 green bonds (2007-2017)
Baker (2018)	Greenium analysis on 2083 U.S. Munis ² 19 green U.S. corporate bonds	-5,7 bps (U.S. munis) -8.2bps CBI certified green bonds	Afer tax-yield regression and OLS regression	2083 green bonds U.S. munis (2010-2018) 19 corporate green bonds (2016-2018)
Sergei G. (2022)	Estimated greenium on European green bonds, particularly in the UK, France, the Netherlands and Germany markets	-4 bps (overall) No significant greenium in green bond market of the UK, France, Netherlands and Germany	Multiple OLS regression Dependent variable: current Ask Yield of bond issue.	462 green bonds (2007-2021)
Karpf & Mandel (2018)	Estimated greenium on 1880 green bonds in the secondary market	+7.8 bps	Yield curve (Svensson 1994) Oaxaca- Blinder decomposition	1880 green bonds (2010-2016)
Tang e Zhang (2018)	Estimated greenium in the primary market of 1510 green bonds	No greenium. The green bond issue is, however, positive for shareholders	Evet study. Regressione del differenziale di rendimento su molteplici variabili	1510 green bonds (2007-2017)
Koziol C (2022)	Stima del greenium nei green bond governativi tedeschi	Between - 68bps and 81bps	Pooled Ols panel regression with bond fixed effect and robust standard error $GBP_{it} = \beta_0 + \beta_1 LP_{it} + b \cdot Bit + i \cdot It + s \cdot St + \epsilon$ GBP (green bond premium) = observable yield differential and liquidity premium	4 green bond tedeschi (2021-2022)
Larker D et al (2020)	Estimation of greenium by calculating the price differential between green bonds and traditional bonds	No consistent greenium	Baker et al. (2018) Methodology	2896 green bonds
Loffler et al (2021)	Estimated greenium in the primary and secondary bond market from 650 international issuers	Between -15bps and -20 bps	Matching approaches: - CEM (coarsened exact matching) - PSM (Propensity score) using probit model	2000 green bonds
Huang et al (2023)	Estimating greenium as a function of the spread between non-green bonds	Between -10bps and 20 bps, more significant and sensitive in non green bond treasury spread	$Y_{g,i} = \beta_0 + \beta_1 Y_{ng,i} + \beta_2 Y_{2ng,i} + \gamma_1 CSD_i + \gamma_2 CPD_i + \epsilon_i; \epsilon_i \sim N(0, \sigma)$ Where: $Y_{g,i} \in Y_{ng,i} = Y_{g,i}$	5983 green bonds (2014-2022)
Bour(2019)	Estimation of greenium and simultaneous calculation of the relevance of non-financial disclosure on the value of the differential	-23.2bps (up to -110bps for bonds with higher transparency)	Zerbib (2019) methodology, adding the variables related to CBI certification, second-party opinion and Green Bond Principles	631 green bonds

Source: Authors Elaboration

² Muni-bonds, short for “municipal bonds”, are bonds issued by local authorities and administrations with the aim of raising funds to be used in their area to finance projects, infrastructure works and other public interest objectives.

Purpose of the paper. *The objective of the paper is to verify the existence of greenium, as a “time invariant” effect of the panel regression expressed in the methodology, in a large sample of green bonds and over an extended period. Therefore, the analysis tests the following two hypotheses:*

HP1: The greenium, as a “time invariant” effect of the price difference between GB and traditional bonds in the selected sample, exists and is significant.

HP2: The greenium is affected by the following variables:

- 1) Bid-Ask spread;
- 2) Amount issued;
- 3) Financial rating of the bond (S&P);
- 4) Sustainability rating of the bond (degree of transparency, presence of a second party opinion, adherence to the CBI or European standard according to the Action Plan on sustainable finance);
- 5) Type of issuer (States or Companies);
- 6) Currency (euro or dollar).

Data

The data were collected from Refinitiv Workspace database and selected, through a matching methodology between green bonds and traditional bonds, within the Green Bond Guide, an area of the database that contains data on the entire green and sustainable bond market. The sample size is 1216 GB. The original sample size of 1429 GB was stripped of smaller, insignificant issues of less than USD 10 million. The large number of GBs selected required the use of the application programming interfaces (APIs) provided by the database to collect daily price and yield data for each bond over a period of 1/03/2020 to 1/03/2023.

Following the analysis methodology of Zerbib (2019), data were collected for two Traditional Bonds per GB, bringing the sample size to 4642 bonds. In the following section, the methodology and criteria for matching GBs and TBs are explained. In the section on analysis methodology, the reason for choosing two Traditional Bonds for each green is explained.

The collection followed four steps:

- (1) *All GBs with the following characteristics were identified:*
 - (i) *Issue value of at least USD 10 million.*
- (2) *Traditional bonds with the following characteristics were selected.*
 - (i) *Same issuer as GB.*
 - (ii) *Similar maturity.*
 - (iii) *Same rating.*
 - (iv) *Similar issue size.*
 - (v) *Same currency.*
- (3) *The final dataset consists of two traditional bonds for each selected green bond.*
- (4) *Finally, a data table was constructed which includes.*
 - (i) *difference in yields over the time period;*
 - (ii) *difference in prices over time;*
 - (iii) *changes in liquidity over time;*
 - (iv) *issuance volume;*
 - (v) *type of issuer;*
 - (vi) *rating;*
 - (vii) *currency.*

A table with descriptive statistics referring to the sample is presented below:

Tab. 2: Descriptive statistics of the international GB sample

Source: Authors Elaboration

The decision to include such a high amount of bonds from non-governmental issuers is an attempt to make the analysed sample as similar as possible to the current market situation. In fact, according to Refinitiv Workspace's Green Bond Guide, the size of the global green bond market in 2023 is approximately \$2.5 trillion. Of this, about 70 per cent will come from corporate issuers. Similarly, a percentage close to 40 per cent has been chosen for Eurobonds, consistent with the market figure of approximately 37 per cent of active Eurobonds in 2023.

Methodology. The methodology of analysis (Zerbib, 2019) is suitable for the verification of hypotheses also in view of the reference period, which is characterised by great uncertainty.

The quantitative analysis involves four steps.

The first step aims to determine whether there is a difference in performance between GBs and traditional bonds.

The second step aims to verify whether, based on the panel analysis, the model constant exists "naturally" for all green bonds. To this end, it is appropriate to develop a fixed-effects panel analysis precisely in order to have the "time invariant" effect of the difference in the performance of green bonds compared to their conventional counterparts as a constant. The suitability of the fixed effects model will be tested through a Hausman test. The starting formulation for the calculation of greenium therefore takes the following form:

$$\Delta \tilde{y}_{i,t} = g_i + \beta \Delta \text{Liquidity}_{i,t} + \epsilon_{i,t} \quad (1)$$

³ Eurobonds are defined as all bonds, corporate and government, from European supranational entities

where:

$\Delta \tilde{y}_{i,t}$ is the ask yield differential over time between the ask yields of GBs and the TB yield calculated by interpolation.

g_i is the greenium;

$\Delta Liquidity_{i,t}$ is the change in liquidity calculated as the difference between the liquidity of the GBs and the liquidity of the TB, using the Bid-Ask spread as a proxy.

$\epsilon_{i,t}$ is the error term.

The third step is a cross-sectional analysis, which aims to verify whether the components of GB:

- 1) currency,
- 2) issuance volume
- 3) rating
- 4) type of issuer
- 5) certificates of transparency (CBI, ICMA, Second Party Opinion)

are determinants of the greenium factor. Finally, in order to draw conclusions, we proceed to the analysis of the constant of the above-mentioned model over the time span of the sample.

We then proceed to the explanation of the variables and their empirical composition:

$\Delta \tilde{y}_{i,t}$ is the difference between the yield of the GB and the yield of the TB created by the interpolation of the two TB for each GB. The interpolation, in this case, occurred by calculating the average between the yields of the TB, chosen from GBs with similar maturities.

The difference between the yields of the securities pairs is calculated as follows:

$$\Delta \tilde{y}_{i,t} = y_{i,t}^{GB} - y_{i,t}^{TB} \tag{2}$$

where:

$y_{i,t}^{GB}$ is the yield of the GB_i at time t;

$y_{i,t}^{CB}$ is the yield of the TB_i (traditional, constructed by interpolation) at time t.

Liquidity is therefore calculated as follows:

$$\Delta Liquidity_{i,t} = Liquidity_{i,t}^{GB} - Liquidity_{i,t}^{TB} \tag{3}$$

where:

$Liquidity_{i,t}^{GB}$ is the measure of liquidity for GBs;

$Liquidity_{i,t}^{TB}$ is the measure of liquidity for TBs.

The liquidity calculation for both GBs and TBs is as follows:

$$Liquidity_{i,t} = \frac{Ask Price_{i,t} - Bid Price_{i,t}}{(Ask Price_{i,t} + Bid_{i,t})/2}$$

Following the model presented by Zerbib (2019) and, therefore, having compared one green bond with two of its traditional counterparts, the calculation of the liquidity of traditional bonds requires an additional step. Should the coefficient of the independent variable of liquidity (bid - ask spread) not be significant and close to 0, it would be demonstrated that there is no correlation with the existence of greenium.

$$Liquidity_{i,t}^{TB} = \frac{d_2}{d_1 + d_2} Liquidity_{i,t}^{TB1} + \frac{d_1}{d_1 + d_2} Liquidity_{i,t}^{TB2}$$

with:

$$d_1 = |GB_{maturity} - TB1_{maturity}|$$

$$d_2 = |GB_{maturity} - TB2_{maturity}|$$

In order to demonstrate which characteristics of green bonds are most impactful on the formation of greenium, as required in the second hypothesis, a second model was constructed, which involves the distribution of the constants resulting from the panel regression of model (1) as the dependent variable of formulation (4) and the development of a series of regressors referring to the characteristics of GBs that could be impactful in the existence of this phenomenon. The determinants chosen are: amount issued, rating (S&P), type of issuer, presence of documentation supporting the bond (second party opinion, CBI certification, ICMA, sustainability rating) and currency. The determinants just mentioned will be transformed into dummy variables and inserted as independent variables in the following model:

$$\hat{g}_i = a + \gamma_1 IssueAmount_i + \gamma_2 Rating_i + \gamma_3 Currency_i + \gamma_4 IssueType_i + \gamma_5 Cert_i \epsilon_i \tag{4}$$

Where:

\hat{g}_i s the distribution of constants from the panel regression (1)

$\gamma_1 IssueAmount_i + \gamma_2 Rating_i + \gamma_3 Currency_i + \gamma_4 IssueType_i + \gamma_5 Cert_i$ are the dummy variables of the determinants on which the analysis will be carried out.

Managerial Implications. *The issuance of bonds by firms has significant managerial implications:*

- *constitutes a tool for acquiring financial resources through an alternative channel to the banking one and makes it possible to diversify funding sources, reducing the risk associated with a too strong link with a single funding channel;*
- *it also implies an important organizational and transparency effort to make decisions regarding the technical characteristics of the security to be issued, the issue market, the timing of the issue, the choice of consultants to be involved, and constitutes an important moment for the growth of managerial skills and of the entire company structure.*

With regard to the issuance of GB, further considerations concern the importance of issuing a security that has an important environmental objective, in line with the indications of the 2030 Agenda of the United Nations and the European taxonomy on sustainable economic activities, in order to pursue the objectives of ecological transition and reduction of polluting emissions.

Fig. 1: Green bond issuance over the years and by country

Source: Refinitiv Workspace, Green Bond Guide

From a managerial point of view, therefore, the relevance profiles of a GB issue are very evident and represent an essential challenge for many companies. This is also demonstrated by the data relating to the growth of emissions over the years, above all due to the increase in global attention on the issues of environmental sustainability, on those of mitigation and adaptation to climate change and the reduction of pollution.

Among the profiles of managerial relevance, also from the point of view of marketing and communication, the transparency and clarity of the information to be provided to savers appears to be particularly important. This information concerns the issue, the second party opinion, the rating assigned to the issuer and the security and finally to the reporting on the use of the proceeds. To this end, the need for specific managerial skills and training courses on ESG sustainability is evident in order to change the corporate culture and direct it towards greater efficiency objectives. An adequate management structure, combined with adequate transparency, is essential to increase investor confidence, reduce the cost of debt, create value and feed greenium, to the benefit of issuers and savers and of the sustainable finance sector, of which GB are today an important tool.

Originality of the paper and expected results. *The analysis of the presence and of the determinants of the greenium factor in a context of strong uncertainty and instability in the markets, constitutes the first element of originality of the work. This analysis allows us to focus on what are the important elements at the time of issuance to reduce the cost of debt capital and to maximize the creation of financial and sustainability value of the GB. The chosen sample, with particularly significant dimensions even compared to the existing literature, can be considered as representative of the sustainable bond market, considering that the issues of social bonds, social impact bonds and other ESG bonds are decidedly less significant. Furthermore, the consideration of the transparency of the documentation supporting green bonds towards investors (based on the compliance of the bonds with the ICMA and European standards, on the adhesion to the Climate Bond Initiative and on the presence of an adequate second party opinion) represents an element of particular relevance to the analysis. In this regard, we expect to see more greenium*

in those bonds that demonstrate a greater degree of transparency and adherence to standards. This would highlight the sensitivity of investors to environmental sustainability issues in financial investments and could lead to a further increase in emissions, to the benefit of the environment and collective well-being.

Finally, the work intends to pave the way for research on the existence and the determinants of a different premium, that relating to social bonds, which can improve the characteristics of future issues, highlighting the variables that have the greatest impact on the premium and which most positively affect the 'investor. The issuance of social bonds has grown strongly in recent years, especially in the period of the COVID 19 pandemic, during which many social projects have been financed through the issuance of this type of bond. This condition justifies the deepening on the greenium of green bonds, in order to replicate the study on social bonds and possibly on new forms of sustainable bonds, the result of innovation in the field of positive impact finance.

Customer perceived sustainability and brand equity in the Italian banking sector: the mediating role of satisfaction and trust

MARCO BARONE* CANDIDA BUSSOLI* DANILO CONTE[▲]
LUCREZIA FATTOBENE** DOMENICO MORRONE**

Abstract

The growing consumer concern for environmental and social issues, the awareness that sustainability can be an opportunity for strategic change and competitiveness and the pressure from supervisory authorities have led Italian banks to adopt CSR policies and integrate ESG strategies within the banking structure to increase the value of their intangible assets, especially brand equity.

The literature has highlighted how financial consumers' perception of sustainability positively relates to the bank's brand equity. However, little has emerged on the mechanisms underlying consumers' perception of sustainability and its relationship with banks' value.

This paper investigates the relationship between bank consumers' perceptions of banks' sustainability initiatives and brand equity by examining the mediating effect of customer trust and satisfaction.

To this end, a survey collected 941 valid responses from Italian banking consumers. Structural equation modeling (SEM) analysis found that bank consumers' perceptions of sustainability directly influence brand equity. Trust and satisfaction positively mediate this relationship in the Italian banking sector.

These findings offer relevant insights, suggesting the importance of informing customers and promoting their awareness of sustainable activities, as customers' perceptions, in turn, influence the value of the bank.

Framing of the research. *Recently, the banking literature has increased its focus on sustainability. In particular, numerous studies highlight the direct and positive relationship between ESG (environmental, social and governance) or CSR (corporate social responsibility) activities and banks' financial performance (Ho et al., 2019; Wu and Shen, 2013).*

Since the 2008 financial crisis, the Italian banking sector has changed its service offering, aiming at economies of scale and greater risk diversification, which has led to greater efficiency and cost reduction (Chiorazzo et al., 2008).

These changes were necessary due to the increasing competition in the sector, which is still a high-cost, high-yield system (Drummond et al., 2007). However, the banking sector is characterised by a strong standardisation of services that, together with pressure from supervisory authorities (Bank of Italy and Consob), has led banking institutions to differentiate their products by integrating ESG practices and reinforcing their structure through CSR policies. Sustainability efforts, in terms of sustainable initiatives and proper brand management, have proven to be the key that has enabled Italian credit institutions to distinguish themselves from their competitors.

Moreover, the 2008 financial crisis also caused reputational damage to banks, which exploited CSR policies to enhance their intangible assets, improving their reputation and promoting trust and credibility (Chiaromonte et al., 2021; Forcadell and Aracil, 2017), and legitimise their economic performance (Birindelli et al., 2015).

In the banking industry, brand equity is critical to a company's success (Lai et al., 2010; Pinar et al., 2012). In the customer-bank relationship, trust and satisfaction play a crucial role (Muflih, 2021).

Effectively, consumers have increased their awareness of environmental and social issues (Chen, 2010; Rizomyliotis et al., 2021). Thus, given its role in society, the banking system is strongly under pressure from public opinion, which

expects a significant social return (Azmi et al., 2021). For these reasons, banks must integrate the ESG expectations of their consumers into their strategies.

The literature has highlighted how consumers' perception of sustainable assets influences a company's reputation (Brammer and Pavelin, 2006) and brand equity (Torres et al., 2012, Wang et al., 2021). Still, so far, little is understood about the mechanism underlying consumers' perceptions of sustainability and how they relate to the value of banks.

Despite the growing interest in consumer behaviour and sustainability, more empirical studies need to examine if and how the trust and satisfaction of financial consumers affect banking brand equity. To fill this gap, the present work intends to analyze the influence of the perception of the social practices of Italian banks on brand equity through the use of satisfaction and trust as mediators of the relationship. Analyzing the role of these variables in the sustainable behaviour of banks is essential because brand equity, trust and satisfaction have significant implications on marketing results (Fatma, 2015; Hafez, 2018).

Purpose of the paper. This paper intends to analyse the relationship between banks' sustainable activities and their value from a consumer perspective, particularly on customers' perception of their bank's engagement in sustainable activities and the consequences on their brand equity. The literature on the relationship between CSR and brand equity in the Italian banking sector is limited. Moreover, the present research introduces two mediating factors into this relationship, trust and customer satisfaction.

Brand equity results from the co-creative interaction between the brand and consumers (Jones, 2005). It is defined as the combination of the assets and liabilities associated with a brand name and symbol that add or detract from the value provided by a company product or service (Aaker, 1996).

In the literature, a positive impact of CSR and ESG initiatives on brand equity has been found through improvements in brand engagement, brand sentiment, brand credibility, brand awareness, brand image and brand communities (Hoeffler and Keller, 2002; Puriwat and Tripopsakul, 2022).

CSR behaviour is a strategic driver in improving brand performance and enhancing brand equity (Brickley et al., 2002; Hur et al., 2014; Lai et al., 2010; Rizomyliotis et al., 2021). The ability to meet consumer expectations improves brand equity in the banking sector (Fatma et al., 2015). As seen, the expectations of banking customers are focused on sustainability efforts.

Consequently, the bank's brand equity improves upon meeting customer expectations concerning sustainability issues (Hafez, 2018). Hence, we propose the following hypothesis:

HY1: Bank consumers' perception of sustainable activities is positively associated with brand equity.

Another important implication is linked to the building of trust by the stakeholders in the bank.

Trust, defined as expectations that the other party will behave as expected (Hart and Saunders, 1997) or acceptance of vulnerabilities based on positive expectations of another individual's behaviour (Rousseau et al., 1998), is problematic for banks after the 2008 financial crisis.

Adopting ethical principles in the banking structure, which reflect its values and characteristics, creates greater trust among the bank's stakeholders (Brown and Dacin, 1997), building reliable relationships between internal and external stakeholders (Coulter and Coulter, 2002).

Consequently, to rebuild the trust of their stakeholders, banks have intensified their efforts in CSR activities (Carnevale and Mazzuca, 2014; El Khoury et al., 2021; Pérez and del Bosque, 2015; Shen et al., 2016), seeking to improve the welfare of society and maintaining profit targets (Sen and Bhattacharya, 2001).

Accordingly, we propose the following hypothesis:

HY2: Bank consumers' perception of sustainable activities is positively associated with consumers' trust.

Building on social exchange theory (Emerson, 1976), trust in one's bank improves the relationship between the customer and the brand, increasing the customer's commitment to the bank (Grayson and Ambler, 1999). The literature identifies that trust comes from previous experiences with the brand and outlines a positive relationship with brand equity. Consumers' trust in the brand is considered a driver of company survival (Delgado-Ballester and Munuera-Alema'n, 2005). Other research shows a strong positive connection between trust and brand equity (Ambler, 1997; Jevons and Gabbott, 2000; Kim et al., 2008). Hence, we propose the following hypothesis:

HY3: Bank consumers' trust in the brand mediates the influence of consumers' perception of sustainable activities on brand equity.

Recent findings have identified that an antecedent of ESG performance is stakeholder satisfaction with corporate culture, diversity, work-life balance, managerial leadership, and compensation (Lee and Raschke, 2023).

Customer satisfaction is an evaluative judgment about a company, product or service (Oliver, 1997) derived from a cognitive, affective or mixed analysis (Jun et al., 2001). Investigating an inverse relationship, the literature highlights ambiguous results in the relationship between ESG performance and satisfaction (Perez and del Bosque, 2016): some research suggests a positive relationship (El-Garaihy et al., 2014; Luo and Bhattacharya, 2006); others provide no significant effect of perceptions of CSR on customer satisfaction (Bravo et al., 2009). Other studies have identified that customer satisfaction can be considered one of the outcomes of CSR (Koch et al., 2020; Mulki and Jaramillo, 2011; Salmones, Perez, and Bosque, 2009; Walsh and Beatty, 2007). Therefore, bank customers will likely feel greater identification and satisfaction if the company is socially responsible to stakeholders, including shareholders, employees and customers. Hence, we propose the following hypothesis:

HY4: Bank consumers' perception of CSR activities is positively associated with consumers' satisfaction.

Satisfaction has been shown to have an intense influence on firm performance (Li, Ragu-Nathan, Ragu-Nathan, and Subba Rao, 2006; Matzler and Hinterhuber, 1998; Mulki and Giaramillo, 2011). Empirical research has highlighted a

positive relationship between the level of customer satisfaction and the impact on the company's reputation (Anderson and Sullivan, 1993; Matzler and Hinterhuber, 1998) and brand equity (Aaker, 1992; Blackston, 2000). Increased customer satisfaction leads to greater consumer loyalty (Keller and Lehmann, 2006), reducing the firm's vulnerability in periods of greater competitive stress (Anderson and Sullivan, 1993). According to Donaldson and Preston (1995), consumer satisfaction is a piece in the broader concept of social performance, capable of generating value. Some scholars suggest that sustainability be considered in any analysis of the relationship between CSR and corporate performance. Some of them have examined the role of customer satisfaction as a mediator in this relationship (Luo and Bhattacharya, 2006; Alafi and Hasoneh, 2012). Banks that behave responsibly can gain ongoing stakeholder support and access to valuable resources, which build favourable, strong and unique brand associations, and improve brand awareness and, therefore, brand equity (Keller, 2003). According, we propose the following hypothesis:

HY5: Bank consumers' satisfaction mediates the influence of consumers' perception of sustainable activities on brand equity.

Methodology. The empirical analysis was carried out using the survey method. Therefore, structured questionnaires were distributed via Google forms from November 2019 to January 2020, obtaining a number of complete and usable questionnaires equal to 941.

The items included in the questionnaire relate to the perception of CSR, satisfaction, customer trust in Italian banks and their brand equity. These questions can be answered on a Likert scale from 1 (not at all) to 5 (very much). Furthermore, the socio-demographic information of the respondents was collected, in particular: gender, age, monthly income range, education, reference financial institution and period of relationship with the customer.

Item analysis was performed using structural equation modeling (SEM) to simultaneously demonstrate multiple direct and indirect relationships between the independent and dependent variables (Hafez, 2018; Hair et al., 2010).

Confirmatory factor analysis (CFA) was also conducted to evaluate the construct validity (Kaiser, 1974) of 10 items with maximum likelihood extraction in Stata software.

Two distinct models were developed to elucidate the mediating effect of the satisfaction and trust variables between the perception of CSR and the latent variable of brand equity. The goodness of fit measures of the constructed structural models was carried out.

Results. The CFA highlights the validity of the factors used in the subsequent two SEM analyses. In particular, all latent variables showed good convergent validity, the average extracted variance (AVE) values greater than the threshold value. An excellent discriminant validity is tested between the observed and the latent, with a value of the squared correlation of the latent lower than the lowest AVE (Fornell and Larcker, 1981). Therefore, these elements have reasonable, constructive validity and reliability. Positive results also come from the composite reliability (CR), whose values recorded for the factors are above the cut-off value of 0.7 (Alarcón et al., 2015) for all latent variables used. In Cronbach's alpha analysis, all the items have a value higher than the threshold value of 0.7, confirming the goodness of the items. The 2 SEM models show excellent goodness-of-fit indices, in line with the pertinent one (Hu and Bentler, 1999; Xia and Yang, 2019), reaching their cut-off points, which is a good sign of the acceptability of the structural model. All the threshold values relate to: the root mean square error of approximation (RMSEA), the standardized root mean square residual (SRMR), the comparative fit index (CFI) and the Tucker-Lewis index (TLI). In both models, the ratio of chi-square to degrees of freedom is just above 3 but well below 4, reaffirming a correct fit of this measure.

In the first model with Trust, the SEM analysis shows that the paths from Perceived CSR to Trust and Trust to Brand Equity are very significant (1% level) and positive, such as the positive and significant direct relationship between perceived CSR and Brand Equity and their indirect effect (significant and positive). From this evidence, it is possible to confirm the first (HY1), the second (HY2) and the third (HY3) research hypotheses. Therefore, the latent variable related to Trust mediates between customers' perceptions of sustainability and brand equity in the Italian banking sector. The second SEM analysis with Satisfaction identifies all highly significant and positive paths, specifically, the pathways from Perceived CSR to Satisfaction and from Satisfaction to Brand Equity, the direct and indirect impact of perceived CSR on Brand Equity. These results confirm the first hypothesis (HY1) and lead to not rejecting the fourth (HY4), an effect of perceived CSR on Satisfaction, and the fifth (HY5) research hypothesis. Therefore, the latent variable Satisfaction averages the effect of customers' perception of sustainability on brand equity in the Italian banking sector.

Research limitations. Although the Italian banking scene represents an interesting context for investigating the influence of consumers' perception of sustainable activities on the value of the bank, the analysis could have needed more than a context for a single country. Therefore, it would be helpful to replicate the survey in different countries, allowing for a cross-country comparison which could highlight the role of national culture.

Furthermore, it would also be interesting to test the research hypotheses outside the banking system, replicating the analysis on other sectors to define the results' generality.

Finally, the survey focused only on consumer perceptions of banks' sustainable operations rather than banks' sustainable programs. Future research can examine the relationship between sustainable businesses and brand equity, distinguishing between consumer perceptions and actual agendas.

Managerial implications. The results highlight the relevance of consumer perceptions of the value of banks. In line with Freeman's theory of stakeholders (1984), the results highlight the positive impact of sustainable activities on corporate performance, allowing stakeholders to align their interests with those of the company. Furthermore, these results provide important information to managers in the Italian banking sector, where competition has significantly

increased in recent years, suggesting improving the value of the banks' brand through sustainability practices and thus achieving a differentiation of the offer. Banks' boards of directors should pay more attention to both direct environmental activities - such as policies to reduce consumption of electricity, paper and water, use of recycled materials, reduce CO2 emissions, regulations and codes for environmental protection - and indirect activities, through the promotion and communication of sustainable financial products and instruments, such as subsidized loans for the installation of energy production plants from renewable sources, loans for the energy efficiency of buildings, subsidized loans for the purchase of low environmental impact like hybrid cars. Lastly, activities linked to the bank's territorial and social proximity to the local area include donations for sporting and cultural activities, programs to support the most disadvantaged groups, scholarships for disadvantaged young people or the promotion of financial education. Both direct and indirect activities should be developed and appropriately communicated to customers in order to increase their awareness and, in turn, improve the bank's brand equity

Originality of the paper. Although previous studies have already widely underlined how the integration of CSR and ESG practices represents a sign of differentiation (Hsu, 2012), the present study is the first to examine the link between bank sustainability and brand equity and the mediation role of trust and satisfaction in the Italian context and provides results with various managerial implications. This analysis was necessary in light of the growing number of sustainability initiatives by Italian banks in recent years, following both the global trend towards greater commitment and the guidelines of the supervisory authorities. Furthermore, to foster the positive effects of sustainable initiatives, a bank needs to inform its customers, promoting their awareness, since their perceptions, in turn, affect the value of the bank. Our study shows that banks' CSR and ESG activities could foster consumer trust and satisfaction, positively influencing brand equity.

Who is responsible for food waste in restaurants? Young Italian consumers perspective

CHIARA SCRIMIERI* MARIA COLURCIO* ALBERTO PASTORE[♣]

Framing of the research. *Food waste is one of the biggest social problems in the world today. Each year, approximately 950 million tons of food is lost and wasted worldwide (United Nations, 2020). While food loss occurs at the production and wholesale stages of the food supply chain, food waste occurs at the last two stages: retail and consumption (Food and Agricultural Organization, 2020). This article focuses on food waste and, in particular, food waste from foodservice consumption.*

As in other developed countries, more than 70% of food waste in Italy occurs at the consumption stages (household and out of home), as shown by the Italian Food Waste Governance and Practice (BREAD Project Report 2021, Dr. Principato).

Food waste in the foodservice sector is quickly becoming a major problem, accounting for nearly 12% of total food waste (Tostivint et al., 2016). With the increasing trend of eating out, fueled by rising incomes and tourism, food waste in restaurants has become a major problem in both developed and developing countries (Wang et al., 2017). Although studies on consumer behavior related to food waste have increased exponentially over the past decade (Dhir et al. 2020), many scholars have recognized that the issue of food waste in foodservice has been less thoroughly studied, despite being identified as one of the greatest challenges (Principato et al., 2018; Wang et al., 2017). The foodservice sector includes all outlets that offer food and/or beverages for immediate consumption outside the home (WRAP, 2013), and includes several important subsectors such as restaurants, hotels, healthcare, education, and staff catering. Our study refers to all of these subsectors except health care and education, which are also referred to as cost sectors to distinguish them from profit sectors, which instead are HO. RE. CA and canteens (Marthinsen et al. 2012).

Studies on consumer behavior are mostly sociological and psychological in nature (Schanes et al., 2018; Boulet et al., 2021). The main theoretical approaches are: the Theory of Planned Behavior (TPB) (Heidari et al., 2020; Liao et al., 2018; Mondéjar-Jiménez et al., 2016; Stancu et al, 2016), which attempts to explain individual behavior from a rational perspective by considering three main variables (personal attitudes, subjective norms, and perceived control behavior); recent studies have integrated TPB with other theories such as Value-Belief-Norm (VBN) theory and Social Practice Theory (SPT). VBN theory adds moral or personal norms as variables that can explain sustainable behavior (Yildirim and Semiz, 2019; Farr-Wharton et al., 2014). SPT takes into account the social context and material resources available to individuals, as these determine many food-related daily routines, allowing us to understand how and why food is wasted (Schanes et al., 2018). The factors that drive food waste are numerous and multi-layered (Boulet et al., 2021). The levels are: Individual (micro), household (meso), and external (macro). The factors are: demographic factors such as age, education and income level, knowledge and awareness of the problem, social factors such as norms and culture, country or region of origin and its legal framework, GDP, etc.

Despite numerous studies, especially at the individual level (Boulet et al., 2021), and although the relationship between psychosocial variables and pro-environmental behavior has been demonstrated (Bamberg and Möser, 2007), the behavioral theories used offer only partial explanations of food waste behavior (Boulet et al., 2021).

There are no studies that use attribution theory or its variables (locus of causality, locus of stability, and locus of controllability), although this theory is heavily used in consumer behavior research. In fact, to our knowledge, the studies don't take into account a fundamental aspect of being human, namely the attribution of meaning that individuals constantly give to themselves when confronted with a traded or observed behavior (Heider, 1958). In this context, the authors proposed a change of perspective in food waste research in a first study (Scrimieri et al., 2023). If the focus so far has been on the causes and prevention of food waste, we believe that analyzing the consequences of the behavior exhibited will help to take into account psychological mechanisms such as the attribution process, which haven't been considered so far. Previous studies have already pointed out that very few studies consider guilt or shame as predictors

of pro-environmental behavior and that no research has examined the role of the internal attribution process (Bamberg and Möser, 2007).

A recent literature review indicates that a gap exists between consumers' intentions regarding food waste and their ultimate behavior (Dhir et al., 2020). It's likely that the attribution process is the missing link in explaining the relationship between these two variables.

Purpose of the paper. This study, which is part of a broader research study, aims to identify the key elements involved in consumption in the food sector in order to provide a conceptual framework that takes into account the attribution process, in addition to the variables that will emerge from the exploratory studies. Based on the assumption that people waste, the goal is to prevent repeated wasteful behavior in eating out. We also aim to identify intergenerational differences in food wasting behaviors. In this study, we present the preliminary results of an exploratory study with two generations: Millennials and Generation Z.

Methodology. We conducted three focus groups to explore factors influencing food waste in the restaurant industry. We selected 17 young Italians who usually go to restaurants/canteens and formed three groups that were heterogeneous except for the generational variable. The exploratory survey included young consumers (Millennials and Generation Z), as they're considered a segment that wastes more food due to their preference to eat meals away from home (Mondéjar-Jiménez et al., 2016; Principato et al., 2015). Additional focus groups with earlier generations are in progress. The focus group method was appropriate given the exploratory nature of the study (Bray et al., 2011) and was recommended for its high validity and ability to analyze complex consumer behaviors in depth, which is particularly common in sustainable consumption studies (Fernqvist et al., 2015; Michelini et al., 2020; Soma et al., 2021).

The focus groups were conducted online and recorded with audio and video cameras. First, participants were informed about the study procedure, their confidentiality, and their right to withdraw at any time. The first group consisted of seven participants between the ages of 27 and 34, and the other two groups consisted of five participants between the ages of 20 and 25. The details can be found in Table N. 1. Each focus group lasted between 110 and 130 minutes.

We used a semistructured interview model to explore respondents' thoughts and intentions in a free-form manner (Olavarria-Key et al., 2021). It consisted of two sections. In the first section, participants were asked how much they knew about food waste and what the main sources of information were, followed by a discussion on the same topic. In the task, participants were asked to formulate short words and phrases about food waste based on their perceptions. In the second part, participants were shown pictures of food waste and asked to identify first with the situation in which they themselves wasted food and then with the situation in which they witnessed food waste. In both cases, they were asked questions about these behaviors, their consequences, and their causes. A lengthy discussion developed about these issues. The recording of each focus group was listened to and transcribed. The researchers then coded and discussed the results.

Tab. 1: Focus groups participants

Focus group	Participant	Age	Gender	Higher education	Student today	Lives alone
1	1A	33	Female	No	No	No
1	1B	27	Female	Yes	Yes	Yes
1	1C	27	Female	Yes	Yes	No
1	1D	30	Male	Yes	Yes	No
1	1E	31	Male	Yes	Yes	Yes
1	1F	30	Male	Yes	Yes	Yes
1	1G	34	Male	No	Yes	Yes
2	2A	25	Male	No	Yes	No
2	2B	22	Female	Yes	Yes	No
2	2C	23	Female	Yes	Yes	Yes
2	2D	21	Male	No	Yes	No
2	2E	22	Female	Yes	Yes	No
3	3A	22	Female	No	Yes	Yes
3	3B	20	Female	No	Yes	No
3	3C	24	Male	Yes	Yes	No
3	3D	26	Male	Yes	Yes	No
3	3F	25	Female	Yes	Yes	No

Results. We present here the main results of the three focus groups, grouping the main themes (variables) that emerged spontaneously and proposing a conceptual model. We were able to identify variables that originated from previous studies as well as new variables.

Problem awareness

The first aspect the researchers wanted to explore in the focus groups was the knowledge and problem awareness of the participants. They were asked to write down what comes to mind when they think of food waste. The words used referred to different aspects of food waste and didn't differ between groups. We found that the words agreed on three groups of meanings: places (restaurant, hotels, wholesale, canteens); actions (misallocation, mistakes, carelessness, optimization, adequate service, reuse, recycling, shopping, doggy bag, party, all you can eat, avoidance, respect,

indifference); and social conditions (poverty, malnutrition, hunger, Africa, culture, consumption). Although almost all participants claim that food waste isn't a particularly popular topic, "it's not a topic that is talked about much" (2C); "there isn't enough media attention to the issue" (2E); "I first came across this issue when I downloaded To Go To Go" (3C); "some TV shows like Master Chef bring attention to the issue" (3D); "it should be talked about more" (1E). Almost all members of Groups 2 and 3 agree that food waste is a serious and planetary issue. "I grew up with the ideal that absolutely nothing should be wasted, simply out of respect for those who, unlike us, have nothing" (3D); "my mother always told me as a child, eat your plate, think of the poor children who have nothing" (2A). Three participants from the more mature focus group suggested that most young people are primarily concerned with the social and economic aspects of food waste rather than the environmental impact: "I think apps like to go to takeout, they're actually used to saving money" (1B); "we're used to throwing food away because it's spoiled" (1A); "since it's cheap, it doesn't matter to throw it away" (1G). These perceptions suggest that the consequences of food waste aren't always visible to consumers, but Generation Z is more aware than Millennials.

Social norms

The issue of social norms emerged as a factor that can influence doggy bag use, and apps such as To Go To Go cannot prevent food waste behavior. "Sometimes people are ashamed to ask for the doggy bag" (2C); "I always ask for the doggy bag and I'm not embarrassed" (2B); "You shouldn't be ashamed to ask for the doggy bag" (2E); "I ask for the doggy bag to give it to those who need it" (3F); "I ask for the doggy bag and I've absolutely no problem with it, but I see that it's not accepted by all restaurants, especially the older restaurants, they almost look at you questioningly and don't know what to do" (1G); "some restaurants don't know what the doggy bag is" (2D). Those among the participants who have experience as waiters note that customers don't always agree with the doggy bag: "very often it happens that some customers forget the doggy bag on the table and then I've to run after them" (1C); "you feel addressed" (1A); "not always and not to everyone I tell to use To Go out of shame" (1F). Some participants said that older people are uncomfortable asking for a doggy bag: "when I was in a restaurant with older people, they asked me if I wasn't ashamed to ask for a doggy bag" (1E); many agreed that "it's better if the waiters offer a doggy bag themselves." A cultural aspect also emerged, "When there is a party, there always has to be extra everything because people shouldn't leave because they're hungry" (3A). Traditions and customs are part of it, but apparently something is changing: "Having spent a lot of time in America, I noticed that there is a strong culture there: You're always offered the take-away box there, it's just common there. Here, on the other hand, that's unfortunately not the case, not that it's seen as a bad thing to take your stuff home, but it's still not seen that way, in my opinion" (3D); "if they used to look at you askance with the doggy bag and not have anything to give you, nowadays (after Covid) practically everyone at least has the takeaway box, even if they don't ask you for it now, at least they have it" (2A).

Emotions

When asked about the emotions that food waste triggers, the most commonly cited emotions were: anger, guilt, sadness, and grief. These emotions emerged when asked to indicate what triggers food waste, but also spontaneously during the discussion.

Attribution of responsibility (locus of causality)

When food is consumed outside the home, responsibility for loss and waste can be assigned to different actors for different reasons. For food waste at the consumption stage, blame is usually attributed to consumers (although restaurants and waiters are also blamed). We found that for food waste, the more unpredictable and uncontrollable the waste, the more likely responsibility is attributed to external causes (external attribution), while for waste by others, the more the cause is seen as stable and controllable, the more responsibility is attributed to internal causes (internal attribution). Two scenarios were proposed in the focus groups, accompanied by some pictures and open discussion about the causes of waste and the barriers to preventing or reducing waste. When it came to personal waste, responsibility was attributed not only to themselves but also to others (friends, the restaurant, the waiter, the host), especially when they had no control over the decision. "It happened to me at dinners with friends, the only times dishes were left over" (3C); "the guests could have avoided the waste. But, also the waiters trivially..." (1C); "when you're with friends, you don't watch what you order. .and you end up wasting" (2E); "you waste more during the party...because we're a fake society...a manifestation of our society's way of life, which tends to excess" (1D). When it came to observed wastefulness (and the person who wasted was unknown), responsibility was almost always shifted to the person committing the act. "People are rude" (1B); "there are people who can't handle their orders...they always do it" (1A).

Controllability

"If I am not the one organizing the event (party/buffet), I will waste more..." (1A); "If there is an opportunity to choose a half portion... I will waste less" (2B). These are some examples of controllability that emerge spontaneously during the discussion.

Stability

"Usually we order ... anyway, and then someone eats it" (2A); "They always waste" is something many participants agree on when talking about other people wasting food. This variable, like controllability, also emerges spontaneously during the discussion.

Attitude

During the discussion in Groups 2 and 3, all participants showed a positive attitude toward reducing food waste: "At home, my family and I also pay attention to food waste when we eat out" (2B); "we pay more attention when we go

to restaurants and order only the bare necessities.” In Group 1, one participant said, “I often don’t know if I’m hungry and I may order too much food.” (1G).

Situational factors

Some participants agree that it’s difficult to deal with leftover food in certain situations, such as when travelling, “That’s happened to me too... I didn’t take the bag with me because you literally have to carry it around when you go out and don’t come home... a burden when you don’t have a car” (3A); “In a special situation, like when the food is bad... it’s impossible not to waste” (2E). Many participants mentioned the “all-you-can-eat” formula, in this situation people don’t waste because of the “rule of the game” in these restaurants.

Price consciousness

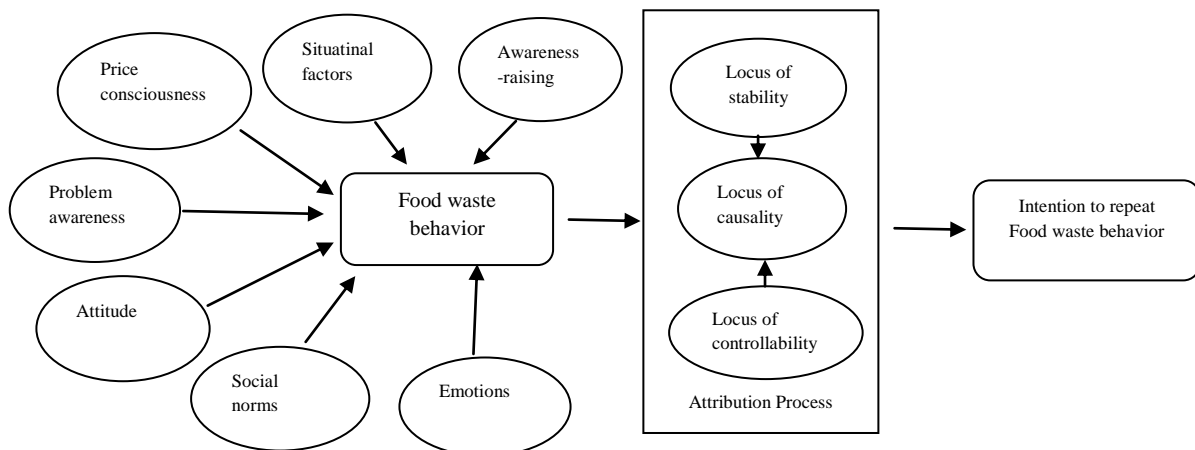

Price is one of the factors most frequently mentioned in previous quantitative studies (Geffen et al., 2016; Mallinson et al., 2016). “For example, the whole portion costs 8€ and the half costs 6€: you can think that you end up taking the whole portion for two euros more” (1E).

Effect of awareness-raising efforts by restaurant

In all three focus groups, the component of information and awareness raised by the restaurant, both in terms of staff and environment (menus, messages in the restaurant), was highlighted as critical to preventing food waste. Many participants indicated that they often rely on the waiter for portion size information. All participants agreed with this sentiment, saying, “There should be a lot more awareness in restaurants.” Many participants believe that restaurants should raise awareness by posting notices on the menu or in the restaurant; waiter training also proved important in raising awareness about food waste reduction.

Although more focus groups will be conducted, these initial results allow us to add to our previous model of the “causal attribution behavior process” variables that precede the behavior and attribution process, which in turn determines the future intention to repeat or not repeat the behavior. The purpose of this study was to examine factors that may contribute to the occurrence of wasteful behavior and, in addition, to assess the attribution process and behavioral intentions. The results show us that many of the variables already identified in previous studies emerge spontaneously, such as awareness, attitude, social norms, emotions, price consciousness, emotions. However, situational factors also emerge, such as the presence of rules in the restaurant (all-you-can-eat formula) or personal situational factors (discomfort or lack of appetite) or even issues related to the taste of the dish. In addition, new but crucial variables for food waste prevention were identified, such as “effect of awareness-raising efforts by restaurant” and the presence of intervening variables in the attribution process, such as “attribution of responsibility (locus of causality)”, controllability and stability of food wastage behavior. Future quantitative studies are needed to test the proposed theoretical model.

Fig. 2: proposed theoretical model

Research limitations. The main limitation of our research lies in its incompleteness, because the data we present concern the first surveys on young generations, Generation Z and Millennials. Once the saturation of qualitative data is reached, we will be able to test the model with a structured survey to obtain further quantitative feedback. Regarding the goodness of the data we analyzed for this preliminary study, the main limitation concerns the selection of focus group participants: almost all of them come from large urban centers or live in a city like Rome, where there are more apps like To go to go that help prevent food waste.

Managerial implications. The study has several implications, the most interesting of which concern future research and the development of strategies for food waste management in the foodservice sector. The theoretical implications concern the development of models that attempt to explain consumer behavior related to food waste and provide a cognitive advantage. The practical implications concern food waste and consumer education.

In particular, the study offers implications for restaurateurs who implement consumer awareness interventions to reduce waste. Previous studies have shown that restaurateurs prioritize customer satisfaction over waste reduction (Hennchen, 2019). This study offers insights on how to combine food waste reduction with customer satisfaction and provides guidance for restaurant professionals.

The study has implications for institutions and policymakers that could incentivize food waste reduction efforts in the hospitality industry.

Originality of the study. *The results provide the first confirmation of a conceptual model that combines variables from different theoretical streams, with the aim of understanding the emotions and practical variables that influence the sense of responsibility for food waste behavior in restaurants. And they allow the first reflections on interventions that can use the sense of responsibility to promote responsible consumption behaviors.*

Trashing the Planet: A Study of Out-of-Home Food Waste in Public Establishments[♦]

LUDOVICA PRINCIPATO^{*} LUCA SECONDI[♦] CAMILLA COMIS[♦] GIOVANNI MATTIA^{**}

Framing of the research. *Today we are faced with an incredible paradox. Globally about one third of the food produced for human consumption is lost or wasted every year while, at the same time, up to 811 million people go hungry (FAO, et al., 2021). Reducing food loss and waste (FLW) is essential to create a more sustainable food system, which is why its halving has been included in the UN Sustainable Development Goals (SDGs). Even though FLW is generated at various points in the food supply chain, most of it occurs in the final stages (Secondi et al, 2015). Indeed, according to the latest Food Waste Index Report published by the UN Environment Program, 17% of the total amount of food produced globally is wasted at the household, retail, and food service levels. In particular, according to the same report, the latter has a global average FW of 32 kg per capita per year (UNEP, 2021). Also at the European level, the food service sector is a significant part of the problem, representing the third largest source of FW after the household and food processing industries (Stenmarck et al., 2016).*

Bearing the above issues in mind and given the evident tendency towards out-of-home consumption (d'Angelo et al., 2020; Corrado et al., 2018; Pires et al., 2022) the need to prevent and mitigate FW in this sector has become a key priority from both a scientific and practical perspective (Principato et al., 2021; Dhir et al., 2020; Filimonau et al., 2022; Papargyropoulou et al., 2016; Principato et al., 2018). In this sense, understanding the causes that lead to the creation of FW in this sector is essential to implement strategies to prevent, reuse and redistribute such waste. Indeed, according to the European Food Waste Hierarchy, preventing the generation of waste is the first priority, followed by its redistribution and reuse. If this is not possible, the next choices, in order of preference, would be recycling, combustion for energy recovery and lastly landfilling (Directive 2008/98/EC). The implementation of these actions is important not only for environmental and social benefit, but also for the resulting economic implications (Hanson and Mitchel, 2017). Indeed, as indicated by Hanson and Mitchel (2017), reducing FW means optimizing costs and thus better management control of one's own business. In particular, the study has showcased that for every dollar invested in programs to reduce waste in the food service sector, there is an average saving of \$7 in operating costs (Hanson and Mitchel, 2017). Nonetheless, most restaurant managers do not seem to be aware that FW reduction and redistribution initiatives could also mean a reduction in costs (Principato et al., 2018).

In this context, thanks to the development of digital platforms and the spread of the sharing economy, interesting innovative solutions have recently been proposed to mitigate FLW in the catering sector (Filimonau et al., 2019). This is the case of food sharing platforms whose main objective is to redistribute the food surpluses generated at the production, distribution, and catering levels through a variety of roles and forms of collaboration (Michelini et al., 2018; 2019). In particular, according to the study by Michelini et al., (2018) three types of food sharing models can be distinguished: (i) sharing for money, for platforms that redistribute food by asking for a monetary payment (for profit); (ii) sharing for charity, for platforms that redistribute food for charity (such as Caritas or Banco Alimentare); and (iii) sharing for the community for peer-to-peer platforms, i.e. that distribute food for free among peers, connecting demand and supply of surplus food. Among the most popular food sharing platforms at the moment is the Too Good To Go app, which belongs to the sharing for money category. Founded in 2016 in Denmark, the app has expanded to 17 countries, including Italy, where it has saved more than 52 million meals (TGTG, 2021). At present, there is a lack of literature on how this particular application can benefit not only its consumers but also the public establishments that utilize it. Despite its growing importance as a topic of concern, to the best of our knowledge, there has been little research conducted on the issue of FW in the food service sector in Italy. In addition, most of the existing literature has focused on the quantification of waste rather than an in-depth study of its causes and potential management practices (Dhir et al., 2020; Martins et al., 2018; Principato et al., 2018). Indeed, the absence of a cohesive view of the strategies aimed

at reducing FW limits managers from readily implementing these strategies, and researchers from identifying the constraints involved (Vizzotto et al., 2021).

Conceptual framework. FW management in the food service sector is a multifaceted phenomenon that involves a wide range of factors and activities (Martin-Rios et al., 2018). These can be associated both with service-related aspects, (Principato et al., 2021;2018) as well as with personal consumer variables (Principato et al., 2021; 2023 Lorenz et al., 2017; Rhom et al., 2017). In this regard, according to the literature, the factors contributing to FW among consumers vary based on their relationship with food, culinary preferences, emotional state, and hunger levels during meals (Principato et al., 2021, Lorenz et al., 2017; Rohm et al., 2017). On the other hand, when it comes to kitchen FW, the primary reason for its generation is the challenge of accurately forecasting the amount of food that will be consumed each day, leading to excessive preparation and surplus food (Silvennoinen et al., 2019; Principato et al., 2021; Papargyropoulou et al., 2016). Based on the above, to minimize FW, it is necessary to identify where and how this waste occurs. Principato et al. (2021) classify three stages where FW can occur: (i) food preparation, (ii) food service, and (iii) consumption by customers. Similarly, Bezt et al. (2015) find that FW in the restaurant sector can occur during the stages of acquisition and storage, preparation, service, and post-service (leftovers on plates). Overall, therefore, it can be argued that FW management focuses on three operational stages: (i) pre-cooking; (ii) cooking; (iii) post-cooking (Filimonau et al., 2019).

In light of the above-mentioned scientific literature, a conceptual framework was formulated in the present study to illustrate the phenomenon of out-of-home FW, with a specific focus on public establishments. Five stages in which the phenomenon of FW occurs among public establishments were highlighted: (i) provisioning, (ii) food preparation, (iii) storage, (iv) service, and (v) final customer. For each of these, the actors most responsible for the phenomenon are highlighted as well as procedures and misbehaviors that cause the waste. Finally, the framework highlights possible actions to prevent, reuse or redistribute food waste, in line with the European food waste hierarchy.

Purpose of the paper. The objective of this study has been to investigate the levels of FW, the underlying causes of the phenomenon, and possible practices to prevent, reduce and redistribute such surpluses from the perspective of public establishments. In particular, it sought to: (i) investigate the level of awareness of public establishments regarding the phenomenon of FW and its relative impacts; (ii) quantify the monthly economic losses resulting from FW; (iii) identify the existence or non-existence of a system for measuring waste and, if it does not exist, identify its possible barriers; (iv) define the main waste management practices implemented by the of public establishments; (v) determine which are the operational phases in which the greatest amount of food is wasted and the possible causes related to waste; (vi) verify the knowledge of the Gadda law and the incentives to donate; (vii) finally, to analyze the reasons for adopting the Too Good To Go platform, highlighting its strengths and weaknesses.

Methodology. The present study was designed to gather data on Italian public establishments. A combination of qualitative and quantitative methods was used to achieve this goal. In both cases, the survey was conducted on Italian public establishments that adhere to the Too Good To Go platform and the participation was voluntary and conducted online. The first step was to conduct in-depth qualitative interviews with 9 public establishments that were selected by Too Good To Go organization. The interviews were conducted online via computer-assisted web interviewing (CAWI) between April and May 2022. The establishments were selected based on their type and geographical distribution to ensure a representative sample of the entire Italian territory. In particular, 4 public establishments from Northern Italy, 2 from the Centre and 3 from the South were selected. The interview procedures ensured anonymity and confidentiality according to current standards. They were digitally recorded and conducted through a semi-structured interview template that was designed specifically for the present study, adapting to the conceptual framework described above. More specifically, the questionnaire comprised a set of 30 questions organized into 5 sections: (i) food waste: knowledge and attitudes; (ii) food waste: data, causes and actions to reduce it; (iii) actors responsible for food waste (iv) actions put in place or that would be put in place to reduce food waste; (v) focus section on Too Good To Go.

Based on the results of the qualitative interviews, a quantitative survey was developed and conducted. In this case, data was collected by means of a questionnaire consisting of 37 questions, including multiple-choice and open-ended answers, divided into 4 sections: (i) food waste: knowledge and attitudes; (ii) food waste: data, causes, actions to reduce it (iii) focus section on Too Good To Go; (iv) indications on the public establishment. The survey started in July 2022 and involved a total of 329 interviewed public establishments. Of these, only 166 completed the section about their use of the Too Good To Go application. The majority of the interviews were conducted with owners, proprietors, and managers of public establishments, and the survey included a variety of food service businesses such as bars, bakeries, restaurants, pizzerias, takeaways, fruit and vegetable shops, and gastronomies.

Preliminary results and discussion. The present research is still in progress. From the preliminary results, it emerges that the majority of public establishments are conscious of the environmental, social, and economic impacts associated with FW. Of these, the economic impacts represent those of which they are most aware. In this respect, 31% of respondents declare wasting an amount of food equivalent to more than 400 euros per month, followed by another 18.5% who declare an economic loss of between 200 and 400 euros per month. In addition, about 80% of the respondents state that they are committed to reducing waste, indicating as the main ways of FW mitigating the use of apps against FW (83%), the donation of food surpluses to friends and relatives, the self-consumption, the reuse, and, lastly, the donation to charities. Despite the high level of awareness of the impacts generated by FW, only 13.6% of public establishments claim to have implemented a FW measurement system. This is mainly due to the apparent futility of doing so or reasons related to loss of time, in line with previous studies (Filimonau et al. 2019a; Filimonau et al., 2020). Among the measurement methods implemented, the most common seems to be the use of IT tools, weighing, and

control of sales and orders. Concerning the operative stage in which the public establishment claims to waste more food, in accordance with the conceptual framework elaborated in this paper, 72% of the respondents identify the service phase as the one where the greatest amount of FW occurs. Here, the inability to predict customer flow, resulting in unsold products at the end of the day, is considered the main cause of waste by 73% of public establishments. Besides this, the need to provide a wide choice to the consumer, overproduction, procurement errors, and a lack of awareness are other reasons mentioned by respondents. In relation to the knowledge of the Gadda Law and its incentives to donate only 8% said they were aware of it. With respect to the last objective of the present study, which aimed to explore the reasons behind using the Too Good To Go platform, the preliminary results revealed that 73% of respondents joined the platform with the intention of reducing FW, rather than for financial gain. Additionally, 61% indicated social, ethical, or environmental reasons as their motivation. The same trend is also reflected in the reasons for using the app. In terms of earnings, the data shows that a significant proportion of interviewees (39%) reported making between 0 and 50 Euro per month using Too Good To Go, while a much smaller percentage (only 3.6%) claimed to earn over 400 Euro per month. Finally, the majority of participants, precisely 84.3%, identified the "daily unsold" category as the primary type of food offered in the Too Good To Go box. Among the products offered, pastries and bakery items emerged as the most frequently popular options.

Research limitations. This study presents some limitations that need to be acknowledged. Firstly, the study only focused on public establishments in Italy that adhere to the Too Good To Go platform, which may not be representative of the entire food service industry. Therefore, more public establishments are suggested to address the issue. However, considering the still limited existing literature concerning this topic, we believe that the preliminary results obtained can help stimulate further study on the topic. Secondly, the sample size of the study is relatively small, particularly in the section regarding the use of the Too Good To Go application, with only 166 establishments completing this section. Finally, the survey only includes the views of owners, proprietors, and managers of public establishments, which may not fully represent the views of all staff members.

Managerial implications. From a managerial perspective, contributions will be manifold: 1) the need to prioritize waste prevention action rather than distribution. Our preliminary results suggest that it is necessary to broaden the range of corrective tools. Indeed, many public establishments declare utilizing apps against FW as their primary tool for mitigating FW. This, in accordance with the European Food Waste Hierarchy, highlights the importance to focus more on preventive actions rather than redistribution. To this end, it's critical to improve forecasting techniques and inventory management. In this sense, managers should prioritize training staff to minimize FLW and use the available resources efficiently; 2) the need to implement FW measurement system in the food service sector. In accordance with the previous literature (Filimonau et al., 2019; 2020; Papargyropoulou et al. 2016; Pirani and Arafat, 2016), this study shows how the lack of accurate FW assessments is a persistent factor in the catering sector that prevents effective FW mitigation; 4) understanding the causes of FW and the operational stages in which occurs. Understanding the reasons why waste is generated in the food service sector is essential for developing strategies to prevent, reuse, and redistribute such waste. This requires conducting in-depth research on the subject and identifying the specific stages where FLW occurs; 4) the need for increased education and awareness-raising efforts around the Gadda Law and its benefits for public establishments. Our preliminary results show how only a small part of the interviewed was aware of the Gadda Law and its incentives for donation is concerning. By promoting a better understanding of the Gadda Law, more public establishments may be encouraged to donate, which can have a positive impact on society as a whole. Overall, the study results underscore the importance of continuing efforts to increase awareness of the Gadda Law and the benefits of donating; 5) the importance for small businesses that need to make themselves known to join the app Too Good To Go. As highlighted on the app's website itself, the use of the platform is as useful for customers as it is for public establishments, allowing them to increase their visibility and attract new customers.

Originality of the paper. In terms of originality, the present research provides a comprehensive overview of the issue of FW in the food service sector, with a particular focus on Italy. The study sheds light on the economic implications of reducing FW, a crucial aspect that is often overlooked in the current literature. It also points out the lack of research on FW management practices in Italy and the need for additional studies to identify the constraints involved in implementing FW reduction strategies. In addition to this, the paper examines innovative solutions such as food-sharing platforms that can significantly contribute to reducing FW in the catering sector. These platforms can connect businesses with surplus food to those in need, thereby reducing FW and simultaneously addressing food insecurity. Overall, the present study provides valuable insights and recommendations for researchers, policymakers, and managers in the food service sector to tackle the issue of FW and create a more sustainable food system. The findings can contribute to more effective resource management and the promotion of social and environmental responsibility within the food service sector.

Applying Behavioural Insights to Sustainable Mobility Behaviour

VALERIA FARALLA*

Abstract

The present study is an ongoing research project that focuses on the application of behavioural science to sustainable mobility behaviour. The research project aims to experimentally test different behavioural interventions, designed to promote and facilitate the use of sustainable transport practices, and provide recommendations for mobility management policies and strategies. The research also focuses on the relationship between individual heterogeneity and sustainable mobility behaviour and addresses the question of behavioural insights' knowledge among transport planners and policy-makers.

Framing of the research. *Air pollution is one of Europe's biggest environmental health risks (European Environmental Agency, 2022). According to Legambiente (2023), air pollution is decreasing too slowly in Italian cities. This makes the latest recommendations of the World Health Organization (WHO, 2021) more difficult to achieve. Although there is no single cause, urban traffic is one of the main sources of common air pollutants. Urban traffic is affecting the quality of life of residents not only through pollution and safety issues but also through road congestion and other driving-related issues (lack of parking areas, noise, territorial impacts, etc.). This makes necessary a shift from private car mobility—considered as the less sustainable level of transport (Waygood and Avineri, 2013), to alternative modes. In this framework, the understanding of the decision-making processes underlying mobility behaviour can be critical to providing clear context and guidance for effective sustainable urban mobility.*

To date, decision mechanisms shaping mobility behaviour are affected by cognitive biases that can prevent individuals from exercising a rational choice and cost-benefit analysis (Avineri, 2012). For instance, over- and underestimation of Local Public Transport (LPT) features, such as costs or travel time, can have potential negative consequences on the perception of service quality and the demand for public transport services. If this occurs, a change in the quality of services provided alone cannot necessarily support the use of public transport in favour of individual mobility options. Moreover, the choice of transport mode has been found to be characterized by high levels of habit formation in consumption preferences that can be difficult to break (Mackett and Robertson, 2000).

A promising approach to the problem is promoting more sustainable mobility decisions through the use of Behavioural Insights (BIs) tools. The BIs term was coined in 2010 by the UK's Behavioral Insights Team (BIT). BIs can be defined as “an inductive approach to policymaking that combines insights from psychology, cognitive science, and social science with empirically-tested results to discover how humans actually make choices” (Organization for economic cooperation and development - OECD, 2023). This approach applies behavioural science to the study of decision-making by direct observation of people's beliefs and decisions, starting from the dual-system model where our decisions often rely on and are driven by unconscious and automatic processes, rather than deliberative ones (Kahneman, 2012). In some cases, these automatic processes may introduce biases that affect individual actions with possible negative consequences for subjective and community well-being (Thaler and Sunstein, 2021; Kahneman, 2012; Frederick et al., 2002; Loewenstein and Prelec, 1992; Tversky and Kahneman, 1992; Thaler, 1981; Kahneman and Tversky, 1979). For example, according to the sunk cost effect, people may “continue an endeavor once an investment in money, effort, or time has been made” (Arkes and Blumer, 1985, p.1). In line with this view, individuals may prefer the private car as a transport mode since they are already paying for the costs of owning their vehicle.

Different BIs methodological framework exists. For instance, the BASIC toolkit (Behaviours, Analysis, Strategies, Interventions, and Change; OECD, 2019) or the MINDSPACE (Messenger, Incentives, Norms, Defaults, Salience, Priming, Affect, Commitments, Ego; BIT, 2010; see also Dolan et al., 2012). Nevertheless, one thing all these tools have in common is the underlying structure, which must contain the identification of the behavioural drivers of the target problem, the possible strategies to be implemented, and the preliminary testing of the identified approaches before a large-scale intervention. BIs make extensive use of experimental designs, especially Randomized Control Trials (RCTs) and can be applied in a variety of research areas (e.g., Soman and Yeung, 2021; Viale e Macchi, 2021; Bucher, 2020; Mondino, 2019; Teraji, 2018; Halpern, 2015; Wendel, 2013). Moreover, the strategies that can be implemented in the BIs approach can be of different types. Among them, we can particularly find nudges which have been defined as “any aspect of the choice architecture that alters people's behaviour in a predictable way without

* Post-doctoral Research Fellow in *Behavioural and Experimental Economics* – University of Piemonte Orientale and LabVR UNISI, University of Siena.
e-mail: valeria.faralla@uniupo.it, valeriarfaralla@gmail.com.

forbidding any options or significantly changing their economic incentives. To count as a mere nudge, the intervention must be easy and cheap to avoid. Nudges are not mandates. Putting the fruit at eye level counts as a nudge. Banning junk food does not.” (Thaler and Sunstein, 2008, p.6; see also Thaler and Sunstein, 2021; Sunstein, 2017). Nudges have roots in behavioural economics (Thaler, 2018; Kahneman, 2012). Notably, they can take the form of defaults, feedback, graphic warnings, social norms and peer comparison, in terms of sustainable mobility behaviour (Metcalf and Dolan, 2012; Toledo, 2008), or even of specific choice architecture characteristics (Gössling, 2013; Pucher and Buehler, 2008). BIs’ strategies can however take different shapes, characterized by different levels of paternalism. Namely, the boosting approach is an ensemble strategy in which cognitive and motivational competencies are targeted to promote individual competencies (e.g., communication, information, and disclosure; see Hertwig and Grüne-Yanoff, 2017; Grüne-Yanoff and Hertwig, 2016).

As applied to mobility choice, a variety of behavioural drivers and strategies have been already identified (e.g., Stockhammer et al., 2021; Törnblad et al., 2014; Innocenti et al., 2013; Avineri and Goodwin, 2010). Among others, we can find the use of default options and social norms, and the framing of information (Pietroni and De Rosa, 2021; Ortman et al., 2017; Lehner et al., 2016; Mattauch et al., 2015). Larrick and Soll (2008) found that the use of “miles per gallon”, rather than “gallons per mile”, seems to relate to an underestimation in the valuation of replacement of inefficient vehicles due to systematic misunderstanding of the measure of fuel efficiency. Also, Bartle et al. (2013) showed that user-generated information can be used for promoting sustainable mobility behaviour within a group commuting to work, particularly among those who lack information because they are new to the workplace/transportation mode. As for default options, Pedersen et al. (2011) found that habitual car users tend to underestimate their satisfaction with public transport which indeed increased in the sample after using LPT for a full month. As noted earlier, habits can be initially difficult to break. However, using the behavioural approach, simple plans can be implemented to remove the identified driver by proceeding in small steps (the participants were indeed travelling free of charge).

Despite these encouraging results, however, the application of behavioural science—especially with respect to sustainable mobility, is quite recent and even a more clear-cut definition of BIs is needed (Hallsworth and Kirkman, 2020); not to mention that the heterogeneity in people’s responses to different strategies may reduce the replicability of the intervention at intra- and inter-individual levels, thereby increasing the context-dependence (Lehner et al., 2016). If, on one hand, the available evidence is not completely sufficient, and further investigation is required, on the other hand, publication bias can enhance the true size effect of strategies whose results have been published. Moreover, once an intervention has been found to be successful on a large-scale level, the effects of the identified approaches are not necessarily long-term. For instance, Gravert and Collentine (2021) recently found that long-term habit formation is stimulated by economic incentives (trial period) but not by social norms. The role of infrastructure and the quality of the service, to be considered as a hard measure to stimulate sustainable mobility, as well plays a crucial role in mobility behaviour (Fraquelli, 2021).

Another crucial aspect is that travel preference can be considered a social dilemma in which people must cooperate to achieve the group’s interest (Fujii and Taniguchi, 2006; Fujii et al., 2001). This widens the mobility choice into a social decision problem, possibly of moral value, and creates the need for control of additional variables, such as altruism proxies or risk-taking propensity, and identification of individuals that may be more cooperative.

Purpose of the paper. Moving from the framing of the research, the present study aims to test different types of behavioural interventions promoting and facilitating the use of sustainable mobility, particularly local public transport. We also want to test whether individual heterogeneity may influence sustainable mobility behaviour and assess the level of knowledge on BIs among transport planners and policy-makers.

There are three main hypotheses to be tested. The first hypothesis (H1) is that, overall, classical economic incentives promote better than BIs sustainable mobility. However, according to the second hypothesis (H2), BIs strategies are more effective for certain segments of individuals (i.e., depending on the cultural and social context, attitude towards sustainable mobility and the LPT, and biased decision-making processes). The third and last hypothesis (H3) predicts that the level of knowledge on behavioural science approaches among transport planners and policy-makers remains limited.

Methodology. The study is an ongoing research project. To test the hypotheses outlined in the previous section, we intend to conduct a randomized experiment, accompanied by a post-experiment survey questionnaire, and a qualitative semi-structured, in-depth interview.

More specifically, as for H1, three different types of intervention will be tested using a between-subjects design: economic incentive, nudging, and boosting. Participants will be asked to complete a decision-making task including a choice experiment on sustainable mobility. In this experiment, each type of intervention corresponds to a treatment. Subjects will be assigned an economic incentive in one treatment. In the other two treatments, they will be instead presented with a stimulus targeting the automatic processes (nudging treatment) or information targeting the cognitive system (boosting treatment). A control condition will be included. Immediately after the between-subjects experiment, to test H2, all the participants will be administered the post-experimental questionnaire including socio-demographics items, public transport attitudes and preferences, and measures of economic preference, including such as intertemporal choice and pro-social behaviour. This part of the study is expected to be tested on a large-scale trial, by using online platforms, after a preliminary pilot experiment.

Finally, the H3 hypothesis will be examined using qualitative semi-structured, in-depth interviews, to be conducted among selected transport planners and policy-makers, eliciting the level of knowledge on BIs as applied to sustainable mobility behaviour.

A pre-registration of the study design will address the publication bias and other related issues.

Expected results. In line with the outlined hypothesis, we expect that BIs strategies are more effective for certain subgroups and that the segmentation of individuals can take into account the behavioural drivers underlying their decision-making in sustainable mobility. As for the behavioural science approaches among transport planners and policy-makers, we expect to confirm the hypothesis that the level of knowledge remains limited and, if not, BIs strategies are only slightly applied and are not typically part of the set of actual policy instruments. We also expect that the two parts of the study will provide recommendations for policy implications and future research directions.

Research limitations. The present study has limitations that might provide opportunities for future research. First, the experiment is not testing the long-term effects of the identified approaches. This can be further investigated by observing decision-making from experience rather than description, using a field experiment. Second, each experimental procedure has its drawbacks (Bateman et al., 2002; Pearmain, et al., 1991). As a result, to reduce this limitation, alternative procedures should be also tested in conjunction with choice experiments to compare the obtained results. The same applies to qualitative semi-structured, in-depth interviews. Finally, the use of BIs such as nudging has been criticised, especially about the manipulation of choice with potential ethical issues (e.g., Madi, 2020). We intend to address this limitation by providing a detailed discussion in the full-length version paper. However, future research can also address this issue by assessing subjects' acceptability and preference for different policy interventions.

Managerial implications. The results of this study are supposed to provide relevant suggestions for mobility management in promoting sustainable transport. In this regard, the present study aims to identify the strategies that can be more effective in formulating mobility policies at different levels and that would be suitable for changing travellers' attitudes and behaviour—particularly private car mobility, in favour of more sustainable modes of transport. Furthermore, the results of this study can be expected to recommend where mobility management programmes may have more impact (households, workplaces, etc.). Policy-makers can make large use of behavioural evidence and, since the proposed strategies are relatively low-cost measures, the sustainable mobility approaches can result in a high benefit-cost ratio. In addition, not only the results may be informative for promoting new programmes, but for communication strategies as well. The qualitative interview can eventually improve the effectiveness of managers in the mobility area, or at least provide some useful insights into how to include behavioural science in their work.

Originality of the paper. Although previous studies have already addressed the importance of behavioural science in mobility choice, to the best of our knowledge, the literature is still very limited when compared with more traditional approaches, mainly focusing on acceptability and socio-demographics (e.g., Loukopoulos et al., 2005; Thorpe et al., 2000). Most importantly, the originality of this paper lies in the simultaneous testing of such different behavioural interventions aimed to promote and facilitate the use of sustainable transport practices. Equally important is the use of segmentation, taking account of the heterogeneity of mobility behaviour, and the use of both qualitative and quantitative measures. Finally, the present study has important implications for both practice and theory since better deliberative processes that occur between transport planners/policy-makers and individual users can be shaped. This in turn has important implications for promoting residents' safety and decreasing the global and local impacts of unsustainable mobility behaviour.

Sustainability driven mimetic isomorphism in organizational fields' configuration: Evidence from US interlocking directorates

SILVIA RITA SEDITA* ANNALISA CALOFFI* SILVIA BLASI* AMIR MAGHSSUDIPOUR**

Framing of the research. *Organizational fields have been theorized by institutional theorists as the domain where the network relationships of an organization influence its actions (Warren, 1967). Scott (1995: 56) defined an organizational field as “a community of organizations that partakes of a common meaning system and whose participants interact more frequently and fatefully with one another than with actors outside the field”. Most recent research has claimed that they can be perceived as relational spaces, where ties are formed for different motivations, such as geographical proximity, technological similarity, or environmental protection (Wooten and Hoffman, 2008). Whereas the concept of field in organization theory is well established, field formation still remains a theoretical puzzle (McInerney, 2008).*

For example, a stream of literature analyzed trade fairs and other temporary gatherings as field configuring events (Lampel and Meyer, 2008; Schüßler et al. 2015), because of their capability to create loci that “allow disparate constituents to become aware of their common concerns, join together, share information, coordinate their actions, shape or subvert agendas, and mutually influence field structuration” (Anand and Jones 2008, 1037).

Research in institutional theory has pointed to transorganizational structures as critical to the process of field configuration (Anand and Watson, 2004). We focus here on board interlocks as relevant transorganizational structures. They have been under the scrutiny of organizational scholars since early '80s (e.g., Burt, 1983; Davis, 1991; Mizruchi, 1982, 1996; Zajac, 1988), when they have been considered as forms of social networks, conduits of information between organizations, and a good indicator of interfirm ties (Galaskiewicz and Wasserman 1989, Mizruchi 1996, Mizruchi and Galaskiewicz 1993).

Since then, they have been a good setting where to test different theories about organizational fields. Among them, institutional isomorphism, configuring as optimal structures for spreading imitative behaviors, certainly played a central role (Galaskiewicz & Wasserman, 1989). In fact, the process of homogenization between organizations is a common driver of the spread of information among them and, consequently, of the structuring of organizational fields and interlocking directorates (Mizruchi, 1996).

Scholars identified three main categories of institutional isomorphism (Di Maggio and Powell, 1983), as coercive isomorphism (the result of direct pressure from powerful organizations or society); mimetic isomorphism (it occurs when an organization models its behavior or structure on other similar organizations as a way to reduce uncertainty in its environment), and normative isomorphism (it occurs primarily through professionalization and the dissemination of best practices) (Krause et al., 2019). For example, Meyer and Rowan (1977) state that organisations tend to become isomorphic with the environment in which they operate. Environments create needs that spread beyond the boundaries of the organisation, so organisations incorporate isomorphic elements to manage these interdependencies.

Since interlocking directorates are relational structures, our analysis investigates drivers of network architectures. In this respect, existing literature pointed at four primary perspectives (Ahuja et al., 2012): agency, opportunity, inertia, and exogenous and random factors. We focus on opportunity, which is based on the idea that agents tend to prefer linking within groups rather across them (Li and Rowley 2002), being driven by homophilic behavior (i.e., assortativity, Ahuja et al., 2012).

Lazarsfeld and Merton (1954) coined the term “homophily” to refer to “a tendency for friendships to form between those who are alike in some designated respect” (p. 23) and initiated a rich tradition of research that has investigated the tendency toward assortativity in a variety of social contexts and relations (McPherson et al. 2001). Different organizations' characteristics can attract others to form relationships. Focusing on homophilic attitudes (i.e. those possibly driving mimetic isomorphism), the literature suggests that organizations can be likely to have relationships with others, for example, with similar experience, size, target markets, supply channels, technology, location, or those operating in the same or complementary sectors.

Here we originally focus on sustainability driven mimetic isomorphism because of the increasing relevance of sustainability concerns in leading organizations' decisions (Greenwood et al., 2002; Howard-Grenville et al., 2007). Sustainability is more and more attracting the attention by management scholars (Williams et al., 2017). This is relevant also for organizational fields. In fact, Hoffman (1999: 352) pointed at the importance to consider an organizational field as "more than just a collection of influential organizations", but as "the center of common channels of dialogue and discussion", and he firstly linked the concept of organizational field with environmentalism, analyzing the US chemical industry. As a result of his analysis, he claims that field membership can be based on a central issue (the environmentalism, in his case), not on a common technology or market.

Some contributions have already linked sustainability and isomorphic attitudes of organizations. For example, scholars investigated how coercive isomorphism has exerted a significant influence on an organization's social and environmental reporting (Othman et al., 2011). Despite this, we still have very little knowledge on the role of sustainability as a possible driver of mimetic isomorphism in organizational fields. Grounding on the literature on organizational fields' formation and structuring, mimetic isomorphism, and sustainability we precisely aim at filling this research gap.

Purpose of the paper. The objective of this article is to show whether and how sustainability dimensions in mimetic isomorphism are institutional mechanisms for the configuration of organizational fields (Scott, 1991). Specifically, this work aims at exploring this aspect elaborating on interlocking directorates explicitly adopting a relational perspective. As suggested by established literature on organizational networks, micro-level dynamics play a fundamental role in understanding their structures (Ahuja et al., 2012). Micro-foundations have received increased attention in strategy and organization theory over the past decade (Felin and Foss, 2005), recognizing the importance for management and organization scholars to unpack collective constructs and look at the aggregate and emergent dynamics associated with individuals and their interactions (Felin et al. 2015). Moreover, scholars studying institutional isomorphism have long considered precisely board interlocks as a vehicle for spreading mimetic strategic practices among organizations operating in a specific field, such as foreign expansion and the adoption of poison pills (Connelly et al. 2011, Davis 1991).

Specifically, we focus on the opportunity to establish homophilic ties driven by sustainability concerns, with the effect of configuring an organizational field, which possibly overcomes the boundaries of geographic proximity, industrial sectors, technological regimes, or other typical factors traditionally used to group similar organizations.

In order to do so we explain homogeneity of organizational forms and practices by the means of a set of indicators that allows us to distinguish among different sustainability dimensions which can drive mimetic isomorphism among organizations. They are: 1) Environmental (ENV), which evaluates the existence of clean energy programs, pollution prevention programs and environmentally proactive activities; 2) Community (COM), which measures community engagement programs; 3) Employee relations (EMP); which is designed to identify companies that have practices in place to develop strong employee relations; 4) Product (PRO), which evaluates the existence of quality control programs and if the company invests in R&D and innovation; 5) Governance (GOV), which analyses the existence of transparency programs and policies to prevent corrupt business dealings. These five categories are selected also because they correspond to the five certifications of B-Corps (community, customers, environment, governance, workers, as listed by B Lab Global). A B-Corp-driven approach is relevant for our purposes because B-Corps are "businesses that meet the highest verified standards of social and environmental performance, public transparency, and legal accountability in terms of balancing profit and purpose" (Blasi and Sedita, 2021, 108).

In sum, we aim at crafting a theory around institutional and organizational network literatures (mainly through the concept of assortativity) focused on the role of sustainability dimensions in shaping mimetic isomorphism in field configuration. Thus, exploiting an empirical application in US interlocking directorates, we investigate the following: How does the sustainability behavior of organizations affect tie configuration among them (i.e., organizational field configuration)? Are there heterogenous roles of different dimensions of sustainability in tie configuration?

Methodology. Following an established tradition, we study interlocking directorates taking a network perspective (Mizruchi, 1996). Sharing a member between two different boards of directors is seen as a tie of a network. In this way, the complete network is a representation of the structure of the totality of companies' boards which share at least one member with other companies.

Moreover, taking a geographical perspective to set the boundary of the network, leads to leave room also for isolated firms as companies where boards' members do not serve in any other firm but are located within the same geographical unit.

From the methodological point of view, we implement an Exponential Random Graph Model (ERGM) (Robins et al., 2007) to analyze the structure of the network made by interlocking directorates.

ERGMs are based on exponential graphs, which have a general specification (Robins et al., 2007) as:

$$\Pr(X = x) = \left(\frac{1}{k}\right) \exp \left\{ \sum_A \eta_A g_A(x) \right\}$$

$\Pr(X=x)$ is the probability that the network (X) created in the exponential random graph process is identical, in terms of a number of specific characteristics, with the observed network (x). η_A is the parameter corresponding to the

network configuration A , and $g_A(x)$ is for the network statistics. Network statistics obtain values equal to 1 if the corresponding configuration is observed in the network x and 0 otherwise. κ is a normalizing constant defined as

$$K = \sum_x \exp \left\{ \sum_A \eta_A g_A(x) \right\}$$

with $\chi(n)$ being the space of all possible networks with n nodes. Thus, the probability $\Pr(X=x)$ depends on the network statistics $g_A(x)$ in the network x and on the parameters represented by η_A for all considered configurations A . The value of η_A indicates the impact of the configuration on the log-odds of the occurrence of a tie between two nodes.

In ERGMs, estimations are preferably achieved with Maximum Pseudo Likelihood or Markov Chain Monte Carlo Maximum Likelihood Estimations. They allow to generate a distribution of random graphs by stochastic simulation from a set of starting parameters and then they are refined by comparing the obtained random graphs against the observed one. This procedure is repeated until it (possibly) stabilizes.

Following theoretical literature on architectures of networks, often applied to organizational settings (Ahuja et al., 2012), ERGMs can investigate features at the nodal, dyadic, and structural level (Hunter et al., 2008). Finally, they provide several assessments of the quality of the model, such as goodness of fit (GOF) statistics, the Akaike Information Criterion (AIC), and the Bayesian Information Criterion (BIC).

We considered a sample of 2234 US-based companies listed in the MSCI ESG KLD STATS Dataset Universe D in 2015. They have 12758 interlocking directorates relationships. The database divides sustainability-related activities into several macro-categories, of which we included in the analysis the ones above recalled (Environmental; Community; Employee relations; Product; Governance).

Each sustainability-driven category is composed of a different number of entries (that take the value of 1 or 0 if the answer to specific questions is yes or no, respectively), which are further disaggregated into positives (strengths) and negatives (concerns) indicators. Positive indicators capture the company's good practices, negative indicators the bad ones. For each category, we constructed a unique index by adding the positive indicators and subtracting the negative ones.

Moreover, we also control for other factors that may affect the propensity of companies to have interlocking relationships. They are: 1) Cognitive similarity. It aims at detecting firms' sectoral similarity building on the idea that operating in same or different industries can affect propensity to establish interlocking relationships. We build this variable on NACE four-digit codes. 2) Experience. It aims at detecting the propensity of companies to form interlocking relationships with older others building on the idea that firms' experience can influence the propensity to form interlocking relationships. This variable takes into account years of every company from their foundation. 3) Institutional similarity. It aims at detecting the similarity of the regulatory environments under which companies operate since they can influence the propensity to form interlocking relationships. We build this variable with reference to US States where companies are located.

Finally, we also included in the estimation two network-based covariates. They are "Edges" and "GWESP" (Geometrically-Weighted Edgewise Shared Partnerships). Edges adds a network statistic, which is equal to the number of ties that connects the agents in a network. It is a structural variable of ERGMs and it is usually included in such models to control for the overall density of the network (Hunter et al., 2008). It investigates the tendency towards having ties and it usually results in a negative estimate because nodes are less likely to have ties with each other in comparison to what is observed in random networks. GWESP statistic models triad closure. It is based on the idea that triads that contain two ties will tend to form the third, i.e., if two people A and B know the same person C , it will likely that they also know each other. Triad closure can be considered a network creation process that leads to network transitivity, i.e., the formation of complete triangles (Goodreau et al., 2009).

GWESP is expressed as follows (Hunter 2007):

$$w = e^\alpha \sum_{i=1}^{n-2} \{1 - (1 - e^{-\alpha})^i\} p_i$$

Where α is the GWESP decay parameter, n is the number of nodes in the network, and p_i is the number of actor pairs who share i partners.

ERGMs can be designed according to specific effects at the nodal, dyadic, or structural level. We adopt the "absdiff" (absolute difference) effect on our five core variables since it allows us to estimate homophilous or heterophilous behaviors of members of interlocking directorates as a function of the selected dimensions. This effect is computed for numerical continuous nodes' attributes, and it investigates if one node is more likely to have a tie with others which have similar or different values on the same attribute. In our case, it can let us know if a member of a company's directorate is more likely to be in another directorate once the two companies have different grades in terms of specific sustainability dimensions (e.g., if one company is very good in environmental sustainability and the other one is very bad in the same dimension). "absdiff" is measured in differences, so a negative estimate suggests the presence of homophily (companies sharing a member of their directorates have similar values in the selected sustainability dimension, i.e., they have small absolute difference), while a positive one the prevalence of heterophily

(companies sharing a member of their directorates have different values in the selected sustainability dimension, i.e., they have large absolute difference).

We also adopted specific terms on control variables. The “nodematch” term is implemented for the estimation of cognitive (“Cognitive Similarity”) and institutional similarities (“Institutional Similarity”). In fact, it allows us to investigate if companies operating in the same industry and if companies operating in the same institutional setting (proxied by the State where a company is located) are more or less likely to share a member between their boards of directors. The “nodecov” term is implemented in the case of experience (“Experience”) and it allows us to investigate if companies are more or less prone to share a member of its board with older companies.

Results. Table 1 provides some descriptive statistics at the network level. Network density appears to be quite low (0.5%), as only a relatively small portion of relationships (12758) occur out of the maximum number of possible relationships (2494261). However, this value is in line with density of other networks of interlocking directorates computed on such a large scale and including all the isolates originally composing the sample (van Veen and Kratzer, 2011).

Despite this, the network structure is quite pervasive, since 1805 out of 2234 companies (around 81%) have at least one interlocking directorate relationship with another company. Among them, the most interlocked company has 205 linkages with others (it shares at least one member of its board of directors with 205 other companies). In contrast, 429 companies (around 19%) are not connected.

Tab. 1: Descriptive statistics at the network level

Network feature	Value
Nodes (members of boards of directors)	2234
# Connected nodes / # Isolates	1805 / 429
Edges (shared members in two boards of directors)	12758
Maximum number of possible relationships	2494261
Density	0.5%
Lower degree/Higher degree	0/205

Source: our elaboration

Table 2 shows some descriptive statistics at the firm level. All the sustainability dimensions under investigation range from negative (minimum is -3 in the case of “EMP” and “PRO”) to positive values (maximum value is +7 in the case of “EMP”) and the most likely value is always null. Mean values are always slightly positive, suggesting - on average - a general, but moderate, predisposition for sustainability dimensions for firms under study. Among control variables, only “Experience” is numeric, and descriptive statistics show that the youngest company is 3 years old and the oldest one is 278 years old, with a median value equal to 37 years and a mode equal to 23 years.

Tab. 2: Descriptive statistics at firm level

	Min	Mode	Mean	Max	Obs.
ENV	-2	0	0.40	6	2234
COM	-1	0	0.01	1	2234
EMP	-3	0	0.50	7	2234
PRO	-3	0	0.035	3	2234
GOV	-2	0	0.044	1	2234
Cognitive (Industry)	/	/	/	/	2234
Experience (Years)	3	23	37.14	278	2234
Institutional (Location - State)	/	/	/	/	2234

Source: our elaboration

Table 3 shows estimates of the ERGM. Model M1 to model M5 include “Edges” and a core variable one by one (“ENV Difference” in M1, “COM Difference” in M2, “EMP Difference” in M3, “PRO Difference” in M4, “GOV Difference” in M5”). Model M6 estimates all the previously included variables, one structural variable to take into account the propensity to form triangles (“GWESP”) and three selected control variables (“Cognitive Similarity”, “Experience” and “Institutional Similarity”) which may affect the architecture of the interlocking directorates under investigation.

The full model - M6 converges, and it presents quite appropriate goodness-of-fit statistics (matching degree, edgewise shared partners, and geodesic distributions) and horizontal parameter traces. They are useful to assess to what extent the parameters of the ERGM accurately predicted the observed network (Hunter et al., 2008).

Tab. 3: ERGM results

Estimates of “Edges” always result in negative and statistically significant coefficients. Negative estimates for this structural variable are common in ERGMs and they suggest that boards are less likely to share a common member in comparison to what is observed in a random network.

Estimates of all the core variables included from model M1 to model M5 result in negative and statistically significant coefficients, suggesting that the more two companies are distant in terms of the sustainability issues under scrutiny the less likely they share a member of their boards of directors.

Looking at control variables inserted in model M6, “GWESP” results in a negative and statistically significant coefficient and this suggests the presence of fewer triangles than expected. “Experience” results in a negative and statistically significant coefficient and this suggests that companies are less likely to share a member of their boards of directors with other firms characterized by high experience (measured as the years from the foundation). Also “Institutional Similarity” results in a negative and statistically significant coefficient and this suggest that companies working in more similar institutional settings (proxied by the fact of being located in the same State in the U.S.) are less likely to share a member among their boards of directors. Finally, “Cognitive Similarity” results in a not statistically significant coefficient, thus we cannot interpret this finding with statistical confidence.

All the core variables included in model M6 confirm previously acknowledged results except the case of “COM Difference” that retains the negative estimate, but it loses the statistical significance in the full model.

Research limitations. First, this work does not study the frequency of interactions or the length of interlocking relationships, neither other types of ties (being them related with sustainability issues or not) that go beyond the sharing of a member between pairs of companies’ boards, or the control variables included in the model specifications. Certainly, investigating more on such aspects may be of interest for further research. Second, the analysis is based on static data, and it is not able to investigate the evolution of the relations across time or to focus on potential and latent ties as other contributions have done. Third, data are collected from an US database, thus, findings can be extended in other geographical settings with caution. Fourth, despite the fact that a variable controlling for co-location in the same state of pairs of companies is inserted, this only partially takes into account the possible role played by spatial proximity. A proper variable for spatial proximity is not inserted because models including it do not converge.

Managerial implications. Findings of this study may be considered by managers operating across different sectors because they suggest the possibility of implementing firms’ strategic planning in favor of different forms of interactions among companies and in favor of more inclusive knowledge-sharing within networks, when sustainability issues are taken into account. Specifically framing the study of such networks on sustainability issues, allow them to enlarge their knowledge on current sustainability related knowledge sharing as well as to develop further interactions for strategic and effective inter-firm relationship networks in achieving sustainable outcomes and practices. Finally, findings can be of interest for companies simultaneously operating on different domains of sustainability. In fact, as suggested by estimates included in the full model, some sustainability dimensions as those closer to environmental issues, employees’ relations, product and governance-related aspects are more likely to stimulate the configuration of boards interlocks; while others, as those more associated to community engagement programs, might be addressed adopting other strategies.

Originality of the paper. *To the best of our knowledge this paper is the first one to empirically investigate organizational field configuration (by the means of a study on US interlocking directorates) specifically focusing on how different dimensions of sustainability may be associated with attitudes of companies to mimetic isomorphism. On the one hand, this approach provides an original contribution on field formation which seems to be an under investigated issue in organizational theory; on the other, this work elaborates on an aspect increasingly relevant in organizational theory and organizational field literature, as sustainability dimensions; thus going beyond traditionally investigated factors as geographical proximity, technological similarity, or environmental protection. Specifically, it contributes to previous literature by exploring sustainability driven assortative mechanisms as micro-foundations of mimetic isomorphism, and therefore networking in interlocking directorates.*

Measuring Museum Sustainability. A Dictionary-Based Content-Analysis of French and British National Museums' Annual Reports

MARA CERQUETTI* CONCETTA FERRARA* DOMENICO SARDANELLI[♠]

Framing of the research. Sustainability is intrinsically linked to each museum's mission, embedded both in its long-lasting nature as a permanent institution and in the need to serve current and future generations (Cerquetti, Montella, 2021). This connection has finally been included in the museum definition approved in Prague, on 24 August 2022. The Extraordinary General Assembly of ICOM recognized the role of sustainability both explicitly and implicitly. On the one hand, the museum definition clearly states that "museums foster sustainability"; on the other, the social dimension of sustainability is recalled by shaping museums as "accessible and inclusive" institutions, which "foster diversity" and "operate and communicate ethically, professionally and with the participation of communities, offering varied experiences for education, enjoyment, reflection and knowledge sharing" (ICOM, 2022).

As already argued (Cerquetti, Montella, 2021), a two-way relationship between museums and sustainability arises: first, social, economic and environmental sustainability can support museum development (sustainability for museums); second, museums can contribute to sustainable development (museums for sustainability). In addition, sustainability should be framed as a multifaced concept composed of intertwined dimensions - cultural, economic, social and environmental (Stylianou-Lambert et al., 2014; Magliacani, Sorrentino, 2021). Among them, culture acts as a center point for the other pillars of sustainability (Culture as Sustainability) and, therefore, "an overarching dimension of sustainability" (Soini, Dessen, 2016, p. 3).

The Covid-19 pandemic and the energy crisis have strengthened the unprecedented problems and uncertainties that emerged in the Age of Disruption (Lindqvist, 2012; Janes, 2014; Lobo Guerrero Arenas, Zuluaga Medina, 2021; Giusti, 2023), proving the environment to be one of the most pressing needs. On this matter, Pomian (2022) has recently argued that, in the long run, global warming and the need to save energy will be a threat to museums. According to the philosopher, ecological ideology opens up a perspective that is difficult to reconcile with museums. As structurally loss-making institutions, they will no longer be state priorities. However, it is worth noting that museums can greatly contribute to climate action through their use of resources and their educational and research programs (McGhie, 2020). In other words, they are responsible not only for environmentally conscious operation and use, but also for shaping environmentally conscious visitor attitudes (Ásványi et al., 2021) and promoting visitors' criticality, introspection and agency (Navas Iannini, Pedretti, 2022).

In this scenario, climate change stands out as society's largest and most complex challenge, calling for a radical transformation in all sectors and countries (NEMO, 2022; Da Silva, Walbe Ornstein, 2022). A recent survey on the climate crisis answered by 578 museums from 38 European countries between April and June 2022 reveals some weaknesses in the sector (NEMO, 2022). Even though almost 80% of museums state that SDGs are reflected in their strategic plans, only 8.9% have made an analysis of possible challenges resulting from climate change. The main causes for impeding museums' sustainable transitions are the lack of funds (59.7%), the lack of support from public administration or policy direction (38.8%) and the lack of knowledge (30.5%). Almost 70% think there is insufficient knowledge about SDGs and climate action. The survey results also suggest that "there is hardly any difference between small, mid-sized and large museums when it comes to prioritizing sustainability, emphasizing sustainability in the planning and management of the museums' premises and properties, or providing opportunities for training around climate-related issues or public actions" (NEMO, 2022, p. 17).

Aiming to contribute to the debate, in recent years, the scientific literature has been discussing how to measure, evaluate and communicate sustainability. Some scholars tried to provide evidence of the impacts of market orientation, customer value approach and innovation on museum sustainability (Recuero Virto et al., 2017). Other studies focused on sustainable criteria for evaluating museum performances and improving their results (Orea-Giner, 2021) or suggested a specific model for measuring museum sustainability (Müller, Grieshaber, 2023). Moreover, given the importance of stakeholder collaboration in the sector, effectively communicating sustainability policies and practices

has been proven to have a strategic role for its implications across an organization's entire supply chain (Wickam, Lehman, 2015).

When it comes to accountability tools, the quality of annual reporting by museums shows room for improvement (Botes et al., 2013; Brown, 2014; Bambagiotti-Alberti et al., 2016). According to the NEMO survey (2022), 61.8% of museums do not have methods or criteria to measure and assess their sustainable efforts and less than 20% are not required to report their sustainable or green actions to their funding organizations.

Purpose of the paper. This research aims to measure the degree of sustainability in European museums' annual reports and similar documents (e.g., annual reports and accounts, "rapports d'activité" and "bilans d'activité").

To have a large, representative, and comparable sample, the research focused on the United Kingdom (UK) and France national museums. As reported by the 2021 edition of the Global Attractions Attendance Report, the annual attendance study for the entertainment and museum industries, published by TEA and AECOM, these countries host the 20 most-visited museums in the world: 5 museums are located in London (UK) and registered 5.4 million visitors in 2021 and 2 in Paris (France) with an attendance of 3.8 million visitors (TEA, AECOM, 2021, pp. 74-75). Moving the focus to the EMEA (Europe, Middle East, and Africa) 20 most-visited museums provided by the same study, 55% (11) are in the UK or France (Tab. 1). Together, in 2021, these institutions registered an attendance of 13.2 million visitors, corresponding to 56.5% of the total attendance of the 20 museums included in the ranking (TEA, AECOM 2021, p. 83).

Tab. 1: EMEA top 20 most-visited museums in 2021 (source: TEA, AECOM, 2021)

Country	City	Museum	Attendance
France	Paris	Musée du Louvre	2,825,000
Russia	St Petersburg	State Hermitage	1,649,000
Spain	Madrid	Reina Sofia	1,643,000
Vatican	Vatican City	Vatican Museums	1,613,000
Russia	Moscow	State Tretyakov Gallery	1,581,000
UK	London	Natural History Museum	1,564,000
France	Paris	Centre Pompidou	1,501,000
UK	London	British Museum	1,327,000
Spain	Madrid	Museo Nacional Del Prado	1,175,000
UK	London	Tate Modern	1,156,000
France	Paris	Musée D'Orsay	1,044,000
France	Paris	Cité Des Sciences et de l'industrie	984,000
Italy	Florence	Galleria degli Uffizi	970,000
UK	London	Victoria & Albert Museum	858,000
UK	London	National Gallery	709,000
UK	Edinburgh	National Museum of Scotland	661,000
UK	London	Science Museum	646,000
Netherlands	Amsterdam	Rijksmuseum	625,000
Poland	Oświęcim	Auschwitz-Birkenau Museum	563,000
Netherlands	Amsterdam	Van Gogh Museum	366,000
Total attendance			23,460,000

Additionally, the UK and France are the countries where annual reporting practices are most deeply rooted, due to both legal and cultural issues.

Since the 1980s, the UK government has implemented a reform program across the public services aimed at differentiating activities at the core of the public sector and those functions that can be undertaken either within or outside the public sector. Along this process, national museums were asked to make and publish annual reports and financial statements through the institution of the board of trustees, thus discharging accountability to external users (Wei et al., 2008, p. 32). In England, the annual report and account (ARA) is a mandatory document for national museums sponsored by the Department for Culture, Media and Sport (DCMS). As stated by the Museums and Galleries Act 1992, each body shall prepare an annual statement of accounts giving a true and fair view of the state of its affairs (par. 9, c. 4); this document shall comply with directions given by the secretary of state in terms of form, content, methods, and principles to be followed (par. 9, c. 5). A similar situation is found in Scotland, Northern Ireland, and Wales, where national museums are supported and funded by the devolved legislatures and specific acts provide directions on annual reporting practices: the National Heritage (Scotland) Act 1985 established that the board of trustees of national museums shall prepare an annual statement following the instructions of the secretary of state (sched. 1, par. 9, c. 3); the Museums and Galleries (Northern Ireland) Order 1998 expressly refers to the annual report

as a mandatory document, to be prepared by the museum board of trustees and transmitted to the department (par. 11); in Wales, the majority of museums operates under the Public Libraries and Museums Act 1964, which placed public museums and art galleries under the superintendence of the secretary of state, thus allowing local authorities to provide and maintain museums and art galleries and establishing the obligation of annual reporting (par. 17).

In France, annual reporting practices for national museums are not an explicit legal obligation. In this country, museum regulations depend on the ownership structure, specifically whether it is a non-profit organization (NPO) or a public body entity. Regarding NPOs, the decree n. 2009-540 of May 14, 2009, generically refers to associations and foundations and establishes the obligation to publish a balance sheet for those who received more than 153,000 euros of donations during the year. Thus, neither museums nor annual reports as mandatory documents are mentioned. Considering the public entity's perspective, the Code du patrimoine establishes as mandatory the annual reporting activity only for the Haut Conseil des musées de France, a national consultative body providing recommendations to French museums, which is required to make and publish an annual report (art. R430-5). Nevertheless, the number of national museums accustomed to reporting documents (mainly "rapports d'activité" or "bilans d'activité") is significantly high. This aspect, together with the continuity of these practices over time (the first public editions of these documents date back to 1973¹), shows how the need for transparency and accountability is well established in the French national museums' context.

Given these premises, we compared the degree of sustainability intensity in strategic and performance reporting of national museums of the UK and France. The role of the government in managing public museums should impact on the sensitivity to sustainability of these organizations. However, it is interesting to inspect whether there are cross-country differences, especially considering that British museums are legally-bounded to report, while French museums are not. To date, no research has investigated sustainability intensity in European public museums' reporting. Furthermore, the paper aims at assessing the impact of the Covid-19 pandemic on the degree of sustainability-related reporting of public museums.

Methodology. In the UK, among the English museums and galleries sponsored by the DCMS, 15 are defined as "national" - as they are established by Acts of Parliament - and 5 are classed as "non-national", namely public-funded museums, other than those directly funded by the central government (NMDC, 2003). In addition, there are national museums in Scotland, Wales and Northern Ireland, supported by the devolved legislatures: national museums in Scotland are funded by the Scottish Executive Education Department and include 5 institutions; in Wales the national museums group funded by the Welsh government is called Amgueddfa Cymru and includes 7 bodies; national museums in Northern Ireland are funded by the Department of Culture, Arts and Leisure of the Northern Ireland Executive and are grouped within the National Museums NI, which looks after 4 institutions. In France, the network of national museums (Réseau des Muséaux Nationaux) includes 66 institutions. Among them, 18 are classed as "établissements publics", as they belong to public institutions, thus having administrative and financial autonomy, 17 are "services à compétence nationale", being part of institutions with national competence and 11 are under the supervision of other ministries.

For the purpose of this research, a group of 37 national museums has been considered (Tab. 2). In the case of the UK, being annual reporting practices mandatory for all museums, we considered the 15 English national museums, in addition to National Museums of Scotland, Amgueddfa Cymru and National Museums NI. Regarding France, 19 museums have been included in the analysis: 15 museums with special autonomy and 4 museums under the supervision of other ministries. A total of 120 documents in both English and French language have been analysed: 67 annual reports and accounts (ARA) and 3 annual review (AR) related to UK museums, and 44 rapports d'activité (RdA) and 6 bilans d'activité (BdA) referred to French museums. As the reporting documents in the UK straddle two years, the last four editions of each document have been considered; in the case of French museums, as the reporting activity corresponds with the solar year, the analysis included the last three editions of each document.

This timeframe also made it possible to consider the COVID-19 dimension and analyze its impact on the perception of museums about sustainability issues, by comparing documents editions published both before and after the deflagration of the pandemic.

Depending on the main focus of the museum, we categorized each museum into one of 4 possible types: artistic, historical (including ethnographical museums), scientific, or group of museums. We adopted a dictionary-based approach to test the hypotheses. Therefore, we constructed a dictionary of expressions related to sustainability. A first panel of words and expressions was constructed starting from the glossary of GRI standards and from the inspection of the most frequent sustainability-related words of the non-financial reporting documents of two well-known international organizations (the annual report of the Van Gogh Museum, and the sustainability report of the Ferrero

² It includes the National Museum of Scotland, the National Museum of Flight, the National War Museum, the National Museum of Rural Life, and the National Museums Collection Centre.

³ It includes the National Museum Cardiff, the St. Fagans National Museum of History Cardiff, the Big Pit National Coal Museum, the Blaenavon National Wool Museum, the Dre-fach Felindre near Llandysul National Slate Museum, the Llanberis National Roman Legion Museum, the Caerleon National Waterfront Museum and Swansea.

⁴ It includes the Ulster Museum, the Ulster Folk Museum, the Ulster Transport Museum and the Ulster American Folk Park.

⁵ A unique "rapport d'activité" for the "établissement public des musées d'Orsay et de l'Orangerie" is produced.

⁶ A unique "rapport d'activité" for the "établissement public des musées nationaux de la céramique à Sèvres et de la porcelaine Adrien Dubouché à Limoges" is produced.

Group). This initial bag of expressions was enriched with additions made by the authors individually and through collective brainstorming. Finally, each of the authors categorized each expression into one of four categories: the three categories of ESG reporting (Environmental, Social, and Governance) and a Transversal category, encompassing general sustainability-related terms. The inter-coder agreement (De Swert, 2012) was deemed satisfactory (Krippendorff's alpha = 0.71), and any disagreement on the categorization of specific expressions was solved through collective discussion. The sustainability dictionary was then translated into French, paying attention to preserving the original meaning of words. In translating to French, all relevant synonyms were considered, while some English expressions resulted in duplicated French occurrences, that were dropped from the final list. For these reasons, the English and French dictionaries did not include the exact same number of words.

Each document was tokenized and, in addition to unigrams (individual words), also relevant n-grams (multiple-words expressions) were preserved as meaningful tokens and not divided into individual words. This procedure was employed to allow the subsequent computation of frequencies of both single-word and multiple-words sustainability-related expressions.

Following the textual editing stage, for each document we computed the E (Environmental), S (Social), G (Governance) and T (Transversal) scores, as the percentage of category frequencies over the number of the document's total occurrences. Then, a comprehensive sustainability score (ESG score) was calculated as the average of the four category-scores. The ESG score was used as the dependent variable (DV) of a mixed-models with random intercept and the museum ID as the grouping variable. As independent variables, we considered two fixed-effect variables at the museum level and two fixed-effect variables at the document level. The museum-level variables were the country of origin (UK or France), and the museum type (historical, artistic, science, or mixed), while the document-level variables were the cut-off year (i.e., whether the document was published before or after than 2020, the year of insurgence of the pandemic), and Covid text relevance (i.e., the presence of Covid-related words within the document).

Results. The findings show that the museums' country of origin and the presence of Covid-related words within the documents had a statistically significant influence on the ESG score (Tab. 3).

Tab. 3: ANOVA table; DV: ESG score (source: authors 'elaboration)

	MS	NumDF	DenDF	F-value
Country	5.142	1	36.337	168.222***
Museum type	0.033	3	23.857	1.095
Cut-off year	0.099	1	81.569	3.228
Covid relevance	0.297	1	86.412	9.605**

Significance codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 1

More specifically, British museums' reports had significantly higher scores ($M = 1.343$, $SE = 0.0355$) than French museums' reports ($M = 0.675$, $SE = 0.055$; t -ratio = -12.950, p -value .0001; Fig. 1).

Fig. 1: Mean difference in ESG score by country (source: our elaboration)

In addition, the documents mentioning Covid-19 or related words had significantly higher ESG scores ($M = 1.117$, $SE = 0.0389$) than Covid-unrelated documents ($M = 0.901$, $SE = 0.0629$; t -ratio = -3.075; p -value = 0,0028, Fig. 2). Instead, museum typology and the cut-off year had no effect on the ESG score.

Therefore, it seems that British museums had in general a greater awareness of the sustainability impact of their activities, as compared to French museums. This might be due to contextual differences, and especially to the fact that in the UK annual reports are mandatory, while in France they are not. Being required by law to publish the annual report, British organizations might feel increased pressure to comply with the law by putting greater emphasis on the positive externalities of their activities. Furthermore, this sensitivity to sustainability reporting might also be the result of higher efforts in sustainable activities.

As for the impact of Covid-19, our results provide interesting insights. Indeed, it turns out that the insurgence of the pandemic is not a sufficient condition to spur sustainability intensity in reporting, since the cut-off year did not have a significant effect on the ESG score. However, when the reports mentioned the Covid theme, they ended up having higher ESG score. Thus, awareness of the pandemic seems to imply greater sensitivity to the environment and the social implications of business activities.

Fig. 2: Mean difference in ESG by Covid relevance (source: our elaboration)

Research limitations. This study shed light on aspects of sustainability reporting that have been neglected by previous literature. However, it is limited in the scope of the analysis. Further research is needed to extend the boundary of investigation toward different national contexts and private museums. For instance, local museums might have a very different perspective on the relevance of the community than national museums have. Similarly, further investigation is needed to inspect how different aspects of sustainability are affected by contextual and textual variables. Finally, we did not delve into the relationship between the textual ESG score that we computed and the actual sustainability performance of museums. About this issue, future studies might focus on measuring the actual level of sustainable activities carried out by museums, so to uncover potential greenwashing issues.

Managerial implications. Our findings can be translated in policy and managerial advice. Firstly, from a policy point of view, the research suggests the need to support museums' annual reporting, its culture and methods as a tool to improve museum awareness of sustainability issues and the active role each institution can play in facing climate change (museums for sustainability). Secondly, a strengthened culture of accountability can have a significant impact on museum sustainability, fostering better use of resources, value creation for different stakeholders and caring for the environment (sustainability for museums). More implications can be better detailed after further investigation.

Originality of the paper. To date, this is the first paper to focus on the sustainability reporting of public museums. The study adopts a dictionary-based content-analysis approach to measure the level of sustainability expressed by strategic and performance reports (annual reports and accounts, annual report and accounts, rapports d'activité, bilans d'activité) of the national museums of the UK and France. The cross-nation sample allows to inspect the embeddedness impact on sustainability reporting. The study takes into account the effect of exogenous environmental shock (i.e., the Covid pandemic) and assesses its influence on national museums' sustainability reporting.

Keywords: museum sustainability; dictionary-based content-analysis; sustainability reporting; ESG

The social media strategy of cultural institutions in the pandemic: the case of Italian opera houses

NICOLA BELLINI* GIOVANNI SIRACUSA* MARINA RAGLIANTI* SERENA ROVAI**

Framing of the research. *The use of social media as a marketing tool is by now well established in businesses (Creevey et al., 2022; Infante & Mardikaningsih, 2022) and the Covid-19 pandemic clearly had an impact also in social media marketing behaviors (Dubbelink et al., 2021; Mason et al., 2021; Taha et al., 2021). Similarly, cultural actors had increasingly engaged in social media (Siracusa, 2020).*

Opera houses do present, however, some very significant specificities, like the aging of audiences. There is a paradox in this: opera survived in centuries thanks to its adaptability to changing social, cultural, and economic contexts, and yet nowadays opera is perceived as having lost connection with the contemporary world and the new generations. For some decades now, the attraction of younger people has become a major and widely unresolved issue. Various attempts failed to deliver the expected results: the opening of some performances to supposedly price-discriminated audiences (“students and workers”), the re-packaging into more accessible and “cross-over” formats and the content modernization through Regie-theater approaches. Thus “democratization” in opera has a distinctively generational character and digital marketing is inescapably part of this trend, as Internet opens a new field for the dialogue between this kind of performing art. Opera houses are now present on the most important social media, although - in a global perspective - the heterogeneity of approaches, of the level of engagement and of the contents is extreme, also due to very different propensities to “go digital” in individual organizations (Bellini, 2021).

As “synchronous collaborative performing arts”, requiring the audience’s physical presence, opera has been severely impacted by lockdown rules (Seetharaman, 2020). In Italy, theatrical performances were suspended nationally as of March 2020. In June, performances open to the public were allowed on strict terms, but in October, facing the second wave of the epidemic, the government ordered closure once again and did not allow limited re-opening until the end of April 2021. Finally, full opening began on October 11.

During the lockdowns, digital technologies shifted from a “nice to have” perception to a “critical to have” one, forcing a move from discretionary to forced innovation (Akpan, Soopramanien, and Kwak 2021; Heinonen and Strandvik 2021). To opera house the priority was to “un-distance” customers (Kolokytha & Rozgonyi, 2021), but there was also an opportunity to test and develop new ways to approach the market both in terms of products and of media (Bellini & Raglianti, 2023; Chatzichristodoulou et al., 2022). Resulting differences in digitalization strategies can be explained by several factors: the more or less advanced position on the learning curve of digital markets and technologies; the digital mindset of human resources; conservative attitudes of market leaders, confident in the stability of their market position in the long term; the profile of the top management, decisively nurtured by their previous experiences in different contexts; the level of external integration with other companies and with institutions (like research centers and universities) (Bellini & Raglianti, 2023).

Both Italian and foreign opera houses have increasingly adopted digital marketing, contributing to the emergence of an opera-related digital community on a global scale. They are now present on several social media platforms such as Facebook, YouTube, Twitter, and Instagram. However, the level of engagement on these marketing tools is quite heterogeneous and also the choice of platforms varies substantially. No significant structural relation emerges, e.g., with the reputation or international ranking. The most famous and largest opera houses are not necessarily the most digitally active.

In most cases (and remarkably so in Italy, until the pandemic) the adoption of social media has been limited to provide an alternative channel for the communication of “one-way” information about events, plans, contingent information (like the cancellation of events, changes in the artists’ cast) etc. However, the interactivity dimension has been developing with different patterns. Opera houses have been engaging audiences mostly the use of images and videos (especially on Facebook, Instagram and YouTube). These may be trailers of new productions, backstage

documentaries, expert introductions to operas, interviews with artists or memories of related past events (including the video recording of past performances), reports of attendants' experiences, and even discussions about controversies affecting the reputation of opera houses, like those concerning inappropriate behavior by world-famous artists in the wake of the "MeToo" movement.

One must also mention the role played by a number of specialized external media (opera magazines and blogs), fully or partially operating on the web, that are influential in shaping opera houses' reputation. Popular social networks accounts are also held by individual artists. To them social network activities are a necessary promotional tool and an effective way to maintain a constant flow of information towards the communities of their fans. Some accounts create opportunities for a more personal and empathic interaction, that is not limited to professional achievements, as the artist shares backstage and personal stories and opinions (Bellini, 2021).

Purpose of the paper. In this paper, with reference to the case of Italy, we investigate how opera houses interacted with their audience during those months and how this changed their social media strategy. Our research questions can be summarized as follows:

- Which opera house was most active and successful in interacting with its audience during these months?
- What social strategy was adopted by the opera houses to cope with the health emergency and subsequent closure to the public?
- From a strategic perspective, were there any major changes between the period before and after the opera houses closed?

Methodology. The research was made possible by the cooperation with the IT company Linkfluence France. "Radarly", their AI-powered Social Media Intelligence platform, allows for a highly effective data scraping, combined with human expertise. Radarly can collect a potentially infinite amount of data (from public profiles), without geographical, linguistic, or temporal boundaries. The process to extrapolate and store data and contents online, referred as "data scraping", is far more difficult to carry out nowadays than it used to be in the past, mainly because of the quantity of data potentially available, but also because of two important and very tight limitations: the General Data Protection Regulation and Application Programming Interface (API) data scraping thresholds. These limitations made data exploration and analysis very difficult for many authors. The innovative contribution that this study wants to give is based on the use of a tool capable of overcoming these boundaries. Thanks to third party providers, social media APIs and web distributed scraping, Radarly collects data from more than 400 million sources. This process of retrieval changes according to the region, language or period and is carried out through a first "query", a set of keywords, hashtags or sentences which recall to a specific or general topic. After all sources are analyzed and all the contents captured, a phase of enrichment occurs, in which AI tools assign different indicators to the contents as sentiment or topic. In a second moment, results are requested through another "query" that, as well as the first one, includes keywords, sentences and mentions that recall the topic of the study. In fact, privileges obtained by Linkfluence are only possible thanks to commercial agreements with major social network platforms and data providers.

Our research was based on a sample of Italian opera houses that included all major ones, i.e.:

- the 13 "opera foundations" (as defined by the Italian law): Fondazione Teatro Massimo di Palermo, Teatro Comunale di Bologna, Teatro del Maggio Musicale Fiorentino, Teatro Carlo Felice di Genova, Teatro di San Carlo, Teatro dell'Opera di Roma, Teatro Regio di Torino, Teatro Lirico G.V. Di Trieste, Gran Teatro La Fenice, Arena di Verona, Teatro Lirico di Cagliari, Petruzzelli e Teatri di Bari, and
- two "tradition theaters" with a proven reputation of engagement in digital innovation: Teatro Comunale Luciano Pavarotti in Modena and Teatro Coccia in Novara.

Their social media performance was monitored in the 2-year period from Nov. 2019 to Oct. 2021, a time range that begins before the pandemic outbreak and ends after the reopening of theatres, therefore including both lockdown periods.

Results. Their use of social media shows a fluctuating but continuous trend, with peaks during the first lockdown. The opera houses in the sample generated more than 12,300 posts on major social platforms (Facebook, Instagram, and Twitter) (Fig. 1). Facebook was mostly used (56% of posts), followed by Instagram (39%) and Twitter (5%). Preferences for individual platforms were quite diversified. Some of the Theaters and Foundations have preferred to use one platform, while others have diversified their use. E.g., the Maggio Fiorentino shared more than 2,500 posts, mostly on Facebook. Only in some cases does Instagram turns out to be the most used platform, while Twitter nowhere asserts itself as the main platform (Fig. 2).

Fig. 1: Number of posts shared by the Italian Opera houses on the main platforms from November 2019 to October 2021

Fig. 2: Number of posts by opera house

Considering online interactions and audiences reached (Tab. 1), Teatro alla Scala’s social performance was undoubtedly the best, standing at more than one million interactions and reaching 32 million online users. Before the first lockdown the prominence of the main Italian opera house was out of question. In terms of interactions with the public and visibility the Teatro Alla Scala had no equal. Almost 40 percent of the sample’s interactions, in fact, were generated precisely by the content shared by the Scala, with an audience reaching close to 4 million users online. The premiere of the 2019/2020 season, “Tosca” by Giacomo Puccini, achieved more than 120,000 interactions, with an average of 1428 interactions/post.

Other opera houses (like the Maggio in Florence) did not translate high number of publications into large numbers of interactions or audiences reached. The La Fenice opera house in Venice did very well in terms of interactions, but less so in terms of viewership. This is partly explained by their preference for Instagram, which provides greater user engagement, but limits the sharing and, consequently, the number of online users exposed to the content. Most opera houses however had a much more limited levels of visibility and interaction. The Carlo Felice Theater Foundation ranks third in number of publications. However, the values of interaction and audience reached are not comparable to other Theaters, which, despite the lower frequency of publication, still achieved wide visibility and interaction.

Tab. 1: Number of posts, interactions and audiences reached (million)

	Audience reached	Interactions	Posts
Teatro Alla Scala	32,22	1,02	1217
Teatro San Carlo Napoli	13,38	0,50	1628
Teatro Del Maggio	8,11	0,34	2503
Teatro La Fenice	6,82	0,65	716
Arena di Verona	4,77	0,17	305
Teatro Carlo Felice	3,35	0,10	1529
Teatro dell’Opera di Roma	3,05	0,14	337
Teatro Massimo Palermo	2,34	0,20	641
Teatro Regio Torino	2,20	0,15	1197
Teatro Lirico di Cagliari	1,60	0,11	968
Teatro Comunale di Bologna	0,94	0,03	309
Teatro Coccia	0,48	0,03	703
Teatro Lirico Giuseppe Verdi	0,35	0,03	409
Teatro Comunale di Modena	0,24	0,02	276
Fondazione Teatro Petruzzelli	0,20	0,01	69

Looking at the contents, nine categories were identified: 1) promotion of live performances; 2) promotion of online shows (opera streaming, digital productions); 3) information to the audience (times of performance, cast changes etc.); 4) photos from performances; 5) reposts; 6) backstage photos and videos; 7) video excerpts from performances; 8) testimonials (e.g., interviews with cast); 9) business collaborations.

The promotion of performances was the main theme, with a strong duality between live and online, the latter being neglected during regular opening periods. The pattern was reversed during the lockdown. During the first lockdown, promoting shows online was the most published content category by theaters. Interactions with communities increased but audiences reached dropped. The performance of the Teatro Regio di Torino was interesting (Fig. 3).

Fig. 3: Posts shared on Facebook, Instagram and Twitter by type (November 2019 - October 2021)

Commercial partnerships had the highest visibility per post. Teatro alla Scala originated nearly 26% of this, however, greatly influencing these results due to their large online community. Content of an informational nature, on the other hand, has very high interaction values per post. Promotion of performances, especially the live ones, failed to stimulate digital communities, receiving low interactions per post (Tab. 2).

Tab. 2: Impact per type of posts

Content	Audience/post	Interactions/post	Number of posts
Videoclips from shows	6969	241	3937
Backstage	6683	344	3554
Information	6693	379	2819
Photos from shows	9679	364	1678
Repost	3425	301	867
Business partnerships	15222	341	612
Promion of online shows	6991	278	520
Testimonials	9746	278	338
Promotion of live shows	5974	213	194

During the lockdowns, being unable to accommodate audiences in the auditorium, theaters have increased their use of social media. Following the announcement of the state of emergency and subsequent closure to the public, the theaters' social profiles feverishly increased the intensity of posting. Among them, the Regio di Torino had the largest increase, reaching the first position among the most active Theaters during the months of closure.

Some campaigns were launched aimed at increasing audience interaction and engagement, through messages of solidarity towards the opera house and its artists. The social campaign #ProudToBeRegio, launched by the Teatro Regio di Torino itself, generated 135 pieces of content, receiving more than 27 thousand interactions, and reaching more than 345 thousand online users. The Maggio Fiorentino opera house (hashtag #NoiSiamoIlMaggio), with 63 posts, reached 143 thousand online users and got more than 15 thousand interactions. Similar initiatives, but with less media resonance, were also carried out by Teatro Alla Scala (#WeAreLaScala) and Teatro La Fenice.

A multitude of free-of-charge digital content was made available through the Theaters' official channels, with the use of hashtags to specify the content. In this, the San Carlo Theater in Naples stood out positively, with 191 posts related to live broadcasts on Facebook and to recorded performances on the Theater's official WebTV. They achieved 47 thousand interactions and more than 15 million users reached. The Maggio opera house in Florence focused on live performances. With nearly 190 pieces of content, nearly 18 thousand interactions were recorded with an audience close to 620 thousand online users. On the other hand, Teatro Carlo Felice promoted a multichannel type of content, broadcasting live archival performances both on social channels and on the dedicated website.

The 2020 summer season was marked by the gradual reopening of theaters and performance venues. As a result, content veered toward promoting live events. Digital content, on the other hand, declined sharply. Behind-the-scenes content increased. With audiences now ready to be welcomed, digital content took a back seat, at least according to the data. The particularity of this period was the frequency with which the opera houses advertised and promoted performances of a “traveling” nature, thus no longer inside the theaters but in picturesque places in the open air. This is the case of Cagliari’s Teatro Lirico, with the performance of “La Cavalleria Rusticana” staged at the Parco della Musica Arena. Or again the Coccia Theater, which, on the occasion of #EstateNovarese2020, promoted a series of performances right in the Courtyard of the Castle of Novara. Behind-the-scenes content increased significantly during the summer period, ranking as the fifth most frequently published category of content. Among the Theaters most active on this front is Teatro La Fenice, which was responsible for 20 percent of the overall behind-the-scenes content shared during the quarter.

During the second lockdown, after a summer full of live events, hashtags used for the first lockdown were back in fashion, such as #LaCulturaNiSiFerma and #ApertiNonostanteTutto. Solidarity campaigns were dusted off. The Teatro Regio di Torino recovered its social campaign #ProudToBeRegio, with which it stimulates its community. With 92 posts, less than the 135 previously recorded, the Regio still managed to reach 49 thousand users and record 10 thousand interactions. The Teatro del Maggio launched its social campaign #UnaFotoAlGiorno, chronicling performances and spaces: 226 pieces of content for nearly 28 thousand interactions.

However, it is online events that are now dominating (56% of total posts). Among the most active were the Teatro San Carlo in Naples, the Teatro del Maggio and the Teatro Lirico in Cagliari. This second closure recorded almost twice as many interactions per post (308 vs. 178), as well as greater audience reached per post (6,500 vs. 5,000) for this type of content.

In contrast to what happened after the first reopening in June 2020, the “new normal” after the second reopening shows substantial continuity with previous months and is characterized by an above-average frequency of publication. The promotion of live performances is back as the first topic, but the promotion of online shows increases from 7% to 16 %, and monthly publication of content is well above average.

Research limitations. The scope of research has been limited to a number of Italian opera house because of time and resource constraints. Of course, following this explorative study, an extension to other countries would allow for a comparative analysis of the performance of different business models, e.g., to opera houses that are less dependent on public subsidies and more on corporate sponsorships. An ex-post assessment of the longer-term impact of the pandemic experience on social media strategies can be an important task for future research.

Managerial implications. Italian opera houses clearly performed as “newcomers” in the social landscape. Their approach was differentiated, and the frequency of publication did not always translate into community interactions or number of users reached. This can be explained by the choice of platforms, the previous record on social media, but also - as other streams of our research project show through case studies (Bellini & Raglianti, 2023) - by the availability of appropriate “dynamic capabilities” within the organization. An open question concerns the lasting character of the pandemic legacy. Data being presently collected confirm that the legacy is there, although approaches to digitalization are still highly differentiated.

A most interesting aspect of this is the shaping of digital audiences. Radarly data are being elaborated and show a significant impact on young audiences, also thanks to additional actors in the social landscape, such as artists, commercial brands, and influencers (Agostino et al., 2019).

Originality of the paper. The paper contributes to the analysis and interpretation of the impact of the Covid-19 experience on the business models of cultural institutions with reference to their digital marketing strategies. It is based on a unique set of data, professionally collected in cooperation with a social media intelligence platform.

Keywords: social media strategy; opera house; pandemic

Assessing willingness to pay for different ecosystem services: results from a comparative study on river basins

NATALIA MARZIA GUSMEROTTI* GRETA COLOMBI* FRANCESCO TESTA[▲]
ALESSANDRA BORGHINI** MARCO FREY**

Framing of the research. *The last two decades has seen the rise of interest for the concept of ecosystem services (ES) and their monetary evaluation. The increasing understanding of the urgency to create a framework to promote a sustainable development for the thrive of human society and economy while sustainably using natural resources for future generations (UN, 1987), led to the necessity to develop a concept to bridge the principles of ecology and natural science with social science and economy (Braat and De Groot, 2012). This necessity encompasses, indeed, the arising awareness on the connections between the natural world and the anthropic one, which implies the comprehension that human well-being depends on the good ecological status of natural ecosystems (Guerry et al., 2015). Therefore, the concept of ecosystem services has gained attention not only between scholars, but also in the context of policy making, public management, and corporate responsibility. The definition of ES finds its roots in the Millennium Ecosystem Assessment (MEA, 2005), where ES are defined as “the benefits people obtain from ecosystems” and it evolves, few years later, in the “direct and indirect contributions of ecosystems to human well-being” (TEEB, 2010), thanks to the common acceptance of the role of ES in guaranteeing health, livelihood and survival of human societies.*

A step forward into the progress of the ES concept for a sustainable development and a responsible use of natural capital, has been represented by the efforts made by scholars and TEEB’s working groups to assess an economic and monetary value to ES. Despite its controversial aspects, the monetary valuation of ES has been recognized as an important tool for the sustainable and efficient management of natural resources, with practical implications on the decision-making process for environmental protection (Costanza et al., 2014). According to Costanza, the valuation of ES is inevitable, due to the intrinsic interconnections between the natural environment and human societies. We already use ES at different levels, from everyday life to business, and any time we make a decision regarding their application or maintenance we are considering a benefit trade-off based on their evaluation. Standardized and universally accepted methods for ES evaluation may, therefore, increase the transparency and accountability of the considerations achieved, resulting in an improved and unbiased decision-making process. Furthermore monetary evaluation of ES may be considered helpful in raising awareness on the usefulness of any goods and services provided by natural resources and translating it in economic terms, providing a tool to communicate efficiently ecological fundamentals and their contribution in sustaining human life, to different targets and in different contexts (Chee, 2004).

The monetary valuation of ES came up against several issues, considering that, first, many ES belong to the category of common good (Barnes, 2006) or common pool resources (Lant et al., 2008); and second, only a few ecosystems may be priced and traded in a real market (TEEB, 2010). As a matter of fact, according to the most accredited classification, while some ES (such as the provisioning ones) are consumptive and therefore, own a direct use value, most ES fall into the category of non-use or indirect-use value. Those latter ones may have a direct use value, but are considered not consumptive (as the case of recreational ES); may be necessary for benefiting other ES (as the case of supporting and regulating ES); and finally, may be esteemed for their intrinsic value (as the case of spiritual and aesthetic ES).

In order to deliver a correct evaluation of all the distinct typologies of ES, several approaches have been developed and tested during the last thirty years (Freeman III et al., 2014). Among them, the Contingent Valuation Method (CVM; Mitchell et al. 1989) is among the most applied techniques for assessing the non-market value of public goods such as

the ES. This stated preference technique relies on questionnaire-based surveys where the respondents are asked to establish how much they would be willing to pay (WTP) for having access to a public good or service which is relevant for their livelihood or wellbeing, or how much they would be willing to accept (WTA) as a form of compensation for the loss or the inaccessibility of that good or service, in a hypothetical market.

Considering the emerging concerns on water security (Jury et al., 2007) at a global level and the incoming drought emergency in Italy (ISPRA), it is more than ever relevant to understand factors underlying citizens support for projects aimed at restoring degraded ecosystems and guaranteeing the possibility of benefiting ES related to clean and accessible freshwater for multiple uses. Therefore, this study will assess WTP for restoring freshwater ecosystems and investigate the motivations behind attitudes and behavioral intentions in the context of pro-environmental behavior. This is mostly relevant in the light of the commitment of key stakeholders, society and policy makers to improve the overall health of water resources and restore degraded ecosystems.

Purpose of the paper. Considering the emerging evidences that have shown the increased influence of psychometric characteristics of the target population (Deng et al., 2016, Raymond and Kenter, 2016, Sánchez et al., 2018, Wakita et al., 2019) over socio-demographic and economic variables that have been conventionally addressed by traditional economic theories, recent studies led to the urgency to develop a multi-disciplinary approach that includes not only the socioeconomic, but also the psycho-social dimension of population (Obeng and Aguilar, 2018), embracing moral (Shan et al., 2019), ethical (Spash et al., 2009) and emotional (Lam et al., 2022) factors.

Addressing the above-mentioned need, this study provides a comprehensive framework for analyzing the expressed preferences of WTP for the restoration of two drainage basins located in the northern Italy, comparing two scenarios that differ for the level of restoration of the ecosystems, and, consequently, for the ES that will be provided, and the uses of water resources guaranteed in the mid-term future. The results have been interpreted under the frame of the Theory of Planned Behavior (TPB; Ajzen, 1991) and the Value-Norm-Belief Theory (VNB; Stern et al., 1999), which have been successfully applied to explain a wide range of pro-environmental behaviors, including WTP (Yuriev et al., 2020). Therefore, this study aims at: i) providing useful insights on the comprehension of the psycho-attitudinal factors underpinning pro-environmental behavioral intention, with specific reference to WTP for freshwater ecosystems' restoration; ii) Compare the estimated value of ES that own a direct use-value and ES that don't; iii) investigating the role of psycho-attitudinal factors and the perceived benefits from different categories of ES in the evaluation process.

Methodology. We used the CVM to assess the citizens' WTP to finance an intervention to restore a river basin and improve the quality of ES provided by the area. The payment vehicle identified was an increase in the water bill. The choice of using WTP instead of WTA is due to the increased evidence that WTP allows to obtain a more reliable economic value (Del Saz-Salazar et al., 2009). In order to test our hypotheses, we replicated the same conceptual framework in two different sites. Firstly, we carried out a questionnaire-based survey on a representative sample of residents in Emilia Romagna, in the area between the cities of Forlì-Cesena, Ravenna e Rimini, which is close to the river basin to be restored in the hypothetical scenario proposed. This first survey was conducted on 518 respondents (Study 1). Second, to test the reliability of the first findings, we replicated the general structure applied in Study 1, to a smaller sample of citizens (278 respondents) living in Piemonte (Study 2). The two sites are characterized by similar features: both areas are considered urban zones with a strong presence of industrial, agricultural, and commercial activities.

In order to produce consistent results, the survey has been structured following the guideline developed by NOAA (Arrow et al., 1993) for contingent valuation studies. Each survey was divided into five sections, made mostly up by closed answers questions:

- the first section contained questions on socio-demographic and economic characteristics of respondents (age, gender, family members, income, residence, education, job role);
- in the second section, the area of the intervention was presented with pictures and a brief, but clear description;
- in the third session we included some questions to investigate the habit of the respondents to spend time in the area and their knowledge of it;
- in the fourth section, we explained the different scenario of the hypothetical market. In both the studies we described two different scenarios. In the first scenario the intervention on the ecosystem will provide residents with safe and clean drinking water for personal use only, while, in the second one, recreational activities and clean water for industrial and agricultural use will be guaranteed as well. In order to produce valuable results and reliable measure of non-market value of ES, goods and services provided by the river basin were explained in detail using plain language and providing simple and realistic examples. In addition to the text description, the section presented also images of the hypothetical appearance of the area after the intervention and the activities that will be carried out thanks to the ES provided. After the description we asked the respondents to make a bid for financing the intervention in both scenarios, and we added some question to distinguish true zero bids from protest voters (Ramajo-Hernández and del Saz-Salazar, 2012);
- in the last section we investigated psychometric, behavioral and attitudinal traits of respondents with 5-points Likert scale questions.

The data collected by the two different surveys were analyzed separately by means of Structural Equation Modelling (SEM), and regression analysis. Structural Equation Modelling is gaining momentum in the analysis of psychological traits since it allows to combine exploratory (EFA) and confirmatory factor analysis (CFA) with path analysis, and, therefore, to model the direct and indirect relationships between latent (unobservable) variables. This method allows, thus, to test different structural models, compare them and measure their validity. SEM was used mostly to assess the

influence of the psychometric and attitudinal traits on the WTP in the first (WTP1) and second scenario (WTP2). Then we use bivariate and multivariate logistic regression to investigate the differences between the WTP elicited in the two scenarios.

The psycho-attitudinal model was developed starting from two of the most popular approaches to explain pro-environmental behaviors: the Theory of Planned Behavior (TPB; Ajzen, 1991) and the Value-Norm-Belief Theory (VNB; Stern et al., 1999). Ajzen argued that each environmental behavior may be predicted by the intention to perform the behavior, which, in turn, is defined by: i) the attitude towards the behavior (i.e. whether the behavior is considered right or wrong to be performed); ii) the social norms, which is due to the perceived social pressure to engage in a certain behavior (i.e. pressure exerted by familiars, colleagues or friends); iii) the perceived behavioral control, which reflects the easiness to perform the behavior. On other side, Stern proposed a model where the principal value orientations (biospheric, altruistic and egoistic) reflect on general beliefs (i.e. beliefs regarding the concern for environmental status in generic terms) and specific beliefs (i.e. beliefs on the awareness of the context related problems and on the ascription of responsibility for self or other), which influence, in turns, the development of the personal moral norms that determine the engagement in a specific behavior. The majority of studies that apply these theories to explain WTP, employ extended or mixed version of them, by introducing new variables or modifying the assumed direct or indirect relations between the variables (Yuriev et al., 2020).

In this preliminary phase of the data analysis, the psycho-attitudinal variables that we consider to explain the variance in WTP are:

- attitude towards environmental activism behavior, which measures the inclination to perform behavior that imply “active involvement in environmental organizations or demonstrations” (Stern et al., 1999);
- Environmental concern, which measures the awareness of the general compromised status of natural ecosystems and related risks;
- Ascription of responsibility to the Government and public authorities;
- Perceived benefits of ES, which refers to the awareness and knowledge of the different typologies of ES provided by the area subjected to the intervention.

The model has been enriched with the following socio-demographic and economic variables, which are generally applied as predictors of WTP results:

- Age;
- Gender;
- Presence of children in the family;
- Education;
- Income;
- Frequency of visits in the area;
- Residence’s time lapse in the area.

Results. Although the study presented is still “work in progress”, to date, the preliminary results of the statistical data analysis showed some interesting results.

First of all, a two sample t-test was performed to compare the WTP in the two scenarios proposed for each study. According to the results of Wakita et al. (Wakita et al., 2019) on invisible and visible MES, in both studies the mean value of WTP1 (Study 1: $M = 33,06$, $SD = 32, 26$; Study 2: $M = 37,95$, $SD = 38, 65$) was significantly higher, than WTP2 (Study 1: $t(df) = 2.36$, $p = 0,01$; Study 2: $t(df) = 2.03$, $p = 0,02$). These results are validated additionally by a robust test where the protest voters are excluded.

In Study 1, 103 respondents (20% of the total sample) weren’t willing to pay to support the intervention in the first scenario, while 112 respondents (22%) weren’t in the second. It’s important to underlying that among them, only a minority was considered true zero, since 86 respondents were identified as protest voters. In most cases (59%) respondents showed no differences in eliciting a bid in the two different scenarios, but the 26% of respondents presented a higher WTP1, while the remaining (15%) a greater WTP2.

In the Study 2, 45 respondents (16 % of the total sample) weren’t willing to pay to support the intervention in the first scenario, while 53 respondents (19%) weren’t in the second. In this case 34 respondents were identified as protest voters. As for Study 1, also in Study 2 the majority of respondents (63%) offered the same bid for WTP1 e WTP2 and the 26% of them a higher WTP1, while the remaining a greater WTP2 (11%).

Our Structural Equation Model (SEM) predicted that the four independent psycho-attitudinal variables identified have a direct influence on WTP, considered as a behavioural intention. Both models had an acceptable model fit (Study 1: $\chi^2=464.431$, $p<0.001$; $RMSEA=0.041$; $CFI=0.963$; Study 2 $\chi^2=441.967$, $p<0.001$; $RMSEA=0.065$; $CFI=0.928$). According to expectations, and to TPB, attitude towards environmental activism behavior was positively related to WTP in both scenarios, in Study 1 and Study 2 ($p<0.001$), while the other variables didn’t significantly predict WTP in any case.

On the other hand, surprisingly, no psycho-attitudinal variables are significantly related to the relevant difference between WTP1 and WTP2 value in both studies. The only variables that seem to explain the tendency to evaluate discordantly the two scenarios are the habit to visit the area, the age, the education level and the residence’s time lapse. Nonetheless these results need further in-depth analysis to be interpreted properly and provide valuable insights.

Research limitations. The most relevant limitation of this study refers to the conceptual framework proposed to understand the factors influencing WTP. Even if our framework is based on the Stern’s VBN theory and the model includes the main psycho-attitudinal and socio-economics factors, the emotional, moral and ethics aspects have been

only poorly addressed. Nonetheless, in the last few years many scholars have advocated the necessity to evaluate the weight of emotional and ethical factors in the adoption of pro-environmental behaviors. Emerging evidence has shown that besides the traditional economic approach based on utilitarianism and consequentialism which focus on the usefulness of preserving ES for human beings, many environmental decisions may be based on a deontological set of values (De Groot and Steg, 2008, Spash, 1997). Additionally, this ethical implication seems to be relevant also in the context of WTP (Ojea and Loureiro, 2007, Raymond and Kenter, 2016, Spash et al., 2009). Moreover, in the recent years, some authors have discussed that emotions, such as feeling guilty, may play a relevant role in determining the adoption of pro-environmental behaviors, directly or acting as a mediator on value, beliefs and moral norms formation (Bamberg and Möser, 2007, Notaro et al., 2019). Despite these considerations, as argued by Kollmuss and Agyeman (Kollmuss and Agyeman, 2002), since there are numerous external and internal factors that may affect pro-environmental behaviors, which should be related in a complex and structured system, developing a model that includes all the different potential explaining variables may be “neither feasible nor useful”. In order to avoid unnecessary complexity that may have hidden some other relevant factors, thus, our model doesn't take into account ethics and emotions, but we recommend that will be considered in future research.

Another limitation that it's worth mentioning, regards the choice of relying on CVM to assess the value of non-use and indirect-use ES. Some scholars, whose considerations are corroborated by a few empirical studies (Sauer, U. , Fischer, A. 2010), argued that a hypothetical market doesn't represent necessarily the behavior that would be adopted in the real world. Despite these reservations, CVM is commonly accepted as a reliable system by most researchers and it's, so far, one of the few techniques available to measure non- market value. Moreover it's largely appreciated for its versatility, because it is applicable to a wide range of contexts and ES (Freeman III et al., 2014).

Managerial implications. Despite of this increasing awareness and the rise of academic literature on the relevance of natural capital for the livelihood and survival of human societies, our development is still occurring at the expense of ecosystem maintenance and natural fund, leading to an alarming degradation of ecosystems, severe loss of biodiversity and an unsustainable use and extraction of natural finite resources (MEA, 2005).

As highlighted by the last report of IPCC (IPCC, 2022) the effects of climate change and anthropic pressure on ecosystems and water availability is dramatically increasing and is leading to catastrophic consequences. For this reason, risks correlated to water insecurity, defined as ‘the capacity of a population to safeguard sustainable access to adequate quantities of acceptable quality water for sustaining livelihoods, human well-being, and socio-economic development, for ensuring protection against water-borne pollution and water-related disasters, and for preserving ecosystems in a climate of peace and political stability’ (Grey and Sadoff, 2007), are gaining more and more attention (WEF). Consequently policy and decision makers at international levels are addressing the water crisis, promoting ecological conservation policies, circular strategies, the development of innovative technologies for wastewater treatment and the sustainable use, management and consumption of the water resource. Considering this, the ecosystem approach, encompassing the identification of ES, their economic valuation and the comprehension of the several factors that contribute to the assessment of their value, provides valuable insights for policy and decision makers in the light of the Water Framework Directive, introduced in Europe in 2000 to protect and restore the water environment and ensure its long-term, sustainable use (Vlachopoulou et al., 2014). This consideration is even more relevant, given the recent decision of United Nations members to restore 30% of degraded areas by 2030 (COP15). Provided the enormous investments needed for achieving this ambitious goal, the evaluation of ES would become more and more significant at different stages of the policy and decision making process.

Originality of the paper. To the best of our knowledge, there aren't academic publications on willingness to pay for freshwater ecosystem services that compare two different scenarios of ecosystem restoration and, following, of the ecosystem services provided in the different cases. This structure allows to investigate not only the underlying socio-demographic and psycho-attitudinal factors affecting WTP but offers important insights on the perceived usefulness and benefits from different kind of ecosystem services and how this perception may affect the respondents' intention of adopting pro-environmental behavior. As a matter of fact, perceived benefits from ES, defined as the positive outcomes derived from the good and services provided by a functioning ecosystem which are clearly recognized by the respondents, are positively correlated with attitude towards pro-environmental behavior and consequently, with the intention to perform the behavior (Chiou et al., 2021). The difficulty to assess the economic value of ES and to engage citizens in program of eco-compensation rely partially on the poor knowledge and awareness of the wide range of services provided by natural ecosystems. Regarding this, some scholars have shown how the concepts of “ecosystem”, “ecosystem services” and “ecosystem restoration” are still poorly recognized and understood by the general public and how this gap in knowledge inevitably affects the perceived usefulness and benefits of ES (Chiou et al., 2021). In addition, cultural, regulating and supporting ES are difficult to intellectualize and materialize due to their intangible nature. Wakita et al. (Wakita et al., 2019) carried out a first comparison between visible and invisible marine ecosystem services, by assessing, in a comparative study, the WTP for regulating and provisioning ES. Surprisingly their results show that the WTP for the invisible MES exceeded the WTP for the visible one. Following the experiment on MES, we verified that the influence of knowledge and perceived benefits of ES on WTP hasn't been largely investigated by academic research, and this paper represents a first attempt to fill this gap.

Keywords: Willingness to pay (WTP); regenerative economy; ecosystem services; ecosystem management; river basin; comparative study

To stay or not to stay in eco-friendly hotels: A norms perspective

MARIO D'ARCO* VITTORIA MARINO* RICCARDO RESCINITI[♠]

Framing of the research. *Tourist activities play a relevant role in environmental degradation (Liu et al., 2022). Particularly, hotels operating 24 hours a day represent one of the most energy-intensive type of business activity (Huang et al., 2015). Against this backdrop, tourists can mitigate their negative effect on the environment by deciding to opt for an eco-friendly hotel, namely, a specific type of accommodation that follows environmentally friendly programs and implements environmental management activities, such as green marketing, corporate social responsibility (CSR) strategies, and a green supply chain management (Chen and Peng, 2012; Mohd Suki and Mohd Suki, 2015).*

Focusing on the demand side, the tourism industry is still far from being sustainable (Buckley, 2012), as evidenced by the existence of an awareness-attitude-behavior gap correlated with a range of personal and psychological barriers (Antimova et al., 2012; Cocolas et al., 2020; Hibbert et al., 2013; Juvan and Dolnicar, 2014). Against this backdrop, both scholars and practitioners are suggesting changing individuals' patterns of behavior via norms intervention (Landon et al., 2018; Perry et al., 2021; Wang et al., 2022; Wu et al., 2021). According to Thøgersen (2006), it is possible to distinguish between descriptive social norms, injunctive social norms, and personal norms. Descriptive social norms concern the individual's perception of what other people do or don't do in any given situation. Hence, descriptive social norms move individuals to act via social information (Cialdini, 2007). Injunctive social norms regard the individual's perception of what others approve of or expect of them. Therefore, as highlighted by Cialdini (2007), individuals engage in a given behavior because they feel social pressure (e.g., family, peers, school/work, community). Personal norms differ from descriptive and injunctive norms because they concern moral obligations (Schwartz and Howard, 1981). Personal norms are incorporated into individuals. Contrarily, both injunctive and descriptive norms are external factors, which in turn can be internalized as personal norms (Thøgersen, 1996). Therefore, they may exert a positive effect on a given behavior indirectly, through internalized norms (Silvi and Padilla, 2021).

According to the extant literature, individuals' intention to stay in eco-friendly hotels is positively influenced by injunctive social norms (Chen and Peng, 2012; Kim and Han, 2010; Nimri et al., 2020) and personal norms (Bashir et al., 2019; Yan and Chai, 2021). A negative correlation was found between descriptive norms and intention to stay in eco-friendly hotel (Wang et al., 2023). Focusing on the mediating role of personal norm on the impacts of descriptive and injunctive norms on intention to stay in eco-friendly hotel, Doran and Larsen (2016) showed that personal norms mediated the link between injunctive social norms and intention to choose eco-friendly travel options. No empirical studies to date investigated the mediating role of personal norm in the effect that descriptive norms have on intention to stay in eco-friendly hotel. However, this aspect has been tested on other specific pro-environmental behaviors in the tourism context, such as young vacationers' waste reduction and recycling intentions (Han et al., 2018), or tourists' pro-environmental behaviors (Wang et al., 2020).

Purpose of the paper. *The study assumes a normative perspective to investigate how tourists are willing to opt for eco-friendly hotels. Since sustainability is everyone's responsibility this study adopts a cross-generational perspective. Hence, we investigated how different generational cohorts are willing to opt for eco-friendly hotels. Generational analysis is of paramount importance to recognize demand changes and opportunities in a given market or industry (Li et al., 2013). As maintained by Dimock (2019), there are five major generations: the Silent Generation, Baby Boomers, Generation X, Generation Y, and Generation Z. Those who were born between 1928 and 1945 are considered as the Silent Generation. Baby Boomers were born from 1946 to 1964. Generation X were born between 1965 and 1980. Generation Y, also known as the Millennials, were born between 1981 and 1996. Finally, Generation Z includes anyone born between 1997 and 2012. In this study we compared Generation X, Millennials, and Generation Z.*

Based on the literature concerning normative theories and empirical studies about behavioral intention to stay in eco-friendly this study advanced the following hypotheses:

H1: Personal norms have a significant and positive impact on tourists' intention to book an eco-friendly hotel.

e-mail: vittoria.marino@unisannio.it

♠ Full Professor of International management and marketing – University of Sannio, Benevento, Italy
e-mail: resciniti@unisannio.it

H2: Descriptive social norms have a significant and negative impact on tourists' intention to book an eco-friendly hotel.

H3: Injunctive social norms have a significant and positive impact on tourists' intention to book an eco-friendly hotel.

H4: Personal norms mediate the relationship between descriptive social norms and tourists' intention to book an eco-friendly hotel.

H5: Personal norms mediate the relationship between injunctive social norms and tourists' intention to book an eco-friendly hotel.

See Figure 1 for more details.

Methodology. This study adopted a self-administered questionnaire distributed by mail. We employed previous tourism literature to develop the measurement items for the present research. Specifically, personal norms were measured using four items based on the scale of Landon et al. (2018) (i.e., "PN1: As a tourist, I feel morally obliged to do whatever I can to minimize my environmental impact"; "PN2: I would feel guilty if I were responsible for damage to the environment as a tourist"; "PN3: Minimizing my impact on the environment is the right thing to do"; "PN4: I am obliged to do my part to reduce my impact on the environment as a tourist"). Injunctive social norms were measured using four items adapted from Chen and Tung (2014) (i.e., "ISN1: People whose opinions I value would prefer that I stay at a green hotel when travelling"; "ISN2: Most people who are important to me think I should stay at a green hotel when travelling", "ISN3: Most people who are important to me would want me to stay at a green hotel when travelling). Descriptive social norms were measured using a scale, which comprised two items, developed by De Leeuw et al. (2015) (i.e., "DN1: Most people who are important to me will stay at a green hotel when travelling"; "DN2: Most people whose opinions I value will stay at a green hotel when travelling"). Finally, three items adopted from Nimri et al. (2021) were used to measure tourists' intention to book an eco-friendly hotel (i.e., "INT1: I am willing to stay at an ecofriendly hotel when travelling"; "INT2: I plan to stay at an eco-friendly hotel when travelling"; "INT3: I will make an effort to stay at a green hotel when travelling"). All items were measured on a seven-point Likert scale (1 = Strongly disagree, 2 = Disagree, 3 = Somewhat disagree, 4 = Neither agree nor disagree, 5 = Somewhat agree, 6 = Agree, 7 = Strongly agree).

We used Google Form to create and distribute the online survey. We collected 570 answers between September and December 2022 in the Italian context (Male = 45.4%, Female = 54.6%; Mean age = 33.7, Std. error of mean = 0.504, Std. deviation = 12.05). Structural equation modelling (SEM) and multigroup analysis via SPSS® AMOS were performed to analyze collected data. Before proceeding with the SEM analysis, we conducted a confirmative factor analysis (CFA) to investigate model reliability, as well as convergent and discriminant validity of the measures (Hair et al., 2017). A bootstrapping procedure (5000 subsamples) with a bias-corrected interval of 95% proposed by Hair et al. (2014) was adopted to evaluate the statistical significance of the path coefficients (β). A multigroup analysis was performed to evaluate significant differences between Generation X, Millennials, and Generation Z regarding their intention to opt for an eco-friendly hotel.

Results. Good model fit values were found in CFA ($X^2 = 104.107$, $df = 48$, $X^2/df = 2.169$, Incremental fit index (IFI) = 0.984, Normed fit index (NFI) = 0.971, Comparative fit index (CFI) = 0.984, Tucker Lewis Index (TLI) = 0.978, and Root mean square error of approximation (RMSEA) = 0.045. As showed in Table 1, Cronbach alpha values were found above the accepted significance level of ≥ 0.70 (Hair et al., 2010). Composite reliability (CR) values are also above the threshold of ≥ 0.60 suggested by Hair et al. (2010). Therefore, the results indicate that the reliability of the measurement model is acceptable. The validity of the measurement model was estimated by examining both convergent validity and discriminant validity (Hair et al., 2010). The average variance extracted (AVE) was used to measure convergent validity. All the AVE of each construct are above 0.50 (Hair et al., 2010). Thus, the convergent validity is acceptable. Finally, we used the criteria of Fornell and Larcker (1981) to test discriminant validity. According to the results depicted in Table 1, the square root of the average variance extracted of each construct was higher than inter-construct correlations; hence, discriminant validity was supported.

Tab. 1: Reliability and validity assessment.

	PN	ISN	DN	INT
PN	0.850			
ISN	0.411	0.898		
DN	0.611	0.428	0.935	
INT	0.664	0.488	0.489	0.829
Cronbach's alpha	0.872	0.880	0.857	0.773
Composite reliability	0.856	0.881	0.865	0.774
Average variance extracted (AVE)	0.723	0.806	0.874	0.687

Note: Bold values = square root of AVE.

According to the results of the SEM analysis (see Table 2 and Figure 1) except for H2, all the other hypotheses are supported. Personal norms ($\beta = 0.524$, $p < 0.001$) represent the main predictor of intention to stay in an eco-friendly hotel, followed by injunctive social norms ($\beta = 0.245$, $p < 0.001$). The correlation between descriptive social norms and intention to stay in an eco-friendly hotel was not statistically significant ($\beta = 0.065$, $p = 0.29$). While injunctive social

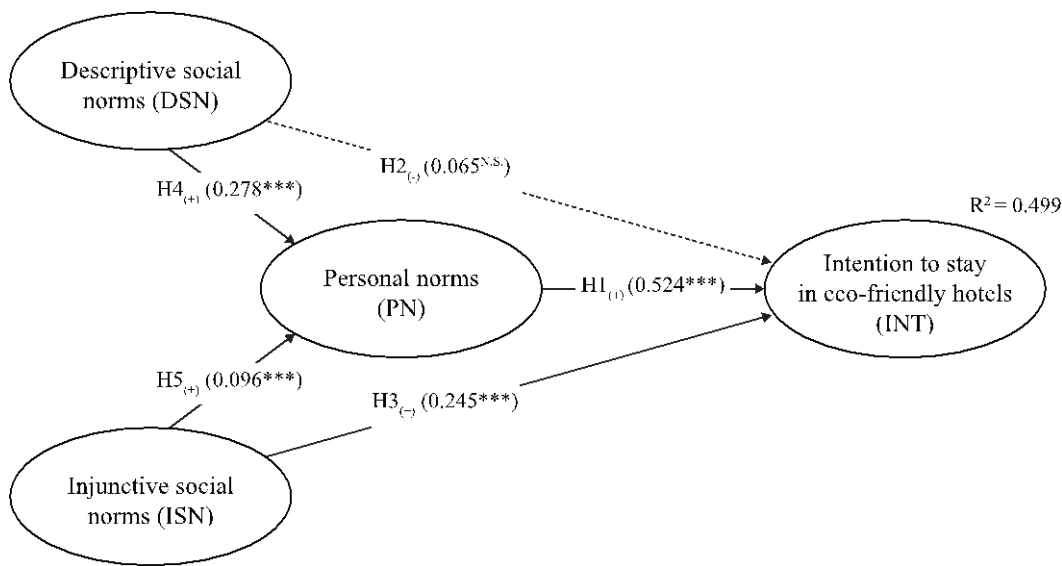

norms influence intention both directly and indirectly through personal norms, descriptive social norms influence intention to stay in an ecofriendly hotel only indirectly through personal norms.

Tab. 2: Results of hypotheses testing.

Paths	β	95% CI		P-value	Hypothesis
		Lower	Upper		
PN \rightarrow INT	0.524	0.411	0.628	$p < 0.001$	H1 supported
DN \rightarrow INT	0.065	-0.05	0.173	0.29	H2 not supported
ISN \rightarrow INT	0.245	0.164	0.324	$p < 0.001$	H3 supported
DN \rightarrow PA \rightarrow INT	0.278	0.208	0.006	$p < 0.001$	H4 supported
ISN \rightarrow PA \rightarrow INT	0.096	0.052	0.151	$p < 0.001$	H5 supported

Note: β = Standardized β Weights; CI = Confidence interval.

Fig. 1: Figure 1. Hypotheses results and path coefficients. Notes: **** $p < 0.001$; N.S. = not significant.

Results of the multigroup analysis indicate that respondents of Generation X ($n = 172$) are more prone than other cohorts to book an eco-friendly hotel while traveling, the predictive power of the model is 50.9% ($R^2=0.509$). Follows Generation Z ($n = 208$), the model predicts the 47.7% ($R^2=0.476$) of the intention, and Millennial ($n = 190$), the model predicts the 41.9% ($R^2=0.419$) of the intention. The significant influence of personal norms on behavioral intention characterizes all three generational cohorts. Descriptive norms do not exert a direct effect. Whereas injunctive social norms exert both a direct and indirect effect through personal norms.

Research limitations. This research has limitations that may represent avenues for future research. First, this study has been conducted only in one country, that is, Italy. Hence, future research can perform cross-cultural analysis to increase the generalizability of the results. Second, we investigated the behavioral intention. Therefore, future studies could measure actual behavior. For example, a survey could be administered on-site to the consumers of an eco-friendly hotel.

Managerial implications. This research informs practitioners in several respects. First, the results of the study advise practitioners about the relevance of personal norms in influencing individuals' intention to opt for eco-friendly hotels. This means that people are motivated by inner values rather than external forces such as social information and peer pressure. Furthermore, this study highlighted that tourist sustainability matter different generations. Specifically, since Generation Z will represent the central work force in society (Yamane and Kaneko, 2021) and it is expected to dominate the consumer market in the near future (Su et al., 2019), hoteliers should pay attention to this cohort, for example by adopting specific product offering and communication strategies to promote eco-friendly hotels.

Originality of the paper. To the best of our knowledge this is the first study to investigate the phenomenon of individual's intention to opt for an eco-friendly hotel while travelling by assuming a cross-generational perspective. To the best of our knowledge, it is also the first to investigate the mediating role of personal norm in the effect that descriptive norms have on intention to stay in eco-friendly hotel.

Keywords: Generational analysis; sustainable tourism; norms; eco-friendly hotels

Oleotourism: a bibliometric review of the literature and valuable paths for rural Italian territories

LUNA LEONI[•] ELENA CASPRINI^{*} GIACOMO DEL CHIAPPA[♦]

Framing of the research. *The tourism industry is facing significant challenges due to high levels of competition among destinations and the growing knowledge and specialization of consumers, which require constant innovation and attention to the desires of modern tourists (Goffi et al., 2019; Streimikiene et al., 2021). Consumers seek emotional and experiential products capable of enhancing their life quality and well-being; thus, tourism firms must offer intangible value through tangible proposals (Sigala, 2019).*

To do so, tourism firms are called to rethink how their business takes place, and this can be done by re-establishing the connection to their local roots, from which to draw inspiration and resources for innovative strategies and value creation and sharing among multiple actors at multiple levels, with cascading positive economic, social, and environmental impacts (Attig and Brockman, 2017; Mair et al., 2016; Paniccia and Leoni, 2019; Soderstrom and Weber, 2020; Sternad et al., 2017).

In this vein, gastronomic tourism is a popular practice providing experiential contact between tourists and destinations (Lin, 2014; Ryu and Jang, 2006). It involves learning about a territory through its culinary culture, including the traditional dishes, history, knowledge, and social customs of local communities, providing authenticity, involvement, and education to tourists (López-Guzmán et al., 2014; Germann Molz, 2007). In particular, gastronomic tourists have three main characteristics: i) They are interested in tourism offering that provide emotions, authenticity, and learning; ii) They would like to contribute to the sustainability of the territory they visit; and iii) They seek that food is able to improve their health and well-being (Lin, 2014).

In this sense, among the different types of gastronomic tourism, Oleotourism is in line with these characteristics. In fact, Oleotourism - or olive oil tourism - has been gaining ground in recent years, especially due to its environmental and cultural values, favouring the preservation of both tangible and intangible assets linked to the olive-growing areas (Alonso and Krajsic, 2013). This type of tourism is particularly important for Mediterranean countries - such as Spain, Italy, and Greece - that are almost the only holders of this heritage worldwide; thus, the largest producers (Sabbatini et al., 2016).

Accordingly, Oleotourism can be considered a strategic resource due to its social, economic, and cultural value and its potential to revitalise and differentiate rural areas of Mediterranean countries, increasing and improving their international attractiveness (Alonso, 2010; Alonso and Krajsic, 2013; Northcote and Alonso, 2011). Furthermore, it is worth noting that this form of tourism embraces and satisfies different types of tourism and related tourists, such as rural (e.g., agritourism), nature-based (e.g., health tourism), and cultural tourism (e.g., gastronomic tourism) (Pulido-Fernández et al., 2019).

Purpose of the paper. *Based on the above, the aim of this work is twofold. The first one is to identify and investigate the literature produced up to now about oleotourism, to establish the current state of the art on the subject and its future research venues. The second objective is to identify possible lines of action for Italian rural territories that produce olive oil based on best practices reported in the literature.*

For the sake of clarity, it is worth noting that reviews on oleotourism already exist (e.g., Hernández-Mogollón et al., 2019; Pulido-Fernández et al., 2019). However, our study differs from previous ones since it provides a clear bibliographic coupling analysis, thus adding to Hernández-Mogollón et al. (2019)'s bibliometric and content analysis that resulted in having identified oleotourism demand, oleotourism supply, and SWOT analysis; and Pulido-Fernández et al. (2019)'s contribution that classified literature on two perspectives (i.e., demand and supply) and seven links (e.g., gastronomy, industrial, rural, nature) to olive-oil tourism.

Methodology. *Bibliometric reviews in business and management fields are increasing (Zupic and Čater, 2015) because they provide more objective and reliable literature analyses compared to "classical" reviews by quantitatively*

analyse the academic literature and providing a comprehensive map of a research field (Diodato and Gellatly, 2013; López-Fernández et al., 2016). This article used the Scopus research database.

To ensure that all pertinent evidence was gathered, ad-hoc keywords were developed and used, associating them with Boolean logic, namely “OR”, “AND”, and truncation (i.e., *) when appropriate. Hence, the following research strings were used: (olive* OR oleo* OR ole*) AND (touris*). The set of keywords was based on those used by Hernández-Mogollón et al. (2019).

The query was run on 13th March 2023, in “Title, Abstract, Keywords” and was limited to “Business, Management and Accounting” as the subject area. It is worth noting that we avoid using the term “oil” since it returned contributions related to oil for transportation. Thus, a total of 68 contributions resulted from the following query:

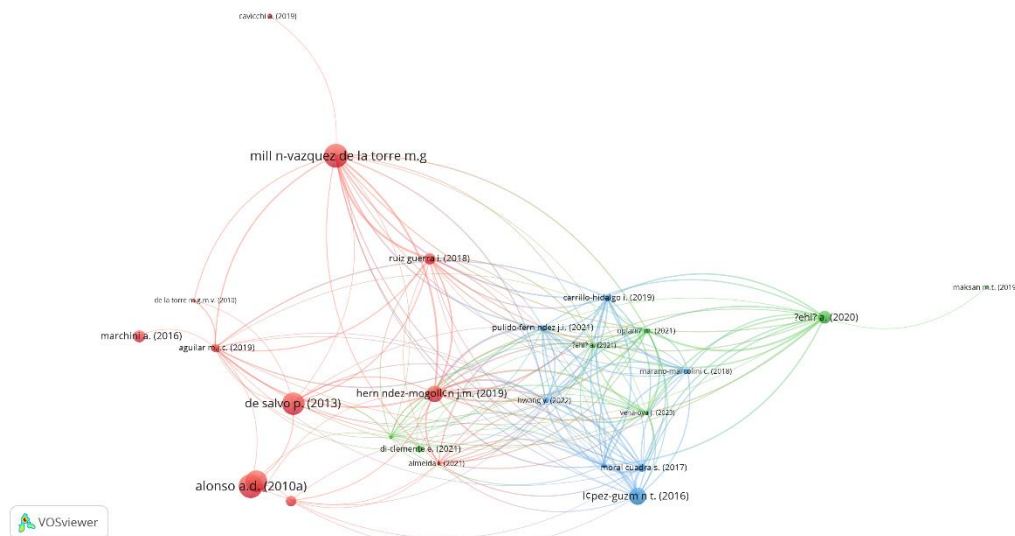

TITLE-ABS-KEY (((olive* OR oleo* OR ole*) AND (touris*))) AND (LIMIT-TO (SUBJAREA , “BUSI”))

We then proceeded in revising the titles and the abstracts of these papers to identify our intellectual core that eventually resulted in 37 papers. Several studies, in fact, entered in the initial set of papers because they contained reference to Oliver’s expectancy disconfirmation theory or linkages to other authors mentioned in the abstract (such as O’Leary and de Oliveira). Our final sample is smaller than Hernández-Mogollón et al. (2019)’s one that considered 52 documents based on “Olive oil tourism, Oleotourism, Olive tourism, olive-based agrotourism” research string in Scopus and Web of Science databases, plus doctoral theses, and books, and then the contribution by Pulido-Fernández et al. (2019) that returned in 39 papers on Web of Science, Scopus, SciELO and Google scholar databases.

The smaller number (than the previous literature reviews) of the contributions we selected resulted, however, in a more focused and replicable analysis. Moreover, our intention was to select only peer-reviewed articles published in journals. Therefore, all grey literature (e.g., theses) was not taken into account. Furthermore, we concentrate exclusively on the Scopus database because it is recognized as one of the main databases used in bibliometric related studies (Ellegaard, 2018; Lei and Liu, 2019; Yu et al., 2018) and about 99.11% of the journals indexed in Web of Science are also indexed in Scopus (Singh et al., 2021); therefore, we can hypothesize that our query exclusively in Scopus was able to extrapolate all those contributions that we would have found after searching in Web of Science as well.

To analyse the final sample, we used VosViewer software, and we found 3 clusters (minimum cluster size equal to 5) based on 27 out of 37 contributions, as represented in Figure 1. This denotes very disconnected research, which does not have an established knowledge base.

Fig. 1: Bibliographic coupling analysis

(Source: VosViewer)

Results. The first cluster (red) comprises 13 papers on the timespan 2010-2021. It looks at the producers and the other stakeholders who might be involved in developing the oleotourism offer. In particular, there are several type of organizations and “format” to consider such as museums and specialized shops (Almeida and Silveira, 2021), the development of gastronomic routes (Millán-Vazquez de la Torre et al., 2017), and events such as open oil mills (Marchini et al., 2016). In fact, there are different types of tourism, based on specific pull factors such as experimental (meant as the involvement of the tourists in ‘in-field’ activities), nature and sports (e.g., walking), and other attractions and cultural heritage (Ruiz Guerra et al., 2018).

The second cluster (green) comprises 7 papers that consider how to develop oleotourism. In this vein, tourist experiences (Campón-Cerro et al., 2022; Čehić et al., 2021), the role of residents’ involvement (Di-Clemente et al., 2021), but also oil mills, oil-related museums, olive farms, olive oil roads, and oleotece (Čehić et al., 2020) are important. A crucial aspect it also related to the identification of certified (PDO) olive oil (Maksan and Brečić, 2019).

The third cluster (blue) comprises 7 papers in the timeframe 2016-2022 about the factors affecting oleotourists. In this regard, the literature mainly refers to three aspects: (a) socio-demographic characteristics, such as gender, country of origin, age, professional category, income, with a particular relevance of education (Hwang and Quadri-Felitti, 2022); (b) types of experience (Hwang and Quadri-Felitti, 2022); (c) variables related to the tourists destinations such as shopping area, sports (López-Guzmán et al., 2016).

Based on these three clusters and on an analysis of the remaining papers that did not appear in the VosViewer analysis, we provided an overarching framework that could guide future research.

Firstly, we noticed that there is a broad heterogeneity in terms of countries. Specifically, countries differ among them both in terms of demand (what tourists are looking for) and offer based on the level of oleotourism development (i.e., life cycle). Surprisingly, we found contributions from Croatia (Maksan and Brečić, 2019), beyond the more traditional Spain (Aguilar and García, 2019) and Portugal (Almeida and Silveira, 2021), while little is known with respect to the Italian context (Cavicchi and Santini, 2019; De Salvo et al., 2013). This occurs despite the fact that Italy has a long-lasting tradition and reputation in term of oleo production and a huge potential, just little exploited at the moment, in term of oleotourism. This urges to deepen the scientific debate on this still emergent type of tourism, especially in certain countries (i.e., Italy).

Secondly, extant research noticed the need to involve multiple stakeholders. In other terms, we think that there is a need to deeply understand the extent to which whether, and the extent to which, the tourism stakeholders share a common boundary object (Del Chiappa et al. 2018) as per needed to develop an oleotourism ecosystem capable of connecting multiple stakeholders, no latter residents, at multiple levels, namely: micro (i.e., local level), meso (i.e., regional level), and macro (i.e., national, and even international, level). To this respect, we suggest moving from the already identified activities (Čehić et al., 2020; Marchini et al., 2016), but also involve all the other associations that could play an important role on the promotion and valorisation of the olive oil. In particular, we think that the activities identified by Pulido-Fernández et al. (2019) - based on a panel of experts - could contribute to developing the oleotourism. In this respect, a co-evolutionary approach to oleotourism and all the involved actors may be beneficial in order to understand how to create the ecosystem (Cristofaro et al., 2019; Leoni and Cristofaro, 2022; Paniccia and Leoni, 2019). The co-evolution concept, in fact, has demonstrated to be a valid perspective to grasp the key interdependencies among the natural, socio-cultural, and economic resources of firms and their external environment, as well as their dynamics over time (Brouder and Eriksson, 2013), especially in tourism contexts (Paniccia and Baiocco, 2020). In fact, co-evolution in tourism allows identifying the factors that can promote co-evolutionary adaptations between tourism firms, institutions, local communities, and tourists that co-determine the tourist offering, enhancing the natural and cultural identities of a destination with positive effects in terms of life quality (Bramwell et al., 2017; Ma and Hassink, 2013) and, in turn, on sustainability (Li et al., 2022; Zutshi et al., 2022). In particular, co-evolution in tourism allows considering the interactions that take place among multiple stakeholders at multiple levels, namely micro (tourism entrepreneurs and their firm), meso (the destination in which the tourism firms are rooted) and macro (the wider socio-economic and natural system); thus, it constitutes a valid lens with which future studies could investigate the actors and processes related to oleotourism.

Thirdly, we acknowledged the presence of studies on consumption (Sabbatini et al., 2016), while little is known about tourists' buying behaviour and how tourists are willing to pay more for olive oil, beyond the PDO designation (Maksan and Brečić, 2019).

Fourthly and lastly, we did not see contributions on the role of new technologies in shaping oleotourists' experiences and on how they can be adopted, for example, by all those stakeholders that might create an oleotourism ecosystem.

Research limitations. The paper has focused only on Scopus database, while it has not considered Web of Science and Google Scholars. Similar to the other two reviews identified (i.e., Hernández-Mogollón et al., 2019; Pulido-Fernández et al., 2019), also our results show that there are two aspects to consider (i.e., supply and demand), but we propose to stretch the existing research towards the broader concept of oleotourism ecosystem.

Managerial implications. This manuscript advances current research on the oleotourism, introducing four main factors that oleotourism' stakeholders might consider in designing their strategies: the Italian oleotourism positioning within the European context and beyond it (little is known on other countries characterized by both tourism and olive oil production); the actors that need to be involved in proposing an oleotourism offering (in terms of the development of an oleotourism ecosystem); the oleotourists' profiles that, contrary to other products such as wine, are less investigated; how to use technologies in both supply and demand sides for helping oleotourism.

These four factors represent the basis on which to build valuable paths for rural Italian territories, especially in the South of the country. In this regard, it is important to underline that 80% of the Italian production of olive oil derives from the regions of southern Italy such as Puglia, Calabria and Sicily, and that Italy holds more than 40 denominations of Protected Designation of Origin (PDO) and Protected Geographical Indication (PGI) recognized by the European Union (Associazione Nazionale Città dell'Olio, 2019). Despite this, oleotourism was recognized, by law, like wine tourism only in 2021 (see the current article 2135 of the Civil Code). Furthermore, according to the report "La valorizzazione turistica dell'olio" (Garibaldi, 2019), 37% of Italian tourists have visited an oil firm and/or an oil mill during their most recent trips and 69% would like to take part in them. Moreover, the desire to discover olive oil is not limited to the place of production. As many as 60% of Italian tourists would like to be able to taste different types of olive oil and find a specific olive oil list in combination with the dishes offered by restaurants.

The above demonstrates the existence of a market that need to be satisfied, as well as the need to go beyond the traditional offering - mostly linked to visits to production sites and tastings - in order to build broader and more segmented proposals, capable of stimulating tourists' curiosity and active participation. To this end, the ability of Italian destinations to integrate - within their own tourism portfolio - the experiences related to olive oil becomes crucial.

Therefore, the development of oleotourism in Italy represents an extraordinary chance to offer new opportunities to Italian and foreign tourists, based not only on a taste experience, but also on the culture and history of each specific olive-oil growing area.

Originality of the paper. This paper identifies valuable possible paths that rural Italian territories rich in olive trees can implement to enhance local territories through tourism and with positive cascading effects in social, environmental, and economic terms at multiple levels (local, regional, national/international).

Keywords: Oleotourism, Tourism, Olive oil, Sustainable tourism, Local tourism, Review.
